...the husband] is a worried [guy]. His wife often threatens to leave him – not because of any conflict but because five people in his family suffer from arsenic poisoning. "Life has become somewhat tense... My problem is that I can't leave my family," said [the husband], who teaches zoology at a [gals'] college at Rajarampur in the north-western [Bangladeshi] district of Chapainawabganj. Like [the teacher], despair is gripping many families in this village where people say they are fighting a losing battle against a previously unknown enemy. As villagers drink water from wells considered safe, more and more people fall sick and develop various symptoms from black body spots to tumours and gangrene. "We are helpless," said... [another villager, who believes it] was infected by arsenic contamination years ago but only recently realised its dreadful effects... [Now the 26-year-old] lives in fear because one of his brothers has already died and several other members of his family have symptoms of arsenic poisoning. There is hardly a family in Rajarampur and nearby Naysankha village which does not have at least one member suffering the effects of contaminated water. "Fighting the effects of arsenic pollution is an uphill task and so far we have not had much success," said... [the] professor of zoology and mining at nearby Rajshahi University... "The problem is widespread. It requires coordinated efforts by researchers, doctors and the Government to try to contain it,"... An arsenic content of up to 0.1 mg per litre of water is considered safe for drinking, but in many areas in Chapainawabganj and neighbouring districts wells contained 4 or 5mg per litre and sometimes even more... "Contamination is caused by the [naturally occurring] arsenic-rich pyrite mineral in the water..."... Public health authorities have sealed dozens of wells, including 15 in Rajarampur. But hundreds more are still in use because people have no alternative source of water. River water is generally arsenic-free but is often contaminated with other diseases. "Hardly any progress has been made in the fight against arsenic pollution. In some of the worst cases, victims develop tumours in the lower abdomen and die from bleeding when these burst," said... a front-runner in the campaign against arsenic contamination... "Some victims suffer rotting of their nails, which is often mistaken for leprosy." ...The public health department was doing little and had not attached much importance to what... [the campaigner, himself] a victim... called "a growing menace." ...wells more than 15m deep were generally found to have high arsenic contents. "Those only... 9m to 12m... deep are usually safe... We are trying to make the people aware of that... [But] the Government is virtually quiet [on the problem]. Politicians tend to ignore it... and the general public are mostly ignorant." The Government says only three people have died from arsenic-related illnesses over the past year. But in a report earlier this year, Dhaka's *Independent* newspaper quoted health officials as saying arsenic contamination of sub-soil water threatened 15 million people in northern and south-western Bangladesh. A survey by a group of [NGO]s found that many people in these areas had developed severe rashes, mainly on the palms of their hands and feet, and were suffering from chronic intestinal complications... Doctors and officials say the social effects of arsenic contamination are as bad as, if not worse than, the health hazards. "No groom would agree to marry a bride with arsenic poisoning – except in very rare cases. These poor girls and their families face social rejection... Some husbands have divorced their wives after they discovered symptoms of arsenic poisoning. Many others had their proposals of marriage refused." ...[■] Communities in the top half of the North Island are drinking imperfect water, says the Consumers' Institute magazine... It said 68 of N[Z]'s 137 communities with more than 2000 inhabitants had water supplies with "a high risk of contamination in the source, treatment or distribution system." Towns deemed by the Health Ministry as having... a very high level of risk included Taupo... Those classed as having... an unsatisfactory water supply... included... Helensville... and Warkworth.

...The North Shore City Council is aiming to safeguard drinking water. The council has started a programme to protect against backflow – the flow of water and contaminants, mainly from industrial and commercial sources, into the public water supply. The water network manager... said the main cause of backflow was a drop in pressure in the water system... [In related news, Takaka's] Chief Fire Officer... [i]s afraid of running out of water in the middle of fighting a fire. [His] brigade had repeatedly asked the Tasman District Council to help buy a water tanker. But the brigade and council disagree over the flow rate required to make the hydrants effective... Water supply problems in Takaka... forced firefighters dousing a house blaze... [– that] could have led to four deaths... [–] to pump from a nearby swimming pool rather than a hydrant 20m from the scene.

...Wellington residents' weekly rubbish bags will help to warm city swimming pools from next month... Council swimming pools in the suburbs of Tawa and Johnsonville will switch to methane gas supplied from Spicer Valley landfill... [T]he change would save about 15[%] in heating costs for the pools... [Incidentally], new studies raise questions about the safety of chlorine used to purify everything from swimming pools to municipal drinking-water supplies. In the latest study a team of Finnish scientists report... that MX, a compound produced when chlorine reacts with organic material in water, causes cancer in... rats when swallowed in large quantities... As a disinfectant, chlorine is one of the public-health success stories of the 20th century. After it was first used to purify water supplies in the early 1900s, typhoid fever, cholera and dysentery virtually disappeared from the U.S. But the chemical has been under attack in recent years by environmentalists for contributing to the destruction of the earth's ozone layer. Greenpeace's "Chlorine Kills!" campaign... urged pool operators to look for an alternative to chlorine. An editorial... tried to put the drinking-water problem into perspective. It pointed out that at the highest levels of MX found in U.S. water supplies, the additional lifetime cancer risk was only 2 in 1 million. But it encouraged further investigation of the effects of MX and other chlorination by-products, and two weeks ago the National Institutes of Health announced that it was launching a two-year study. The NCI editorial also warned about the perils of abandoning drinking-water chlorination too hastily. It noted that when Peru did that in 1991, some 300,000 Peruvians were stricken in a cholera epidemic.

...Filterzone... is the invention of a Takapuna company... [Currently in] the process of being patented, [it] took two years to design and another two years to complete... Filterzone uses ozone to zap the life out of bacteria, especially giardia and cryptosporidium, which are immune to chlorine and other forms of treatment... Using ozone to treat water has been known to the world as early as the 1840s. It was used in 1893 to treat water in the Netherlands. The idea has been revived in the U[S] because of concerns over the use of chlorine... Ozone is already used commercially to treat water in spas and swimming pools... [However, b]ig-scale ozone plants are expensive... Filterzone is [not only cheaper,] it is portable and relatively idiot-proof... The Filterzone process introduces ozone to the water and, through the process of oxidation, it gets rid of algae and bacteria, among other things. Filterzone's "brain" is a computer working on fuzzy logic which tells the system what to do. In simple terms, it "knows" when the water is treated... [T]he machine provides up to 100 tonnes of water per day... Because Filterzone is a stand-alone machine, it can be placed anywhere – in an isolated resort or a small village. Once it is installed, it functions on its own and requires full servicing once a year. It is intelligent enough to wait when there is a power failure or when there is insufficient water to process. Any breakdown will send off an alarm or make the computer dial home to report there is a glitch. Phone or satellite links will provide 24-hour contact with the home base... The Rodney District

Council has tried Filterzone at its Muriwai water treatment site since October 1996, supplying... “the best water in N[Z]” to more than 500 people... During the trial period, there were three power failures at Muriwai. Once, [the designer] had more than 30 messages on his telephone from the computer to tell him the system had shut down. But once the power supply came back, it reported that it was back in action.

...A broken power cable caused a blackout for up to 200 homes in Remuera last night. A Mercury spokes[per]son... said the power cut started just after 7 pm... Electricity was restored after an hour... Much of central Takapuna was [also]without power for part of last night. The power cut hit about 6.15 and affected 10 streets...

About 10,000 Hamilton households endured a cold, dark night last night after a fault in a Trans Power supply transformer cut their electricity about 5.30 pm. Trans Power hoped to have power restored by midnight.

...A... blizzard buried New England and the north-east under nearly 90cm of heavy, wet snow yesterday, downing power lines... More than 168,000 households were without power in the state... [In further news from the US, a] massive solar flare that burst off the sun was predicted to cause a geomagnetic storm around Earth late in the week. Scientists at the... Space Environment Centre in Boulder, Colorado, warned that the flare was rated as a class X, the highest intensity classification, and... advised... [r]esidents of Canada and the northern U[S]... that the stream of charged particles could cause problems with satellite communications and power grids when it interacts with Earth’s magnetic field.

...a solar flare... [is hurtling] toward the Earth... The sun spat out the flare – it’s actually tons of charged hydrogen and helium, same as the sun – and propelled it toward Earth at about 2.4 million kph. Flares normally occur every three or four years, stretch across 50 million km and take anywhere from 16 hours to several days to pass Earth. This one is the largest since a 1989 flare that knocked out a power grid in Quebec for nine hours. Oh, yes, they can disturb the Earth’s magnetic field [– ‘peeling it away like an onion’ –]and give heart attacks to electric wiring, telephone lines and electronic transmissions. Earthlings need not fear. Scientists say that such flares are harmless to humans, and the few common effects are limited to missed telephone calls... [–] a solar burst shortly after the New Year... knocked AT&T’s Telestar 401 satellite out of service, a \$200 million loss... [–] and TV programs. “Maybe people will read again,” mused a flare-watcher in New York. Another perk: flares set off pretty auroras such as the Northern Lights.

...With the America’s Cup and other significant events looming... we should start brightening up our city... Auckland could learn a lot from the way European countries light up their cities. In many countries, particularly in France, master plans are being developed for illuminating landmarks and buildings. Floodlighting the local church around the corner is no longer seen as a waste of precious electricity as it would have been during the energy crisis in the 1970s. Lighting adds beauty to the environment and gives cities a feeling of character. The exterior lighting of the Sky Tower in Auckland is a graphic example of the effect this type of lighting can have on our city... Imagine a plan which included the lighting of the majority of our classical, historical and major industrial and commercial buildings... Imagine the enhanced mood it would create around the upper harbour and the visuals we would enjoy when viewing it from afar, if the superstructure, rails and pylons... [of the] dull and drab... Harbour Bridge... were illuminated. If you drive around Auckland at night there are numerous buildings just screaming out to be lit in an artistic way... and if you are feeling really adventurous – how about the slopes of Mt Eden? We should not forget some of the dark and gloomy parks and reserves which so often are the scenes of crime. We all know what it feels like to walk through or around dimly lit areas in the city. It is a well-documented fact that criminal elements do not like high illumination because of the risk of detection or recognition... So come on building owners and managers (not to forget our city planners), let’s get moving. We need to copy our European counterparts... [– although we] should avoid copying the parish of Bramber, Sussex. Street lights there were switched off for three nights as a cash-saving experiment. The electricity bill for the period tumbled by... \$20. Unfortunately, bills for switching the electricity off and on totalled... \$60. Ratepayers paid an extra \$40... for their three nights of darkness.

...Most [N[Z]]companies can cut their power bills by around a fifth by taking simple steps to conserve energy, according to the Government’s Energy Efficiency and Conservation Authority... The Government set up the authority two years ago to help companies reduce energy waste. At last count it was working with 700 firms... Changes as basic as reducing the wattage of lightbulbs, or repairing leaks in steam pipes, are proving to be big savers... “Many businesses simply don’t know where the energy they are using is going...,”... said... the authority’s communications executive... Even companies like Mobil Oil have benefited from an energy audit. It is saving around \$4000 a year at each of its service stations after introducing new lighting and air conditioning units.

...Lights going out for efficient energy-saver... Despite a new era of competition and supposed efficiency in the electricity industry, N[Z]ers are paying more to heat their homes. In five years bills have risen 20[%] above inflation. Now, the only Government-funded organisation set up to combat rising power bills has had its budget cut from \$3 million to \$1.9 million and faces extinction in an upcoming review. It appears the taxpayer may be in danger of cutting off its nose to spite its face. The Energy Efficiency and Conservation Authority (EECA) was praised earlier this year by the International Energy Agency, which noted its effectiveness was limited by its modest budget. The authority was set up in 1992 with the aim of demonstrating how to wring more value out of every dollar spent on energy – for homes, businesses and transport. Its establishment coincided with deregulation of the power boards, which were turned into companies looking to sell more power and increase profits. It also followed the 1992 power crisis, when drought resulted in the state generator, ECNZ, worrying that hydro power... might not be available. A massive “switch off” campaign that year led to a 20[%] cut in demand for electricity as N[Z]ers went without in the national interest. But there was – and still is – a better way: energy efficiency offers even larger savings in consumption without the hardship. In other words, we can use less power, save money yet enjoy greater levels of comfort in the form of warmer houses with more appliances... The authority began work by focusing on its own backyard: government departments. It has had some spectacular achievements... Within a year of the authority’s formation its base, the Ministry of Commerce building in Wellington, had been refitted with energy-efficient equipment – light bulbs, new lights, timer switches – at a cost of \$40,000. Commerce’s power bill was cut by \$43,000 a year, repaying the outlay and then some almost immediately. More recently Auckland Healthcare... has shaved \$250,000 from the annual power bills for three of its hospitals, most of it on lighting... The authority loaned Wellington Hospital \$600,000 from which it is making savings of \$200,000 a year and has already repaid half the loan... The authority’s acting chief executive... says the loans scheme to schools, hospitals and the like is achieving annual savings of \$4.8 million. The private sector has also benefited. So far 700 major companies have signed up to an “Energy Wise” programme. Sixteen of those were recently given awards by the authority, having amassed collective savings of \$23 million a year. An Energy Saver Fund, directed at households, has resulted in 32,000 homes installing better lighting, hot water systems and insulation, but many more thousands of homes remain draughty and mould-prone... Market proponents argue people will insulate their homes and install efficient natural gas or electric heat pumps when the cost of electricity makes them realise it is worthwhile. They say people should be free to choose when and if they take those steps. The rationale for the authority is that energy efficiency can become part of a market but needs a kick-start. What incentive, for example, does a landlord have to insulate a house when tenants pay the power... bills? For that matter, what incentive do tenants have to insulate a house they do not own? Significant decisions, or more accurately, non-decisions, by the Government this year include the deferral of a carbon tax and failure to act on recommendations that the 20-year-old “interim” building code standards for home insulation be upgraded.

...Bureaucrats are [still]at odds over stricter home insulation standards... Last year the threat of legal action by the makers of Lockwood homes led the National Administration to back off a long-awaited plan to change the rules for colder parts of the country... Now the Treasury has weighed in with its opposition to the proposed change to the building code. Like the Roundtable, its opposition is largely philosophical. The former Minister of Energy... said in July last year that upgrading the building code was a “key element in the Government’s energy efficiency strategy and part of

N[Z]'s internationally reported response to its commitments under the Framework Convention of Climate Change." [The former Minister of Energy] told the then Internal Affairs Minister... that [his department] wanted the Building Regulations Act amended without delay... The Secretary of Internal Affairs... acknowledged the urgency of the matter... but the department has yet to produce recommendations. A spokes[person] for the Minister of Internal Affairs... said a fresh report from the department was not imminent and [the spokesperson] did not know when to expect it.

...[As efficient use of our natural resources becomes a priority for the 90's it seems more important than ever that we take this concern into our own homes. And there is plenty a canny kiwi can do to make their nest more energy efficient. Like making sure your home is properly insulated. And making sure you are using the most energy efficient appliances. *With up-to-date styling and high-tech bonded magnetite heating cores, the new generation of night-store heaters* are a good example of efficient use of energy – they use cheaper "Off-Peak" electricity to charge up overnight and then they release their energy during the day when you need it.' The new Nightsaver price option released last June offers real savings for households that can manage on one tank of hot water a day. The benefits will vary, but Nightsaver could save a 4-person household on the Household price rate \$5 to \$10 on their monthly power bill.']

...North Shore residents... [were] saved... from a big power cut yesterday morning. A Wairau Rd power pole burst into flames about 3 am when a glass insulator failed... Power N[Z] staff isolated the area and rerouted power to most affected suburbs. But the loss of two 110,000-volt power lines meant the morning peak demand would have to be reduced to avoid blackouts. A radio appeal went out to go easy on the electricity and phone calls were made to key users such as the Devonport Naval Base, North Shore Hospital, Chelsea Sugar Refinery and supermarkets. The Power NZ chief operations manager... said the city's hot water heating was turned off and the big users were asked to delay or rotate the use of some heavy-demand equipment. "We are very grateful to everyone who had a cold breakfast or left the laundry until later. We cut normal power demand by 15[%] and that made all the difference,"... The crisis was over by 10 am, but 11 firms near the damaged pole were without power until midday. They will have a credit on their next power bill because they were without power for more than six hours. It was a busy morning for faults staff as high winds caused other brief power cuts in Whangaparaoa, Milford and western parts of the North Shore.

...Stress can make people say the oddest things. Take the victim of last week's destructive electricity "surge" who told a Power N[Z] official that it would teach her not to leave her appliances plugged in. This by way of chat to the company that had just zapped her Murrays Bay home with a ruinous 380-volt surge of electricity, putting out of action every plugged-in electrical device in her place. To say nothing of the electrical goodies of 34 neighbours as well. I suspect that, in her shoes, I might have been rather less generous. My father, however, would have been nodding in agreement. Indeed, the chances are, if [dad] had lived in that street, [dad] would have had the only functioning television left. [Dad] was a stickler for unplugging the box. I suspect it was something to do with its rumoured propensity to self-destruction. And also to the stern admonitions of the instruction book. These days, of course, you would have to go to bed half an hour early each night if you wanted to do the rounds of the electrical gadgetry, unplugging as you went. And you would have to be up two hours early each morning to reset the various built-in timing devices. Still, the great Murrays Bay surge does make one feel a tad vulnerable. Stop worrying, the Power NZ experts assured me. Last week's unfortunate surge was an extremely rare event. As for the increasingly sophisticated electronics of our modern-day home gadgetry, it's apparently not as vulnerable to the spikes and surges of the power supply as is sometimes made out... "I don't protect myself against it,"... Power NZ's network performance manager... assured me, "and I'm as aware as anyone." [The manager] said most modern home appliances had a voltage "clipper" which diverted excess voltage to earth or, in extreme cases, protected the equipment by self-destructing. Only if [the manager] were working from home would [it] consider additional "protection." This would be a battery-backed device to provide an "uninterruptible power supply" to his computer. This would give him five minutes' battery power – in the case of a power failure – to store data.

...If it's vital you keep going during a power outage, Power N[Z] can help. No matter where you are, PowerProtect lets you carry on for as long as you need through an Uninterruptible Power Supply. And with a power filter, you protect your sensitive electrical equipment, like computers and security systems, from potential damage caused by power fluctuations. For more information on how PowerProtect can help you finish what you start, call... 0800 POWER NZ or 0800 769 376.

...[Swedish power officials were left scratching their heads after] an outage that cost an estimated \$7 million. The power cut affected 50,000 households in western Sweden and forced the SCA forest products company to shut down three plants. The cause of the cut was a mystery until a great horned owl – alive but with singed feathers – was found near the outage site... □ MONKEYS have emerged as the biggest threat to New Delhi's off and on electricity supply. Senior officials have asked the New Delhi Municipal Committee to immediately appoint monkey catchers to tackle the growing menace of the monkeys which tend to jump over transformers causing short circuits.

...A Taranaki schoolboy survived last night after climbing a power pole and causing a short circuit which cut power to more than 300 homes. [The boy], aged 10, of Waitara, is in Waikato Hospital with serious burns. [A police officer had found the boy motionless. "The boy] was draped between the transformer and the pole. It was obvious that [the boy] had well and truly had a shock. You could see burns on his hands and back." A Powerco spokes[person] said the boy was lucky to be alive. "I don't think there are too many people alive today who have taken 11,000 volts."

...US ranger Roy Sullivan... would have hung on to his hair, toenails and eyebrows if he had subscribed to the power of the pyramid. They were burnt off more than once when he was struck by lightning no less than seven times throughout his life... The power of the pyramid... [is] about to be reincarnated in a totally new form thanks to... a University of Queensland laboratory... [which has] constructed a sort of downsized '90s version of the ancient Egyptian icon. Consisting of just three sections of collapsible aluminium tubing, it's... a portable lightning shield. As long as the occupants are at least 25cm from the frame they will survive a direct hit... The device... [was] developed to protect soldiers in Singapore, but anyone caught outside in a thunderstorm would benefit... But what's really needed is for science to take complete control of these Acts of God: To tame lightning at its heavenly source... [I]n their miniature world... modern day Zeuses have... [already learnt how well-]placed lasers could discharge thunderclouds at will... The next step is to test... laser logic outside in the real world... [■ NZ] researchers have linked high-tension power lines – already associated with higher rates of leukaemia among children – to asthma and depression in adults. The ground-breaking research suggests that people living within a 20m "shadow" of high-voltage lines are three times as likely to suffer asthma and twice as likely to have major depression. Researchers believe the danger levels drop rapidly outside that 20m-zone. The major new study also indicates that these people have a higher incidence of diabetes and are twice as likely to suffer from immune-related illnesses such as allergies and dermatitis. Auckland is most affected because of the city's population density but high-voltage lines stretch across the country. Although less than 1[% of NZ]ers live near the lines, the research has implications for the vast number of people exposed to electromagnetic fields at work. For example, industrial sewing machine operators, welders and some supermarket check-out operators are subjected to prolonged magnetic field exposure. But although the evidence linking electromagnetic fields to health problems mounts, scientists are yet to prove the link. The research is expected to stimulate worldwide debate when it is presented to an international symposium of electricity and magnetism in Italy next month... Some 570 people in South Auckland, West Auckland and the eastern suburbs took part in the three-year study. The participants consented to detailed measurements of magnetic fields being taken in their homes, to releasing their medical records and giving blood samples. The study... revealed that adverse health effects became apparent in homes with magnetic field readings as low as 5 milligauss or mG. (The reading is obtained by measuring the density of the magnetic field with a handheld device.) One home recorded a 190mG reading... An Auckland University... psychology department... academic involved in the research... said the research findings added weight to other studies which suggested the internationally accepted electromagnetic field exposure limits should be lowered. The National Radiation Laboratory recommends 1000mG as a safe level, based on the guidelines...

Medium sized electric welder[s generate 5000mG (0.04 kilovolts/metre), while the inside of an] electricity substation... tended to be... 10,000[mG (9kv/m)]... Houses close to high-voltage lines, which already sell more cheaply because of the lines, could be under further price pressure as the result of the research. "Personally, I would not want to live underneath these power lines – I would want to move as soon as possible, not because I'm certain I would be affected adversely but I would not want to live with the doubts,"... said[the professor, who]... likened it to earlier this century when agents like tobacco and asbestos were suspected of harm – but it was many years before there was conclusive proof.

...[an Aucklander] knows that living in the shadow of a looming 110,000-volt pylon is not a great selling point for her home. But... [the Blockhouse Bay resident] has fresh worries... [after hearing] yesterday about... the health effects of living directly under live power lines... "It does alarm me for my health and my children's health and secondly for the price of my property." ...[the] bus driver... was aware of possible health effects when... [buying] her immaculate home three years ago for \$95,000. "It was a bargain. For the price it was a matter of taking the risk or living in a hovel. It's a risk you take when you want to give your children a home and you only have the basic deposit." A real estate agent has recently priced the... three-bedroom... home... at \$145,000. The nearby series of power lines was listed as a big disadvantage. Her clothesline sits dead centre under a high-voltage tower... A Hillsborough resident... trie[s] to get her three children away from her house every weekend and every school holiday... [They] appeared calmer away from the house, but [the mother] did not know if it was related to the pylon... in her otherwise tranquil back garden [- which] almost put her off buying the property four years ago. But... [the Hillsborough resident] wanted a good neighbourhood for her [kids] within a certain budget... Trans Power sent out questionnaires to affected residents every year which related to maintenance issues... No health questions were asked.

...Although hardly an unbiased observer, Trans Power[']s general operations manager... is not convinced that power lines can be blamed for the alleged health risks posed by electromagnetic fields... "It can be pretty depressing living next to a power pylon in South Auckland, but that is not necessarily because of electromagnetic fields... [Seriously though, the] problem that I have is how do you distinguish the source of the electromagnetic fields which are supposed to be causing the problems? They are not tagged." ...The power of the field was generally determined by the amount of electricity consumed by the device being used, with appliances such as hair dryers and food processors creating bigger fields because of the wiring coils in their electric motors. Other devices subjected users to fields for longer periods, such as electric blankets and bedside clock radios... [The manager] – who has not seen the yet-to-be-published study – ...said people tended to blame high-voltage transmission lines for powerful electromagnetic fields when they actually produced relatively low levels. "It is because they are so big and noticeable, but magnetic fields are associated with current rather than voltage." ...[and] their strength fell rapidly with distance. Placing power lines underground would make little difference – overhead tension lines were no less than 12m from the ground at their lowest point, and they would have to be buried the same depth to achieve a similar ground level reading... A Ministry of Health booklet says the highest voltage transmission lines in N[Z] produced electric fields of up to 3 kilovolts per metre, although trees and buildings reduced their strength to only a few per cent of that. The ministry concluded that there was no simple yes or no answer to the question of whether electromagnetic fields from power lines and appliances are completely safe.

...A [US] study published in the *New England Journal of Medicine*... found... magnetic fields from electrical appliances and power lines do not raise the risk of acute lymphoblastic leukaemia, a common form of childhood cancer... [In related news,] Waikato power poles are getting an electronic once-over from the heavens. The Hamilton-based company WEL Energy is using... the Global Positioning System... to pin down the location of its 50,000... poles... [T]he survey will allow [i]t... to react more quickly during power outages, and to improve planning for maintenance.

...Lines of history are disappearing in Morningside. The ancient power poles which flank New North Rd have been dug up after decades of service and replaced with shiny arcing lights. The look of the road has changed and is much cleaner with all the drooping power lines buried beneath the pavement. The removal of the old totara and A[US]n hardwood poles created a minor flurry among handy[people]... keen to lay claim to the tungsten-hard sentinels for retaining walls and gardens. Mercury Energy is swapping poles all over the city, though few were as old as the [Morningside] collection. The company is spending \$8.5 million this year on the task because it wants to tidy up its network. Main routes are being tackled first, because that reduces the number of poles hit by wayward vehicles. With fewer pole-strikes, power supply is that much more secure. Reliability is enhanced with the wires buried where bad weather cannot affect them. And the new curved metal [streetlight] poles are what Mercury calls frangible – they are designed to crumple on impact, which increases survival odds... [T]he wooden poles... date from the years that first trams and then trolley buses rumbled along the city streets. They needed to be tough as teak to carry the weight of overhead cables and wires for the trolley network... At the turn of the century, the electric tram run from Khyber Pass... to Kingsland... was so popular that hundreds of people endured long waits before squeezing on to the open and uncomfortable vehicles which trundled through gloomy suburbs. In 1903 the route witnessed the worst tram disaster in Auckland history. A tram packed with Christmas Eve shoppers rolled backwards down a slope from Eden Terrace to Rocky Nook. As it gathered speed it slammed into a city-bound tram. Passengers were tossed from the top-deck like ragdolls and knocked out by the lurching trolley arm. When the smoke cleared, three people lay dead and 50 nursed shocking injuries. But this tragedy failed to deter tram-riders and the top-heavy double-deckers remained on the route despite an inquiry recommending their removal. It took the car to kill off the trolleys and the modern bus fleet is still trying to catch up... [Incidentally, the] North Shore City Council is pushing for a law change to give local authorities greater control over utility companies which install underground cables and pipes. The council is concerned at the growing number of utility operators. It wants to be able to tender for the provision of utility services, thereby reducing congestion under the road.

...The burying of 3km of high-voltage power lines through Pakuranga may mark the beginning of the end for pylons. A \$4.6 million project by the Manukau City Council, Transpower and property developers will see new, more powerful transmission cables placed underground by April next year. A 2.2km tunnel running eastwards from Ti Rakau Drive through Botany Downs will carry the new 220,000-volt cables. The project is designed to be more friendly to the environment and less hazardous to health. The 1.8m diameter tunnel will be 2m beneath roads rather than homes... Transpower... said yesterday that the future was in underground cables but they were expensive... Transpower looks after 13,000km of transmission lines... The Mayor of Manukau... said the project would be totally funded by the private sector, which saw room for the development of 500 new homes and commercial properties. The value of existing homes is expected to jump up by 30[%]. "I hope other local government units will follow our lead and work in partnership with private sector interests to remove large, unsightly pylons from sensitive areas of the landscape,"...

Construction will start on Monday on Mercury Energy's \$62 million tunnel for power cables between Penrose and... Auckland city. The Mayor of Auckland... struck the first blows for the 9.2km subway, which will be large enough for a golf buggy to drive through. The total project, including new electricity cables... is budgeted to cost around \$110 million. Mercury's chief executive... said that in the short term the tunnel would cost more than to lay cables in a shallow trench, but [having the cables '30 to 50 metres below the surface will protect them from damage due to diggers' and] there would be [other] longer-term savings. "The tunnel has a life of around 200 years and we will be able to add new cables to it over that time. In addition, we will have easy access to cables that have a 20-year lifespan,"... Other users, such as telecommunications companies, would lease tunnel space... The tunnel will follow the Southern Motorway for much of its route... to Mercury's substation on the corner of Hobson St and Fanshawe St.

...Underground tremors were felt in Auckland last week – not from an earthquake but from earthworks on the Mercury Energy tunnel... Basalt rock is being blasted at the Penrose site to extend the 6m vertical shaft of the tunnel to 70m, the depth required for boring to begin.

...The first bites of... [the] power cable tunnel underneath Auckland [city] were chewed out yesterday when a special drilling machine descended below Hobson St... Called a Roadheader, the mechanical excavator was lowered down a 20 m shaft and began to blast rock... The machine is operated by a construction worker, and the debris it produces is cleared away by a crew waiting at the surface. The device will bore a tunnel to a point below the Symonds St off-ramp... [of] the Southern Motorway... generally following the surface street layout. At that point a giant tunnel boring machine capable of digging out 100m a week will do the hard work. The tunnel will... meet... the Auckland central business district[']s... power needs beyond the year 2000. Completion is expected in November 1999. - 1997

ON THE EDGE OF DARKNESS... Auckland city leaders and emergency services last night ordered an unprecedented shut-down of the central city until power is restored – at least a week away. A crisis committee of police, civil defence officials, firefighters, health officials, insurers and Mercury Energy said the risk to public health and safety was too great and no shop or office should open without power until further notice. The full magnitude of the crisis became apparent when the Fire Service warned it was not safe to enter buildings with alarms, sprinkler systems and lighting out. “Those who [still] have power in the CBD are likely to lose it; those who don’t have power shouldn’t expect it to return,” the committee said. “Any power available will only be sufficient for hospitals and emergency services.” Police have brought in mass reinforcements to protect shops and buildings left vulnerable by the lack of lights and alarms. Health inspectors will be checking food retailers to ensure hygiene standards are met. Auckland’s courts, university and the technical institute had already decided to shut for the week, meaning delays to trials and disruption for tens of thousands of students. The costs to the city and nation are likely to run into hundreds of millions of dollars. Many businesses face crippling losses – possibly bankruptcy – and are unlikely to win more than limited compensation from Mercury Energy... Businesses with emergency generators – like Sky City, the Ports of Auckland and the *N[Z] Herald* – will cope, but... [e]ngineers warn that machines designed to provide backup for short periods could easily overheat and catch fire if run at capacity for days at a time. The Auckland Employers’ Association said bosses were obliged to pay workers to stay home. About 60,000 work in the affected area, which is the hub of N[Z]’s business community. Many more come to the city daily for business and shopping. Thousands of apartment dwellers and occupants of inner-city hotels have been told to find alternative accommodation. Businesses that were able to relocate at the weekend did so, including some to Sydney. Disgruntled tourists likened the situation to that of a [Last] World nation. The spotlight turned on Mercury’s board and management, with the chief executive... [offering to] resign if the board wanted him out. The consumer trust that owns Mercury demanded the company restore supplies urgently “irrespective of cost.” The level of disruption was totally unacceptable, said the trust chair[person]n... Asked if... [it would] call... for the Mercury board to resign, [the chairperson] said: “Not yet...” However, the trust expected a full inquiry and report back “with an assurance the Auckland CBD would never again face such a crisis.” Mercury’s board apologised publicly but indicated it did not believe it or its management were at fault. “It’s the most incredible, freakish bad luck you could ever imagine,” the chair[person]n of Mercury... said. But the former chair[person]n of Mercury... said the four big cables that failed were up to 30 years old and concerns about their reliability had been raised five years ago or more. Opposition politicians pointed fingers at the Government for the way it restructured electricity supply companies five years ago to make profitability the prime objective ahead of reliability of supply. “Aucklanders need to know if their electricity costs will rise again to pay for fixing this disaster,” said the Auckland Central MP... The Mayor... was concerned th[at] people did not realise the seriousness of the situation, which could worsen... Fears that [the] power crisis will damage the country’s reputation as an international tourist destination are deepening each day it lasts. A group of tourist promoters from overseas who searched for meals among the inner-city’s closed restaurants called it “Gotham City” after Batman’s city of darkness. [Editor’s note: ‘originally *Gotham* was a village of Nottinghamshire, with which are connected many of the simpleton stories of immemorial antiquity.’]

...Holiday from hell for Aussies... A trip to Auckland for a family wedding degenerated into a comedy of errors... “It’s been awful. I just can’t believe that something like this could happen in a city this big,”... Things started off well enough for the party of six as they travelled the country. But on Wednesday they hit Auckland and were turned away from their pre-booked Hobson St apartment because the lift was out of order due to renovations. Then came a power cut just as they were ironing shirts and getting ready for the wedding. Then the heavens opened on them and they returned, dripping, to a still powerless hotel. They woke in the morning to find the power was still off and they were being evicted for the second time in three days. So they... went back to the... unfinished... Hobson St apartments. But the only room available was a... sixth-floor apartment. “...there was no emergency lighting on the stairs so we had to feel our way up to the sixth floor. But apart from that we had a great time,”... The hotel learned only late yesterday morning that Mercury Energy could supply a generator to allow it to operate last night.

...A senior doctor says lives were endangered at Auckland Hospital after emergency generators failed to kick in when power was cut to operating theatres... [T]hree surgical theatres were being used on Friday night when the blackout hit... [T]he clinical director of the hospital’s operating theatres... would be demanding answers today. The failure came after the hospital agreed last week to run its emergency generators for some of its daily needs, to take pressure off Mercury Energy’s fourth cable. When that cable failed on Friday, the hospital’s computers had trouble pinpointing the exact problem, leading to the delay... “Senior medical staff are extremely concerned that the engineering systems of the hospital allowed this to happen. We rely on the back-up generators to come in within 10 to 15 seconds and that didn’t happen.” ...[the clinical director] put the delay at about 25 minutes... [S]taff had worked incredibly well with no adverse effects on patients. A manual over-ride was now installed to prevent a repeat of the problem... The hospital was expecting two extra generators yesterday, which would provide most needs should all Mercury’s cables fail. But only one generator had arrived last night. The second is expected to come tomorrow after last-minute maintenance.

...The cable system: what went wrong... Electricity runs into 50 Auckland substations, which radiate it to surrounding areas. Two major substations supply the CBD... [Both] are fed by two 110kV cables... [– containing copper] or aluminium conductors... [surrounded by insulation, filler (including ducts) for gas or oil... coolant...], a lead casing, then a bitumen or plastic case, steel]... or wire tape[, and an outer plastic sheath –] ...which run side-by-side about 1.5m apart and are buried 1.5m deep. The city needs three operational cables to run normally, and can get by (with minor outages) on any two... *January 22:* The first of two 1950s gas-filled 110kV cables running from Penrose to Quay St fails. *February 9:* The second gas-filled cable fails. Probable reason: Design faults. Insulating grease thins in heat, and pressurised gas eventually causes it to form blockages. Areas of cable become unpressurised and deteriorate. *February 10:* Mercury asks CBD businesses to cut back on power. *February 19:* The first of two 1970s oil-filled 110kV cables running from Mt Roskill to Liverpool St fails in a joint, producing major power cuts. Probable reason: The joint was badly prepared, or the earth moved slightly. *February 20:* The second oil-filled cable fails. Probable reason: Stress caused by driving the cable to its limits. *The city is expected to be running normally again by March 3.*

...The cabinet will discuss the Auckland power blackout today but is unlikely to make any hard decisions. The Minister of Energy... [said] yesterday that the first priority must be to get electricity restored... In the meantime, [the minister] did not want to “clutter the focus” of Mercury Energy’s management until that was done. But... was seeking official advice over whether [the minister] had the authority to call an inquiry or... would have to resort to the Commission of Inquiries Act – “which I really think is elevating it a little high.” [The minister was, however,] critical of Mercury... saying it must have been aware... the cables were under pressure because three years ago it had committed \$120 million for a tunnel project to replace them. [The minister] believed... there should be an investigation into whether the replacement programme was left too late. The P[M]... said the Government was taking the issue very seriously and was looking at what it could do. But both [the PM and the minister] were firm that any compensation claims were not a matter for the Government but for Mercury... and its customers... The Alliance... criticised Mercury[']s

priorities in slashing its maintenance staff while managers and directors “massively increased their personal pay.” Last year the director’s fee paid to the chair[person]... had been raised from \$50,000 to \$70,000... Meanwhile the workforce had been cut from 1141 in 1992 to 596 today...

Aucklanders wondering what went wrong with their “no worries” power company and who to blame need to look back a few years. In 1992 the Government approved a poorly disguised but ingeniously planned path to privatise Mercury Energy that had little public support. The disaster Auckland has encountered is a demonstration of the limitations of market mechanisms for running the electricity system. By allowing Mercury to be owned by a trust but not controlled by it the Government accepted a situation where, in the public mind, even the appearance of honesty and integrity went out the window. With it went the former chair[person] of the board... forced out by the other directors... [for opposing] the way the ownership structure was set up. The intention was – and still is – to float 25[%] of Mercury on the stock market. The catch is that the owners of those shares will appoint five of the nine directors. The publicly-elected trust, which will then have 75[%] ownership, will remain toothless. Right now the situation is arguably worse. Five directors have no accountability to anyone – and represent shares not yet floated... Extreme El Nino weather is clearly a major cause of the crisis. Records have been set for heat, humidity and low rainfall this summer. As well as triggering unprecedented demand for air conditioning and refrigeration it meant the four crucial 110kV underground cables have likely been damaged by constant vibrations from traffic, trains, construction work and sloppy digger drivers. Whether such extremes should have been foreseen and prepared for earlier will be a matter for an inquiry to deal with.

...[Auckland’s] electricity crisis is battering financial dealings far beyond the Queen City’s Golden Mile. At least one multi-million dollar hire purchase scheme is affected, denying the payment by instalments option to would-be buyers of big-ticket items around the country. And the Income Support computer system servicing the Auckland and Northland region has crashed... Meanwhile, [public]... health inspectors will patrol inner-city Auckland again today to lock up food shops posing a health risk... They [will] also start... surveying apartments to assess their water and sewage systems. The authorities warned that all food in fridges and freezers affected by the cuts should be thrown out. The Loaded Hog bar-restaurant at the Viaduct Basin had thrown out an estimated \$8000 of seafood, meat and ice cream, said the assistant manager... However, it had hooked up a generator to keep beer in its boutique brewery at the correct temperature.

...The cold fingers of the power cuts are reaching out to touch the city’s homeless. Hundreds of cups of tea and coffee served at the Auckland City Mission drop-in centre in Hobson St are in jeopardy, as are meals served at the Methodist Mission shelter in Airedale St. The distribution of food to more than 70 foodbanks may also be under threat... But both organisations are determined the homeless and needy will not suffer and are looking at arrangements to keep their operations rolling... At the weekend hundreds of retailers tried to operate without power. Some said they had no choice but to open for business because they had lost thousands of dollars as a result of the cuts... Frustrated staff at many shops used torches to show customers goods, hoping to salvage a small portion of their lost income... [But the] power failures means loss of customers, time and a lack of opportunity for businesses to sell their more valuable products, which have had to be stored in safes... Of the retailers who elected to close over the weekend, a large number brought in security staff to guard their shops... One business[person] who closed his three large shops in the central city... had lost about \$50,000 a day because of the blackouts. “We’ve got mouths to feed like everyone else,”... Horns blared as motorists tried to cross uncontrolled intersections or turn into major roads... Police have asked people to stay away from the central city unless their needs are urgent. The Mercury Energy chief executive... said [yesterday that] the company accepted responsibility but denied claims of negligence.

...A wheelchair-bound student[] was stuck in a lift for 45 minutes because of power cuts on Friday... [The] science student at Auckland University, was rescued by a lift technician. [It] is now paying \$125 a night at a Newmarket motel... [while waiting] for the power to come back on. “I’ll be asking Mercury... for compensation... I’ve got... cash to pay for the motel this week, but I won’t have any left...” Even if [the student] could walk up the stairs... the lack of... services on his 11th floor apartment would make it impossible to live in... The rest of the city’s apartment dwellers spent the weekend throwing away... spoiled food, getting stuck in lifts, being locked out of their homes and trudging up and down darkened stairwells.

...It will probably be business as usual on financial markets today despite the electricity crisis, thanks to a lot of work behind the scenes by Auckland brokers and banks. Much of that work has centred on moving staff from the central business district to suburbs... or... other cities... Dealers and brokers left in the cbd are likely to work in T-shirts and shorts rather than suits, after climbing the stairs to their dealing rooms where the air-conditioning will probably not be working... An organisation such as an investment bank could potentially claim huge losses if electricity cuts meant it missed out on money-making deals. [However,]Mercury... is confident... it would have to compensate for a few costs only... because its liability in the crisis is limited by supply contracts it has with consumers... The main cost would be to meet service guarantees... [which] allow for payments of \$50 to domestic consumers and \$200 to commercial consumers who have their supply interrupted. But while saying this is its only liability, the company is already compensating for other costs. The company has told customers they will not have to pay line charges for the length of time they go without electricity. The company has also agreed to reimburse consumers who are running their own generators.

...The cloud cast over the Auckland [CBD] by the electricity crisis is proving to have a silver lining for equipment hire firms. They have been overwhelmed by demand... for... security lights... [and] electricity generators from businesses... [Y]esterday Projex was unable to supply generators as they had all been hired. It was the same story at Hirepool where... there was a waiting list for generators. Many had been used on floats in the Hero Parade on Saturday night and... the company... was waiting to see when they would be returned... Both... [companies] were seeking more generators from outside Auckland. In some cases, generators were being removed from locations outside the [CBD] where they were being used only as a back-up or standby system... [Hirepool said one] company was paying to have a generator trucked from Wellington to Auckland at a one-way cost of about \$2000... Most clients were hiring the generators for an open-ended week... The cost of hiring a generator varies from... \$40 a day for a 1800-watt machine to \$200 a day for a 30,000-watt machine. Fuel, usually diesel, is extra but the hire companies will co-ordinate its supply.

...[telecommunications companies a]re operating using back-up generators, with Telecom expecting to consume 20,000 litres of diesel a day. Telstra was last night flying an additional backup generator to Auckland from Sydney and Clear Communications was installing a second standby generator to cover the risk of breakdown before power is restored... Meanwhile... Telecom, Clear and Telstra... are offering [CBD] businesses free call-diversion to non-cbd locations to help them cope... [with] moving as many staff as possible... outside the district or getting them to work from home... [By the way, the] power crisis has forced Auckland police to postpone their first-ever uniformed protest march to call for more pay.

...The... [blackout] snapped... the... Auckland police communications life-line... for... an hour when power surges blocked emergency calls. More than 100 calls were diverted to Wellington and Christchurch. The problem, late on Sunday night, affected communications equipment at the Auckland central police station, which in turn stopped calls going into the new communications centre in Great North Rd... [S]taff at the communications centre sat helpless as 111 and general calls ceased coming in... In a separate incident also believed to be related to the power crisis, the police Central One radio channel collapsed for about three hours early on Sunday. But police bosses said backup systems swung into action and allowed staff to respond to emergencies... Fire Service resources were stretched to the limit... with an average of one callout to power-struck fire alarms every five minutes.

...Firefighters rushed to eight central Auckland buildings yesterday after alarms sparked by overheated emergency generators... [A]ppliances were called in from several suburban stations. The Fire Service fire hazard manager... said generators had to be wired by competent electricians and carefully sited in well ventilated areas. “A lot of them are not geared up for this type of thing.” And in many cases the water cooling systems were not working properly... [M]ost portable generators were designed for use out-doors and had not been used for years... ● A... Mercury Energy

s[spokesperson says the CBD] can not expect full power again until March 15... On Sunday, it estimated that full supply would be restored by March 3. [The spokesperson] refused to speculate on what was causing the delays... [or] on when any of the four major electricity cables would be working.

...Workers are being warned to read the fine print in their contracts to avoid being ripped off by their employers during the crisis. The Council of Trade Unions president... yesterday said... some bosses would try not to... pay workers told to stay home... A[n A]uckland industrial relations advocate... said employers could not automatically force workers to take time off during the crisis as annual leave. "The Holiday Act 1981 requires no less than seven days notice for annual leave to be given when an employer is directing an employee to take annual leave." Some bosses were suggesting staff work from home but that was unrealistic for most businesses...

Tens of thousands of people were turned away from work... yesterday... morning after businesses that did not heed [a] call to close lost power and were forced to shut... [when] Auckland's power crisis spread beyond the [CBD]... with blackouts in [the]surrounding suburbs... of Freemans Bay, Ponsonby and Newton... A spokes[person for Mercury]... said the blackouts should not spread beyond the fringe of the [CBD], but cuts to hot-water heating in other suburbs were necessary... The Mayor of Manukau... demanded assurances from Mercury that supplies to South Auckland would be maintained... Another alarming weakness in the national electricity supply system – a Transpower substation at Henderson – was revealed by power companies north of Auckland as a threat to their supplies. The substation is overdue for a substantial upgrade as growing demand in the North puts it under strain, but Transpower, Power N[Z], Northpower and Top Energy are at odds over who should pay.

...Before the crisis this week in central Auckland, [an]electricity industry consultant... rated the cable supplying the North Shore and Northland as the greater risk... [O]verseas practice is never to rely on a single cable for loads over 300MW. The cable running from Henderson... carries 600MW. A violent storm, a tumbling pylon or an aircraft flying into the cable would cut two-thirds of Northland's power supply... The Power N[Z] operations manager... says his company was disappointed Transpower had failed to address the region's electricity-supply problems when Mercury Energy decided to build the Penrose tunnel... [A Transpower spokesperson] says local power companies must pay for any upgrades or new cables but so far they are refusing to do so... [Incidentally,] Mercury Energy is suing... Transpower for cheaper electricity. The longstanding pricing wrangle, which dates back to 1996, is understood to involve more than \$10 million which Mercury has allegedly been withholding while contesting Transpower's charges. Transpower is considering its own legal action.

...Small-business owners turned their fury on the Auckland City Council yesterday as their hopes of seeking legal recompense from Mercury Energy faded... They claimed that their firms were facing bankruptcy thanks to... [a city c]ouncil message advising visitors to stay away... The owner of the Buro Bar... said: "Even though some of us have power, there are no customers because they've been told not to come into the centre. The council is crippling us." ...Next door in Monique's Cafe, [its owner claimed to be] losing important regular customers. [The owner] was angry that big hotels were given emergency generators but small businesses were left to collapse... Up in Lorne St, [a]watchmaker... lambasted Mercury Energy: "It's... made the whole city a laughing stock – it's just unbelievably pathetic." ...[the owners of] Aladdin's Kebab in the Countrywide Bank food hall in Queen St... say the[y]... will lose a week's turnover of around \$7000 but will still have to pay rent, rates and wages – and, adding insult to injury, their power bill. "We survived the war, you know, in Lebanon... But we... may not be able to survive long-term cuts..." ...A war council of about 80 businesspeople crippled by power loss gathered at the Civic Tavern to discuss options... One possibility... was a business rates amnesty... [□ Mercury Energy] acknowledged yesterday that the area affected by its four failed cables was larger than first stated... Company management also... [confirmed s]uburbs skirting the central city face daytime cuts to water-heating supplies as Mercury engineers try to move more power into the city. "Our advice to people in the areas affected is to shower before 7 am,"... Mercury's network general manager... said. Storms wreaked havoc on other parts of the Mercury network on Monday night, cutting power to parts of Avondale, Mangere, Whitford and Clevedon. Mercury said the cuts were not related to the central city crisis and supplies were restored yesterday morning.

...One of the worst blackouts in Quebec history gripped the province yesterday, with more than a million households battling to cope without power... [after an icy] storm... splintered trees and... [downed] power lines... Montreal-area hospitals were overloaded with emergencies, including dozens who broke bones slipping on the ice and about 100 people overcome by gas fumes from faulty heaters. The same slow-moving system... brought violent weather and flooding to the U[S] south. At least 14 people died. Meanwhile, [as Auckland's power failure continues to bring]... misery to many Aucklanders, business has been brisk for some. Camping stores report... record sales of portable gas stoves, lanterns and torches... Mobile phones [have]also sold well. Marinas [are relaxing] rules to accommodate boaties who want... to stay on their launches and yachts. "If our customers say they need to stay on their boats because of the power cut we are prepared to be sympathetic," said the manager of Westpark Marina... Restaurants and bars in Ponsonby... reported tills ringing... [due to custom from people who] were unable to cook for themselves because their flats were without power... Eden Park stadium [i]s... looking forward to bumper crowds for the start on Thursday of the second cricket test match against Zimbabwe as workers find themselves with unexpected days off.

...[although] work by Mercury is expected to restore some power [to Auckland's CBD] later in the week with one of the four failed major cables coming back on line... [t]he Schweppes Showtime summer concert in the Auckland Domain on Sunday is in jeopardy because co-sponsor Mercury, which had promised to light up the night, is worried whether that will send an inappropriate message during the crisis. Advertising for the event has already been cancelled... The Aotea Centre[and] the Town Hall... are open, with concerts and corporate events proceeding as planned... [However, m]ovies at the Hoyts Midcity complex have been cancelled... Freemans Bay Primary School last night announced it would close from tomorrow until power was restored. It urged parents to keep pupils at home today, if possible, after enduring most of yesterday without power... The Auckland Regional Chamber of Commerce... said temporary office space... has... been made available for a nominal cost at the Expo Centre in Epsom and a vacant building in Howick. Both sites had been wired up for phone and computers... Meanwhile, costs are mounting at Auckland University's central-city campus... Expensive chemicals refrigerated in the science laboratories are threatened, and orientation activities scheduled to start next week have been thrown into chaos. Student leaders said they hoped to postpone most of the events for a week... Many of the... hundreds of out-of-town students... arriving to take up residence in Auckland University's central-city hostels and flats... [were] turned out on the street yesterday... [(a spokesperson] said the university would lose about \$75,000 because of rent refunds and unexpected costs resulting from the blackout[). Some out-of-town students]... at least had somewhere else to stay outside the... [CBD, others] returned home immediately, and those from overseas with nowhere to go were offered a bed at a camping ground in Auckland's eastern suburbs... The... Auckland City Council... said... [v]acant council pensioner units in outer suburbs were likely to be used... [for] people needing accommodation outside the city centre... The council was trying to find other housing... in vacant council flats or motels[, but many]... inner-city dwellers are staying put despite some having to climb 15 storeys on a darkened fire escape to an apartment with no hot water, lighting, refrigeration or cooking facilities... Extra rubbish collections are being organised for spoiled food and the council has closed its two central city art galleries. The city library is operating a reduced service... All bus, train and ferry services are running... [but as] the Ports of Auckland struggles to cope, a container vessel, the Maersk Tekapo is being diverted to Tauranga. Its 350 containers will be unloaded at Tauranga and railed to Auckland.

...Ports of Auckland was the biggest victim... of the city's power cuts with its operations brought to a virtual standstill, disrupting N[Z]'s external trade. Forced to generate its own electricity, it had power enough for only two of its seven container cranes to operate at reduced speed... The port was able to handle only 200 containers on Sunday, a 90[%] reduction from a normal day's throughput... [It also] railed 200 containers to Wellington... [on] Sunday... and a further 40 followed yesterday morning, with more rail shipments planned... The backlog from just one day at the port was going to be appalling, said... [the] executive director of the Customs Brokers and Freight Forwarders Federation. If the downtown power

failure persists, imports of vital goods could be subjected to delays and extra costs... One offer to help the port solve its power problems came from... a lawyer... acting for owners of vessels on charter to South Pacific Shipping Line which is [in] the process of liquidation... [T]he port was considering the proposal but its power needs were specialised. "Using a ship's power may be possible but won't solve our problems. What you can source from a ship would only match one of the mobile stand-alone generators." ...the Navy is fending off calls from the public to hook its ships into the local electricity grid[because, according to the]... fleet marine engineer... the ships generated power at a higher frequency than shore-based systems and could not produce a safe supply for anything except lights and heating... ● [Last night t]he... managing director of P&O... said his company was faced with significant additional costs. "We had to bypass Auckland with our ships. This is costing us a significant amount of money. I presume at the end of the day, Mercury would pay for it. Certainly, we don't intend to pay for it, nor the customers. There is also the question of demurrage (the rate payable to a shipowner by a charterer for failure to load or discharge a ship within the agreed time)...." ... Some other shipping lines have yet to make diversion decisions, deterred by the extra costs they would incur.

...*Want to leave?* The Internal Affairs Passport Office at 380 Queen St is closed but processing is continuing... As news of the power crisis spreads overseas, the Tourism Board is trying to dispel notions that the whole country is affected. A spokes[person] for the board... said some newspapers in Asia had reported with sensational headlines that N[Z] was blacked out. "It appears it's not getting balanced coverage overseas." But it is far too early to say whether people were cancelling holidays... To 1200 American passengers stepping off the cruise ship Sky Princess today, the City of Sails may offer little more than harbour views... [A Pom who's] here to present a business seminar, found it cancelled because the buildings were considered unsafe. "If you've got a regulator like we have in the United Kingdom [that regulator] needs his [backside] kicked."...

While Aucklanders – like passengers on a doomed aircraft – reel from the shock that all four major electricity cables have failed, questions are being asked about who knew what, when they knew it and what they did about it. [One e]lectricity industry consultant... knew in 1988 that the electricity supply to central Auckland was precarious. [The consultant] worked with Mercury Energy's predecessor, the Auckland Electric Power Board, on the issue... Transpower... certainly knew that Auckland's ageing cables had between five and 10 years' life remaining... [A Transpower spokesperson] agrees that it has been widely known for some time that Auckland was suffering from both ageing cables and increased demand and that the latter exacerbated problems associated with the former. But it is up to Mercury Energy to determine the exact cause of the fault. Mercury Energy's spokes[person]... could not be reached. Her voice mail was full, according to a recorded message, "Goodbye." Clearly the... two... post... W[W2] cables... made it to the outer limits of their predicted life, but no further. The surprise has been that the two newer cables have also been knocked out. According to [the consultant], not enough was done soon enough to avert the crisis because, until 1994, Mercury Energy and Transpower were trying to find one solution to two major problems facing Auckland's electricity supply... The second is the supply to the North Shore and Northland... But given the parochial nature of power supply it was not Mercury Energy's problem... Aucklanders, whose ire has been raised by this week's crisis, will be further incensed to learn that Wellington's CBD is served by eight cables and... has more interconnection capabilities than Auckland's network... [I]t would take a major catastrophe to knock the lights out on Lambton Quay... according to... a... TransAlta spokes[person]... Is this simply because Wellington is more likely than Auckland to be flattened in an earthquake? [The consultant] blames the disparity between Auckland and Wellington's electricity supply systems on the old N[Z] Electricity Department. As a state department it had a vested interest – perhaps even a ministerial directive – to protect the seat of Government from power failure... ● The... Wellington for Jesus Campaign has blamed the power crisis on the Hero parade. [The campaign's] coordinator... said the crisis was "a warning of the judgment of God following the brazen flaunting of homosexuality and promiscuity" in the parade on Saturday night.

...The 1996-97 power survey, the latest available from the Electricity Supply Association, shows Mercury had more faults per 100km of cable than WEL Energy (Hamilton), TransAlta (Wellington), Southpower (Christchurch) or Dunedin Electricity... [The number of faults per 100km in Auckland was 8 – mostly] on the smaller 11kV lines, which were not the ones associated with the power crisis... [– while the other cities recorded] 2.2... 6.7... 2.27... and... 4.91 [respectively]... However, some provincial areas... were ahead of Mercury... Hawke's Bay Power, which had... 18.56... faults/[100km]... said the main cause was Napier's salty soil, which corroded cables... [But power could be] re-routed without inconvenience to customers... [The ESA] said Mercury's high number of faults had to be balanced against the fact that it had more cable than other suppliers. It must maintain 2537km of cable, compared with TransAlta's 1089km and Southpower's 1847km... [Auckland has more cables length-wise but, whereas its CBD was supplied by 5 cables, Christchurch] is supplied by... 10... and Hamilton by six [– although all] are smaller capacity cables than those in Auckland... In Christchurch, the system's only Achilles heel is the Addington substation... [D]amage to the substation by earthquake would cause the city some problems. Dunedin's [CBD] is supplied by three substations, each with two cables. [A Dunedin network] manager... said the system was reliable and closely monitored.

...The events of the past few days have clearly illustrated the importance to consumers of a reliable and secure supply of electricity. In the planning and implementing of market reforms in recent years, electricity has tended to be regarded by Government ministers and officials as a product to be brought and sold... Undoubtedly it is a product but it is also an essential public service. The lives of most N[Z]ers are completely disrupted without it... It is vital that the opportunity is taken to collect as much information as possible on the actual costs incurred by consumers as that will influence the desired level of future security and the price which consumers will be prepared to pay to have security of supply. Government policy now encourages electricity consumers to negotiate a contract with a supplier for a desired level of security and to pay a premium on the price if they require a high level of security. Under the Electricity Act 1992, generators of electricity no longer have an obligation to supply consumers and the Government has legislation in the pipeline to remove the obligation from suppliers too... The questions which now need to be asked appear to me to be: ● Is the average electricity consumer being well served by the reforms? ● In what ways (if any) could the reforms best be improved or modified for the benefit of the consumer? ● Who (if anybody) in this country any longer has a responsibility to consumers for maintaining an adequate and reliable supply of electricity, apart from the individual contractual arrangements between consumers and suppliers? I believe that the answers to these three questions will be very important for both the Government and our electricity industry when they consider the appropriate strategy for reliable electricity supply in the future... [■] The second Penrose-to-Liverpool St substation... cable was ready to be repressurised yesterday after jointing... [–] splicing in a... 3m long... permanent... replacement section... [–] was completed. Testing will follow, and Mercury says this line is on target to be re-energised on Friday. Repairs on the... Penrose-to-Quay St cable began yesterday morning and are expected to take five days. After that it will still need pressurising and testing. This cable is not expected to be live until Wednesday next week. The repair of the first Roskill-to-Liverpool St cable... is proceeding well and jointing is ready to begin... The remaining cable, set into the side of a bank, is providing a challenge because a 4m chamber needs to be created around it to provide a safe working area for engineers.

...[an] Auckland city barber... has quickly adapted to cutting hair by candlelight... and swapp[ing] his electric shaver for old-fashioned trimmers and a razor... [Incidentally, prices] for wholesale electricity have slumped dramatically in the few days since supply to Auckland's [CBD] was cut, with North Island prices falling... from almost \$40 per megawatt hour last week to about \$15... yesterday. [However, t]he degree to which the price has been affected by lower demand following Mercury's problems is difficult to assess[– because c]heaper electricity from South Island power stations has come on to the wholesale market in the past week or so, replacing more expensive gas-powered electricity plants.

...What do cities Ouagadougou and Ulan Bator have that Auckland does not? Electricity. Auckland is on its own when it comes to power crises... There may be only one television for every 210 of Ouagadougou's 500,000 residents but at least the set works. In vast, remote Mongolia, people are shocked to hear about Auckland's powerless plight. "It is a disgrace," said a sympathetic [person] at the British Embassy in the capital[with a]

population about 700,000. Electricity fluctuated but a nice, hot cup of tea was never far away... Situation normal in Uzbekistan's capital, Tashkent, where, the *Herald* is tersely informed, occasional cuts cause inconvenience but are generally not an issue... [D]iplomats... in Vietnam's capital, Hanoi, feel sorry for Aucklanders... Hanoi used to suffer regular power cuts about six years ago but, apart from power surges caused by electrical faults, residents were now guaranteed a steady supply.

...No need, said the *Australian*, for the last one leaving to turn out the lights. In the *Canberra Times*, [a] cartoonist... ran a pitch black square above the caption: "N[Z] All Black." Across A[US] and into Asia, Auckland's blackout has made the news, even eclipsing similar woes overtaking the Queensland capital of Brisbane. As the city's power crisis continues, apocalyptic reports of mass evacuations, business closures and health fears have raised new outcries over privatisation of electricity suppliers in A[US]. In NSW, where proposed privatisation is ripping the Labour Government in two, [the] Electrical Trades Union... warned that Auckland's darkness was a "precursor of things to come." ...Similar fears spread south to... where the already-privatised industry has come under renewed attack for similar commercial thinking, forcing a spirited defence by the Victorian Power Exchange... [It]s manager of communications, rejected both comparisons between Auckland and Melbourne, and the possibility of Mercury-style blackouts in Victoria. But in Brisbane, where reforms promised to provide uninterrupted supplies and cheaper power, comparisons became inevitable as the city followed Auckland into a series of generating failures and rolling blackouts. Brisbane's problems were compounded when power failures caused backups and overflowing in the city's sewage treatment plants, spilling raw sewage into creeks and stormwater drains. But yesterday Brisbane was shunted into a poor second place by newspapers and radio and TV stations fascinated by the chaos in Auckland.

...Auckland's image took a [further battering in AUS] yesterday after the Government there warned against visiting the city centre until power was guaranteed. Overseas reports again said Auckland, rather than the CBD, was powerless. Mercury is flying seven portable generators in from A[US] today. It has leased them for a fortnight for about \$1.5 million. They will add 9MW to the 22MW already brought from N[Z] cities... The cost of the crisis to Mercury to date is estimated at \$8 million, a figure likely to pale into insignificance when compared with the total costs to businesses. A Melbourne law firm... was preparing a "potentially massive" claim against Mercury on behalf of several Auckland businesses.

...The Government plans to push on with further electricity reforms... [T]he Minister of Finance... [said] yesterday that Auckland's power crisis would not derail a bold new programme of asset sales. If anything, the events of the past few days would "focus people's minds on the need for continuing reforms,"... [the minister said. By the way, last night in Parliament the NZ] First leader... said Mercury had so run down its services that it had hired staff from neighbouring Power N[Z] to help during the crisis. It had then got the company to paint out Power N[Z] from its trucks and uniforms to stop being found out... Mercury ha[s] increased its monitoring of cable routes from once a week to twice a day in the wake of the crisis... Overnight security had been placed at all repair sites to make sure they were not vandalised.

...[a] 66-year-old... has come out of retirement to act as Auckland's last line of defence against further power cuts. Armed with his hard hat and maps... [the] electrical supervisor... who... retired from Mercury last year... hits the streets at 7.30 am on a lone vigil – to ensure no one is digging up the city's five vital power lines... [F]our of the cables have failed, and... any strikes now by contractors installing plumbing or drainage would be a disaster for the city. The vital line is the live 22kV cable running from the Kingsland substation to [the] Liverpool St one. Emergency services could be without power if it failed. [The inspector] travels the 25km route of the cables twice a day... keep[ing] an eagle eye out for tell-tale piles of clay, and holes in the road... So far [the inspector] has found two contractors digging holes near the cables, and is monitoring their progress. While contractors should have detailed maps of existing cables... some do not – in which case [the inspector will] ask... them to stop work until they do.

...The [person] in the middle of the city's electricity storm rejects any suggestion that the company's maintenance programme caused the crisis... [The] chief executive of Mercury... said it was naive to suggest that routine maintenance would have averted the central city blackout. "When cables are buried two metres underground, the correct and best practice for maintaining them is to leave them... It is absolute nonsense to suggest that the cables are not properly maintained. The one thing you don't want to do is dig them up – that's what damages them... We have never had trades[people] to repair 110,000-volt cables because the incidence of failure is so occasional that it would be ludicrous. It is such a specialised task – that's why these repairs are taking the best part of 10 days – that anyone who's qualified has to work on it pretty well continuously to keep their skills up." [The chief executive] noted that the transformers, switches and related equipment that do need to be maintained had all "worked admirably." ...[the chief executive then confessed:] "It may appear, with the benefit of hindsight, that our ethic of keeping the power on and being reluctant to shed load meant that we loaded the cables up more than was smart. Having said that, the cables were never loaded above 90[%] of the manufacturer's recommendations and when the cables got to that level at the end of last week we started load shedding." [The chief executive]... said the "public mood" might make it sensible to use the \$27 million dividend due to be paid at the end of April to recompense affected customers.

...The temptation is always to find someone to blame. And the reaction of the vulnerable luminaries is always to duck for cover. Monday's choreography was particularly elaborate. By 7am... [the Energy Minister] said there would be no early inquiry. By 10am the P[M], sensing the importance of deflecting attention from her Government, announced that there would be. The previous president of the National Party... [– the one person] who opposed his own minister's original ownership plan for Mercury and years ago paid the price for his trouble [–] was suddenly resurrected and reinstated to the board on Monday afternoon. That vacancy was created by the... executive director of the Auckland Chamber of Commerce and Industry... who, having begun Monday as deputy chair[perso]n of Mercury, had by 7 pm that evening resigned and become one of Mercury's staunchest public critics. But it is now time to leave the witch hunt alone and focus on the underlying cause of this crisis. Its origins are not to be found in bad luck or hot weather but in the culture that exists in Mercury (and elsewhere), the ownership plan that created that culture, and the ideology that created the ownership plan. Almost unbelievably, Mercury is owned by people who, individually or collectively, have no control of it... The prevailing ideology is that power companies must behave competitively, and the Government wanted combative people from the private sector to do their bidding, unencumbered by any accountability structures. And so it was. Price hikes, revaluations, skill shedding, take-over bids, rocketing profits and a major investment down in Taranaki. The product was no longer electricity: the product was the bottom line. Mercury used to employ cable jointers. They do not do so now. When Mercury claims that its maintenance is up to scratch I am tempted to wonder how they would know, given a staff reduction of 46[%] in recent years. The culture is that the engineers are out and the baked bean counters are in. But electricity is not like baked beans. It is a unique product, unable to be stored. The Government's reforms do not acknowledge this reality... When the ideology failed, at 6 pm on Friday, the Government sought to do as little as possible, and they did it all weekend. It was four days before Transpower announced that they were looking at an alternative supply... The market is a good servant. But it is a bad master, and this week we saw that it has our cabinet by the throat. Even now [the minister] clings bizarrely to the notion that we need more market. Ideology has swamped common sense... ● [A]... report on the accident which killed a worker in Mercury[']s... 9.2km power-supply tunnel under central Auckland last month has been delayed... but tunnelling continues... William Hetet, aged 48, of Huntly, was pinned against the tunnel wall when an electric locomotive derailed on January 14. [William] died on the way to hospital. Two weeks later another experienced miner... was paralysed when part of the tunnel collapsed on him. [The paralysed miner] said from his hospital bed that [it] feared for the lives of fellow workers because safety measures on the... project were slack. Tunnelling resumed a day after his accident, as approved by a Ministry of Commerce mining inspector... [H]is report on both accidents is still two weeks away.

...[the owner of the] Wyndham St shop, Fast Finish Photo... does not want to fill out the "additional comments" section of an Auckland Chamber of Commerce survey about electricity losses, because what [the shop-owner] wants to say... would not be pleasant... [His shop] usually has sales of \$12,000 a week, but yesterday's turnover was a mere \$170... [The shop] has weekly expenses of about \$6000... The information... sent to the

chamber will be used “for the purpose of exploring future options” related to compensation... Some businesses have “business interruption” insurance, but... to be eligible they had to include a “supplier extension” clause covering the failure of public utilities... The Auckland Chamber of Commerce has asked the Inland Revenue Department to defer tax payments or remove late penalties for the GST and March 7 tax payments for those affected... [Unaffected is the] McDonald’s restaurant at the Starship[, which]... is still cooking hamburgers because of the priority electricity supplies Mercury... has given to the... children’s hospital...

Visiting N[Z] without going to Auckland is like visiting France without seeing Paris, say tourist operators reeling from a downturn in business. They fear the power crisis is leading tourists to choose other destinations because of a perception that the gateway to... [NZ] is closed. About 50[%] of business travellers are cancelling bookings... But... [the] Schweppes Showtime will go ahead at the Auckland Domain on Saturday night – without the backing of Mercury Energy... Showtime organisers opted to plough on after securing three generator trucks capable of powering the stage and laser light show... However... the... Central City Library [ha]s closed until further notice... [T]he power crisis has[also] forced the Auckland Land Title Services office to close. Millions of dollars of sales are up in the air with nervous buyers and sellers unsure if their deal will survive the delay.

...Using 18 generators to provide [enough] power... to operate four of its seven cranes... Ports of Auckland says it will be able to cope with the volume of cargo expected... over the next seven days... The port... has also been able to restore night lighting, allowing 24-hour operations to continue... One strategy has been to make sure that export reefers (refrigerated containers) arrive at the port as late as possible, minimising the time between when they arrive and are connected to the power and when they are disconnected and put on ships... To further conserve power, ships with their own cranes were required to use them rather than the port’s gantry cranes... A mobile crane pick[ed] up some of the slack on... Bledisloe Wharf yesterday... Meanwhile... Mercury Energy is investigating a proposal to string a transmission line straight from the national grid to rescue downtown Auckland... while it waits for the Penrose tunnel to be finished... Mercury is confident the... temporary 110kV... overhead line... with two independent circuits on the same poles... could be installed within 10 weeks... [– a]ssuming there are no environmental roadblocks or technical hitches... – ...using the Auckland rail corridor from Penrose to the city. Transpower... estimates the temporary link could cost about \$5 million... Tranz Rail, which owns the rail corridor... has already given its support in principle... Mercury Energy will meet Tranz Rail officials today to discuss technical, operational and safety issues. But Mercury noted that it is also exploring other options such as new, smaller interconnections between the CBD and neighbouring substations in case there is a technical hitch with the overhead supply proposal... [In another development, all] of Mercury’s directors and senior officials, including recently resigned directors, have been warned by the law firm [which appoints the five directors who are unaccountable to the public] that any comments on compensation matters could prejudice the company’s insurance cover. That cover stipulates that Mercury must not admit any guilt or liability.

...[one pensioner] is about as angry as a Queen St shopkeeper, which is pretty mad right now. Sitting in his Bucklands Beach home – where the lights are still on – [the pensioner] feels a strong sense of betrayal that the city’s electricity supply system [it] oversaw 24 years ago was never upgraded. Between 1971 and 1974 [the pensioner], then the Auckland Electric Power Board’s assistant chief engineer, was already worrying about weaknesses in the two gas-filled electricity cables supplying Auckland’s [CBD] – cables laid in the 1950s which [the engineer] always believed were wrong for the Auckland terrain. Whenever there were road works near the supply lines, the cables were decommissioned – a tricky process in itself. [The engineer] discovered that the cables were damaged from being de-gassed too quickly. [The engineer] noticed... “frothing” of the oil used in the gas-filled cables. But while... concerned, [the engineer] did not believe the situation in the early 1970s was urgent. The cables would survive another 10, maybe 15 years, if they were not abused... [The engineer] expected by the mid-1980s that the A[EPB] would be upgrading electricity supply to the CBD. [The pensioner] was stunned to discover this week that nothing had been done... Locked away in Mercury Energy’s Newmarket headquarters are the board’s records – agendas, minutes, reports and discussion papers. When the N[Z] *Herald* sought access to these archives, Mercury Energy, already under attack this week for poor communication, said no. It says it has a legal opinion that these once-public records are now commercially sensitive. Luckily, ex-A[EPB] members have long memories... Hungry lawyers and nervous insurance companies – the first looking for ways to win compensation, the latter looking for reasons not to pay out – need only read Mercury’s annual reports for indications that the board knew about the problems and had the money to fix them... Mercury Energy did, after all, commission the Penrose tunnel soon after taking over the board’s assets in 1993. The tunnel was originally scheduled to be finished in late 1997. Planning consents delayed it by two years.

...Before the crisis, Mercury had put a lot of effort into improving its image... – through its sponsorship of outdoor family events, among other things... [Since] the power blackout[, many]... would say that Mercury Energy’s public relations performance... has been almost as defective as the cables that caused the crisis. When Mercury[’s] chief executive... commented... [on TVOne] that: “We will accept responsibility but not culpability,” it sounded suspiciously like Mercury’s public relations advisers were driving in the back seat of a car now filled with lawyers.

...The inquiry into Auckland’s power crisis will investigate how Mercury is run – including the role of the country’s biggest law firm... [– after] the Treasurer... singled out [the law firm]... for the second day running... Claims for damages against Mercury could keep lawyers in work for years...

The consumers trust that owns... 100[%] of Mercury, but... has only 50.5[%] voting authority and can only appoint four of the company’s nine non-executive directors... wants to fast-track compensation claims for losses related to this week’s power cuts so the company’s planned share float can get back on course. Consumers could be offered big capital payments and extra dividends to help push the float through. The power cuts... have undermined Mercury’s float because of possible contingent liabilities related to compensation. The trustees believe a sharemarket float is the main way they can get control of the board of the company... [In the meantime, Mercury]’s plan to erect huge electricity poles alongside homes has set sparks flying... Last night residents reacted angrily... saying the poles will destroy the views from their homes and apartments and create eyesores... A keen gardener... said: “We are not bothered by the railway line at the end of the garden, because we don’t really notice it. But the poles are a different matter. They won’t have much room to install them and I am worried they may try to cut down trees which provide a vital screen between us and the rail track... [W]e are all paying the price... [for the] \$85 million profit... [Mercury] made...” ...The... 160... 18m poles – ...normal poles are 8m... – will make a continuous low hum. [However,] if residents living next to the poles and cables do not approve of Mercury’s scheme, it is hard luck – the lines are being brought in under emergency provisions. Work will start next week and the poles will remain in place for 18 months...

In a twist of fate, Mercury Energy lost power to its own Newmarket headquarters yesterday in a cut which hit about 3000 users. The building was plunged into darkness for about 15 minutes when a jumper cable blew at 1 pm... [– although the c]ommunications manager... said the vital control room and computers were not affected... as they had fail-safe systems. The headquarters was switched to another electricity source fairly quickly. But other businesses and residential users in Newmarket, Parnell and Remuera had no power for up to three hours. One dentist needed three people to help remove a... drugged... patient from an electrically elevated chair. Many other doctors and dentists in the area said they were affected... Afternoon appointments had to be cancelled. A 100-year-old [gal] had her Life Link system, a button which connects her directly to emergency services, rendered useless... Her grandson said Mercury’s attitude to her predicament was callous. “They told me there was nothing they could do; that perhaps I should move her to a hospital...” ...[the latest cut coincided with an announcement by] Mercury Energy and the Auckland mayor... [of] plans... to split available power between inner-city users next week. Students will deliver 50,000 flyers today – explaining to

businesses and residents whether they can expect power from 7 am to noon, or from 12.30 pm to 6 pm. Mercury said there was a 90[%] chance that power would be available to everyone in the evenings. But the general manager [of Mercury] urged people to be “cautious – even frugal” with their use: “It’s not ‘come in and turn everything on time,’ guys”... Meanwhile, [plans]... for hardship payments to victims of power blackouts are being carefully crafted to avoid any admission of liability by Mercury Energy[, which] is effectively routing payments to customers through the Auckland Energy Consumer Trust to avoid losing its insurance coverage... Mercury is unable to make payments directly because [of] its insurance policies... So far \$2 million has been made available. Mercury and trust officials are discussing whether more money could be forthcoming.

...Aucklanders looking forward to a return to normal were told yesterday to forget it... Mercury management said cable repairs had suffered a serious setback. The days of blackouts, rationing, closed shops and half-empty streets now look set to stretch on for weeks... Mercury had said the first of the four main cables... would be fixed by Thursday, then Monday. Now the firm is reluctant to give a date, although it says its teams of engineers are working “flat out.” ...Yesterday’s glitch – where it was found that before the cable was repressurised old oil, not properly cleared, had seeped into the gas duct – indicates the painstaking task Mercury has in front of it and the potential for more to go wrong... Electricity industry experts... yesterday suggested the news might get worse before it gets better. Restoring full voltage to cold, old 110kV cables is one of the riskiest and most tense parts of the repair. “Mercury will be lucky to get three out of four cables back and they might manage only two,” one source said... [On a lighter note, the] central city blackouts have given bright sparks plenty of ammunition to poke fun at Auckland’s plight. Here’s a selection of jokes seen and heard. *Q:* Why did [Iraq’s President] hastily sign the UN accord before the R[NZAF] Hercules touched down in the Gulf? *A:* ‘Coz military intelligence told him that Mercury Energy directors were on board. *Q:* How many Mercury executives does it take to change a light bulb? *A:* We’ve got four light bulbs, we don’t need to change them. *Q:* Why is everybody walking around with their hands in the air? *A:* ‘Coz many hands make lights work... *Pub patron:* “I’ll have a light beer thanks. *Bartender:* “Sorry mate, we’re out for a couple of weeks!” *Q:* Why did Auckland build the Sky Tower so high? *A:* To see if there’s light out there. *Q:* How do you make Aucklanders feel better about the crisis? *A:* Who cares? (Of course, this one came from someone south of the Bombay Hills.) *Q:* What did Aucklanders use before candles? *A:* Electricity. *Q:* What’s Auckland’s favourite drink? *A:* Powerade. *Q:* How can you tell an Aucklander in a power cut? *A:* You can’t tell an Aucklander anything – that’s why they have power cuts. *Q:* What do you call a Mercury board member with a torch? *A:* A light looking for the end of the tunnel.

...The red lights are off but business grinds on in Fort St... “We work whether there’s light or not,” said [one] masseuse... “The light is only needed to count the cold cash from customers...” ...● [Inner-city] tenants... may not be legally obliged to pay rent during the power crisis. [A] commercial lawyer... said people renting apartments or offices... might have a case, if they could not come to reasonable agreements with landlords first, for withholding rent. “I would feel comfortable defending a tenant who hadn’t paid rent.” The legal arguments would centre on whether people had reasonable access to their premises, whether facilities such as lights... lifts... and air-conditioning were available. A landlord had a legal obligation to provide “quiet enjoyment” for tenants... “Under general principles, it is clearly inequitable to have to pay rent for the use of premises that can’t, in principle, be used... In an office building, it is the building owners who can’t give you access, even though it is beyond their control.”

...The sudden influx of diesel-powered generators has led to five people being overcome by fumes, according to public health experts... [I]n experienced restaurant and shop staff have suffered health problems after using generators in confined spaces. None of the cases is thought to be serious... [What’s serious is the news that t]hree inner-city food shops have gone bust... The shops relied on the morning patronage of office workers and the crisis hit them particularly hard. “The proprietors have just walked away. And they won’t be coming back.” ...one owner, who said [it] could not survive without daily business... was keeping a low profile because... creditors [were] chasing him... “Most businesses don’t go broke in a week. But some of these guys run on a knife’s edge.” However... dozens of other small businesses against the wall may be aided by a \$2 million relief fund... From Monday, businesses will be able to claim from \$500 to \$2000. They can apply at the Town Hall, and will need to prove they are... Mercury customers; have annual turnover of less than \$250,000; need assistance to operate because of the power crisis; and be located in the [CBD] and unable to move elsewhere... A[n]... Auckland Energy Consumers Trust... trustee... said people would be compensated for some losses on phone rentals, leases, security and generator hire. They could expect to get money in 12 to 24 hours. But food shop proprietors would not be given money to compensate for food that had to be discarded. Insurance would normally cover that... [The] Mayor... said... Auckland City Council... tenants could expect about two weeks rent-free as well as the rates-penalty relief announced earlier this week... Meanwhile... apartment... dwellers hit by power cuts have been warned to flush out their water pipes – or risk catching potentially fatal diseases. The alarm was raised by Metrowater, which said residents risked catching water-borne infections like Legionnaire’s Disease or being poisoned by lead or copper which leached into stale or stagnant water. City apartment blocks with electric pumps that have been out of action for a week or more are most at risk... As a precaution, engineers will flush the water mains in the [CBD] area tomorrow to ensure that supplies from all its water mains are fresh... Metrowater was also concerned about a possible build-up of explosive levels of methane gas in apartments where sewage pumps have been out of action... [Inner-city] residents should flush their toilets during check-up visits to... prevent gas building up.

...BUSINESSES have been told not to move back into Auckland’s city centre and Mercury Energy has called for [more] generators... as the power crisis drags into its second week... Four extra generators are being flown in from A[US] within the next 24 hours; more may follow next week. Mercury is also investigating bringing in... generators that were to have been used by allied forces in the Persian Gulf during strikes against Iraq.

...Last Thursday was... the... Mercury Energy chief executive[’s]... 60th birthday and apart from a few presents strewn around the office, no one would have noticed. [His wife had] cancelled a surprise city centre party because there was no power – and it wasn’t quite appropriate anyway. “It hasn’t been the best of birthdays,” said... [the guy who] considered putting his head in the oven [upon hearing that] Auckland’s fourth power cable had failed. “Then I realised it was electric...” ...Surprisingly, there have been tougher times for [the guy] who was appointed chief executive in April 1994... [– like when it] was the chief executive of the South East Queensland Electricity Board 12 years ago[and] workers took on the government [by going] on strike, blacking out the whole territory for three weeks. “In a sense that was more difficult than this. There isn’t a risk to life or limb here. Most people can move out of the city. In Queensland everything was blacked out and we never knew when it would end.” ...When... offered the... job as... [Mercury’s] chief executive... the... A[US]n was... “not at all interested. The prospect of managing a distribution utility in N[Z] was not going to set me on fire,”... Money may have inflamed his interest. When his appointment was announced, a former Mercury Energy trustee... – who had resigned in protest at what [the trustee] saw as the creeping privatisation of a publicly owned asset – claimed his salary package was worth \$450,000 a year. Both... [himself] and the company’s chair[person]... disputed that figure, although unnamed senior company sources confirmed it. But at the end of what has been the most torrid week of his tenure[, the AUSn] could be forgiven for wondering whether the money’s good enough. As the city was plunged into the darkest depths of the power crisis [the AUSn] was keen to portray himself as a [manager] determined to face the music – and equally resolute that [it] would not be distracted by a witchhunt or a call for public bloodletting... [The AUSn] believes the blame placed on Mercury is unfair. “...Nothing last week shook my confidence that we haven’t made mistakes. I’m sure there hasn’t been a cover-up... The worse any inquiry will come up with is that someone may have made an error of judgment but there are no signs of that yet. Some of the media comment has been cruel in the extreme. If you are going to rubbish people you are doing everyone a disservice. I have a clear conscience. I don’t stay awake at night thinking about small businesses struggling... [However, at] the moment the reputation [of Mercury] is as low as you can get and my personal reputation is somewhat below that. If the inquiry establishes there is blame attached, without a doubt, you can expect my resignation.”

...THE power crisis which has blacked out central Auckland was probably both foreseeable and preventable, despite claims to the contrary... But fingers which point to... [Mercury]'s move to reduce staff and blame this for causing shoddy maintenance as a cause of the problem, appear wide of the mark. The blackouts were unlikely to have been caused by lack of maintenance. Instead, the probable culprit appears to be the way Mercury managed rising demand for electricity from CBD customers through an increasingly vulnerable line network... In 1992, inner city apartments were barely a gleam in a developer's eye. By 1997 they had increased in number by 458%. In 1996 alone, more new apartments were completed than existed in total in 1992. Apartments are comparatively high users of electricity, with their requirements for hot water, cooking, heating and airconditioning, as well as services such as elevators, electronic security doors, lighting and alarms. And they often replace low-grade buildings, which were vacant or used for purposes such as storage, and which had very low electricity requirements. Similarly, the CBD office market recovered strongly... [from] the severe post-87 sharemarket crash recession... The amount of prime CBD office space which was occupied increased by 50% between 1992 and 1997. And modern offices with their computers, faxes, and airconditioning[, etc.], are big users of electricity. Other major commercial users located near the CBD, such as Ports of Auckland, also benefited from strong growth... Over the past few years it has... [increased its] need for power by 40%... In the last week, some commentators have claimed Mercury was too distracted by its protracted takeover bid for neighbouring Power N[Z] to take heed of this growth and ensure an adequate supply of electricity was available to the city. But that claim is unfair and untrue. In fact, it continued to work on the original plan to double the amount of electricity it could supply... Had the tunnel been completed on time, as Mercury envisaged, then the present crisis would almost certainly have been avoided. But it was not to be. The company did not gain the necessary consents under the Resource Management Act until June 1996, and by the beginning of 1997, Mercury had still been unable to conclude satisfactory contracts with the owners of the land under which the tunnel was to travel. These were... Transpower, Transit N[Z], the Auckland City Council and Tranz Rail. In announcing the tunnel plan in 1995, Mercury['s] network general manager... gave security of supply as a major reason for its development, and in words which now have an ominous overtone, described the motivation behind it as "make sure the lights stay on, make sure the lights stay on and make sure the lights stay on, or resign"... [Then, at] the beginning of 1997[, it] admitted that without the tunnel, the strain on the company's ageing cables would lead to outages and restrictions. Those words have since proved unfortunately prophetic.

...The crisis crippling the city was foreshadowed by blackouts in December 1995, and the following January and February... with faults and failures in three of the four cables now out of action... Mercury just managed to salvage the situation but the near-disaster prompted shaken engineers to warn the Auckland City Council that [Mercury] expected its system to fail by the end of 1997. Mercury bosses now say that prediction – revealed in the N[Z] *Herald* yesterday – was based on faster growth in power demand than actually happened... "Various large projects, including Britomart... have not been completed," said the Mercury general manager... Mercury had expected that the total [CBD] load would increase from 202MV in 1995 to... 222.3 this year.

...NO ONE can sensibly argue that the sprawling civic conglomerate that is Greater Auckland is easily managed or notably efficient. It has grown too rapidly, spread too far, suffered from a diverse kind of political tribalism, and is now reaping the whirlwind of it all... The provision of the Sky Tower, like the Harbour Bridge of earlier years, gave Aucklanders something of an edifice complex, but the opening of Te Papa at Wellington might have blunted that psychosis. The provision of such big-ticket items sometimes blunts the realities of civic management. It is what is not on show, not a tourist positive, that makes a community tick – the quality of water and the infrastructure of pipes which deliver it; the power available at the flick of a switch, provision for sewage and rubbish disposal. Because communities do not see or even think deeply of such services until they no longer operate efficiently, politicians are able to concentrate on the obvious, big-ticket edifices in prominent view. This is not a problem for... big cities... alone... There... [aren't] many communities which have not suffered from the extravagant lethargy of previous councils... not giving a proper priority to services, but who point to new buildings and their ilk as memorials to their own constipated egotism... [By the way,] Labour's energy spokes[person says]... the terms of reference for the inquiry... into Auckland's power crisis... should be as broad-ranging as possible.

...It's a catastrophe of national – dammit, international – significance and it's going to take us years to get over it if we recover at all. I refer... to last week's revelations that, whatever we may have believed up till now, lemmings do not hurl themselves off cliffs to drown. Reuters whipped the story on to the wires the minute it broke: a group of British naturalists had looked up from their binoculars to tell us that lemmings aren't leapers. Indeed they are "strong swimmers and have a well-honed instinct for survival." Better late than never, you might say. But I'm not sure it's that simple. The inquiry to find out how the plug got pulled on downtown Auckland should add to its terms of reference the job of finding out why we weren't told about the lemmings before now. We've been wandering around for years using these hamster-like rodents as a handy simile for mad suicidal behaviour and now these squinting twerps pop their heads up out of the undergrowth and blandly advise us that lemmings are nature's great survivors. In fact, the BBC television programme that revealed the story told us... [lemmings] get it on under snow which, if you don't mind my saying so, is close to the exact opposite of hurling yourself off a cliff. The ramifications of all this are hard to comprehend... We're going to have to add some of these naturalists to a panel which will help rewrite the dictionaries. "Breeding like lemmings" is going to nudge its way into the vernacular, particularly now RCD has made the rabbit inappropriate as an exemplar of furious fertility. (The bunny doesn't have to miss out altogether: "dying like rabbits" will surely soon replace "dying like flies" in popular usage, especially across the Tasman where flies don't die. We could just import the expression like we imported the virus.) While we're about it we should take a look at a few of the other zoological fictions that support metaphorical usage. We can stop saying "blind as a bat." Bats (and beetles and moles and owls) are not blind, I have discovered. And if naturalists – whose credibility has taken a bit of a hammering over this – really think an elephant never forgets, they should tell us how they know. Do horses really have a big appetite or sweat a lot? Who ever saw a crocodile pretending to cry? I think we need to be told.

...As 'Black Monday' hit the city, businesses were faced with a sudden test of their system's flexibility in an emergency. Some sank and some swam – off to the suburbs with their databases... [An] accounting firm... had upgraded the software on its main computer not long before the lights went out. That meant its four IT staff could quickly reboot it at [a] new remote location and get back all the e-mail, database, tax and other capabilities in double-quick time. "If we didn't have that, we were not going to be able to do any work,"... And when Internet provider Xtra's power went down... on Sunday... it simply carried its servers and other technologies across the road to its Mayoral Drive backup site... The next day the customers did not know the difference... These examples illustrate the searing management lesson of the great blackout: that information technology can save the day. Those companies best positioned to pick up their databases and run were the ones that survived the best. Of course many businesses cannot do that. Restaurants, hotels, manufacturers, the Ports of Auckland and others tied to fixed locations had to muddle along the best they could. But the "portable" businesses such as the professional firms reaped the rewards of heavy investment in [IT. One law]... firm... loaded up its mainframe and departed the Coopers & Lybrand building on Saturday morning at the first hint that the [CBD]'s power might collapse... [The law firm] was ready because it had done its usual... backup of... business on Thursday night. This is called an "incremental backup" – anything new goes on the tape. Also, as usual, the tape had been dispatched to other centres in case of fire or earthquake. So when it had to vacate the building... the firm had a current database to work with... [The firm]'s IT people deconstructed the tape in Wellington and fired it back to the new remote site for the start of the week... The backup-obsessed [NZ] Futures and Options Exchange gave one of the week's most impressive performances. It has backups on backups so that members can keep trading on their screens in all situations bar war and pestilence. When the power went off for everybody else, it kept on humming for the traders through a system of cables running between Wellington and Auckland. If that failed, there was an ISDN backup. The parent exchange in Sydney has its own UPS (Uninterruptible Power Source) feeding the juice to a bank of eight computers, each with its own "hot backup." The Sydney Futures Exchange favours multiple computers over a single mainframe, because the chief executive... believes they

reduce the risk of a complete knockdown. And if all else failed at the N[Z] exchange's base in South Sydney, it could still operate through yet another power backup site in North Sydney. "However, if all of Sydney went out, we would be in trouble,"... Because power is "mission-critical" to exchange members, all can fall back on remote... fully wired... dealing rooms waiting under dustsheets for... years... for events like last week. For example, Bankers Trust has a 62-seat dealing room in Papatoetoe. Some companies did not have to move. The ASB Bank has a basement full of generators. But Countrywide had only one generator to keep its treasury going, and most of its central staff had to move to suburban branches.

...A large generator destined for a building at the Auckland Institute of Technology was flown all the way from Singapore only to be dropped and damaged at Auckland Airport. The AIT general manager... said the generator was a write-off, but insured. The polytechnic had hired it and flown it to N[Z] yesterday at a cost of about \$15,000... The... 1500kg... 350kW generator was not the biggest flown into [NZ] last week... Some of the generators brought in... were 10 times larger. AIT will still open as planned this morning on the main electricity supply. A replacement generator... will arrive this afternoon... [Incidentally, an a]sthma sufferer... had to be put on oxygen and drugs after suffering an attack trying to reach her fifth-floor doctor... [- who] has treated others affected by the power crisis. One patient had fallen down dark stairs twice in the past week, suffering severe bruising... [The doctor] was disappointed that the... [building] had not been put on a generator. The building manager had told her it was too old to have one... Another patient at Auckland Metro Doctors in the Dingwall Building in Queen St had his nebuliser treatment ended halfway through by a power cut.

...an A[US]n... aged 81... who spends a lot of time in... [NZ,] has had enough of Mercury Energy and its promises. After coping for more than a week with on-again, off-again power supply to her... third-floor Liverpool St... apartment, [the]... member of the Auckland Racing Club... thought that yesterday [it] could at least plan her day around the fact that the power company had promised... electricity all morning. But [the AUSn] had been up for just half an hour when the power went off at 7 am – and stayed off until nearly 2 pm... "I've lived in many cities in the world, and I can't imagine this happening anywhere else, unless there was an earthquake or some other natural disaster... Mercury has got to take responsibility for this..." A spokes[erso]n... said the company was trying to give some certainty to consumers about power supplies... "We can only apologise for the frustration,"... Meanwhile, anyone considering withholding rent for properties with no power is being advised to think again. A commercial lawyer has suggested that the courts might back such a stand, but Housing N[Z]'s tenancy service division says that it is unlikely.

...the fund to provide relief for businesses suffering financial hardship because of the crisis... [has so far] paid out... \$16,000... to 19 claimants. There had been 148 inquiries. Of those that had applied, 84[%] had been approved. One business, Cafe Tom Yum, is spending its tax money to stay afloat. The Victoria St Thai restaurant has been ruled ineligible for the hardship fund because its turnover is about \$300,000. Its income is therefore \$50,000 too high for it to qualify as a small business... [T]he husband of [the] owner... said... his wife had invested between \$150,000 and \$200,000 in the restaurant and now faced losing it. "When we get to the end of next month and can't pay the GST we will have to look at putting the business on the market – that's ridiculous." A spokes[erso]n for Redmond Software said: "Where is our compensation? Just because we've had to relocate doesn't mean we aren't losing a whole lot of money." "...It stinks," said... a drycleaning contractor, after being turned down... His premises are in Birkenhead but 90[%] of his business comes from the inner city, where [the drycleaner] picks up and delivers clothes and gets paid on a commission basis. "I completely rely on the area for my living. There must be hundreds of cleaners and courier drivers in my position." ...last night... the... Treasurer... urged business not to be overwhelmed by the power crisis, the Asian implosion or the drought but to focus on the underlying strength of the N[Z] economy. "Let's not lose sight of the whole picture. Let's keep things in perspective and recognise that we have got the fundamentals right for future growth... We should not talk ourselves into a lack of confidence when we have everything to be confident about."

...Now Auckland's power crisis gets really serious. With the wait for a secure electricity supply stretching out to 10 weeks, the strain on business is escalating fast... Some small companies were mortally wounded... last week... and will die... [However,] the large majority survived on adrenalin, can-do spirit, adventure and humour. But such stimulating breaks from the normal pressures and routines of business wear very thin very quickly. The first day, it was fun for teams of lawyers to work around a senior partner's dining room table. By Friday, they might have had enough of such camaraderie... This week, business people will be more tired and, worse, more frustrated... Not only is white collar output lower than usual[-] ...under this stress, the risk of people making bad and costly decisions is rising rapidly. Given the integrated nature of N[Z]'s economy, the repercussions will be national... Mercury's timetable for restoring power keeps slipping... No business which went to the effort and cost of moving into temporary accommodation will want to come back downtown until it feels Mercury can offer reasonable security of supply... People can help Mercury by distrusting it. If they stay away from downtown, power consumption will stay low. But the distrust will cost every business... [□ The] power crisis is being seen as a warning of what might happen if Year 2000 computer problems aren't fixed... "This crisis has revealed an appalling lack of continuity planning," said... the... United MP... who has been trying to get the Government to take a more active role encouraging businesses to ready themselves for the millennium. [The MP's comments were backed up by the] author of *A Survivor's Guide to the Year 2000 Problem*, [who] said the Millennium Bug could make Auckland's problems... [- which are] reasonably narrowly-focussed... [-] look like child's play.

...Betting has all but come to a halt at the Victoria St TAB since the inner city was hit by power cuts nearly two weeks ago. But [the] manager of the agency... has found a new way to keep punters happy while they wait for the power to come back on – speculating about where the blame for the crisis lies. So far... the... law firm... [that chose the majority of Mercury's directors] is odds-on favourite in the Whose Head Should Roll Stakes... [If you can prove God was responsible, you stand to receive \$500 for each \$1 bet. Another odds-on favourite was the] Mayor of Auckland, [who]... yesterday widened the eligibility of businesses for Mercury Energy's relief fund, sparking criticism from a trustee of the company's consumer trust. After complaints from businesses who were barred from obtaining relief, [the mayor] raised the cutoff point for small businesses to a maximum annual turnover of \$400,000... [The trust member] said it was an "extraordinary situation" that [the mayor] was making decisions on who got fund money... Meanwhile, [pleas]... for an emergency bailout of struggling central Auckland businesses sparked crossed wires in the... Government leadership yesterday. At first the Treasurer... responded sympathetically to a request from the Auckland mayor... for an emergency relief fund, saying the Government could consider a range of options... [- including having] the Government give businesses money now and claim this back from Mercury if the company were found responsible... But within two hours the P[M – who, along with her Energy Minister, also features in the Whose Head Should Roll Stakes –] had overruled her [fellow cabinet member] and firmly rejected direct financial aid... [A letter from the mayor] asked the Government to treat the crisis the same way it would a rural disaster... It was over to the Government to decide how much to give and how the fund should be administered, [the letter said. But the PM's response was]... "We still believe that Mercury Energy... has the primary responsibility to deal with any issues of compensation and loss. We are not going to ask the N[Z] taxpayer to pick up what is clearly the responsibility of a commercial entity."

...*'Fiscal responsibility' led to buck-passing...* While Mercury Energy deserves a great deal of disgrace as a consequence of the failure of its Auckland cables, L... [-] a political economist and economic historian... [-] believe we need to look at the bigger picture. The problems stem from the growth of Auckland at the expense of the rest of the country, and from the effects of two cultures now widely pervasive in N[Z]. The first culture, that of commercialisation of all aspects of life, treats public infrastructure as no different from other commodities... The second culture, a recent reinterpretation of "financial responsibility," suggests to us that not spending money is generally more responsible than spending one's income. A financially responsible enterprise is one which is seen to have cut its workforce to the bone. The Government has taken a strong lead in spreading this culture, [especially] through its Fiscal Responsibility Act... Budget surpluses are seen nowadays more as a means to cutting taxes than to a commitment to invest in the social and physical infrastructure of the nation. Financial responsibility has come to mean maximising

surpluses and externalising costs, meaning making someone else pay for the catastrophes... As we noticed with the Electricity Corporation in 1992, and Auckland's water services in early 1994, it was cheaper for the supplying utilities to pray for rain than to prepare for its absence. Another part of the problem is that, thanks to the devolution of responsibility, public utilities are constituted to defend their patch, even if it means legal disputes. Mercury... found itself in a dispute with Transit N[Z], causing a long delay in starting the tunnel solution. Whereas the coordination of infrastructure is of paramount importance to the public, this bigger picture is often lost on the utilities themselves... Ironically, [the]... devolution of responsibility that... now affects all areas of public life... coincided with the rapid expansion of executive central Government. At each reform, the Government has been increasingly able to stand aloof from failures in the supply of public goods... The electricity supply problem is simply another chapter in the problems of water shortages, overstretched schools, public hospitals, inadequate public transport and gridlock on Auckland's roads. N[Z] is starting to display the regional imbalances characteristic of South American countries. Like Buenos Aires, Greater Auckland has one-third of its nation's population [– which means] Auckland's problem is N[Z]'s problem... While I neither live nor work in Auckland's central city area, I am nevertheless inconvenienced by the shutdown of the city. I don't want to have to pay twice, by having to share in the payment of compensation to central city businesses. Rather than focusing on blame, I want to see something good come out of this crisis, something like a national commitment to public utilities. A start might be an end to the pressure from Wellington to privatise the Auckland Regional Services Trust.

...The Treasury's worst fears over the costs of the Auckland power crisis came a step closer last night with confirmation that cuts are likely for a further seven weeks... after two of the four big... cables failed critical voltage tests... at the final stages of repair. A brief flicker of hope during the day when Mercury successfully restored one of the... failed cables ahead of expectations gave way to gloom in the evening. A grim-faced Mercury chief executive... delivered the news financially stricken Auckland businesses had been dreading: "I said 10 days ago it was a dark time – it is much darker now... There is no apology great enough and I realise this will be absolutely devastating for our customers, as it is for us... It is true to say that all of us today are in a state of quite deep shock." ...Last week, Treasury officials put the possible cost to [NZ] at \$600 million but expected to escape with much less if the crisis were resolved by Monday, as Mercury... [had once] predicted... For today and tomorrow the city would continue to be split into morning and afternoon supply areas, with Mercury able to meet about 80[%] of the current (heavily reduced) total morning load, 50[%] of afternoon load and 100[%] of evening load... The introduction tomorrow of a transman cargo ship, Union Rotorua, hired by Mercury to pump 12MW, will add to the 34MW of diesel-powered generators already in operation... [– bringing the total] available... to... 104MW... Other options for Mercury include... hiring a second ship or putting more mobile generators on barges. However, there are constraints on Quay St substation, which is closest to the port... A Ports of Auckland spokes[person]... said all the cargo on board... the Union Rotorua... had to be unloaded before Mercury could begin refitting it... Mercury was paying for transporting the cargo by rail and road to... Wellington, Lyttelton and Nelson.

...The latest chapter in the power fiasco has forced the Government to step in and stop suburban trains to speed up construction of the cable that will become Auckland's lifeline. The Minister of Energy... said Trans Rail had agreed to stop all trains on the Newmarket line... between Penrose and the city. This would shorten the 10-week construction period by several weeks, [the minister said, although it] could not give a definite time-span... [The minister] planned to ring contractors to try to find out how to get the power poles up faster and whether there were any restraints due to a lack of materials or people to dig the holes... Details would be confirmed today but the Penrose commuter line may be closed as soon as tomorrow. Trans Rail would make alternative arrangements for commuters by rerouting traffic through other lines and putting on additional buses... [Meanwhile, only] a fraction of a \$2 million fund to help small businesses through the power crisis has been claimed. By yesterday afternoon just \$114,000 had been collected by 126 people – despite a widening of the eligibility criteria last week. "We were led to believe there were hundreds of businesses going to the wall," said the chair[person] of the Auckland Energy Consumer Trust... "Where are these people?" ...The Mayor of Auckland... said some people had been put off by false rumours. [The mayor] wished to make it clear that accepting money from the fund did not prejudice legal action people might want to take against Mercury in any way. And the forms were completely confidential... There was little chance that people who were not Mercury customers would get money, despite some of them relying on the [CBD] for their income[, although the mayor]... was prepared to look at the criteria again tomorrow if the numbers were still low. It was unlikely that the maximum payout of \$2000 would be raised... [The mayor also said it] was not put off by the... [PM] pouring cold water on [his] plea for crisis funds from the Government... [The mayor claimed to have] some ideas to discuss with [the PM] when they meet tomorrow, but did not wish to go into specifics at this stage.

...Auckland lawyers were warned off becoming involved in the fight between Mercury Energy and the heavyweight A[US]n law firm brought in by its disgruntled customers. [Two] local lawyers... are helping [the Melbourne law firm. One claimed yesterday to have] been approached by colleagues who had told him it was not wise to tackle Mercury... and its powerful legal team... Colleagues said battling "the establishment" would rebound on him later. "It's an unfortunate fact that some lawyers are probably reluctant to get involved in taking on big corporations because, if you offend them, that will offend other people, and it might stir up trouble... Personally, I don't care – I will take on anybody." [The Melbourne law firm] have come to N[Z] with a big reputation gained from a series of victories against A[US]n corporates.

...Most Mercury Energy directors... [– who] will face multi-million dollar personal liability suits if aggressive A[US]n legal bounty-hunters name them in High Court actions on behalf of Auckland businesses... – ...are shielding behind a legal gag imposed by their own lawyers instead of fronting up in public to hard questions on the power fiasco... The *Business Herald* yesterday asked Mercury's directors if they were "satisfied" with the way the company's risk management had handled the crisis. It also sought answers on risk management policies and the adequacy of technical briefings given to directors. Several directors cited an agreement to leave comment to [Mercury's chairperson] as a reason they could not answer the questions. However, [the chairperson], who has been undergoing... treatment to alleviate terminal cancer, told the *Business Herald* [it] would not be answering the questions... cit[ing] legal advice... Just one director agreed to answer the... questions: [the] former Goodman Fielder Wattie chair[person]... who said the possibility that the final two cables might fail was never raised.

...N[Z]'s largest power supply company had no effective risk management strategies in place to cope with the unexpected blowout of all its main lines into Auckland's commercial heart. That has been confirmed by *Business Herald* investigations... [Mercury's chairperson] and chief executive... also miscalculated on the extend of the crisis... [– although] investigations show that... [a] week after two of the four main cables supplying central Auckland broke down, Mercury[']s... engineers did not warn the company's directors of the possibility that a third cable could fail... [E]ngineers discussed the possibility among themselves, [but] did not canvass the possibility... in a February 16 report prepared for Mercury directors. The engineers did note that with two electrical failures in key circuits, there was a need to plan for similar faults in those cables in the future. But the company's top officials... were not formally told of the potential for a breakdown in the other two main circuits keeping the city alive.

...The Government will present a survival plan for central Auckland to shellshocked Mercury Energy bosses this morning. The aim is to have much of the city back to business within five days despite the crippling power restrictions... The plan – nicknamed Apollo 13 after the lunar module that had to shut down almost all its normal operating systems to make it back to Earth – involves assembling a team of experts to advise Mercury and its customers how to run their businesses on minimum power... Under Apollo 13, businesses could return to the central city, but only with extreme energy conservation measures... [I]t was estimated that most commercial buildings could cut their power consumption by... 20[%] by removing unnecessary lights, turning air conditioning up or off, and installing power saving devices on office equipment... Owners could be offered discounts on electricity bills if they agreed to cut use... But indications yesterday were that the... [PM] and officials advising her may be overly optimistic... The plan's chances of success may be limited by Mercury's willingness to cooperate[– especially while the PM]... is advising businesses

crippled by the... energy crisis to sue Mercury... [-] technical difficulties and arguments over who should bear the costs... Meanwhile, a business group is planning a \$180,000 multimedia advertising campaign to draw shoppers back to the district. Heart of the City, a pressure group initially set up to force rates relief, is using \$80,000 of its own money, plus \$50,000 from Mercury and the same sum from the Auckland City Council, to promote a St Patrick's Day parade as payback time. They will ask the council to close Queen St all day on Saturday, March 14, for a festival to celebrate surviving the crisis. A lucky shopper will win a BMW car in a prize draw. A spokes[per]son... said: "We've got to get the shoppers back or else." It is indeed a shoppers' market in Queen St. Most businesses are offering "blackout sales" and discounts... But while plans are hatched to save businesses from bankruptcy, the Department of Social Welfare will be setting up shop in the Auckland Town Hall. It anticipates its unemployment business will boom... The first casualties of the crisis are expected to fall in the restaurant, cafe and bar industry.

...Cheers restaurant and bar is opening today for the first time in 12 days... [but the news might not console the directors of Mercury Energy, whose company] is now almost certain to face a class action by hundreds of businesses for compensation running into hundreds of millions of dollars.

...Small business owners trying to get a share of the \$2 million emergency fund have found cashing in on their woes no easy task... [One person] said his wife... was this week given a cash cheque... made out by the Auckland City Council, which is administering the fund. Because both the council's bank, the B[NZ] Town Hall branch, and [his wife's] bank, the ASB Customs St branch, are closed due to the power crisis, [the husband] tried to cash his wife's cheque at another branch of the ASB. There [the husband] was told the bank could not cash his cheque and [the couple] would have to wait five days for it to be cleared. If [they] wanted a special clearance it would cost an extra \$12. [The husband] rang the council helpline and was advised to take the cheque to the Newmarket or Parnell branches of the BNZ who "were accepting the cheques." • The value of claims from small businesses... has almost doubled. More than \$86,000... [was] paid out... yesterday... taking the total to over \$200,000.

...The P[M] sailed away from Auckland's power woes yesterday afternoon... [The PM's] two-hour caper was not mentioned in her appointments list for the day [when it] was expected to show leadership over the Mercury mess. [The PM] spent only an hour in official meetings earlier in which [it] stressed the need to tackle the power problem immediately[- then said it] would visit struggling shopkeepers before leaving for Japan tomorrow. But the PM took to the sun-drenched Waitemata Harbour shortly after noon with h[er] husband... and their two children... [The PM] quickly came under fire from business people for putting her pleasure ahead of their pain. [A restaurateur] would love to have joined [her] on the harbour. "I would rather be sailing but I can't - I've got a business to save... I'm completely disappointed with [her] whole attitude." Her failure to hit the streets urgently offended even traditional supporters... [A]n unabashed conservative, said the PM had let him down. Yesterday, [it] shut one of his two cafes for four weeks.

...Aucklanders will put on brave faces and summer clothes as they head back warily into a still-under-powered central city on Monday. That will mean little or no air conditioning, limited lift service, less lighting and reduced use of office equipment... Barring further disaster, a total of 122MW should be available... By Tuesday, matters should improve. Another seven diesel generators are being flown from Singapore and Perth... adding 13.2MW. If the second cable is working[- even at a 'reduced capacity' -] that will take available power up to the basic requirement of 150MW... The Labour Department is warning building owners not to go too far with conservation measures. Workers must have adequate working conditions... [While visiting the] Mercury headquarters yesterday, [the PM]... urged Aucklanders to be tolerant and Mercury to adopt Dunedin Electricity's response to the national power crisis in 1992. Dunedin paid its customers to reduce demand and cashed in heavily on the Electricity Corporation spot market by selling power back. The Mercury chief executive... tactfully agreed to "embrace the concept" of demand-side management... • T[he]... owner of an Onehunga generator firm... Power Hire... promised a month ago to supply two 800kW generators for [a concert by the two piano players (r:p1621, ln23)], but the power crisis left him short of equipment and [the owner] warned concert bosses about this. [The owner], who has set up two generators at Auckland Hospital... accepted that [it] had a deal to supply equipment for the concerts but was stunned by the promoters' attitude. "When I told the Americans we could no longer supply them with generators they threatened to sue me. Given the country's problems I think they could have been more understanding." [The owner] finally managed to offer organisers one generator free. Last night, [the]concert promoter... said an American subcontractor was responsible for hiring generators for the tour and admitted that the legal threat was "unnecessary." ...[the concert organisers - who donated] 500 tickets to central-city retailers... [- were] forced to plug into Auckland's dwindling supply of generators... after the plane transporting the show's gear was rammed by a truck in the U[S. Previously, a]... production coordinator said [one of the piano players] had offered to fly in generators after hearing foreign reports that the whole of Auckland was without power.

...When the power crisis first struck there was that old resignation Aucklanders have from time to time: a water crisis in a region where it rains most of the year; a harbour foreshore that boasts oil tanks and containers on prime real estate; entertainment centres that make a bunker look attractive... And now this. But as the nights went by, the humour ran dry. Now, if you ask around, there's that inarticulate disbelief that this could have happened. And an unfocused anger, of course, as we are bitterly reminded when someone screws up that there is no tradition of resignation in this country. Highly paid people tough it out, deflect blame and it all blows over. But not this time. Too many people are hurt, too much money lost. There is... a litigious mood... Two words keep coming up: "Melbourne lawyers." Someone's going to pay, is what you hear. But who? Those who always pay, say the cynics. Us, somehow... Some say the big business guys in the city are reaping what they sowed with their free-market talk and privatisation... But what ordinary Aucklanders have exhibited most is patience, almost passivity. It might have been different if the bodies had started turning up in elevators after that first weekend. But there have been no protests outside Mercury offices with the waving of bill-hooks and a baying for blood; no looting [(as occurred during 'New York's 1977 blackout')] nor window smashing. Voices have been raised in anger, that's true, but we are behaving. We are even driving more carefully[- although having no] red to run[takes] the fun out of it maybe... The fact is we have behaved remarkably well - which is why it is unbecoming of the P[M] to suggest... we should be tolerant, exhibit "goodwill" and "try to make the best of what is a difficult situation." Ma'am, [we]... are, better than... [you] have any right to expect. Talk in candlelit bars and dark stairwells is of the woeful lack of leadership shown by those who have been styled our political masters or better... [A]t Mercury the PR war was lost early. Maybe it was "the most incredible, freakish bad luck you could ever imagine," as... [Mercury's chairperson said. But it] hasn't said much since. Very wise, sir. [Mercury's chief executive] must be the least telegenic front the company could have put up. All that icy, tight-lipped antipodean monotone... You have to ask, too, what kind of company has a "general manager future" called Dr Strange? This is comic-book territory. Still, we do live in Gotham City. And in the middle of this... one of the architects of Think Big... says this crisis will not derail a bold new programme of asset sales. My Mum would have clipped him one and told him that if [a person] could not say anything nice [the person] should not say anything at all. Except maybe about those... lawyer guys lurking in the background. Yes, we are that cynical about lawyers, big business and the free-market miracle - and we are taking it in the meantime because there is nowhere to put the anger. But we are patient - and we will find the place when the time is right. Heard the one about the diesel shortage?

...Auckland diesel deliverers cannot cope with the huge demand for generator fuel - and some businesses are being left dry... The owner of JD's Nightclub... said [it] had run out of diesel three times in as many days, for about an hour each time... [- although the owner] managed to keep his business going in the dark... The general manager of Shuttle Tankers... was asked to deliver diesel to 30 more generators yesterday, but... had to say no... "We have got trucks in from Whangarei and Hamilton, and we are running 24 hours a day, seven days a week. We just can't do any more." ...[the manager] said some people had been panicking, which had exacerbated the problem. "Some of them are ringing up when they still have three-quarters of a tank, saying, 'help, we are running out'." ...But the manager of the Wiri supply terminal... said that despite the rush for

fuel in the inner city, there was still plenty of supply... Diesel consumption from Wiri was only slightly up, at 1.3 million litres yesterday, compared with the usual 1.2 million litres a day... [M]ost diesel in Auckland originated at Marsden Pt refinery in Northland and was fed through a pipeline to the Wiri terminal[... which]... had almost 10 days' reserve... and Marsden Pt also had reserves.

...Go downtown... [and] listen to the music of the diesel in the city The heart of the city pumps diesel. When the lights go down the generators fire up, filling the air with such a din that the cars seem to roll with eerie noiselessness through the streets. On the morning that downtown Auckland grapples with the idea that this state of emergency could simply become a state of affairs, the pavements rattle and hum with an infernal combustion... Many [generators] are so shiny they look like they have just emerged from plastic packaging... At the foot of Wyndham St a small generator "farm" which has grown in parking places was once roughly fenced off with yellow plastic tape. The tape lies tattered now, but over the week, the assemblage of massive thundering boxes seems to have settled into place. Litter has gathered against its windward side; it looks like a permanent installation. This is the sight, these are the sounds, of a city... in a state of siege. The faces that peer from the shops are often anxious, as if the proprietors and staff are startled at the sight of a customer. In idle moments they gather in knots on the footpaths, exchanging stories of days disrupted and businesses bruised... This darkness has been seen around the world. The *Times* in London editorialised, perhaps overstating the case when it said the city "was suddenly brought back to its beginnings." But it did point up the magnitude of the problem when it reminded us that "electricity is the lifeblood of the e-mail age..." The paper's most contestable observation is that Aucklanders are "bemused, unsure whether to laugh at the plight of modern civilisation when its machinery fails or rail at the incompetence" of Mercury. As the city stares at another month or more of this, the grim laughter is fading. Walk the streets of the city and you hear another sound. And when the generators are finally switched off and we can hear it clearly, it may turn out to be a baying for blood.

...[a few] weeks ago a team of high-ranking Chilean businesspeople arrived in N[Z]. Their mission: to observe the workings of N[Z]'s economic miracle in action. As the country's largest business district faded into black, the delegation's raves about N[Z]'s economic performance turned to consternation. Within hours the elegantly suited visitors were on their cellphones to Santiago. "If this is the model, if the system works so well, how could something as fundamental as this happen?" ...[the] chief executive of [a firm of] stockbrokers and investment bankers, [who] spends much of his time talking to the money markets of the world... insists the crisis will generate international shock waves that will be felt for years to come. "It gets to the heart of whether a system [can be relied on]... Our clients are dumbfounded. We're getting calls from all around the world, people saying, 'We can't believe this is happening'." [The chief executive] is convinced that N[Z]'s economic reputation... is... wobbly... "The world has sensed that something's wrong... Now our bubble of credibility has well and truly burst. People don't understand that this is one of the most serious lapses in N[Z]'s performance since 84, when we had problems with the exchange rate. This will hurt us for a very, very long time to come... It's inconceivable Wall Street could ever be out of power... If that happened the power companies feeding New York would be sued out of existence. This is an appalling abrogation of duties. Overseas people are saying that the directors of Mercury, maybe even the Minister of Energy, should resign." [The] Bankers' Trust... has estimated the costs of a two-week power crisis as only 0.1[%] of gross domestic product. In terms of jobs, [Auckland's CBD has 4%] of the nation's workforce... But it is a part of the workforce with huge influence on business confidence... Today a bank rises on almost every corner, each one sucking up huge amounts of electricity. And these are serviced by tower blocks full of lawyers and accountants, who are in turn serviced by the little guys at street level...

Mind where you answer the call of nature, and watch your language. With those words of advice, 40 workers trooped off along Auckland's rail corridor... to save the city from electrical doom... As trains carried the power poles into place, and work gangs began digging the first of 110 holes needed for the project, oblivious drivers whizzed past on the Southern Motorway. No special ceremony attended the raising into position about 2 pm of the first pole... Planners from the contractors, GEC Alsthom, had spent sleepless nights designing the project and preparing the installation.

...Contractors working on the overhead cable project will work around the clock in a bid to finish the job in less than three weeks... GEC Alsthom... will even employ extra staff from rival firms if necessary... During the night... crews will work... with the help of floodlights... The most time-consuming part of the process is threading the six conducting cables and single earth cable along the route. Using nylon guide ropes, the cables are threaded 2km at a time. A winch is used to keep the tension in the cables, so they never touch the ground for the entire route. That could lead to corrosion problems. The threading is expected to take two weeks, and will begin even before all the poles are up... Complicating the process is a section of cable that has to go through a tunnel, and another over a highway.

...Affected residents are being left in the dark about work on an emergency overhead line. [One resident], whose Newmarket house overlooks two poles, said a letter Mercury Energy sent did not tell them anything useful. It should have stated what hours the line would be worked on, how high the poles would be and what, if any, the health risks were. [The resident] was surprised that work would be going on all night – it was the first [residents] had heard of it. "I get up at six every morning to go to work, and I need my eight hours' sleep." And [another resident], whose rented Newmarket house is almost directly in front of a pole site... had not received the letter at all. "I want to know what it looks like, what the noise level will be, and if there is any magnetic field." ...Nearby, [a resident said it] had just spent \$350 on a new television aerial, and wanted to know if the cables would interfere with reception... The letter stated that Mercury was writing to residents as "part of [its] pledge to keep Aucklanders informed." It said work would start at 8 am yesterday, and "you and your neighbours may notice some noise." ...Workers on the cable said one resident had been yelling at them from his balcony and had threatened to "blow it up" if they put the line in. Others, however, were not worried about disruptions. "I am happy so long as it helps the city out," said [someone else from Newmarket]...

Mercury's network manager... has turned to God... for... help... [The manager] said that... the "power of prayer support from our church" and messages of support from friends all over the world... is... the only thing [capable of] pulling... everyone... through... Auckland's power crisis... [While the manager is relying on prayers, the energy company] is preparing to pay Auckland businesses to go without power... [Mercury] will target about 240 businesses that have modern time-of-use meters... For most corporates the power bill makes up less than 1[%] of running costs, but they cannot run without it, so a realistic incentive not to use would have to be set hundreds or thousands of times higher than the price of the electricity.

...Mercury Energy was forced to rely on two cables it knew were unstable... because of the demands of the Britomart project. Documents obtained... under the Official Information Act reveal that Mercury, at the request of the Auckland City Council, agreed to relocate cable in Quay St and Britomart Place to make way for the controversial transport terminal... [that still] has yet to be granted the necessary Environment Court consents to begin construction... A letter from Mercury to the council dated May 22, 1997, says... that taking the 22kV cable circuit out of service meant... "relying on the... two 110kV gas-filled cables... which... will dramatically increase the risk of losing power to a large area of the [CBD]. The recent performance of these cables has shown that problems on one cable invariably causes problems to the other and therefore these cables are not considered reliable." The relocation, estimated to cost \$265,000, was completed in early January. The first 110kV cable keeled over on January 20.

...One of the more absurd conspiracy theories doing the rounds in the wake of the power crisis is that big business somehow had a hand in pulling the plug on Auckland because it was keen to get rid of the Resource Management Act. That feelings run strong on the RMA is without doubt[, and]... Mercury's network manager... is clearly no fan of the legislation. If it had not been for the RMA, [the manager] muses, Mercury could have had new cables to replace the ageing gas cables by now. "If it had been 10 years ago we would have just dug up the road, put great big cables in without anyone telling us [what to do]. Now we have to get approval." Engineers also point out that the RMA has made it virtually impossible for power companies to consider the cheapest and most efficient way of supplying power to... customers – through overhead lines. In fact, overhead

lines have fallen out of favour not because of the RMA but because the public hates them. They are seen as an eyesore, and therefore it is generally thought customers are prepared to pay more for underground supplies. [Furthermore, it] took just a few weeks for the Auckland Regional Council to grant Mercury a resource consent for its underground tunnel. According to the council's strategic policy manager... the RMA is a "convenient scapegoat. The same people who criticise the RMA and say it's a lengthy process are happy to use it to blackmail others,"...

The sudden death of Mercury's chief executive... has led the Government to delay the release of the report into the Auckland power crisis. [The chief executive] was alone in his Newmarket office when [the AUSn] suffered a heart attack and died about 2.20 pm. A meeting in Wellington later in the afternoon between the Minister of Energy... and Mercury board and trust members to discuss the report was cancelled... [T]he report, which is expected to be critical of Mercury and has still not been seen by anyone in the company, would now be released later this week or early next week. It had been due for release today. Both [the minister] and the Mercury chair[perso]n believe the stress on Mr Gilbert in the aftermath of the power crisis would have contributed to his death at 60. "It just shows you the sort of thing that can happen when you put senior management under extraordinary stress..." said [the minister. The chairperson] said Mr Gilbert... had been "totally devastated" at the failure of the downtown cables.

...The way Wayne Gilbert saw it, [the chief of Mercury] was "absolutely responsible" for plunging downtown Auckland into darkness... The... chief was only hours away from hearing what was in the Government report on the inquiry... when... apparently suffer[ing] a heart attack... [Wayne] was found by his secretary and attended by two paramedic staff at Mercury's offices... [They] spent... 40 minutes trying to resuscitate him. The burly A[US]n had previously had heart trouble and, like most mornings, had got up yesterday at 6.30 am, put on a beanie and plastic raincoat, and gone for a walk round Remuera with a neighbour... [That neighbour] and another... jointly owned a fishing boat with Mr Gilbert and they saw another side to the "hard and ruthless" public image of their friend... "[Wayne] was ruthlessly honest, extremely sensitive and extremely loyal..." After the release of the Government report, Mr Gilbert had planned to relinquish his position about September – his contract was to expire next March – and retire to A[US]. Among other things, [Wayne] wanted to indulge his passion for classic cars, "to try and recapture a bit of my youth before it all disappears." ...Wayne... was head-hunted by Mercury... because of his track record in restructuring similar companies across the Tasman. After a 16-year career in the brewing industry, [Wayne] was appointed general manager of the South East Queensland Electricity Board in 1984. His brief was to stop power charges rising faster than inflation. His attack on staffing levels pitched him into one of the most bitter industrial disputes in A[US]n history... 900 members of the state's toughest union, the Electrical Trades Union, were sacked after a dispute over the use of contract labour... [A] member of the union, described Mr Gilbert as... hard... "But we knew where we stood. [Wayne] made it clear that [Wayne] had a point of view and unless you could shift him, that was the way it was going to be." ...Mr Gilbert is survived by his wife... and three adult children.

...Why the lights went out: Mercury gets the blame... The inquiry, made public by the Minister of Energy... in Wellington yesterday... will provide ammunition for the big litigants, such as insurance companies, still expected to line up against Mercury – in the courts if necessary – seeking massive damages to cover their losses. The 193-page inquiry report... quotes from a Mercury letter, dated June 22, which claims nothing the company could have done would have prevented the crisis... [The chairperson of the three-member] inquiry team... is succinct: "We disagree... Too many people in Auckland suffered too much, personally and financially, for a narrower view to be taken." ...Blundering Mercury... bosses did not even know where their power cables were or on what side of the street they lay... In scenes resembling a Monty Python film, a consultant to the inquiry was led on a wild goose chase as Mercury engineers desperately tried to find missing cables without proper maps to guide them... [The] consultant... was amazed there were no markers showing where cables were supposed to be and Mercury had only the most basic of cable plans. On many occasions... [it] was stunned to find cables running through private gardens with trees and shrubs planted over them. Other experts discovered that Mercury... was not even aware that the landscape had been changed since the cables were first installed or that trees endangered some high-voltage cables – even though the risks were clearly visible to bystanders. In another episode, Mercury staff carefully removed kerbside markers for security reasons during the 1990 Commonwealth Games but forgot to put them back. The blunder meant the number of cases where roadworkers dug through cables rocketed. There were only three power cuts in the 32 years before the markers were removed – but three further blackouts since 1990. Yet despite contractors' cutting the cables, Mercury did not bother to protect cables from further damage, putting the entire city at risk.

...Central Auckland power supplies remain under threat of blackouts of up to four days, says the inquiry into the power crisis... [that] lays... blame squarely at the door of Mercury Energy and its predecessor, the A[EPB – although the]... Minister of Energy... acknowledged yesterday the previous National Government's role in allowing the flawed Mercury... company structure to come into being. [The minister, who remains happy to] blame... management failure[s within Mercury] for the crisis... would not have approved the establishment plan as... his ministerial colleague and previous Minister of Energy, had done in 1993... Consumers throughout [NZ] will get a better deal from electricity supply companies with improved customer contracts on the way to provide fairer compensation in power cuts. The inquiry recommended that Mercury's... "no worries" customer service guarantees be beefed up on the side of the consumers and the Government wants the move applied across the industry as a priority.

...Mercury Energy believes it is close to wrapping up all outstanding compensation claims over the power crisis. One of the largest claimants, Ports of Auckland, said yesterday that it had settled with the power company for \$1.3 million... A Mercury Energy spokes[perso]n... said only a handful of larger consumers had yet to reach agreement. And more than 90[%] of affected customers had now lodged claims for compensation. The Auckland City Council settled with Mercury and council insurers for \$2.4 million two months ago. [The spokesperson] said the company had set aside \$128.3 million for all costs incurred with the crisis, including the construction of an overhead emergency line. It would wait to see if that amount had been sufficient. But the issue of individual or group action aside from the Mercury compensation offer is still to be resolved. Yesterday a business lobby group, Power for the People, said some businesses that had gone broke during the crisis were still seeking independent legal action through... Wellington-based... law offices. Many of the businesses had earlier dropped out of possible group action when [a Melbourne-based] law firm... decided not to pursue a case... Mercury's compensation package... offered rebates or cash equal to six months of power bills.

...Six months on from the Auckland power crisis and morale among the staff at Mercury Energy is surprisingly high. Since the crisis the company has been pilloried by politicians and the public, has suffered a first financial loss, and has had to cope with the mayhem of new electricity industry laws. Senior Mercury managers have been forced to quit following the... crisis, while many other workers are likely to lose their jobs as new laws force power companies to consolidate... [A Mercury p]roject manager... noted this week that the upgraded system was as secure and modern as any in the world. For example, the new... \$23.5 million underground cable running from Mt Roskill to Liverpool St... is made of latest-technology materials that have a new type of insulation called XPLE. This plastic derivative is much more reliable than the gas and oil insulation in previous cables... The way... underground cables are installed has... been improved... Mercury is [now] using specialist packing material around the cable, rather than backfilling the surround with soil. Overheating of that backfill was partly blamed for some of the failures. The cable has also been encased in concrete to make sure that stray ditchdiggers do not pierce it... As an extra precaution against the likes of telecommunications contractors breaking the power cable, Mercury has meticulously recorded the route of it electronically. Other protective measures include running a fibre-optic cable the length of the power line, so that its heat can be monitored every 2mm. That will allow the cable to be automatically shut down to prevent any damage if the slightest hint of overheating is detected. The two gas cables serving the [CBD] are... being operated at less than

half their previous stress rating, to ensure that they will not overheat. The other two oil-insulated cables have yet to be repaired fully, but there are also plans to fix those. But it is the overhead line that remains the system's biggest safety net. The fact that it is easily accessible means it could be repaired within 24 hours, even if a train derailed and took out some of the poles.

...Regional power struggle ends... A six-year battle for control of the Auckland and Waikato electricity markets has come to an end, with Mercury Energy agreeing to sell its stake in Takapuna-based Power N[Z] to Utilicorp of the U[S]. As part of a series of deals agreed to yesterday, control of Hamilton's WEL Energy will return to local hands... [T]he community-owned WEL Energy Trust will pay about \$75 million for control of WEL Energy. The trust will also sell a stake it holds in Power NZ to Utilicorp. So far the deals do not include plans to buy out thousands of small shareholders in Power NZ and WEL Energy... Kansas-city based Utilicorp will pay Mercury \$300 million for one-third of Power NZ. Utilicorp already owns a third of the company. Mercury will make a profit of nearly \$100 million on the deal. That money will mostly offset the costs of the Auckland central business district power crisis this year... Mercury and Utilicorp have fought a sometimes vicious battle for control of Power NZ, including an advertising blitz that attacked the integrity of the company directors and management. Many of the early players in the battle have lost their boardroom jobs. Now, the companies have agreed to work together to unravel a series of legal hurdles they put up to stop the deals going ahead. The... catalyst for the change in attitude has been a revamp in electricity laws, which will make it illegal for companies to own both energy-trading and monopoly electricity line businesses. Mercury, Power NZ, and WEL Energy are likely to sell their electricity-trading and power-generation assets as a result of the law changes. □ *...The family of Folole Muliaga have not ruled out taking legal action against Mercury Energy and Counties Manukau Health Board after a report concluded a power cut that stopped oxygen therapy contributed to her death. Mrs Muliaga, 44, was receiving oxygen at her Mangere home when the power was cut on May 29 last year because of unpaid bills... The report said Mercury... acknowledged it was not fully compliant with guidelines that identified vulnerable customers, but had made changes since Mrs Muliaga's death.*

...THE day Mrs Muliaga's death was reported... online I was far away from this compassionate country. "Hell," I said to my travelling companions, "back home [someone] has died because [it] depended on a breathing machine and her power was cut off for not paying her bill." "Why didn't [it] pay the bill?" one of them asked. "Don't know... The story didn't say." When I got back a week or so later the story was still running hot. The P[M] was on the case, demanding answers to every question but that one. The power company was in full retreat and an unnamed agent who disconnected the power was the supposed villain of the piece. But still that question bothered me. No matter how poor the household, if a family member's life depends on the power, wouldn't it be the first bill you paid? The climate of outrage was such that even to ask the question seemed to be considered grossly improper... Finally... a coroner's report has provided a more complete account of the case, exonerating the unnamed agent who cut off her power. The coroner has found that had Mrs Muliaga or her son told the agent [it] was dependent on a respiratory machine, [the agent] undoubtedly would have used the discretion [the agent] had, and had used in previous cases. The coroner finds "some merit" in the contention that [the agent] should have told them [it] had the discretion, but... prefers to put that responsibility on the company.

...[A friend] of the Good Oil was jotting down how much a new car would set him back late the other night when the kitchen lights flickered and went out... [The friend... opened the back door to check the fuseboard and smelled burning. The switch marked "lights" was hot. "I turned it off with a piece of wood. It sparked for a second before spitting out scorching flame and leaving an even worse smell,"... [The friend] phoned Mercury Energy's 24-hour emergency number... But a recorded voice said the service was no longer available. So [the friend] phoned a neighbourhood electrical contractor who, the yellow pages said, was open 24 hours. No luck there, the contractor wasn't answering his paging service. Finally, [the friend] phoned 111 and the fire brigade arrived in minutes. A fire[officer] pin-pointed the short-circuit and shut it down. The brigade doesn't charge to fight a domestic fire or check the threat of a fire. It doesn't charge for a lot of other things either, but that's another story.

...A 63-year-old Methven [resident] charged with 12 counts of criminal damage relating to the sabotage of pylons and power poles... over a wide area of Canterbury in the past year... has denied any involvement in the incidents... [T]he 12 charges... each carry a maximum penalty of 14 years' imprisonment... Nine poles owned by Electricity Ashburton were attacked in two separate incidents of sabotage where the wooden poles were cut through with a chainsaw. Nine Transpower high-voltage steel power pylons were attacked in a similar way... [In related news,] Massey residents were back in their homes yesterday morning as work[ers] dismantled the power pylon that threatened to topple on to houses after a car crash. Up to 80 homes in and around Waimumu Rd were evacuated at 1.30am yesterday, until cranes were brought in to secure the buckled pylon. [One resident... who lives opposite the pylon... slept through the crash. "The first I knew anything was when police knocked on my bedroom window... Then I had to find alternative accommodation." ...[the resident] and his wife drove up to Huapai to stay with his daughter. "I don't think [my daughter] was too happy to see us at 2.30am." ...his 78-year-old neighbour had to call a taxi and stay with her grandson. Thirteen residents drank cups of tea and watched TV at the civil defence headquarters in Elcoat Ave... "Because no one was injured everyone was talking and helping each other and lots of reassurance was going on,"... says a civil defence manager... Police closed off roads and four patrols were assigned to the area to ward off burglars. The first residents were allowed back to their homes at 4am. [The resident who drove to Huapai] returned around 7am yesterday to take medication [it]d forgotten in the rush. Families from two homes 30 metres from the pylon were not allowed to return until mid morning.

...THE car crash into a power pylon which forced the evacuation of 80 Massey homes was an accident waiting to happen, says one resident... Waimumu Rd... residents have long been worried about the speed of some cars travelling along that stretch of road with a deceptive curve. It's the second time in six years a car has crashed into the pylon... [T]he road is used as a quicker route than Triangle Rd to get to the Don Buck Rd area. "We hear people putting their foot on the accelerators before the bend, which they don't really know is there,"... Her daughter's parked car was written off when a car smashed into it outside [thei]r house a year ago. "We've also had a motorcyclist come off, a car in the neighbouring section that's come off the road, and others not judging the curve." [The resident] wants a chicane in the road to force drivers to slow down, or even warning signs... [The resident] was woken at 10.30pm on Tuesday by the crash and later saw the driver being taken away by ambulance. Hers was not one of the homes evacuated by emergency services early on Wednesday, when fears rose the pylon would topple and drag other pylons with it... [The resident] says small wooden posts in front of the pylon... proved useless as a barrier on Tuesday night as the car missed them completely. "Pylons like that shouldn't be right next to the road,"... says [the resident. The] Waitakere deputy fire chief... says Transpower must put a "substantial" metal barrier in front of that pylon and its neighbour to prevent a tragedy. "It's on a bend and on a downward grade of the road as well. Even if there's not another crash for another 10 years, next time it happens the pylon could come down and somebody could be killed,"... Transpower[s] North Island field services manager... says there's "every likelihood" a more substantial crash barrier will be installed. [The manager] says repairs to the pylon are likely to take until the weekend, and Waimumu Rd will remain partly blocked by... cranes until then. "One leg is sheared off and the other one is buckled. We have to replace the bottom section of the tower which could take two or three days." [The manager] says it was lucky there was no power[passing] through the damaged pylon's cables at the time of the crash as it had been turned off for work on the line. [The manager] says the damaged pylon and the repair work will not affect power supplies to the area.

...When teams of police came knocking on Wednesday morning, most sleepy Massey residents quickly realised the danger to their homes from a nearly power pylon – damaged when a car crashed into it. But not all residents had exactly the same priorities about safety in the wake of the car crash. Police explained to one [guy] that if the damaged pylon fell it could take the others down, like a set of dominoes. The resident was very concerned, police inform Westie Bits, but his thoughts didn't run in the most obvious direction. "[The guy] was really worried about the threat the pylon had to his boat," says [the Senior Sergeant... who headed the evacuation. The [guy] headed off the doorstep for the boat to make sure it was absolutely secure. As constables walked up the path, they heard the [guy] say: "Oh, I'd better tell the wife."

...*Air crash ends life full of promise* A former... ski champion who had won a bout with cancer was piloting the helicopter that crashed in remote Fiordland... killing her and four American tourists. Janey Blair, aged 28, renowned for her “guts and determination,” was flying the tourists to a rendezvous with a boat on Lake Manapouri about 10 am when disaster struck. The Fiordland Helicopters chopper appeared to clip power-lines near the Manapouri power station, about 160km northwest of Invercargill. The wreckage was strewn over a beach and in the lake, the deepest in N[Z] and known to Maori as the Lake of the Sorrowful Heart. Yesterday afternoon, the bodies of Ms Blair... and the tourists... were returned to the Te Anau side of the lake. The[tourist’s] names were not available last night. Fifteen people have died in air crashes in the Southland-Fiordland area in the past year. Ms Blair, an experienced fixed-wing and helicopter pilot, was remembered yesterday as an “invincible action [gal].” ...The executive officer of Ski Racing N[Z]... said Ms Blair had helped shape the N[Z] ski racing industry. [Ms Blair] achieved impressive world rankings in the super G and the downhill, and in 1990 won the U[S gals’] combined junior title. “At that time they were the best results N[Z] had ever had.” What was shaping up to be an Olympic career took a setback in 1991 when Ms Blair had reconstructive knee surgery and then was diagnosed with thyroid cancer. In 1993, aged 21, [Ms Blair] fought her way back into the national ski rankings and beat[NZ’s first Winter] Olympic silver medallist... in the Wigley Cup. [Ms Blair] took up flying when... 18. At 21, [Ms Blair] was already flying commercial fixed-wing flights to Milford, and a year later became the only [gal] commercial biplane pilot operating in N[Z]. Ms Blair is survived by her parents and two sisters...

Aviation authorities say there have been delays in marking powerlines and introducing rules to prevent air crashes involving lines and other wires. But in the wake of Tuesday’s helicopter crash, which killed five people, the Civil Aviation Authority says there has been concentration on pilot awareness and education about wire danger... An expert had been brought from America to give seminars for both civil and military pilots and a range of “helikiwi” seminars on the same subject... Pilots yesterday criticised the lack of powerline markers. Queenstown pilot Janey Blair and two American couples were killed in the crash, on the shores of Lake Manapouri. The two couples, who were travelling together, had arrived in N[Z] the day before the crash. They were Sandra Elizabeth Robinson, aged 56, and her husband, Grover Cleveland Robinson III, 56, of Florida, and Chanetta Perdue Terrell, 65, and her husband, Richmond Britton Terrell, 67, of California. The Hughes 530F helicopter clipped a high voltage overhead power cable near the Lake Manapouri power station on its descent. Transport investigators have yet to establish whether the crash was caused by impact with the wires or something before that. Other pilots were yesterday coming to grips with the death of yet another colleague. [A]Queenstown pilot... said Ms Blair was an inspiration to many, particularly after her successful battle with thyroid cancer and her career as a top N[Z] ski racer. “It’s the old story – we are all there but for the grace of God. We certainly don’t think we are bullet-proof and a lot of us have been in the same situation as Janey, but we’ve got away with it.”... [A] Te Anau-based pilot... said yesterday that pilots in the region were struggling to come to grips with the crash. “People are pretty shocked and stunned. Janey was a pretty gutsy little girl.” [A CAA spokesperson] said that in the 20 years to the end of last year there had been 73 “wire-strike accidents,” in which 32 people had died. Most accidents... occurred when aircraft were well below the minimum height at which they should be flying... “You’ve got to have a bona fide reason to be down below that height. Giving tourists a thrill is not a bona fide reason.” [The spokesperson] said there were still issues to be resolved before any powerlines would be marked, including legal issues, who would pay and planning permission... Transport Accident Investigation Commission investigators finished examining the crash site yesterday and the wreckage was put in storage in Te Anau to enable more detailed investigations... [The chief inspector... said two commission investigators would today interview people who were in the area at the time of the crash, including some who heard it.

...powerlines are hindering helicopter rescues at Bethells Beach. The surf club is one of the main groups trying to get the lines placed underground. [The club’s p]resident... says helicopter pilots are loath to land on the beach as sand is sucked up through the air intakes, leading to an expensive cleanup bill. The better alternative, a harder, grassed area at Te Henga Park, is dangerous because of the overhead power lines which are hard to see. [The president] says putting the lines underground will be expensive for the Waitakere City Council. But... the move is essential as a safeguard for the thousands of visitors who make their way to Bethells each summer. At least two years ago a [visitor] died of heart failure at the beach a[fter] the helicopter couldn’t get close to her. “I don’t know if [the patient] would have been saved but it caused some consternation at the time. It [the helicopter] was delayed in getting access to the area.” [A]long-time Bethells resident, [who]... remembers the incident and that there was no safe designated place for the helicopter to land... agrees that safety is a priority and to a lesser degree so is the natural beauty of the environment. “Visually the area will look good without them but I understand it will be a large expense.” ...[the] Waitakere Community Board chair[person]... says no money is available for the scheme in this year’s annual budget. “Hopefully next year we can support some of these projects.”

...*People power behind drive to bury remaining lines* In 1984 the old Auckland Electric Power Board launched a 40-year programme to put the company’s power lines underground. By 1998, when the project was abruptly cancelled, more than 60[%] of its wirescape had been buried. Last week the AEPB’s successor, line company Vector, pledged to revise the stalled undergrounding enterprise. The time needed to bury the remaining 30-plus per cent? Another 40 years. Such is progress. Still, we should be grateful for small mercies. If it hadn’t been for pressure from the elected trustees, this city-friendly programme would have remained stalled. My sources indicate there was a good old brawl between, on the one hand, the trustees who have a mandate from you and me, the owners, to put them underground, and on the other, the directors and management of the company, who are not so keen. Indeed, the latter were more than happy to leave things as they were, or if they had to, to spend no more than \$5 million on it annually. The trustees insisted on \$10 m... and, after some table-thumping, got their way. For someone who remembers, just over a year ago, Vector[’s] chief executive... apparently lauding a \$400 m... plan to bury the remaining lines within 10 years, the present management and director-level reluctance is rather confusing. Back in 1984 the old power board decided, for environmental reasons, to gradually bury existing overhead power lines. Since the 1960s, all new subdivision lines have had to go underground. By 1988, around \$8 m... a year was being spent by Vector on the underground project. This level of spending went on until the 1998 power crisis brought it to a stop. It bounced back on the public agenda... when [Vector’s chief executive] enthusiastically outlined the 10-year project. “We are keen to move forward with undergrounding,” [the chief] declared in a... press release which can still be found on the Vector website. “We’d like to see the unsightly power lines and poles go just as much as our customers would.” [The chief] added... the “outstanding question was how undergrounding could be funded.” [The chief] offered three options: a rise in prices, a decrease in dividends paid or a new source of funding. It was the last option that gives the clue to why the company was suddenly keen on reviving the issue. By launching a hugely expensive, 10-year plan, it gave the then trust chair[person] (r:executive director, p2253, ln49 + chief executive, p265, ln64)... a new chance to ride his old privatisation hobby-horse. By waving the enticing prospect of a wire-free landscape in front of our eyes, [the chairperson] then declared the only palatable way to pay for this was to sell a 20-25[%] stake in Vector... banking on consumers preferring a part-sale to a cut in dividends, in achieving the wire-free dream. The [trustee]election... was to prove how wrong [the chairperson] was. The non-privatising, pro-underground candidates from both ends of the political spectrum achieved a clean sweep. Privatisers such as [the chairperson] were dumped. Now it appears the 10-year plan [the chairperson] was pushing was hokum. Even [the chief] admits to me it is not really a practicable solution – though at a pinch it might have just been possible. “If you threw every resource in the world at it and were prepared to pay too much for contracting and turned Auckland upside down, 10 years is probably the very minimum,” [the chief] now says. However, “I’m not sure there are even the resources to do it that quickly.” ...Ten years or 40, the good news is that parts of the remaining wirescapes of Auckland City, Manukau City and parts of Papakura are on the way out. I say parts of, because Telecom shows no inclination to join the party. The ideal would be for Telecom and Vector and the other utilities to join with city authorities to develop a cooperative undergrounding programme which included extra ducts for future expansion. I suspect, though, that that’s a dream for the science fiction writers...

[The P]M... has attacked as “totally unacceptable” a failure that sent a huge power cable crashing on to houses. Up to 20 people were trapped in their homes when the 250m length of cable snapped and fell 7m from the pylons supporting it onto the road and at least 16 front lawns... It damaged cars and homes, and burnt through fences. Some residents fled when they got the chance and ran across the street, but others had to stay indoors as the live wire sent out sparks... Whetstone Rd residents said an explosive “boom” rang through the street, when the cable – a 220kV conductor line running from Otahuhu to Whakamaru – fell shortly after 10.30am. Contact with a live wire could have been deadly, but Transpower’s general manager of system operations... said the line was live when it hit the ground only for “fractions of a second”... Transpower was still investigating what caused the failure last night... this was the first time a major cable had fallen in an urban area. “We’ve had about three of these [accidents] throughout the past 12 years – they’re rare but they do happen.” ...Transpower, which... would pay for any damage... has been under fire since a power cut last week which left up to 74,000 Auckland homes and businesses without electricity... [The PM said:] “There is going to be a massive expenditure on the upgrade of Transpower’s grid to make sure that that network is not only reliable but safer.”

...Transpower yesterday welcomed The Resource Management Act Board of Inquiry’s draft decision for it to begin its North Island Grid Upgrade Project. The... vital to N[Z]’s economy... project, which has an estimated cost of \$824 million, would see new transmission lines put between Whakamaru, near Tokoroa, and Otahuhu in South Auckland. Transpower said it wanted to start building access roads as early as next year... The new lines will be capable of carrying 400kV... The proposal has met ongoing resistance from environmentalists, farmers and lifestyle block owners whose lands are among the 314 properties affected by the new towers – some up to 70m in height... A Transpower spokes[person] said the organisation had agreements either through easements or ownership with 56[%] of the affected properties... the national grid operator had spent around \$150 million buying 74 properties affected on the line route and eight for substation sites or on the underground cable route.

...The right of power companies to enter private property to maintain lines without the owner’s consent is being tested in court in a \$200,000 compensation claim against UnitedNetworks. [A]Whitianga farmer... claimed in the Hamilton District Court yesterday that UnitedNetworks trespassed on his property when it installed a 1650m cable after the existing 10-year-old cable malfunctioned... [T]he installation of the 11,000-volt cable in 1997 caused widespread floods... [–] heavy machinery cleared a swathe of bush around the trench where the cable was laid that allowed torrents of water to flood five hectares of valuable grazing land after heavy rain... It had reduced the property’s value by making future subdivision and development difficult... [The farmer] also asked the court to grant an easement compensating him for the loss of the land taken up by the four-metre-wide strip where the cable was laid. His lawyer... said the new line belonged to [the farmer]... because the company installed it illegally. The original cable was put in by the Thames Valley Electric Power Board in 1987 under statutory rights granted under old Ministry of Works regulations. [The lawyer] said that in 1992 the old power boards were replaced by profit-driven energy firms responsible to shareholders, and the new utilities were allowed right of access only to “inspect, maintain, or operate existing works”. “That legislation did not grant the powers and authority of the old power boards to new utilities, powers to enter by force and put lines anywhere they want.” ...because the company had installed an entirely new higher-capacity cable alongside the existing cable, it could not claim to have been simply maintaining or repairing. “The work constitutes a trespass, and the defendant is liable.” [The farmer], a Qantas pilot... retired to the 154ha Moewai Farm in 1985. The property ran sheep and cattle and also produced manuka and kanuka honey and oils. [The farmer] said the dispute dated back to the installation under duress of the original powerlines and a cable by the Thames Valley power board. [The farmer] agreed then to pay \$24,000 towards the difference in cost of installing an underground cable rather than powerlines because [it] was concerned about the danger to aircraft and damage to the environment posed by lines... [The farmer] never wanted the original cable installed and agreed to the installation in 1987 only because [it] was threatened with court action... [It] was angry that UnitedNetworks had forced him to again confront the issue, at the cost of considerable stress to himself and his wife. “The company has given me a great deal of aggro. We never asked these people to come on to our land, we didn’t solicit this.”

...Piha residents are reeling after 30 power cuts in the last week, but lines company UnitedNetworks can’t guarantee it won’t happen again over the remaining winter months. Residents say they are fed up and want compensation for the inconvenience... [The] residents have made repeated complaints to UnitedNetworks in the past. [One resident] claims the problem has been getting worse over the last two years... [T]he power failures affect computers and other electrical appliances, sometimes resulting in costly repair bills. “This is the first blast of winter and we’ve already had in excess of 30 outages. What does the future hold for us?” UnitedNetworks['] corporate communications manager... blames strong winds for the latest power cuts. “In high winds you get lines clashing with each other which can short out... My understanding of the Piha situation in the last few days is that... gusty winds... had lines clashing and that intermittently trips out the system. It’s a protection mechanism we have in place so it cuts out and cuts back in. We have also taken lines out of service to retension them so that they are not loose and won’t hit each other and short circuit in those very high winds.” ...one solution is to underground power lines in the area. But [the manager] believes the move is unlikely as high costs would increase power prices for residents. [The manager] says there can be no guarantee of continuous power supply, even if the company put all cables in the country underground. [The manager] says residents should take up the compensation issue with their electricity retailers.

...*Steaming over cold showers* United Networks is in hot water – even if its customers weren’t. The power company is being criticised for leaving Titirangi customers out in the cold after last week’s high winds. [One resident] says her South Titirangi Rd home was without hot water for three mornings. “On Tuesday my husband didn’t go to work with a shower... On Wednesday [my husband] took his towels with him. I must have rung them about 10 times and they kept telling me it would be back on soon.” But on Thursday morning [the resident] spent 30 minutes boiling pots of water... so her family could share a bath... [The] hot water finally came back on during Thursday morning... “If they can make so much profit, they can get [workers] up the poles to fix things quicker... If it had been a school week it could have been more difficult.” United Networks’ spokes[person]... says hot water is cut whenever power needs to be redistributed. “The availability of hot water depends on the demand in the region... The storm obviously took out a lot of lines but we have been repairing them to get electricity to as many people in the region as possible.”

...A series of breakdowns and faults at power stations has left the nation on the brink of a power supply crisis. Transpower... has warned that generation capacity is so low that collectively the industry may not meet winter requirements... Vital North Island thermal stations at Auckland, Huntly and Taranaki (12[%] of the total national capacity) are out of action or crippled... Spilling of water from hydropower lakes by the Electricity Corporation this year may have exacerbated the difficulties. Coping with the problem will be a test of the wisdom and success of last month’s split of ECNZ into three competing generators... The... minister responsible for energy, dismissed the claims of power shortfalls as a “beat-up” by some power companies wanting to raise prices.

...The Commerce Commission is getting new powers to stamp out any price gouging by power companies – ...it will be... [able] to impose price controls on line companies at its own initiative. Under the new regime price controls will be triggered automatically if line companies do not meet price and profit performance measures. First Electric and TransAlta announced retail electricity price increases of up to 13[%] on Tuesday, blaming line charges imposed by Auckland and Christchurch monopoly line companies... [T]he increases are embarrassing for the Government as they come only days after... much trumpeting of cheaper power prices by the Minister for Enterprise and Commerce...

[Westie]s face increased phone and electricity prices when utility companies are put on city council rating valuation rolls. Waitakere City Council will decide whether to charge utility companies rates once the valuation is completed. Both industries estimate about \$100 million in costs will be passed on to consumers if they are charged rates, says UnitedNetwork’s legal and regulatory manager... UnitedNetworks is the lines company that services Waitakere City. [The manager] says Waitakere residents will bear some of the costs if any of Auckland’s council’s charge rates. “As a company we will be incurring higher costs which we will need to pass on to consumers,”... Telecom says it’s aware... [the] council is looking at

charging it rates... but won't confirm whether... [i]t... will also pass on costs to consumers... The Valuer General has made it mandatory under the Rating Valuations Act of 1988 to place utility companies on the valuation roll. [A]Waitakere City Council spokes[person]... says all of the region's councils (excluding Auckland City... [- which] is already rating utility companies...) have joined Waikato and hired Valnet Ltd to do the work.

...N[Z]'s biggest building products maker, [Challenge Building,]will shut down its steel mill for half of next week in an attempt to avoid the worst of the nation's high electricity prices. Workers will begin at 10pm on Thursday night and end Monday morning, taking advantage of the lower weekend power prices. The Pacific Steel mill in Auckland can produce 200,000 tonnes of steel a year for the local market and export. "That will take us to 3000 tonnes a week from about 5000 tonnes," said Pacific Steel's general manager... "We can still supply the domestic market but it means we're walking away from the export market." Power prices have been rising this year because three months of below-average rainfall... left hydro-electricity reservoirs holding 17[%] less water than usual at the start of autumn. Average daily electricity prices have surged almost sevenfold in the past year to \$215 a megawatt hour yesterday, according to an index measured by Marketplace Co, the manager of N[Z]'s electricity market. Electricity in Auckland cost \$154 a megawatt at 1.30pm, four times the average [of]... a year earlier. [The general manager said that like the other large manufacturing plants which are also undertaking temporary shut-downs, his] company had hedge contracts for about 25[%] of its power needs but hadn't been able to buy more at [spot]prices it could afford. Even if power prices fall in the short-term, the lack of affordable contracts means the mill is likely to work only weekend shifts until June 30. "If it ends before June 30, that would be a bonus." ... [Before March 31 this year]... a handful of utilities held a monopoly on... California's... \$US20 billion... [power] industry. The system made sense, given the high cost of producing and transmitting electricity and the need for reliable electricity in this energy-dependent age. But California's deregulation legislation, passed in 1997, opened the market. "You used to have to give all your money to the monopoly utility. Now you can choose an independent supplier," said... the Sacramento-based Centre for Energy Efficiency and Renewable Technologies. Whether consumers will use their buying power to demand lower prices or whether they will be willing to pay more for non-polluting choices are unanswered questions.

...The sun is shining on the award-winning Massey Leisure Centre and Library – and it is being put to good use. Thanks to \$166,000 from the United Networks Shareholders Society, a photovoltaic (...PV) system has been erected on the roof of the building to convert sunlight into electricity to help power the library. A daily average of 30 kilowatt hours is being generated by the system, which provides enough electricity for... two houses.

...They won't say how they did it but their breakthrough opens the way to building much bigger, more powerful[solar] panels... able to power a whole house, more cheaply... [Their] transparent coloured dyes promise to be up to three times more efficient[than normal solar cells]. They're similar to chlorophyll, the green-coloured compound that helps plants make food from sunlight. But the dyes were very difficult to make until the Massey scientists succeeded in enlarging their chemical structure... They say it could be five years before their dyes are incorporated into a solar cell but their discovery offers a ray of hope for future power.

...Scientists have developed a new kind of cell which could make solar energy cheaper than oil within 10 years. The system uses organic materials such as carbon, oxygen and hydrogen that can be extracted from the air... The new system simply does what nature has done for millions of years through photo-synthesis... Organic solar cells could be much bigger than silicon crystals, could be made at room temperature... could also be made in the form of a thin transparent film which could fit over the windows of a building and provide enough energy to run the activities inside[(c)ars could be coated with the material and... be charged up simply by being parked in the sun[– i]f parked indoors, a car's battery could be charged up from solar energy collected on the building[)]... and would eventually cost less than a tenth of the present inorganic cells... [A p]rofessor... of South Korea's Pusan National University, said... that the new system was not yet as efficient as present silicon-based systems [at] converting sunlight into energy. "But to reach the current efficiency of inorganic solar cells took 50 years. Organic solar cells have only been known for five years... All energy on earth comes from the sun... So the best way to solve our energy problem may be to use solar energy efficiently and safely. Solar energy is quite safe, very clean, and there is no limitation on it." ...His team... discovered that organic solar cells can also work in reverse...

Cheques from the power company, rather than the reverse? It can happen... [The homeowner] invites me to peer into the electricity meter box on the back verandah of his Mt Roskill house. It's like any other, so what am I looking for? Then it clicks. The disc indicating usage is spinning in reverse. Electricity is going out, not coming in. It's a [NZ first. The] Aucklander... and his wife... are generating power from the sun on the roof of their own home and selling it to Mercury Energy. And while it may amount to only 50c a day at this stage... it's a glimpse into the future of pollution-free, inexhaustible energy production at minimal cost. "We're an experiment at this stage... but just think of the financial impact if 100,000 households were doing the same and what that portends." The [house's] power comes from an array of 30 photovoltaic solar cells aligned due north, which are sufficient to meet most of their home needs except cooking. For that they use a [LPG]-fuelled, four-hob cooktop and oven. Near-boiling-point hot water is solar-powered with a gas booster for cold days, which has been turned off since last August. Technically their latest system is called "distributed power" and it allows solar-equipped houses or buildings to use the national power grid as a giant storage battery. During the day excess power is fed [i]nto the grid allowing power companies to reduce their production while still meeting commercial demands. Then, when the sun goes down, the solar-powered houses and buildings draw electricity from the grid. "It's a win-win situation... Owners get paid for power they don't need and power companies don't have to spend millions on new power plants to meet peak demands." ...the Japanese are embracing the concept and have set 2020 as the target by when solar-generated power will be their main source of energy. That will be a huge change and saving for... [the country. T]he cost of the latest technology and sufficient for average household needs is around... \$20,000 – about half of what [the Aucklander's] stand-alone energy system has cost to develop since... 1994. In March that year [it] asked a bemused Mercury Energy to disconnect his power and remove his meter. The company had nobody who dealt with such requests but finally an obliging repair[person] did the job and the national grid bypassed [a] little bit of suburbia. The system... installed at the time included a bank of 12 large storage batteries in his basement and an inverter to give 230 volts mains power. The battery bank has been expanded over the years... [but n]ow, with the [house] reconnected to the Mercury grid, the battery system is redundant. However, they are keeping eight batteries as an emergency standby. Similar systems provided some power in Kobe, Japan, after the disastrous 1995 earthquake, when conventional electricity supplies were destroyed. [The Aucklander] says to get the best results from such systems homes and appliances must be properly insulated. For example, his refrigerator's... interior walls are twice as thick. The deepfreeze is the same. Both are of Danish design and manufacture[,] built to demanding insulation requirements. His German-made dishwasher uses and heats just seven litres of water. Only the washing machine and microwave oven are either N[Z]-made or supplied. When... his house... [was built, it] exceeded minimum insulation requirements and included in it all interior walls so there is no loss of heat or cold spots such as the hall. The lights... are low-watt fluorescent bulbs, which put out the same light for less power. The television, stereo and computer are turned off at the wall because even when off on the unit they still use a trickle of power... "As a result, only twice have we had to call in an outside boost to our system over the past five years. The last time was in October a couple of years ago when we had 14 days' rain on end (the... wettest October since 1962) and the PV panels couldn't charge up our batteries sufficiently. So we ran a power cable in from the neighbours to recharge, just as someone in the country with a similar self-sufficient system... would start up a small generator in similar circumstances. It cost us... \$2 for the recharge. If it had been a generator, say \$5 worth of petrol. But now, with our metering agreement with Mercury... and Power N[Z], we'll never have to worry..."

...I'D ALWAYS thought the A[US]n Outback would give me agoraphobia but I had a gentle introduction that whet my appetite. The Wilpena Pound, a... 60 sq km... natural amphitheatre... in the Flinders Range, is on the brink of that unimaginably endless landscape. Its spectacular

scenery makes it a stopover point for travellers headed to Alice Springs, the Northern Territory or across the Nullarbor Plain. The Pound is something of an enigma because it lies behind steep, rocky walls that rise to 400m. They're streaked with seams of orange, purple, red. In the soft, slanting light of early morning or evening the colours are unreal. The amphitheatre is magical – flat, peaceful, studded with black-barked native pines and groves of silver gums. Kangaroos are easy prey for cameras. Galahs, cockatoos and myriad other birds make the only sounds[– especially now that the]... Wilpena Tourist Centre is powered by the largest off-grid solar electricity system in A[US]. It opened in June and is described as a hybrid power station because it combines [PV] solar cells and storage batteries with back-up diesel generators. The use of solar energy saves between \$50,000 and \$60,000 a year in diesel and means that greenhouse gas emissions will be reduced by up to 300 tonnes a year.

...AN INEXPENSIVE solar-powered desalination process developed in Japan by the Mitsubishi Corporation and Nihon Polytechnic uses transparent plastic sheets. A hydroxyl compound with a strong affinity for water is incorporated into the surfaces. At slopes greater than five degrees, the water runs down the plastic sheet and is collected. Mitsubishi calculates that the conversion costs of a tonne of sea water into fresh water will be around \$2. There are almost no running costs except for the current used to operate the pumps that bring seawater into the facility. The development consortium plans to market desalination units about the size and configuration of a household solar water heater, as well as a small unit to replace the heavy, unwieldy models now used on some boats.

...Solar water heating has come a long way in the last few years, and with 40[%] of a typical monthly domestic electricity account going towards water heating costs, many homeowners are considering solar water heating. Water comes into homes from underground pipes at around 10-15 degrees Celsius. This water has to be heated above 55 degrees Celsius to avoid Legionella bacterial growth. An average family uses around 160-200 litres of hot water each day, requiring 10-12 kW of energy to heat. Due to heat losses from the hot water storage cylinder, dripping taps and unlagged pipes, the energy required can be considerably more than this... The annual amount of sunshine falling on an average [NZ] home is equivalent to 200,000 kW. This is fifty times the hot water heating needs of a family home. Capturing energy to heat water is technically a simple process... The aim is to supply 50-70[%] of the annual water heating energy needs, as this gives a good compromise between capital cost and delivered energy. A collector panel three-four sq.metres providing 1800-2800 kW/year is recommended for an average home... At present electricity prices, the cost will be written off in around 12 years. With uncertain electricity prices and a life-span of at least 20 years for... a... solar hot water system... owner[s'll be] pleased with... th[eir]... investment... Information courtesy of the Energy Efficiency and Conservation Authority.

...Israel's innovative Weizmann Institute leads the way in solar energy. [It]s giant reflector can generate 350,000 kW of energy (top[that!]); while in... Britain[, a]... futuristic eco-estate... where green technology extends to the toilet, is to be built in[the] West Midlands. The £1.5 million... scheme consists of 12 houses with inbuilt systems that take warmth from the soil and use solar power for heating and electricity. Sewage will be converted into compost and wastewater recycled to flush toilets... [By the way,] Britain's first cow dung-fuelled power station has been given the go-ahead. The £7 million... plant, to be built in North Devon, will burn methane gas from farm slurry to produce electricity... for the national grid and power local community buildings. The scheme... has won £3.5 million backing from the European Union.

...Britain's first dung-fired power station... will run on about 1.6 million tonnes of farm slurry a year... [The] slurry will ferment... in... [t]wo digesters... produc[ing] methane to power engines to produce electricity... said a spokes[person]... for the... £7.7 m... plant in Holsworthy, Devon.

...An A\$3 million demonstration plant that converts waste material into clean energy was opened in the Latrobe Valley, Victoria last month. The Waterwide energy system, designed and built by the Renewable Energy Corporation, gasifies industrial waste material including forestry residues, pulp waste, sludges, crop residues – even chicken litter – and converts them into energy, with what is claimed to be 99.9% combustion efficiency. [The corporation's executive chairperson]... and the energy gasification systems' inventor... says the demonstration facility is a significant step forward in environmentally friendly energy production. The new technology gasification system eliminates pollutants common to other methods... "Major pollutants that companies such as pulp mills struggle to get rid of can be effectively and efficiently eradicated using the Waterwide technology and as an added bonus the company can save on its electricity bill. The unit is also fitted with state-of-the-art emissions monitoring to guarantee we meet new emission levels compliance," [the inventor] says. Originally headquartered in N[Z], the corporation... now has offices throughout A[ustralasia] and... has recently opened an office in North Carolina, forming an alliance with a major US energy company.

...Former energy-trading giant Enron not only lavished campaign donations on [the Republican who is now] President... but was one of America's biggest political contributors, spreading money across both parties on Capitol Hill. Almost half the present... House of Representatives and almost three-quarters of the present Senate have been beneficiaries of Enron largesse in recent years, say Washington watchdog groups. Since 1989 Enron has made a whopping \$[US]5.8 m... in campaign donations, 73[%] to Republicans and 27[%] to Democrats, says the Centre for Responsive Politics, an organisation that tracks political giving. Nearly half of these funds were donated during [the last campaign], when Enron was one of the top 50 organisational donors in the US. The money kept coming in until just before Enron filed for bankruptcy on December 2. Since then, as the controversy around Enron has grown, some donations have been returned. Texans were by far the biggest Enron recipients, and Republicans got more than Democrats. [The President], being both a Texan and a Republican, and a friend of Enron[']s chairperson... did very well... In all the company made \$US623,000 in contributions to his campaigns since 1993, according to the Centre for Public Integrity, another watchdog group. But the giving did not stop after election day. Enron officials contributed \$US10,500 to his Florida recount committee, and when the recount was ended, donated \$US300,000 for the inaugural celebrations, said ...a... researcher for the Centre for Responsive Politics... What Enron got in exchange for the money was access. [The researcher said the chairperson met the] Vice-President... during... California[']s energy crisis, at the time the Administration was formulating its energy policy. "One thing is clear. They have written a lot of cheques to a lot of people in this town and I guess that gets their phone calls answered when they call cabinet secretaries." It was disclosed last week that [the chairperson] telephoned two cabinet officials last fall as the company's financial situation worsened. The... Democrats were dragged into the Enron scandal when it emerged that... the... former President[']s... Treasury Secretary, had contacted a top official at his old department to find out if the [Republican] Administration could step in to help the energy group. [The former secretary] made his call in November to... the head of the Treasury's domestic finance section, in his capacity as chair[person] of Citigroup, one of the main creditors of Enron. [The former secretary] was one of the most admired members of the [former President's] team, and his involvement will dent Democratic efforts to turn the affair into a new Whitewater... The fall of what was once the seventh largest US corporation is causing great embarrassment for the White House because of the close ties between [Enron's chairperson] and the President. In return for the more than \$US600,000 it donated since 1993 the company is seen to have had a major influence on the [then Texas governor's] energy strategy, successfully pressing for greater deregulation. The \$US5.8 m... of political donations made by Enron since 1989 was seen to have paid off when Congress exempted Enron's key energy trading activities from a bill overhauling federal oversight of commodity markets. In his call to the Treasury, [the former secretary asked the head of the domestic finance section] about the possibility of pressing the bond-rating agencies not to lower their published view of Enron bonds, as such a ratings change would have provoked a crisis of confidence in the group. The Treasury Department said that [the head] had opposed the idea. Subsequent to the call the agencies slashed their assessment of Enron's creditworthiness, triggering its demise. The latest disclosure followed three days of turmoil. First, details emerged of numerous calls by [Enron's chairperson to senior Administration] officials last Autumn, telling them of Enron's growing problems. Hours later[, the person who is both the] Attorney-General and the head of the Justice Department, which is now conducting a criminal probe of Enron, formally took himself out of the case, admitting [it] had taken \$US60,000 of Enron donations in his failed... campaign to retain his Senate seat. The... accounting firm, which audits Enron... had destroyed many documents relating to the audit. The firm has been criticised for failing to detect the private partnerships into which

Enron executives had shunted [\$]millions of... debt in order to keep it off the energy company's main balance sheet... Enron's collapse... wiped out the pensions of thousands... Enron's collapse has [also kept a] power plant... the company... built... at Dabhol, 250km south of Bombay, idle...

THE DAY [the Republican President] took office... was as cold and comfortless as his victory; his motorcade braved driving rain and a gauntlet of demonstrations marking the most contested election result in US history. After[wards, the President said it]... did "not want to hear about politics". But now the moratorium on politics has been lifted and the White House is laid bare by what rivals call "Enronomics" – the political fable of the Enron corporation. The case has all the ingredients of a classic Washington scandal that dwarfs the Whitewater property deal with which Republicans were so eager to hang [the former Democratic President and his wife]: secret stock sales, shredded documents, high-level political contacts – and tens of thousands of innocent victims robbed of their savings and retirement funds while the company's top brass lined their pockets. Enron was the kind of scandal that [nothing on Earth] would hide. The company plunged from a stock rating worth \$US80 billion... into the biggest bankruptcy filing in US history... The ethical – maybe criminal – core of the scandal is that Enron trapped its employees into a "stock lock" – they were not allowed to sell share options bought by way of savings. When the company collapsed, they lost everything. Meanwhile, Enron's executives made a killing by selling shares before the price collapsed... Six Congressional committees are preparing to investigate the firm. But they will have to wait for the two criminal investigations launched last week: one into Enron's bankruptcy, the other into the admission by the company's auditor... that it destroyed thousands of documents about the bankruptcy. [The auditors] had good reason to destroy the papers. The reasons for Enron's destruction are associated with the labyrinth of subsidiaries built up by [Enron's] chief finance officer[, who was] fired on October 24, and other executives. [The chief finance officer] created partnerships with... independently run companies owned by him and others with Enron backing. As a result, hundreds of millions of dollars were slushing overseas to tax havens as [the chief finance officer] and other executives – so they said – sought to shore up the company against a possible fall in energy prices. What they were [real]ly doing was amassing personal fortunes. The ensuing gaps in the balance sheet became a gaping abyss down which the company finally fell. Enron has admitted that it had overstated profits by \$US400 million. However, Chewco alone enabled Enron to keep some \$US600 million of debt off its books. The crucial criminal issue is whether Enron executives misled investors by inflating revenues and minimising debts. The political issue is now closely entwined [with] the Washington elite – and the immediate circle around... [the President. Before] all its troubles, Enron [had] continued to benefit from [the Republican Administration's] policies, notably a refusal to step in during the Californian energy crisis... leaving consumers to pay the price... to Enron... [In local news, t]he extraction of geothermal energy for electricity is being blamed for subsidence likely to damage more than 150 buildings in Taupo within the next 50 years. Contact Energy draws heat from the Wairakei-Taupohara geothermal field but will now face growing opposition to its plans to extend operations. A report prepared for the Taupo District Council said at least 126 buildings and 24 homes would suffer minor damage in future because the soil was losing its strength as water and heat was removed from the ground... The situation is not as severe as subsidence in Waihi where hundreds of homes remain at risk of collapsing due to former mines in the area. But Contact Energy wants to increase its level of extraction from the Wairakei field by 82[%] over the next 11 years, while another firm, Geotherm Group, wants permission to build a new power station there. Both are seeking resource consent from Environment Waikato and will face stiff opposition from the Taupo District Council and residents... [T]he council was seeking legal opinion on the issue of compensation. "It's not of our making and it's not fair to expect Taupo people to carry the can." It was thought the repairs could cost \$1 million. Insurance was unlikely to cover any damage as subsidence in such circumstances was predictable... Contact's Wairakei power plant re-injects 40-50[%] of the water it draws up back into the ground at present. The report says subsidence can be minimised if more fluid is re-injected. [However,] Contact's Wairakei generation manager... said the company did not plan to change anything in the short term and would push ahead with its resource consent application... [The manager said t]he report was based on assumptions about underground pressure trends and the geotechnical properties of the area and until those assumptions were proved, it would be unwise to regard the findings as conclusive.

...A hot idea has won a Rotorua teenager acclaim at the world expo in Hanover, Germany. [Hi]s innovative geyser research placed him among the best of 143 young environmental scientists from 73 countries to pitch their projects to 12 internationally respected scientists at the expo. The 18-year-old and six teens from Finland, the U[S] and Canada have won grand awards worth ...\$[NZ]4191... at the first world championships for young environmental scientists. [The 18-year-old] has also qualified for an internship with pharmaceuticals giant Bayer in Singapore. The announcement yesterday did not surprise those who know the Rotorua Boys' High School head prefect, who also excels at music and Maori language[, and has]... been studying thermal activity at Whakarewarewa Thermal Reserve, recording temperatures and water levels at various pools, since 1996...

Some of the North Island's most beautiful hidden lakes are seeping away. The alum lakes – a collection of bright blue, emerald, red, turquoise and pea-green pools in the Wairakei geothermal valley near Taupo – have dropped dramatically in the past six months and some have dried up completely. They sit on a parcel of land which is owned by the Crown but used by Contact Energy for steam extraction and are surrounded by a bore field which has been in use since 1958. The Department of Conservation and iwi are worried by the drop in water and are investigating... [A DoC spokesperson]... said the low water level was a problem and the department, which had applied to protect the lakes, would try to find the reason for it... Contact Energy's general manager for generation operations... said the water flow coming from the lake closest to the power station – which has dropped a metre in less than a month – was regularly monitored and had stopped in the past three months. [The manager] said Contact was looking at ways to work around the problem. [A scientist from] the Institute of Geothermal and Nuclear Sciences, said a drop of 15m was not easily explained but [it] did not believe Contact Energy's activity could be responsible... [The] Wairakei Forest Tourist Park administrator... said that while the alum lakes were officially part of the park, they were also part of a bore field and therefore not under his control. "There is definitely concern about the ongoing maintenance and preservation of the lakes. They're the jewel in the crown in the tourist sense." But most people do not even know the lakes exist. They are not accessible by road and you must pass through Contact Energy land to get to them. Only those who fly over the area can see what they may be losing... [A h]elicopter pilot... has flown over the small thermal lakes nearly every day for the past three years and is afraid that one of the most beautiful natural features in the region is vanishing before his eyes... [The pilot] used to fly tourists over the lakes as part of a scenic flight which also takes in Craters of the Moon and Huka Falls[, but n]ow avoids the area because its beauty has faded and no longer impresses his clients.

...A[n AUS]n tourist... and her family were soaking their feet in [a] hot pool at... Kuirau Park... when they heard what they thought was a helicopter taking off. "We had been standing taking photos on the rocks in front of [the new eruption] seconds before." ...A new steam vent, formed as hot water forced its way out of the earth, created a cloud of vapour... that killed nearby trees and... [shot h]ot mud and rocks the size of rugby balls... 60m into the Rotorua sky... spew[ing] mud over cars parked... in the Rotorua Hospital car park, some 100m away... The hot water was replaced by the steam that is continuing to rise from the ground in... the... geothermal area... Police were yesterday keeping spectators well away from Rotorua's latest thermal attraction... The freshly erected barricades in the park will be in place throughout this weekend.

...Underneath tens of thousands of people who live and work in Rotorua, hot water bubbles away at a pressure not seen for decades. Almost every week there is now proof that the once-declining geothermal system is heating up. Geysers at Whakarewarewa... are filling up and blowing higher and more often than they have for decades. Near Kuirau Park, steaming holes are opening up on private property, pools are getting bigger and hotter, the ground is getting warmer and gutters overflow with hot water. No one knows where the next geyser will open up, but many residents are complacent – as accustomed to steam and boiling mud as Wellington people are to earthquakes. The resurgence is a guarantee of income for the

local tourism industry, a source of pride for the local iwi... and good from a scientific and environmental perspective. The danger is, however, that a geyser will come up under someone's bedroom... A steaming pond in Tarewa Rd marks the spot where a hot pool burst through the garage of two pensioner flats last year, forcing two widows to flee. A newer house nearby sits precariously close to a... long-forgotten underground pool [that] burst through the ground metres away, spewing hot water and rocks. The effects of the resurgence in geothermal activity are eerie but there is no mystery about the cause. In 1986, the Government ordered all geothermal bores to be closed within 1.5km of... Whakarewarewa. Years of exploiting the 12 sq km Rotorua geothermal field had left once-magnificent geysers barely spluttering... The building controls manager of the Rotorua District Council... said the now-demolished pensioner flats had been built over a geothermal hole that was covered up decades ago... [N]ew houses in the vicinity were required to be built on piles, so they could be removed... "This place is a volcano, a bit like Taupo and other places. Everywhere around here there is something we don't know about and we can't control. They are acts of God."

...tourists who pass through Rotorua each week... endure... the "rotten eggs" stench... to see the city's... natural wonders such as geysers... and... thermal hot pools... But reports this week of the death of Mrs Umlauf-Rueprecht... have again sparked interest in whether living or visiting the Sulphur City is a health risk. Mrs Umlauf-Rueprecht is thought to have been overcome by sulphur fumes while... talking to a friend on the phone. News of her death shocked the Austrian and German audiences of the popular television series *Kaisermohlen Blues*, in which [Mrs Umlauf-Rueprecht] starred for seven years. The soap opera, said to be the Austrian equivalent of *Coronation Street*, was watched by 1.5 million people every night... Mrs Umlauf-Rueprecht... was in [N]Z producing a television documentary. A report from the Institute of Environmental Science and Research... found that [the actor] had toxic levels of hydrogen sulphide in her blood which constituted poisoning from the gas. Rotorua's coroner... will hold an inquest in [two months]. Mrs Umlauf-Rueprecht's son... plans to sue the Tourism Board and the Rotorua District Council for \$160 million over her death. Until the inquest Rotorua's Mayor... and Tourism Rotorua's chief executive... are reluctant to rush into damage control. "Her death is very unfortunate but... [our] population of almost 70,000 and just under 20,000 tourists a week are exposed constantly to the gas and we aren't dropping dead..." said... [the mayor. A recent] study by National Institute of Water and Atmospheric Research (Niwa) scientists found that nearly half of Rotorua's residents were regularly exposed to hydrogen sulphide in doses greater than the maximum levels recommended by the Ministry for the Environment. But neither the Niwa study nor one the ESR conducted last year showed that the hydrogen sulphide levels were high enough to kill... "Generally, levels in Rotorua are around one thousand times lower than the level thought to impact on human health..." The gas, which is heavier than air, becomes toxic only if it collects in areas that are not well ventilated... [B]ecause hydrogen sulphide dulled the senses it could kill people despite its pungent smell... Tourism operators and travel agents have not noticed any downturn in business following the fatality and [one] British tourist... did not think other tourists would be deterred by reports of Mrs Umlauf-Rueprecht's death. "I think the smell is most amusing. We've heard all the wise cracks about it and I think you would have to be most unlucky for it to harm you." ...No Rotorua residents the *Weekend Herald* spoke to yesterday were concerned about living among sulphur fumes... [A Maori who's] lived at Rotorua's thermal Whakarewarewa Village for... 80 years... has bathed all her life in thermal pools and has never known anyone to suffer ill health from the fumes.

...Rotorua's sulphur fumes are to blame for the death of an Austrian actress... but questions remain as to why the gas levels were so high. [Rotorua's] coroner... yesterday adjourned the inquest into the death of [the actress], aged 74, until September but said there was no doubt [the actress] had died from hydrogen sulphide poisoning. Ellen Umlauf-Rueprecht's body was discovered lying face down on the floor of her Sulphur City Motel room... by the motel's owner. [A] constable... told the Rotorua District Court that Mrs Umlauf-Rueprecht had probably fainted... [her] son had visited the Sulphur City Motel shortly after his mother's death and told the owner [his mother] was prone to fainting spells... [-] hit her head on a nearby chest of drawers and fallen into a deep state of unconsciousness with her mouth close to the ground. "It is my belief that from this position [it] inhaled the lethal gases that ultimately killed her." However, [the] constable... was unable to explain how a toxic level of the gas emitted from Rotorua's geothermal waters came to be present, and [the coroner] may call further witnesses in September to try to unravel the mystery.

...Rotorua's renowned Polynesian Spa is to be prosecuted by Occupational Safety and Health over the death of a Wanganui artist who collapsed in a thermal pool... Joanna Margaret Paul was taken off life-support two days after... [being] found by another swimmer floating face down in the hot mineral Priest's pool. A coroner's inquest has not yet been held but it is thought that [Joanna] may have collapsed from hydrogen sulphide fumes. The... rotten eggs... gas... has been blamed for 11 deaths in the city since 1946, including that of Austrian actress Ellen Umlauf-Rueprecht...

Three contractors, from the companies Aquatech and Stargate, died when they were overcome by fumes in a [hu]manhole while flushing out sewerage lines on the corner of Fanshawe and Halsey Sts in Auckland at noon yesterday. They were Kenneth Karu (30), Avondale, Eddie James Rihia (30), Albany, and Darren Skeens (19), Greenhithe... [One] contractor hanging from his safety harness... [had] phoned for help for his two unconscious workmates seconds before [it] too was killed... His efforts to save his friends cost him his life... [H]is cellphone call [was] to another contracting company, Groutseal... [Two of its workers], who were friends of the three... received the call... and... arrived minutes later [but] found the trio dead... [One would-be] rescuer... was taken to Auckland Hospital with shock and gas inhalation... [The] workers who perished... would have died in less than a minute, experts believe... Occupational Safety and Health is investigating the deaths... [An] OSH construction inspector... said it appeared the three... were... not carrying mandatory oxygen detectors and would not have been aware of the lethal cocktail of hydrogen sulphide, carbon monoxide and low levels of oxygen. A tripod usually left over the [hu]manhole to assist in case of a rescue was left in the truck... The owner of Aquatech contractors... lost his brother and cousin in the tragedy... [T]he deaths were the first since the company started nine years ago. "Everyone is devastated. We don't know what happened down there." ...The maintenance work had been contracted out by Metrowater...

Authorities will today try to unravel the reasons behind the country's worst industrial accident in 20 years... Aquatech... said yesterday that it was too early to speculate about how or why the [workers] had died. The firm would hold its own investigation... "There are very strict guidelines and procedures as to how we operate in such situations and that's why we're so baffled and confused... At this stage we don't know why... [they] went down the sewer because that wasn't part of their original brief." The type of work... - flushing fat off the walls of a sewer - could normally be done from street level. The last time three workers died together on a work site was in the mid-1970s when a building platform collapsed at Wellington Hospital... Yesterday's deaths were the first workplace accidents this month and brought this year's total to eight. In the 1997-98 reporting year, 46 workers died in workplace accidents - 16 of them construction workers.

...THE Auckland tragedy comes in a week of complaints OSH was not prosecuting enough employers. It was disclosed last week that in 1996 there were 42 workplace deaths but OSH laid only six prosecutions. [The] Engineering, Printing and Manufacturing Union health and safety specialist... said employers were "getting away with murder" because there had been so few prosecutions. But [the] Labour Minister... rejected the criticisms and said OSH issued thousands of prohibition and improvement notices every year which were often a more effective tool than prosecution. Several workers have been killed in underground accidents in recent years. Four years ago, Terry Harland was swept to his death after descending a [hu]manhole just a few hundred metres from that which... claimed [the latest] lives. Harland was carrying out video surveillance of a stormwater drain when a mini flash flood swept him down the drain. His body was found in Auckland Harbour the next day. Two years later, the Auckland City Council was fined \$8000 for its part in Harland's death because [the worker] was not wearing a safety harness. In 1996, [in] Stratford... John Philp died after... [being] overcome with high levels of methane gas while inspecting a stormwater [hu]manhole on a farm. A year ago, [in] Canterbury... Grant Burns... [was] overcome by fermented carbon dioxide gas after climbing into a steep tank used for mashing pig feed. Burns was not wearing breathing apparatus. [His] employer... was fined \$10,000... The maximum penalty [is] a \$100,000 fine and one year in jail.

...Seven people died and 12 were in a critical condition after being suffocated in an underground water tank on Arutua atoll in French Polynesia. The water tank, a common feature in French Polynesia's outer islands, was in the process of being cleaned by a team of five people who failed to reappear. More people went down to rescue them and faced similar problems. Officials said the accident probably resulted from a build-up of carbon dioxide gas, which led to suffocation.

...two [workers] died of suffocation from hydrogen sulphide gas which leaked at one of the units at Shuaiba refinery... 80km south of Kuwait City.

...Four people were killed and 49 injured in a blast at a refinery yesterday, believed to have been caused by a gas leak, in the second deadly incident in a week at a Kuwaiti refinery. The sources said the explosion at Al-Ahmadi, 40km south of Kuwait City, also caused material damage... "The situation is now under control..." a security source told the official news agency Kuna, which earlier gave a toll of several injured... [The] Oil Minister... had already ordered an official probe into what was called Kuwait's worst refinery disaster since the 1991 Gulf War after two technicians were killed and four others hurt in a major gas leak [at Shuaiba].

...The world's biggest off-shore oil rig, owned by Brazil's state oil giant Petrobras, is poised to become a major environmental threat after a powerful explosion yesterday. Three blasts rocked the 40-storey rig off the coast of Rio de Janeiro state, apparently killing 10 people. The explosion started a fire that killed at least one of the 175 workers on board. Nine workers were listed as missing, and Petrobras said that there was little chance they had survived. Another worker had severe burns... Tense families of the workers a[re waiting] to see if the official death toll would rise when search and rescue operations resume today... Public outrage mounted against accident-prone Petrobras as its biggest platform tilted into the sea. If the rig sinks it could dump crude and diesel into the open ocean, causing yet another environmental disaster... "Petrobras is much more worried about cutting costs than ensuring the safety of its workers and of the environment," said... a federal deputy who met officials after the explosion. It was not clear what caused the blasts at the platform, located in the Roncador oil field... where 80[%] of Brazil's oil is produced... The immense structure was listing three times more than the Leaning Tower of Pisa, according to engineers, and appeared on the verge of lurching into the sea. If it did, at least half of the 1200 cu m of diesel and 300 cu m of crude stored on the rig could spill. Five boats are standing by to collect the oil, but they can hold only half of the total amount stored there... Petrobras said it could lose \$US50 m... a month with the rig out of operation... The P-36 rig can produce up to 180,000 barrels of crude oil per day... [(in comparison, the '37,000 tonne, \$4.5b North Sea platform] Hibernia GBS is... designed to pump almost a million barrels of oil a day in the middle of a stormy ocean[; 'over 30 GBS platforms operate in the North Sea, where icebergs don't go – even so, Hibernia has been surrounded by a protective outer wall designed to break up bergs weighing up to 6 million tons by utilising their own internal weaknesses')]. After starting operations last year, it was only pumping out 80,000 bpd, or 5[%] of Brazil's total daily output.

...The world's largest off-shore oil rig stopped sinking three days after massive blasts rocked the structure, killing 10, but bad weather could hamper efforts to recover the bodies and salvage the platform. The steeply listing 40-storey platform was stable yesterday, after sinking more than 13ft since explosions ripped through a column on Friday... "We are not out of danger and the situation continues to be critical but we are more optimistic now that it is stable," said... Petrobras['] general manager. "It was a great feat to stop the sinking..." Petrobras has flown in U[S] and Dutch experts and 50 tonnes of European equipment to keep the deep-sea platform afloat and prevent an oil spill... A team of 40, including 11 Dutch platform-rescue specialists, was yesterday injecting nitrogen gas into tanks inside the damaged column to expel water and gradually right the platform. It was [currently] leaning at an angle of 25 degrees, two degrees less than at the worst point. Incoming bad weather is expected to make conditions difficult for the divers but not stop the work... If the rig were to sink, up to 1.5 million litres of crude and diesel in underwater pipelines and onboard tanks could go into the ocean. Petrobras said it did not expect the 21 well heads to break, which would have led to a much more serious environmental disaster. After two major oil spills and a series of explosions in which 81 workers have died in the past three years, the accident was a fresh blow to Petrobras, which has been trying to establish itself as one of the world's leading oil companies.

...A methane gas explosion ripped through a coal mine in eastern Ukraine yesterday, killing 80 miners. The accident, at the Barakova mine in Luhansk, is Ukraine's worst in at least two decades. [The Ukrainian]President... and P[M]... both cancelled pending trips abroad because of the accident... Rescuers had recovered all the dead and injured after combing the entire blast area. The explosion occurred 664m below ground – probably the result of a highly explosive mix of methane gas and coal dust igniting. Underground explosions have been common in Ukrainian mines in recent years. Funding cuts since the breakup of the Soviet Union have pushed safety concerns into the background and forced the industry into a struggle for survival. An explosion in the nearby Donetsk region killed 63 miners two years ago, while 48 miners have died in other mine disasters this year... [Incidentally, all] fires at Esso's gas plant at Longford in south-eastern Victoria are out, but Esso cannot say when gas production will resume. The company's chair[perso]n... said yesterday that Victorians would be without gas for at least a week and perhaps longer... [E]xperts, including 12 flown in from overseas, were now able to begin assessing the damage and the cause of last Friday's explosions and fires in which two [workers died. The chairperson] said it was a coincidence the plant had caught fire so soon after production was halted by an ice plug in June this year and totally rejected suggestions that maintenance standards had been lax... About 60 firefighters were at the scene of the fire in plant 1 of the gas facility last night. Earlier, fire crews had crushed gas pipes to cut the flow of gas to the fire and gas detection equipment had been brought in to sniff out leaks. Esso said it had about 200 people working to restore gas production to plants 2 and 3 and to isolate them from damaged equipment in the devastated plant 1... The huge blaze started after at least five explosions ripped through plant 1... All oil and gas production from the Bass Strait fields off the coast were halted because of the explosions, as the Longford plant handles all production from the strait between mainland A[US] and Tasmania. The state's gas system operator, VENCORP, shut down the whole gas system on Saturday except to hospitals, because gas levels were critically low... Gas supplies for hospitals were coming from stored liquefied natural gas and a small supply from a new pipeline from N[SW], which was opened on Friday. The state asked hospitals to defer elective surgery from today until normal gas supplies resumed. As back-up for hospitals, the A[US]n Defence Force flew in equipment for sterilisation, cooking and hot water. The crisis hit on Melbourne's biggest weekend of the year, with tens of thousands of people in the city for the grand final of the A[FL] season. At the Grand Hotel, which was fully booked and hosted two football club breakfasts on Saturday, the kitchen coped by using only electrical appliances, but there was no hot water.

...It will be at least two weeks before Melbourne is back on gas, in a city where nine out of 10 homes rely on it... [But] there is nothing like a crisis to bring people together. Those with electric heating and cooking opened their kitchens and bathrooms to friends and family. Offers of support [have] flooded the city – including bakers offering to heat meals free, and timed hot showers at sports venues. In Carrum, an outlying suburb, [a wife had to feed] her husband, three daughters and visitors using a barbecue and an electric frypan. When the trickle of hot water in the cylinder runs out, the family will shower using buckets with holes or a watering can filled with warm water. In a city that prides itself on its restaurants, it was still possible to eat out. As long as you felt like a focaccia and salad... But for every cafe that was open, there were outlets with signs plastered on their doors – "no gas, no bread, no kebabs." ...restaurants and hotels that continued to use gas in defiance of [an] emergency order were risking fines of \$600 for the first violation and \$120 a day thereafter... [While restaurants and cafes are struggling, electrical appliance] businesses are booming. Phones ran hot at supermarkets with inquiries for electrical goods such as solar showers and breadmakers that had sold out... At Camberwell's large second-hand market, the humble electric frying pan became a collector's item... but [many] small businesses are... losing a lot of money... Giant companies such as... Ford, Holden and Toyota each stands to lose about \$A10 million... a day...

Holden's Adelaide plant will shut down tonight because of the Victorian gas crisis, leaving a question-mark over the immediate future of 4500 workers. A Holden spokes[perso]n... said the employees had been told to return to work next Tuesday. However, there was no certainty the plant could resume operation... [O]ne possibility was for component manufacturers to convert to [LPG] until normal services were restored. A Mitsubishi

spokes[person]... expected his company's Adelaide manufacturing plant would be able to operate until tomorrow. The ANZ chief economist... said the crisis... could seriously affect the national economy. "If the disruption of the gas supply persists for more than one week, then the impact on the... quarter's [GDP] could be of the order of 0.1 of a percentage point..." ...June's restriction caused an estimated \$90 million worth of damage to the state's economy, but that was small compared to this crisis... Meanwhile, not even the dead have been spared by the crisis as crematoriums have ground to a halt. "Without the gas supplies, nobody physically here in Melbourne is able to cremate,"... Some families are travelling up to 130km out of town to take care of the departed at small crematoriums which run on LPG. About 60km from Melbourne, the Geelong Cemeteries Trust is running at about five times its normal rate, handling 30 bodies a day.

...Gas company Esso still has no definite time for restoring supplies to Victoria... [However, a company spokesperson] rejected speculation said to be circulating in Sale, the town near the Longford plant... that gas resumption would take at least a month... Meanwhile, the construction of an 800m bypass pipeline necessary to carry byproducts when gas production resumes was progressing quickly, said [the spokesperson].

...their Premier] yesterday told Victorians to stop whingeing about cold showers as... fallout from the state's gas crisis widened, with more workers being laid off. Industry groups and trade unions fear 100,000 may lose their jobs throughout Victoria... The cost of the crisis to manufacturers is tipped by the A[merican] Industry Group to exceed \$NZ119 million a day... Meanwhile, the energy company Esso is facing what could become the nation's largest class action suit, a claim by the same Melbourne law firm that tried to take Mercury... to court over Auckland's electricity crisis.

...They scoffed at Auckland's power crisis... Now nobody is laughing in Melbourne as the city [continues to endure] its own nightmare... N[Z] authorities say such a crisis could not happen here because gas supplies do not rely on one source... "...if the worst-case scenario occurred and the Maui production station shut down, we would be able to get by on the 50 petajoules of gas per annum from... on-shore fields... This would allow operators to meet the requirements of essential services, and even maintain domestic supplies," said... the National Gas Corporation... [However,] Auckland faces a "serious and real threat" to public safety from dangerously laid Enerco gas pipes... confidential documents obtained by the N[Z] Herald... have revealed. Stainless steel pipe laid by untrained contractors risked "serious degradation," one memo warned... The same notice also disclosed that Enerco did not know precisely where contractors had installed gas pipes. Enerco later discovered hundreds of substandard connections... [which it] was forced to spend hundreds of thousands of dollars rectifying... The memo, issued when the company was having trouble finding 5.8km of pipe from its supply stores, pleaded with contract managers to help locate all addresses where stainless steel was used. The memo said: "This is not a 'witch-hunt' directed at contract managers and there will be no recourse. This is a major problem... and we all need to work together to resolve... [it] in the shortest possible time." The company denies downplaying the scare to the public...

Dangerous flaws in gas connections to Auckland homes, schools and shopping malls were dealt with quietly by Enerco in 1997, despite public safety fears... [C]ontractors cut corners in the race to connect thousands of customers under a \$21 million "mains to frame" strategy[- when] Enerco hired teams of contractors to connect households for \$99... Stainless steel pipe was used above ground, contrary to best practice, or laid near driveways where it could be run over. Pipes tacked on to fences or cast in concrete risked decay. Connections which were meant to be laid 600mm underground were buried under shallow soil cover, posing an explosive hazard to contractors working on water, power or telephone connections. Homes were connected so rapidly that Enerco lost track of pipe leaving its stores.

...Natural gas supply to about 50,000 customers was disrupted... yesterday after a bulldozer ruptured the high-pressure pipeline to the southern half of the North Island. Police said the accident, involving contractors, happened at 3.10 pm yesterday near Himatangi, north of Foxton. The [police spokesperson] said residents described the rupture as sounding like an aircraft taking off as a large volume of gas escaped. The bulldozer operator and a [resident] required treatment for gas inhalation. A 10km stretch of State Highway 1 between Himatangi and Foxton was closed and several properties were evacuated. Natural Gas Corporation... said the rupture affected people [on all sides of the Tararua Ranges, including] the greater Wellington region[, and as far north as]... Hawkes Bay... Repairs to the pipe could take up to two days... [NGC] asked large customers to stop drawing on the gas south of the breach and domestic users to limit gas consumption as much as possible. Contact Energy yesterday warned of serious consequences if lower North Island customers ignored pleas to stop using gas. "This is potentially a very serious situation," [the company's] corporate affairs general manager... said... "We are requiring all but our smallest commercial customers to cease using gas immediately."

...48 wind turbines [are] being put up at a site in the Tararua Ranges near Palmerston North... [by] CentralPower... While the 40m-high windmills are designed for power generation, they also have pulling power with tourists and a steady stream of visitors are expected to check out the first 10 during open days this weekend. They would be well advised to button up, however, as the average wind speed at the site is 35 km/h. The turbine farm is expected to produce 31.7[MW] of electricity - enough for 15,000 households... [■ A NZ-based] Iraqi engineer has developed a mini wind turbine that could revolutionise the world's energy market... [H]is novel design will be small enough to fit on the roof of an average house, with much less noise and vibration than traditional windmills. The Foundation for Research, Science and Technology has given him \$266,000 to develop the design during the next four years. The design is based on a spiral blade originally developed in Sweden for large-scale industrial wind turbines. [The engineer] has subtly changed the shape of the blade to alter the way it catches gusts of wind. "It's an aerodynamic problem that has not been fully solved by others... For sure, it will be cheaper than the conventional existing power supplies." ...the turbine "shouldn't be larger than the antenna of a TV aerial", and would generate electricity in typical wind conditions in most parts of the world. Born in Iraq, [the engineer] was educated in Cairo and London and worked for 20 years in the oil industry in the Gulf. [It] came to N[Z] after the... Gulf War in 1990-91... [The engineer] has already registered two patents in Unitec's name... Unitec is now looking for companies to commercialise [his] invention... Another wind power pioneer... expressed doubts about [the Iraqi]'s design because its vertical blade would be subject to higher fatigue loads than blades with a horizontal axis. But [the pioneer] confirmed that wind power was already cost-competitive at recent power prices of about 6c a kilowatt-hour.

...At Tehachapi Pass, on the grassy hillsides that lead up to [California's] high desert, more than 4900 wind turbines spin out enough energy annually to power 250,000 homes. "Some say they're an eyesore," says [a] local... "But I'd rather have wind turbines than nuclear power plants."

...The problem with nuclear power is that it comes with an unpleasant side-effect: highly radioactive waste material... But what if we could build a reactor that ran on nuclear waste - a reactor that generated power by cleaning up the most toxic substance in existence? Tucked among the fertile vineyards of central California is a machine that promises to do just that. This week, work finished on the National Ignition Facility... The NIF contains the most powerful laser in history... The aim is to split the laser into 192 separate beams, then focus them on a speck of fuel little bigger than a pinhead. The resulting temperatures and pressures will be millions and billions times greater than those on Earth, triggered by the start of a fusion reaction... By using hydrogen as its fuel, the NIF should become the first fusion machine that gives off more energy than is needed to trigger the reaction. But... due to the enormous energies involved (1000 times the amount produced by America's national grid), the laser can only fire once every three hours. For a commercial fusion power station, that would need to be 10 times a second. So... the scientists at the NIF... plan to combine their technology with a traditional nuclear fission reactor, which would require the laser to fire at a far lower frequency.

...It sounds like the plot of a 1950s horror film: bugs may be spreading radiation at the Hanford nuclear reservation. Thirteen spots on the former nuclear weapons site have been contaminated. The source has not been determined, but fruit flies, gnats and ants are believed to be part of the problem. And 35 tonnes of dumped rubbish must be taken back to Hanford because it is contaminated... [By the way, the] cleanup of an old... COLORADO... nuclear weapons factory has come to a halt after 10 workers tested positive for radiation exposure[(usually 'people who work near radiation wear detection devices such as film badges and dosimeters, which record the total amount of radiation to which the wearer has been exposed')].

...it has now been two months since the US] Energy Secretary ordered an investigation... into whether thousands of workers were unwittingly exposed to plutonium... at a federally owned plant in Kentucky. The [secretary had ordered the investigation after the]*Washington Post*, citing court documents, plant records and interviews, reported that uranium workers at the Paducah Gaseous Diffusion Plant inhaled plutonium-laced dust... for 23 years until as recently as 1976... [P]lutonium was introduced... in tiny but dangerous quantities in used uranium brought to the plant... as part of an experimental nuclear reactor fuel recycling programme... The workers were exposed to the plutonium and other radioactive metals in work areas, locker rooms and even cafeterias. The Government did not inform workers about the hazard even after employees started to notice a string of cancers in the 1980s. The *Post* said a lawsuit filed under seal in June by three present plant employees alleges that radiation exposure was a problem at Paducah well into the 1990s... Radioactive contaminants from the 300ha plant, built in 1952, [also]spilled into ditches and eventually seeped into creeks, a state-owned wildlife area and private wells... The Institute of Medicine of the National Academy of Sciences will independently investigate any possible links between illnesses and exposure to hazardous materials at Paducah and other Energy Department sites.

...In an about face, the U[S] Government says it is likely that... hundreds – perhaps thousands – of workers... who built America's nuclear weapons became ill because of exposure to radiation or toxic chemicals. The findings, based on a review of dozens of studies and raw medical data covering an estimated 600,000 workers at 14 nuclear weapons sites, are a reversal of a position held for decades... [that] has stymied numerous lawsuits seeking compensation... [The] Energy Secretary... cautioned that the findings were preliminary and would not be completed for several months but that if the findings were borne out, "the honourable thing for the Government to do is to protect its workers, past and present," including compensation... [● US, f]irefighters were struggling overnight to contain a wildfire accidentally set by park rangers that has destroyed or damaged up to 400 houses in a New Mexico town and is threatening its nuclear weapons lab. The White House said it believed the nuclear materials were safe in disaster-proof bundles... in concrete and steel bunkers... at the sprawling Los Alamos National Laboratory, where the first atomic bomb was built in 1945... "The equipment to keep our plutonium is designed to withstand a crash of a 747 into it," said [the laboratory's]director... The National Park Service came under criticism for starting the wildfire by burning excess underbrush in nearby Bandelier National Monument last Friday despite high winds and dry conditions... Winds gusting to 97 km/h fanned flames that rose up to 60m from burning pine forests... [S]moke... rose 6000m into the sky, clearly visible on satellite photographs... Spot fires from windblown embers erupted in the grounds of the laboratory but were quickly put out... New Mexico[']s Senator... would ask Congress' General Accounting Office to investigate... "I believe someone is responsible... We'll know by next week... if [the excess burning] was a good thing to do or the equivalent of a mistake. I think the latter,"... Since the US stopped testing nuclear weapons... the laboratory's main role has been to make sure existing stockpiles remain safe and functioning.

...An army of 1000 firefighters on the ground and in the sky struggled yesterday to contain a wind-driven forest fire that [has]forced thousands of people from their homes, caused \$US1 billion... in damages and charred vast areas around the top [US]nuclear research facility... Despite their efforts, the mighty blaze spread like a fast-growing cancer across more than 14,500ha of scenic northern New Mexico... Officials had expected cooler temperatures and calmer winds to help them get a grip on the fire... But... winds had picked up again and left them scrambling to hold on to the 5[%] of the fire they had contained on Saturday. [The]US Forest Service fire information officer... said: "This thing is growing and we don't know where it's going to end up. It... is going to burn for weeks." ...Along with the winds... the fire was being fuelled by the effects of a prolonged drought that was the most severe in New Mexico's recorded history, dating back to the 1700s... Officials said 30[%] of the 11 sq km land area of the Los Alamos laboratory... had been burned. None of the lab's permanent buildings was damaged... Air monitors had detected no radioactive releases, but lab officials said they were still taking care to protect a warehouse containing low-level nuclear waste stored above ground. More potent nuclear materials are stored in underground bunkers[– some of which the fire passed over]... The laboratory has been closed, but... a few administrative functions could reopen today... [In related news, the US] has urged North Korea not to restart a nuclear reactor... after the... International Atomic Energy Agency... said Pyongyang had disabled its monitoring equipment... at the five-megawatt Nyongbyong reactor, which the UN believes was used to make plutonium before being closed under a 1994 agreement with the US. "We urge the DPRK... not to restart its frozen nuclear facilities..." said [a]US State Department spokes[perso]n... To do so would "fly in the face of international consensus". The North's official Korean Central News Agency confirmed it began removing the surveillance devices after the UN nuclear watchdog had not acted on Pyongyang's demand early this month to take the equipment away to allow the reactor to be reactivated... It did not appear that the seals or cameras had been disturbed at the reprocessing plant or at the spent fuel rod pond where 8000 spent fuel rods were stored... North Korea's actions and its pursuit of a covert nuclear programme undermined the international community's efforts to help it deal with poverty and other serious problems... Under the 1994 accord, Pyongyang promised to freeze its nuclear programmes in return for a \$US5 billion... package that included two light-water nuclear reactors for power generation and 500,000 metric tonnes of heavy fuel oil a year... Pyongyang, acting after the US, South Korea, Japan and the E[U] decided to halt its heavy fuel oil deliveries, announced plans this month to immediately reactivate the Nyongbyong reactor. The US and its allies decided to cut fuel deliveries after the North acknowledged it had a programme to enrich uranium for nuclear weapons, which was prohibited by the 1994 agreement.

...Nuclear weapons inspectors are being forced to leave North Korea tomorrow in a mounting crisis on the world's last Cold War frontier... North Korea told the IAEA the 1994 agreement... had broken down and its inspectors must go. The expulsion will deprive outside agencies of the last reliable means of monitoring the closed Stalinist state. International monitors will have to rely on satellite images, the testimony of defectors and decoding the utterances of North Korea's leader... "This is a country in defiance of its international obligations," said the IAEA's director-general... The U[S] has said it will step up pressure on the communist state if it refuses to abandon a nuclear arms programme that Washington fears may already have produced one or two atomic bombs. U[S] officials said North Korean missile shipments might be blocked to deny the cash-strapped country further revenue from arms sales. North Korea's order expelling the... inspectors was its latest move in a crisis some suspect is aimed at prising more food and energy aid from Washington and its allies for the starving nation of 22 million. The U[S]... has told North Korea it would not negotiate under duress... Washington will attempt to pressure Pyongyang through its neighbours and allies, along with the United Nations, with a strategy of "tailored containment". Behind the scenes, it also threatened to push North Korea... towards economic collapse. The tension... came to a head [two months ago] when North Korea said it had a covert nuclear programme. The... crisis worsened on Friday when North Korea announced that it was firing up a reprocessing laboratory that could convert spent fuel into plutonium for nuclear bombs and had begun moving fresh fuel rods to the five-megawatt research reactor... South Korea has called for a strategy meeting with the U[S] and Japan. A senior envoy from the U[S] is expected in Seoul within the next two weeks to co-ordinate Washington's policy. While the crisis escalated, [North Korea's leader] relaxed at a concert where an army choir praised him in song. The Korean Central News Agency said an official rally "called on all the Koreans to turn out in the sacred anti-US resistance to drive the US imperialist aggressors out of South Korea and resolutely frustrate the nuclear racket of the US".

...North Korea has for the first time indicated that its membership of the nuclear Non-Proliferation Treaty (NPT) could be the next victim of a deepening crisis over its nuclear weapons ambitions. In a statement last night, North Korea's Foreign Ministry blamed the U[S] for the collapse of the 1994 Agreed Framework accord... Earlier yesterday, [the]US Secretary of State... said that the US did not plan to strike North Korea, which is still technically at war with South Korea... "Military action is never off the table in the sense that it is not an option... We just don't think the circumstances at this time require us to point a gun at someone's head." ...North Korea announced its withdrawal from the NPT in March 1993,

triggering a nuclear crisis that brought the Korean Peninsula to the brink of war. The Stalinist country suspended the threatened withdrawal three months later, after the US agreed to start talks to improve ties with North Korea. [Last night's] statement also blasted Washington for trying to destroy North Korea "with nuclear weapons, gripped by the Cold War way of thinking, going against the basic trend of... heading for reconciliation and peace". "We have been left with no option but to consider self-defensive means to cope with the threat in order to protect the nation's dignity and right to existence." ...The [US] Administration has prepared a policy of financial and political pressure on Pyongyang, the *New York Times* reports. Under the plan, US officials are willing to negotiate, but only providing North Korea first dismantles its nuclear weapons programme. If it refuses, the UN Security Council could threaten economic sanctions, and the US military might intercept... North Korea[n]... missile shipments...

The U[S] is seeking to play down differences with key allies South Korea and Russia over its response to communist North Korea's nuclear brinkmanship, saying it has no plans for sanctions. South Korea yesterday launched a flurry of diplomacy to try and ward off a crisis, while Washington insisted on avoiding calling it that and US officials pushed a strategy they were calling "tailored containment"... Although... [the US] Administration has called for punitive economic measures against... North Korea – already one of the world's most isolated countries – US officials backtracked yesterday, saying sanctions were not currently being considered. Even so, Washington's stance was far from clear. US officials already have unsettled important allies by suggesting that sanctions could be imposed by the U[N]... Last week, South Korea's President-elect... called on North Korea to back down. But South Korea has made plain its reluctance to join any US moves to isolate Pyongyang economically, something that would threaten millions of North Koreans who already live on the brink of starvation... [The President-elect] told his Cabinet: "We cannot go to war with North Korea and we can't go back to the Cold War system and extreme confrontation." Russia aligned itself with South Korea's approach and suggested the US tone down its pronouncements... [However,] Russia also denounced the expulsion of the I[AEA] inspectors...

Russia's 29 nuclear power plants recorded 62 "irregularities" in the first five months of 1998, five times more than in the same period the previous year... [Incidentally, a] steel mill in southern Spain is believed to be the source of a sharp rise in radiation levels detected in France, Switzerland and Italy earlier this month, say Spanish authorities. Scrap metal obtained from an unknown location was melted down at the Acerinox plant... sending a cloud containing cesium-137 blowing to the north and east. Radiation 1000 times higher than normal was detected for a few days, but is said not to have posed any health threat. It was the highest nuclear contamination on the continent since the Chernobyl disaster...

A UN assessment of the 1986 Chernobyl nuclear meltdown says the worst health consequences for 7.1 million people may be yet to come... Three people were killed in the explosion... and 28 emergency workers died within the first three months, the report said. It gave no later death toll but noted that 106 of the other emergency workers... first on the scene were... diagnosed with acute radiation syndrome... 600,000 emergency workers who helped in the cleanup and in the sealing of the destroyed reactor "must be constantly monitored for the effects of exposure to radiation." The three countries most affected by the radiation – Belarus, Ukraine and Russia – continue to pay the price. Soviet officials initially tried to play down the tragedy but official figures now show that several thousand people have died and... 3.5 million were disabled in the Ukraine alone. The... UN Secretary-General... said the exact number of victims might never be known, but three million children required treatment and "many will die prematurely." [The Secretary-General] said response to a UN appeal launched three years ago had fallen so short that the original list of 60 projects had been shortened to the nine most urgent. The projects include modernisation of a hospital, creation of a network of centres to treat children and decontamination of schools, kindergartens and hospitals in Belarus. In Russia, the projects include supplying vitamins to increase immunity to radiation exposure, providing ultra-sound screening of 500,000 children and developing rehabilitation centres for affected people. Among projects in Ukraine are improving healthcare, restoring forests and conducting research into the health impact on future generations. Meanwhile, experts warn... Chernobyl... is effectively a nuclear timebomb... [The] closure of... Chernobyl's last reactor... has been delayed... Officials vow there will be no second Chernobyl in Ukraine... But... [are they right, and] what... about the... [other] Soviet-era nuclear plants...

NUCLEAR TIMEBOMBS... VISITORS to Sosnovy-Bor, a distant suburb of St Petersburg, can't say they aren't warned. The town hall boasts a digital Geiger counter, displaying local radiation levels in large red letters. That's because Sosnovy-Bor's only industry is the Leningrad Nuclear Power Plant (LNPP), with its four huge reactors. Earlier this year the plant looked like an abandoned construction site. Rusting cranes loomed like mutant insects over piles of building materials... They are supposed to be used to revamp the plant's safety systems, an overhaul originally scheduled for completion by the end of the year. But that has been postponed... The LNPP is a Chernobyl-type power station – only much more dangerous. If Chernobyl had happened here, many of the four million people of St Petersburg would have been hit with a huge dose of radiation. Outsiders can enter the plant only with permission from Russia's nuclear-regulation agency, Minatom, which rarely grants visits. Visitors to the LNPP remove their shoes and don plastic booties and protective overclothing, but this seems intended mainly for the amusement of the staff. In the Block 2 Reactor Containment Room, for instance, many employees don't wear any protective gear at all – or even dosimeters... "When we were kids, we used to go swimming in the... waste water from the plant-cooling systems... because the water was so warm," boasts... a technician... aged 22... Officials at LNPP are touchy about suggestions that their plant could become another Chernobyl, and say a meltdown can't happen here. "What we call the human factor is really very important," says [a] technical director... referring to the importance of worker morale in maintaining good safety practices. "You can't underestimate this. It is what you depend on." Yet plant workers routinely get their Government pay cheques as much as six months late. And... critics of the plant have discovered that at least three LNPP employees were heroin addicts. One... died of an overdose last winter, the others were sent to rehab. Russian environmentalists claim at least one addict had access to the vital control room of the facility, and others to radioactive-waste-storage facilities... The I[AEA] says... there were 508 nuclear "incidents" between 1993 and last October alone, an average of more than one for each of the world's 434 operating power plants. Behind the mishaps is a simple fact. Nuclear-power generation is well into its middle age. At plants around the globe, pipes, vats and controls have worn down dangerously, vastly increasing the chances of mishaps, both minor and major. Industry executives insist... nuclear power in Asia, Western Europe and the U[S] remains safe. But the public is no longer buying it. "Now, many European countries are saying... the risk is unacceptably high," says... the I[AEA] chief. Nuclear-reactor orders and start-ups ranged from 20 to 40 a year in the 1980s; in 1997 there were just two new orders, and five start-ups worldwide... "There's no real future for the nuclear industry," says... a physicist and Greenpeace campaigner in England. "It's clear... nuclear power is on its way out." Yet that's easier said than done. Some 16[%] of the world's power now comes from nuclear plants[– and 1/3rd] of Europe's... That kind of dependence makes it impossible for governments to simply turn off the juice. But it isn't the state of the plants in France, America or even Japan that keeps nuclear experts awake at night... Of the 58 Soviet-era reactors still functioning, 15 are... identical in design to Chernobyl. Although the Chernobyl explosion was the result of human error, the design of the plant was also a major factor. RBMK reactors, which are graphite-cooled... have a tendency to get hotter when something goes wrong in the reactor core. Western plants are usually water-cooled, and tend to lose heat during an accident, making them easier to bring under control. The West is worried enough about [Eastern Europe's] ageing plants to have ponied up... \$[US]3.7 billion so far to improve safety and training. But most experts agree... the only way to really make them safe is to shut them down... "As a class, these reactors continue to experience serious incidents, raising the spectre of another accident akin to Chernobyl." Or worse... [T]he Green World environmental group in Sosnovy-Bor, has photos... smuggled out of the LNPP by workers. They show cracks 21m long and 20cm wide in the thick cement of the building used to store highly radioactive waste... "In just this one building there's enough hot waste to make 20 Chernobyls. And it's only 20 years old... What will it be like in 100 to 200 years?" People who live near these old plants are already living with the disastrous

effects of radiation poisoning. Just ask the residents of Chelyabinsk, in the Ural Mountains... The region is ringed with nuclear facilities, but the most notorious is the Mayak Production Association, a reprocessing plant... 80km outside of Chelyabinsk near a town called Novogornyy. In 1957, there was a mysterious explosion of the highly toxic radioactive isotope strontium-90 at Mayak... 28,000... residents and workers... were officially classified as "affected" by the releases. Since then, there have been half a dozen fatal incidents, including a 1967 explosion... that spewed... cesium-137... particles over a large area. The Mayor of Novogornyy... says his small city still draws its drinking water from Karachai Lake, where the complex dumps its radioactive waste. "There is 15 times the limit of strontium-90 in the soil, 38 times the limit of cesium-137... but the authorities don't believe that when the wind blows, people here all get headaches. They say it's just radiophobia." Russian authorities have plenty to hide. A doctor in a village near Mayak... says nearly every member of his family has some chronic medical problem; a granddaughter was born with only six fingers. "We don't have concrete statistics to prove it... But I was born in 1939 and there used to be 50 people in the village my age. Now no more than 10 are left and most of them are oncological cases." At the Novogornyy hospital, the medical director... says there hasn't been a single normal birth there in two years. A school director... says... chronic illnesses are so common that a third of his 230 students are out sick on any given day. Researchers from Mayak came and tested the children's blood but never divulged the results. Few Western countries would tolerate a Mayak or LNPP in their midst, but their own ageing nuclear plants have plenty of problems... At Britain's Sellafield nuclear-power site, a complex of eight reactors and two reprocessing plants, there were 27 level 1 and 2 incidents in [the past two years] – compared with just 32 worldwide in 1997. Three workers there were fired last month for allegedly falsifying safety checks on plutonium. Sellafield is home to the world's first commercial nuclear reactor. Opened in 1956, the facility was designed to run for 25 years. It's... still going. Britain has become the first European country to decommission a reactor, the Dounreay plant... on Scotland's northern coast. The cleanup and shutdown process will take up to 100 years and cost \$1370 m... Authorities acted after acknowledging... waste-storage units were leaking and after finding mysterious "hot" particles on local beaches. The sand-like particles are radioactive enough to blister anyone who sits on them, and dangerous enough to kill a child who swallows them.

...The people who live near Temelin, in the rolling hills of south Bohemia, have been issued with two small tablets each. They have been told to keep them in a safe place – and to take them if anything goes wrong at the Soviet-designed nuclear power plant a few kilometres from their homes. To the fury of its E[U] neighbours, the Czech Republic is on the verge of activating the nuclear reactor, which German experts say may not be safe... The Germans... [and Austrians] this week threatened to veto Czech membership of the EU if the plant, partly modernised by a subsidiary of British Nuclear Fuels Ltd, is activated as planned [next week]... Austria, whose border is only 48km away, has been furiously lobbying against Temelin for months. Greenpeace claims there are serious safety shortcomings at Temelin – claims which are strenuously denied by the Czech nuclear safety authorities. Temelin's two reactors are Russian VVER-1000s – generally regarded as the safest of the Russian designs, and completely different from the reactor involved in the Chernobyl disaster. Work started at Temelin under the old communist authorities, in 1983, and has been going on ever since. Last year, the Czech authorities decided to finish and activate the reactor. Parts of the plant – the instrumentation and control – are being replaced with American designs by the US firm Westinghouse, a subsidiary of BNFL. The Czech Republic is not short of electricity, but Temelin is expected to provide lucrative energy exports. In the villages around Temelin, opinion is divided. "They should have switched it on months ago," says [one villager]. "We should be making money from it. The Germans should mind their own business. They're just trying to ruin our economy." But not everybody agrees. "Of course I'm scared," says... [someone] visiting Hluboka castle with his two young children. "I'm scared for the children." "Czech people don't realise we have a democracy now," says... an anti-nuclear campaigner who lives near Temelin. "They think we have to accept what the politicians decide, like in the old days. They don't realise we can object, so they don't." [The campaigner] organises holidays in the Czech Republic for the child victims of the Chernobyl disaster.

...To the relief of just about everybody outside northern Ukraine, Chernobyl nuclear power station will produce its last electricity this month. After years of intense pressure from the West, the Ukraine has promised it will finally switch off the one reactor still functioning at the infamous site in the pine forests 98km north of Kiev. Chernobyl spawned the world's worst nuclear accident... when a disastrous explosion during a test shutdown of Reactor Four spewed out a nine-tonne radioactive dust cloud that reached as far as Britain. In 1991, Reactor Two was closed after a fire. Reactor One reached the end of its productive life in 1996. Then last week, winter's first heavy snows iced up overhead power lines and forced officials to switch off Reactor Three as a safety precaution. They plan to start it momentarily, only to close it permanently at a grand televised ceremony [next week]. Despite this appalling track record, the workers of Chernobyl defiantly insist their plant is safe, but is being killed off for political reasons. The catastrophic explosion in the early hours of April 26, 1986... is regarded as little more than a technical blip by those who still work there... More than 100,000 people were evacuated after the accident, and the 5800 remaining Chernobyl workers are brought by train from a new city outside the "Zone" as it is known. The original town of Chernobyl is home to about 1000 Government employees, mainly security and forestry workers. The dingy bar in the disused bus station is the main draw in the evenings. Downing copious quantities of pepper vodka as insulation against the sub-zero temperatures outside, the locals lamented Chernobyl's demise. Outside the Zone, few will join their wake next week... Western donors... this year pledged more than £500 million... to fund the closure of Chernobyl and a new steel-latticed "tomb" for Reactor Four. And yesterday the European Bank for Reconstruction and Development made Ukraine a controversial loan of \$US215 million... to help it build two nuclear reactors to replace the Chernobyl reactors. But release of the money will depend on the resumption of aid to Ukraine by the IMF and on the shutdown of the Chernobyl plant... The West is also pressing for the closure of 11 nuclear plants in Russia and two in Lithuania that are of the same design as Chernobyl. Even in Kiev there is relief at the closure, especially among young couples who delayed having families, fearing the effect of radiation on children. Lack of money and poor monitoring techniques mean the overall health impact of the disaster in Ukraine and neighbouring Belarus, the worst-affected territory, is still not known, although child thyroid cancers caused by radioactive fallout have soared. Deaths among the 600,000 cleanup workers brought in from across the Soviet Union are also unknown... In huge lettering above a decaying apartment block[in]... Pripyat, the now-deserted city built just 3km from the station... a Soviet slogan declares: "The health of the people is the wealth of the country." ...I spent two days inside the barbed-wire fences of the 28km exclusion zone after being granted government entry permits.

...Restrictions on 300,000 residents near the site of Japan's worst nuclear accident were lifted last night, but officials are still uncertain what the potential long-term effects will be. Experts said the chain reaction at the Tokaimura uranium-processing plant... had halted for now. People within a 10km radius of the plant had been banned from going outdoors. A Government spokes[person] said a decision would be made later on people living within 350m of the plant, most of whom had anyway been evacuated. At least 55 people were exposed to radiation, including 45 workers at the plant, three fire[officers] and seven people at a nearby golf course... The Government admitted that its response had been slow. "I understand that this is a type of accident that was seen in the 1950s," said[a spokesperson]... "As a modern nation, it's shameful that this kind of accident happened[again]." The emergency is believed to have started when a worker piled almost eight times too much uranium into a container, with the result that it reached "critical mass"... Working through Thursday night, technicians drained water that had helped to feed the chain reaction and sent radiation levels near the plant to 15,000 times normal... [A]t all but two spots very close to the site, levels had returned to normal... Officials told residents that clothes worn during evening rain showers in the area should be washed and locally grown vegetables should not be harvested... Earlier, the Government declared the incident a "level four" on a scale of nuclear accidents... Japan's... worst previous accident, also at Tokaimura in 1997, had been a level three. The 1979... Three Mile Island accident [in the US] was a level five, while the... Chernobyl accident... was level seven.

...The Japanese Government will revoke the business licence of JCO Co, the operator of [the] nuclear fuel reprocessing plant where the nation's worst nuclear accident occurred last week[after]... JCO officials admitted the firm illegally revised a Government-approved manual to allow

workers to use buckets instead of a pump to transfer uranium solution to a tank... [In another development, the Government's estimate of how many people were exposed to radiation... has [been] raised... to 439 from 70... [T]he new calculation takes into account local residents as well as plant workers not equipped with radiation monitoring devices... [The] accident... killed one person...

A ship carrying nuclear material from Japan to Britain... sailed last night despite opposition from anti-nuclear activists, who said the cargo was a theft and attack risk. The sailing of the Pacific Pintail, carrying a weapons-usable mix of plutonium and uranium oxides (MOX)... sufficient for 50 nuclear weapons... has raised tension as it... comes after US warnings of the continuing potential for terrorist attacks. An air of watchfulness surrounded the pier in the looming shadow of Takahama's nuclear power plant 300km west of Tokyo. Police with dogs surrounded two massive, 100-tonne nuclear transport casks trucked to the pier for the loading, 20 security guards stood on the ship's deck and plant security kept protesters out of the area. The Pacific Pintail and 12 Japanese coast-guard escorts had slipped into serene Uchiura Bay, past the Greenpeace International protest ship Arctic Sunrise. The MOX fuel is being returned to state-owned BNFL after Japan's Kansai Electric Power Co Inc discovered that data for a... shipment from Britain had been deliberately falsified. Kansai was to use the fuel in commercial reactors. As a security measure, the Pacific Pintail, which had a machine gun, was to sail with another ship, the Pacific Teal[– which had carried the original shipment from Britain].

...Two shipments of nuclear fuel leaving... the French port of Cherbourg tonight... will sail close to N[Z]'s shores, opening old wounds over the anti-nuclear debate and straining our relations with several key allies... The likely passage of... the... Pacific Pintail and Pacific Teal... through the Tasman Sea within the next month is seen as a direct challenge to the Government's opposition to such shipments. Rather than just carrying waste, the material on board this time is capable of being converted into nuclear weapons and is an affront to the Government's drive for a nuclear-free region... [(France... quietly imposed a ban on information about its... shipments of nuclear material, declaring that such details are tantamount to military secrets and disclosure of them is punishable by a jail term... – but... [t]he move has outraged the country's powerful ecology movement[)]... The... MOX... fuel... is destined for the Tokyo Electric Power Company... 80 more of these shipments... are... planned for the next 20 years...

Plans to build the world's biggest nuclear waste repository in the A[US]n outback are being drawn up in Britain, the *Observer* says... BNFL... had put £5 million... into developing the project which, if it went ahead, could threaten Aboriginal communities and wildlife, the newspaper said. Britain has the world's second largest stock of nuclear waste. In 1997 the Government abandoned work on the deep-level Nirex nuclear dump in Cumbria, leaving the UK without anywhere locally to dispose of its radioactive waste... A BNFL spokes[person] told the newspaper that A[US] had the "right geology and the political stability vital for a deep disposal site... We believe there would be substantial economic and other benefits for A[US]." But the A[US]n Government has rejected the idea... "It is not Government policy to import nuclear waste from other countries and there is no intention to change that. The only thing that is currently happening is that we are looking to identify a site for our own low-level nuclear waste..." ...The *Observer* article follows a similar report late last year in which a leaked video showed the American company Pangea promoting A[US] as a nuclear waste dump. The video said Pangea had searched the world for the best possible location.

...A[US] could "do the right thing for the world" and avail itself of an ideal opportunity to become a nuclear waste dump, says... the... promotional video... made... to sell the concept... Set to soothing background music, a [gal] with a British accent explains in dulcet tones: "A[US] possesses a unique combination of natural, political and infrastructural factors which make it the world's best for the time." After setting out the technological processes involved, the explanation continues: "All this state-of-the-art engineering and activity will have a profoundly beneficial economic effect both direct and indirect on the state and Commonwealth economy, so both the rest of the world and A[US] will benefit from solving this world problem."

...The decision to replace A[US]'s only nuclear facility has run into a storm rolling around the selection of an Argentinian company, and the threat of a catastrophic accident. Commissioned in 1958... the... Lucas Heights reactor in the wooded hills of southwest Sydney... is central to new materials' research, to irradiate computer chips and to produce new materials used in minerals exploration, agriculture and environmental management. Replacement of the facility is considered necessary to keep A[US]'s foot in the nuclear door, give it a credible voice in non-proliferation forums and to continue neutron-based research. But with the reawakening of the anti-nuclear movement, Lucas Heights has come under increasing pressure and now a Senate inquiry has begun into the tendering process that gave the contract for its replacement to Argentina's struggling state-owned INVAP. The Government is accused of pushing through the contract with indecent haste, running foul even of its own nuclear safety watchdog, the A[US]n Radiation Protection and Nuclear Safety Agency, which has said it will not approve a new reactor until a national waste repository has been established... There are other concerns around Lucas Heights. In the surrounding district, surveys have found that 88[%] of its neighbours do not want a new reactor, and Greenpeace reported 75[%] reject the reactor until there is a new waste dump.

...A[US]'s nuclear safety watchdog said yesterday that radioactive water leaked from a cooling pond at the Lucas Heights nuclear reactor last year. A spokes[person] for the A[US]n Radiation Protection and Nuclear Safety Agency... said several litres of the water, used to cool nuclear fuel rods, leaked into a catchment deliberately built for such an event. But there was no indication that surrounding land was contaminated. On the agency's instructions, the A[US]n Nuclear Science and Technology Organisation, which runs the Sydney reactor, had dug holes around the area... to a[cc]umulate... a collection sump... [I]t was still not clear whether the leak was still occurring or for how long the pond had been leaking.

...A NEW LYNN packaging company at the centre of a chemical leak which devastated... the Whau River has escaped prosecution. The Auckland Regional Council... decision... [to] not prosecute... comes six months after 4000 litres of printing chemical n-propyl acetate leaked from a container at [the packaging company], through a stormwater drain and into the Whau. Thirty-year-old eels and hundreds of fish were killed in the spill which left a kilometre section of the Whau devoid of marine life. [The] ARC pollution control officer... who headed the investigation into the spill says the leak was caused by an "unforeseen mechanical failure... Our advice from our legal team is that a prosecution would be hard to pursue... [– as t]here is a clause in the Resource Management Act which exempts companies from prosecution if it is because of mechanical failure... The reality is that we will probably get more co-operation and a better deal for the river than if we pressed ahead with any prosecution." ...[as if to confirm that statement, the officer said the packaging company]'s help in the immediate aftermath of the spill and six months down the line has been "awesome"... [It] has made a long term commitment to restocking the river, to revegetation and continued maintenance of the area. [The company]'s operations manager... says the company "deeply regrets" the spill. "We now have manual safety checks on the piece of equipment and a checking system in place." ...[in addition,] the stormwater drain entrance on the company's property has been sealed to prevent any further spills getting into the river.

...Three companies that developed Westgate shopping centre have been fined \$104,000 for resource consent breaches and serious disregard for environmental controls. Westgate Properties Ltd, WGS Construction Ltd and Cato Consultants were fined by... the Auckland District Court on Friday. [The] judge... says none of the three companies proactively sought to ensure the site or contractors complied with consents and abatement notices issued by the A[RC]. The companies admitted to lacking erosion and sediment control measures required by their resource consents, to discharging sediment into the Manu Te Whau stream over a considerable period and failing to comply with two abatement notices. A[n] A[RC] soil conservator... says the environment was sacrificed [for] commercial gain. "In this case, work that should have been better controlled on the site was given very low or no priority," sa[id] the ARC soil conservator. The manager of Westgate investors Westland Ltd, says there was no intention to spoil the natural resources... "There were some errors made on our part but there were no effects from them and we tried to mitigate them as soon as possible." [The manager] says Westgate was developed during a wet winter and this contributed to problems such as heavy stormwater run off.

...The Auckland region is losing up to... 66,000 tonnes of soil washed into the sea every year – much of it avoidable, according to ARC soil experts. The loss of irreplaceable soil and the impact on fisheries are both serious economic issues... One of the main causes of soil loss is urban

development. The ARC estimates that... 2000 times more sediment runs off bare earth exposed to rain compared to forested areas. Up to 500 tonnes of earth, or 50 large truckloads, can be lost from a five hectare subdivision without adequate soil retention. The ARC works with developers, particularly on sites larger than 0.25 hectares, who are required to gain resource consents to expose bare earth to ensure that appropriate controls are implemented... A... councillor... says soil loss from small sites can be prevented if developers and contractors follow... ARC... stormwater management guidelines... Typical measures include using sand-bags to divert water flows, hay bales to detain and filter flows, revegetation of exposed areas, and covering piles of earth with tarpaulins when it rains. Applying straw mulch to exposed earth also helps to reduce sediment loss... Sediment, a mixture of topsoil and clays, is washed into streams, estuaries and harbours where[, in addition to affecting recreational activities – p]eople don't like to swim or play in muddy waters... [-] it has a devastating effect on... fisheries[('if you wouldn't wash in it don't expect other creatures to live in it')]... Sediment is like an underwater dust storm to fish and shellfish. It is the single biggest water pollutant... in the... region.

...More than 330 flood-related calls were received by Waitakere City Council following June's heavy storm and subsequent downpours in July. About a third of the calls were to report emergency flooding incidents. The remainder related to flooding caused by public drains exceeding their capacity, surface water in backyards and garages, or problems relating to broken pipes and blocked drains on both private and public property. The high number of flooding incidents created a large backlog of jobs for the Council's EcoWater business unit. Priority was given to emergency flooding incidents. Staff are continuing to follow up on minor flooding concerns... Residents are urged to take responsibility to improve stormwater control on their own property by keeping gutters and downpipes clear of debris and fixing broken pipes. EcoWater[']s Education Adviser... says careless disposal of household rubbish is also a concern, as too many cans, paper and plastic bottles are finding their way into local streams. Homeowners also need to consider what impact new landscaping will have on stormwater run-off, and should ensure that any work undertaken on their property meets building compliance codes... The Council itself is actively working to upgrade its stormwater systems so that flooding incidents occur less often. Consequently, EcoWater's stormwater budget... has been significantly increased.

...THE Go Waitakere city councillors push for a zero rates increase this year has been approved in principle by the... Council. However, the final rates for [this year] won't be struck until the long term finance strategy has been agreed to later this month. The council voted to cut spending by \$1,295,000, after days of sometimes heated debate and block voting by Go Waitakere councillors, bringing the budget to \$14,000 under this year's total of \$79.2 million. The draft budget, after annual plan submissions, proposed a 1.52[%] rates increase, excluding regional levies yet to be finalised. A \$276,000 cut to stormwater network renewals was one of the more contentious issues which was kept in the budget through a casting vote by... [the mayor. A c]ouncillor argued that [it] was not prepared to support funding for stormwater year after year when central Government was not paying its share of the work... [But another c]ouncillor was concerned about deferring work on stormwater projects, saying there was a need to fund it now instead of continuing to load the cost on coming years. "We have pipes splitting, the Auditor General will clamp down on us if we don't fulfil our legal obligations to fund stormwater renewals and councillors here are arguing to... save a few measly dollars to keep rates down."

...A series of colourful murals painted around some of the region's stormwater grates are not just there to brighten the city. They are part of a campaign by the A[RC] to educate the people of the Auckland region about our number one urban pollution problem. The [regional c]ouncil, which receives over 1000 pollution complaints a year, wanted to illustrate that when people pollute stormwater drains, they ultimately affect their own enjoyment of the waterways... the... region has to offer... [Anything t]hat enters a stormwater drain... other than rain is considered a poison. Ten murals, depicting either sea life or people... bear the slogan "Poison the Sea, Poison Me". It is hoped... murals like this will be seen throughout the region during the next year... [Another ARC slogan is:] Save the drain for rain! ...Aucklanders... who wash their vehicles on the road or on driveways flush an estimated 500,000 litres of detergent and grime down stormwater drains every year directly into our streams, beaches and harbours.

...A *Part of the Solution to Pollution – You!* ...To help avoid stormwater pollution... there are a number of things that you can do... ■ Drop off oils at petrol stations for recycling ■ Wash paint... brushes in an inside sink that goes to the sanitary sewer ■ Allow left over paint in a tin to dry before disposing of it with household rubbish ■ Wash your car at a car wash or on the lawn ■ Drop off... hazardous wastes at a... refuse Transfer Station.

...A recent editorial in the *Herald* refers to the shame of Auckland's beaches, with the Auckland City Council putting permanent signs on several beaches warning swimmers of water pollution. It's a real concern, but the editorial suggests that a multi-million-dollar council clean-up programme may not fix the harbour. "As a council report has lately observed, separating the stormwater from sewage is going to put more street run-off into the harbour and less into the Mangere treatment plant. Some sort of soakage for stormwater might be a very good idea." This suggests the council has its plan badly screwed up. If its stormwater-sewage separation programme is not going to lead to cleaner beaches, one wonders why the millions of dollars are being spent on it at all. The problem affecting Auckland's beaches is not sewage and it is not stormwater, it is the fact that the two are sloshing around together... If we could get to the situation envisaged in the editorial, we should be very pleased, because the sewage (a comparatively small volume) would all end up at Mangere and the stormwater would all end up in the Waitemata Harbour as it has done for hundreds of years, but it would all be beautifully clean. The reason this doesn't happen in older parts of Auckland City is that houses... were built to a system that is below today's standard and do not have separate drainage pipes for stormwater and sewage. The water from the rooves mixes in with wastewater from washing and toilets and heads off to Mangere... But it often fails to reach that destination. During storms... the sewerage system cannot cope. The sewage-laden water overflows onto roads, streams, into stormwater systems, wherever, and the filthy mix eventually ends up in the harbour. The council is not confused. Separation will clean up the stormwater (partly), but it won't reduce its volume. But it is vastly better to have that volume going clean into the Waitemata than dirty to Mangere (to be cleaned up at great expense). The programme won't completely clean up Auckland's stormwater. Other problems include car-caused pollution washing off roads[-] ...though less of a problem than when we had leaded petrol... [-] industrial waste and so on, but a separate sewerage system would fix a huge part of the problem.

...Officials with an eye on the weather map hope to prevent a rerun of last weekend's emergency that saw raw sewage gush into the Hauraki Gulf... The emergency was caused by the response of alarmed North Shore City engineers to vast amounts of rainwater overloading the capacity of the sewage disposal system. It highlights the widespread problem of stormwater pouring into sewers from the illegal connection of roof downpipes and through cracks and other points of decay in the sewers themselves. On Friday night, the council's engineers switched off the six big coastal pumping stations, which force sewage to the Rosedale... sewage treatment... plant, following several days of heavy rain. They stayed off until late on Saturday afternoon. The engineers feared that with continued pumping an oxidation pond wall would collapse, causing flooding and putting the treatment plant out of action. With all the pumping stations off – an unprecedented move – raw sewage that backed up in tanks spewed on to East Coast Bays beaches, forcing the council to close all beaches for swimming... [W]hen asked yesterday if [the council] was confident a repeat of the emergency could be avoided, [the]... council's water services director... said it depended on the weather... But his staff were reducing pond levels, their usual preparation for bad weather, so that when the [next] storm hit a greater inflow could be absorbed... As beach warning signs become characteristic of North Shore's otherwise beautiful bays, the council has given its wastewater budget a big boost. Just over \$30 million is planned to be spent this financial year from loans and rates – a 34[%] increase on last year's budget. The increase is even larger than was first intended because of public submissions on the draft annual plan. Spending on the 1300km sewer network... [will account for] \$3.4 million this year... [and] would rise to \$5 million next year as information from studies now under way helped to determine which were the priority areas. The sewage treatment plant is also in line for a \$45 million upgrade over the next seven years to improve its environmental performance and to expand it to

cater for a maximum population of 242,000. The Shore's predicted population in 2004 is 220,000. At present the plant is theoretically capable of handling the sewage from a population of 198,000, compared with the Shore's estimated 183,000... "We are not happy that raw sewage gets discharged to the sea," said... a pollution-control officer with the A[RC], "but under the circumstances we feel that what they did over the weekend was probably the best practical option of avoiding a possible dam failure, which would be far worse." Prosecution was not being considered. Auckland and Manukau City Councils say they too have problems with illegal or incorrect stormwater connections overloading their sewage systems, but North Shore seems to be devoting the greater proportion of resources to attacking the issue. Its aim is to inspect each property every two years... Auckland City also inspects properties but... [the] Manukau water services manager... said that with the cost-cutting for this year's budget, his council did not have a programme for investigating and remedying stormwater infiltration. Auckland City has the biggest drainage problem in the region... [I]ts aged, combined stormwater-sewage system... pours an average 20,000 tonnes of raw sewage into the Waitemata Harbour each week... [But t]he pollution problem on North Shore's beaches is, in some ways, more evident, because of the use of warning signs.

...Big sea slugs linked to excess sewage at a North Shore beach are packing a powerful environmental message. Their presence in huge numbers sliming along part of the southern end of Long Bay are a sure sign that something is not quite right, says [a]Torbay resident and scientist[. The p]rofessor... said that... the... creatures – known as sea hares, but related to sea slugs – are not dangerous in themselves. However, the algae they feed on indicated bacteria in the water and... the associate dean of the faculty of science and engineering at the Auckland University of Technology and head[of] the Earth and Oceanic Sciences research centre at the department... warned people not to swim at the south end of the beach, or in nearby Awaruku Stream. The sea hares, which range in size from a few centimetres to as large as a [human]'s hand, spurt out an inky, purplish fluid when squashed and are opportunists that feed on nutrients created by sewage... "The numbers we've got now are far, far in excess of anything I've ever seen before in all the 20 years I've been living here." ...Sometimes the stench was horrendous and even the seagulls would not go near the slugs... [The ARC]'s coastal resources manager... knew little about sea hares. However, [the manager]... said algae specialists had advised the council that the bacteria was not related to human causes. [The professor disagrees, and adds]: "What I'm worried about is that there are new developments, sort of *Coronation Street* style, around Albany and areas that are going up very, very dense. The council says they were a mistake but they're still in the process of being developed." ...The council had a tendency to be reactive, rather than proactive, in dealing with environmental matters, said [the p]rofessor... Council representatives could not be reached last night... [□ Today,] the designers of the next phase of the Rosedale[sewage treatment] plant upgrading w[ill] release their[report on the costs and benefits of retaining oxidation ponds or switching to ultra-violet light or other methods for the final stage of sewage treatment. Ultra-violet light would have to be considered if industrial re-use of effluent is desired.

...Cost estimates for upgrading... Rosedale... are spiralling to meet population growth and environmental standards. The bill could rise... to \$162 m... according to figures to go before a North Shore Council committee tomorrow. The costs facing ratepayers are emerging as... [o]fficials involved in Auckland City's \$360 m... sewer-stormwater separation programme... concede... it may not stop harbour pollution. On the North Shore, a larger sewer[is needed] to carry treated effluent from Rosedale to the sea outfall... The existing sewer is not big enough for the flow from predicted population growth... [Plus t]he existing... outfall... between Castor Bay and Campbells Bay, which extends 600m offshore, does not meet present... resource consent... standards. The council has allowed \$18 m... to build a 1.5km-long replacement, but it could cost \$50 m... [T]he treatment plant would faultlessly have to produce effluent of exceptionally high quality for the 1.5km outfall to be environmentally acceptable. The plant could be upgraded to a lesser standard if the outfall extended further out to sea. Two longer outfall options, costing up to \$60 m... were being considered.

...Efforts to deal with North Shore's sewage pollution woes have passed inspection by the Parliamentary Commissioner for the Environment. A request from a Birkenhead resident prompted the commissioner's office to look into the city's sewage disposal problems, producing a 10-page assessment of the citizen's concerns. The commissioner... decided not to mount a full investigation, concluding instead that the council was implementing two strategies – Project Care and Project Rosedale – addressing the issues of concern to the resident. The work would improve the coastal marine environment, the report said, and there was no reason the two strategies would not be introduced – if money was available.

...A 7.5km-long tunnel for storing sewage beneath three North Shore suburbs is being mooted as a way of providing quick relief from the city's beach pollution woes. The tunnel tank – ...[which would resemble the tunnels for m]oving and storing sewage... [that are currently] being built in Hong Kong, Singapore and Sydney... – [was among] fresh ideas revealed yesterday in an engineering update on plans to improve the city's struggling wastewater system... System improvements costing from \$100 million to \$600 million are being assessed by engineers for consideration later in the year by the council and citizens in Project Care. They are in addition to \$60 million of work already under way to reduce the level of city sewer overflows in wet weather... A tunnel would run from the municipal golf course at Takapuna, to the west of the Northern Motorway, through Glenfield, Unsworth Heights and North Harbour to the Massey University campus at Albany... [T]he council's wastewater planning engineer... said the tunnel could cost \$60 million – making it \$10 million more expensive than conventional storage tanks... It would take six months to work out whether a tunnel was preferable to conventional works... [The engineer] said a study was also being made into the possibility of relieving the network by building local treatment stations – for example, at Long Bay. But the... council's works and environment committee... played down the possibility...

North-west Auckland could have its own... sewage treatment plant within five years, allowing more housing development and reducing the risk of harbour pollution. Watercare Services has just spent \$1.9 million buying 50ha of farmland on Amrein Rd near Taupaki for the plant... The preferred option is estimated to cost \$30 million to \$45 million and could serve up to 20,000 people from the Rodney district and Waitakere and North Shore cities. It could be expanded in future as needed. Alternatives considered could involve five or six plants in Waitakere and Rodney costing up to \$410 million in total and serving 160,000 people; or a single facility for the same population, with a price tag of up to \$400 million... Watercare... said the plant's effluent would end up in the Kumeu River after being discharged on to land nearby, but farmers and horticulturists would be able to tap into the pipe for irrigation. It says the river flow is low for much of the year and the effluent would be purer than the river water... [Currently,] Huapai, Kumeu and Riverhead rely mainly on septic tanks, and Watercare says the soil there does not cope well with septic tank discharges... The proposed plan would also ease the strain on the western interceptor, the main pipe from Waitakere City to the Mangere plant, which is expected to reach its capacity by 2005. That easing would reduce overflows to the harbours from the interceptor and also from the Orakei main. And the Mangere plant's resource consents limit it to serving 900,000 people – only 150,000 more than those now hooked up to it. During the consultation process over the Mangere upgrading, Watercare developed a preference for expanding its future wastewater-treatment capacity through smaller plants, reducing the need for long and expensive pipelines. It has decided all its wastewater customers (who do not at present include North Shore residents or businesses) would pay for the northwestern plant through their wastewater or council rates bills because of the regional benefits... 140,000... Auckland City residents [already] face a possible 17[%] rates increase to finance improvements to an ageing drainage system where one in six pipes is at breaking point... The draft plan proposes spending \$12.7 million on fixing drains in the new financial year, rising to \$23 million by year four.

...West Aucklanders could pay part of the bill for upgrading the Hobson Bay sewer pipeline – even though the pipe doesn't serve their homes. The two kilometre long sewer, built in the early 1900s, carries about 25[%] of the Auckland region's wastewater from Parnell to Orakei across Hobson Bay toward the Mangere Wastewater Treatment Plant... Exposure to marine elements means the pipe, administered by Watercare, now needs a major upgrade. To repair the sewer pipeline above ground would cost about \$26.5 million, with running costs of \$20,000 a year. A tunnel

would cost about \$47m initially and about \$700,000 a year to run. Householders across Auckland could end up paying for this because Watercare serves the entire region... Watercare[’s] communication manager... says the situation evens out, given that wastewater sewer maintenance in west Auckland is also paid by everyone in the greater region. [The manager points out that] it would be too difficult to decide who gets the benefit of a repaired pipe as a way of allocating costs... [Last] October... Watercare asked the public how it wanted the Hobson Bay sewer pipe to be upgraded... Now the company is doing a more detailed consultation, meaning west Aucklanders can also comment because they will help pay the bill... “This is a very high profile and important part of the network... Because that will impact on everyone, we have to let everyone know.”

...Residents living at Waitakere City’s gateway have been saved from seeing the upper Waitemata Harbour turned into a vast sewage pond. A[RC] has canned a North Shore City Council plan to discharge wastewater from Rosedale Treatment Plant into Oteha Stream, which feeds into Lucas Creek then the upper... [h]arbour. The council planned that this would cater for excess wastewater during storms, while it builds a sewage outfall pipe at Mairangi Bay. But Waitakere City ratepayers’ and environmental groups lobbied against the move, saying they did not want their water muddied. Now that A[RC] commissioners have decided, at a hearing last week, to ditch the application, any discharge from the treatment plant into Oteha stream could spell prosecution. Although the decision is a victory for people power, it doesn’t mean there is no risk of such a thing happening in the Auckland region or upper Waitemata Harbour... [By the way, a]uthorities have still not settled on an alternative sewage disposal site... on Waiheke Island... A stand-by site was promised by the Auckland City Council and last week it said a quarry on council-owned land could be commandeered[, but] inquiries yesterday revealed that the quarry was found to be unsatisfactory and the search was still on for an alternative.

...Golfers on Waiheke Island will eventually tee off on one of the best fertilised courses in the region after the local club agreed to accept sewage sludge to prevent a potential waste crisis. From Friday, land leased by the golf club from the Auckland City Council will begin taking septic tank sludge until permanent facilities are found. The council sealed the deal yesterday after weeks of searching for a suitable site... The council intends using emergency provisions of the Resource Management Act to begin dumping immediately and seek approval for at least 12 months’ operation... A Waiheke couple may provide a long-term solution... if they establish a 40ha disposal site, but they face a lengthy consent application process.

...THE announcement curdled in the veins of local environmental lobbyists and had at least two government ministries vowing to fight. Last month the Living Earth company... announced its desire to turn Aucklanders’ sewage into garden compost. With its larger rubbish-disposing partner, Waste Management Ltd, it has formed the Living Earth Joint Venture, a company which already sells compost made from human excrement in Wellington, and has its sights on Christchurch’s sewage-treatment byproducts. As international demands grow for cleaner waterways, the mountains of sludge being extracted from sewage are growing rapidly. But that coincides with vociferous calls for reduced waste volumes through better management and recycling. [‘Treated effluent from the Rotorua wastewater plant is used for forest irrigation – the scheme won an Institution of Professional Engineers of NZ (IPENZ) Environmental Award for Works Consultancy Services in 1992’ – but p]olicy advisers in the Environment Ministry and the Agriculture and Forestry Ministry are nervous about sludge being returned to the soil when it harbours contaminants which could enter the food chain if the land is later used for grazing[(‘NZ authorities won’t allow treated sewage to be used on dairy farms’)]. They are particularly concerned that the Wellington City Council has raised the allowable contaminant levels for this compost, against the advice of its officials. Groups as diverse as Federated Farmers and environmentalists Friends of the Earth fear the precedent set in Wellington will be replicated nationwide, threatening our meat and dairy trade to countries with stringent contaminant levels on their imports, and possibly leaving contaminated sites for future generations... Decades of reliance on superphosphate have built up cadmium in sheep livers to the degree that those from animals older than two and a half years cannot be exported. Considerable effort has gone into reducing cadmium in superphosphate and the ministry does not want to see that work undermined. It wants farmers using biosolid compost to be required to lodge management plans... Set against those concerns are the opinions of two heavy-metal experts... who gave evidence for Living Earth when it applied for resource consents for the higher contaminant levels. They insist that if the correct amount of compost is applied to the soil, it will take longer than 25 years – the duration of the resource consent – before the contaminants exceed... guidelines. In that time... more research should have been done and the heavy metal content in sewage should have been reduced sufficiently by environmentally conscious local bodies to eradicate any long-term problems... For scientists like [the heavy-metal experts], it is a question of balancing the risk of contaminants against the benefits of recycling the rich nutrients in the sewage sludge. It also solves the problem of what to do with the ever-increasing mountains of sludge. As sewage treatment became more common and more efficient, mountains of biosolids piled up across developed countries. The solution to one environmental problem created another. Pumping it out to sea, bulldozing it into landfill or burning it all damage the environment. Plough it back into the garden? Now that was a possibility. Surely that is what nature intended. Dung from humans and animals has been recognised as valuable fertiliser for thousands of years. The problem is that human waste, which can be rendered unhygienic within about 30 days, gets mixed in the same... system as the chemicals and heavy metals from industry, household detergents, cleaning products and even dyes from cheap, imported T-shirts. But before marketers had any chance of convincing the average home gardener to take a bag of it home for the tomatoes or the petunia patch, they had to come up with a more palatable name. After the American spin-doctors got elbow-deep in it, the fetid, slimy leftovers from treating raw sewage became known by the more palatable term, biosolids. What it is, of course, is excrement, mixed with the heavy metals from stormwater runoff. Auckland’s Mangere sewage treatment plant produces around 100 tonnes of biosolids daily. The new, more efficient plant will extract three times as much. Right now the sludge, which is treated and has lime added, is mostly being used to restore the coastal areas around the old plant. But Watercare Services, the company owned by the six greater Auckland councils, knows that before long it will have to find some other way of disposing of the biosolids... North Shore City, producing 20 tonnes of sludge daily, is facing the same question, as is Rodney District (eight tonnes). Both dump it in landfills.

...It would be hard to find a town that has less in common with the heaving metropolis of New York. But for a decade, small, dusty Sierra Blanca, Texas, was linked to New York in what most would consider an unfair relationship: the city literally dumped on it. No longer. The train bringing the human sewage and industrial waste from New York that... had been spread over the Texan desert, has stopped. As people will tell you with mixed feelings the Poo-poo Choo-choo doesn’t stop here any more. “We have been trying to stop this for years so we are very pleased,” said... a local store owner and a key figure in the campaign to stop Sierra Blanca acting as the world’s largest sewage dump. “After it rained it would smell, it was foul, there was a faecal stench. But it was also damaging to our health. It contained a toxic soup of chemicals. It was like holding a gun to our children’s heads.” The contract to spread sewage over 33,000ha of high desert range was won by a Long Island-based firm, Merco, after Congress... stopped the city pumping its sewage into the Atlantic. Since then more than 350 tonnes of sewage has been transported to Sierra Blanca daily. But New York officials have now decided the operation is too costly, which is bad news for the sludge’s new destinations – Pennsylvania and New Jersey... [In local news, w]ork has begun on six giant reactor clarifiers to clean effluent as part of N[Z]’s largest civil engineering project, the \$450 million Mangere sewage purification works upgrade. The 77m-wide clarifiers will biologically remove organic and chemical nutrients from the raw sewage after treatment in screening and settling tanks. The reactor clarifiers will be more efficient than the existing four fixed-growth reactors at the works, which will ultimately make way for three more reactor clarifiers. The nine reactor clarifiers will be able to extract four times the wet sludge that the fixed-growth reactors now remove, about 100 tonnes a day. The improvement in the solid waste removal process will go a long way towards improving the quality of the treated effluent discharged from the works... “The big challenge is keeping the existing plant running while we are upgrading it at the same time,” said a Watercare Services spokes[person]... The first anniversary of work passed last month with the 250 Project Manukau workers celebrating no accidents for the year. After clearing the reactor clarifiers, the effluent will be filtered and disinfected by ultraviolet light... From the works, the treated effluent will run to a point near Puketutu Island, where it will be discharged at high

tide twice a day from six outfalls in a rock wall at the rate of 25 tonnes a second. More than 600,000 cu m of spoil – about three times the amount of dirt excavated for the Sky City casino – was removed from the site of the reactor clarifiers. The spoil has been stored in a 12ha carefully monitored stockpile 15 m high so it can be returned to the site for landscaping to partially conceal the completed reactor clarifiers.

...An eight year programme to dramatically improve the Wastewater system in New Lynn will have a major effect on the system's efficiency and will save ratepayers money. The work will renew or replace up to 90% of the wastewater... network, which is one of the oldest in the city and highly susceptible to inflow and infiltration of stormwater. Infiltration occurs when water seeps through the ground and into cracks in the pipes... [The] rate can be much greater in areas that have pre-1960's ceramic waste-pipes... Inflow occurs when water enters via low-lying gully traps, broken [hu]manholes, or roof downpipes connected to the system. Rainwater should flow to the nearest body of water at no cost. When it gets into wastewater, however, it flows to the Mangere treatment plant and we are charged. This increases costs, reduces the network capacity and leads to sewer overflows in wet weather... The New Lynn programme started two years ago in Miro and Nikau Sts... Flow monitors, rain gauges and closed circuit television were used to determine whether extra water was getting into the sewer system. Existing pipes were then replaced with welded polyethylene pipe which have reduced peak flows in the... network by 25[%]. Residents... can help achieve further improvements by following a few simple steps. • Ensure household gully traps are 25mm above ground... • New toilets should be the 6/3 variety (6 litres for main flush and 3... for a half flush)... • Fit volume control devices to household taps; there is no noticeable difference in water flow, and you will save... on your water bill.

...Having read about the necessity to conserve water and suggestions in the press and by circulars from the Waitakere City Council, I have assiduously followed their suggestions, expecting the savings to show on my water bill. Alas, my latest bill contained an item "balance of minimum charge". This was not only charging me for the water I had saved but GST was added to it. Surely this is a contravention of the Fair Trading Act? How can GST apply to water not delivered. Can any[one]... enlighten me? I rang the Waitakere City Council and was told I should use more water!

...Rain, rain, rain. We get our fill of it in Auckland, watering our parched gardens and making manicured lawns wet and soggy. Everyone knows that rain is necessary to life. But it's easy to see just what a waste all that rainwater is when its ultimate destination is an underground stormwater system via guttering and downpipes. In fact, if every household collected rainwater on a daily basis, 65[%] of average water needs could be met free – courtesy of Mother Nature. People have relied on rainwater for household, landscape and agricultural uses for centuries. As communities have grown and become more centralised, community water treatment and distribution systems have gradually replaced the collection of rainwater as our primary water supply system. Yet, as sustainable use of water worldwide has become a major issue, there has been a renewed interest in collecting rainwater. And think of the major benefits to you and/or future generations – saving on council water charges, reducing flooding, reducing wet weather sewage overflows, and helping to reduce pollution of our beaches and waterways. Local authority public water supplies should always be used for drinking, food preparation and kitchen use – and if you are intending to drink rainwater, it must be appropriately treated... Several types and sizes of barrels and tanks are available to install into domestic homes, ranging from 200 litres to 9000 litres. They can be installed on ground level or wall-mounted, or set under a house for aesthetic purposes. A building consent is generally not required for garden irrigation rain tanks, but is needed for all household plumbing. Tanks larger than 6000 litres may additionally require a resource consent to ensure that they meet certain criteria, such as distances in relation to boundaries. If you do install a rainwater system, there are several 'must do' tasks. 'Not suitable for drinking' signage must be fixed to all rainwater system faucets, and backflow prevention devices should be installed to stop possible mains water contamination... Remember, the installation of a 4,500 litre tank for collecting rainwater from a typical Auckland roof can reduce peak stormwater flows by... 35[%], so it's definitely worth the effort... The amount of rainfall you can collect is solely dependent on the size of the surface area and the amount of rainfall. As an example, on the North Shore where the annual rainfall is 1200mm, a 150 sq metre roof can comfortably collect 180,000 litres of water per year – or an average of 500 litres per day. That is more than enough to cover... garden, laundry and toilet water needs... [Incidentally, after] the \$2.2 billion Getty Museum was completed in Los Angeles... it was not until the public started complaining that the experts realised they had forgotten to include public toilets in most of the building. Not that we can afford to be too smug about this bizarre oversight. Auckland didn't do much better when it came to... [the] \$125 million tart up of the Viaduct Basin. Certainly there was provision for public super-loos in the waterfront redevelopment plans, and yes, appropriate piping was installed during the makeover. But of the above-ground business end, there was no sight. For reasons which I still can't understand, the powers that be paid for the toilets, had them built and then decided not to install them... Fear of over-use, perhaps. Whatever, it took a flurry of public complaining and unsightly peeing off the back of yachts before the pristine dunnies were moved out of storage and into use. Then, of course, there's Aotea Square. Wait until you reach that popular meeting place and seek out a toilet and you are in trouble. There isn't one. There hasn't been one since the old underground one got bowled... during the construction of the Force Entertainment Centre. What have the "caught short" done since? Well, not unnaturally, they seek relief in the neighbouring Aotea Centre or Town Hall or Force Entertainment Centre. Not that any of these public venues greet those in need with any warmth. Certainly there are no directional signs from the square, and, as a city council report admits, "it would be fair to say that general use of those toilets is not encouraged." Now, after many complaints and much report writing by planners and managers, Aotea Square is to get an \$80,000 plus GST, two-seater, unisex, 24-hour dunny all of its own... [I]t sounds as if the new Aotea relocatable is part of a renaissance of city conveniences... Next for the unisex revolution are the grotty High St [guys'] toilets in the Victoria St carpark. Electronic counters reveal that, with 300-400 users a day, they are, with the ones in the Big Pinky at the corner of Wyndham and Queen Sts, the city's most popular relieving spot. As far as the Big Pinky loos go, they are to get an interior upgrade and, like High St, become a 24-hour facility. And best of all, they'll remain free.

...Piha residents are kicking up a stink over whose plan should be used for new public toilets at the beach. The Waitakere City Council wants to build two toilet blocks and changing areas at the northern end of the settlement. It aims to improve facilities for the hundreds of thousands of people who visit the area each year. [One b]ach owner... says the council supported a resident-backed design for composting toilets with deep holes. But the A[RC] thinks this could see dangerous nitrates seep into ground water and on to the beach. The regional council favours a system which would filter waste and divert the residue to underground storage areas close to the beach. The waste would lie close to the surface where it could evaporate. [However, the bach owner] says that would prove equally damaging to the environment, and create no-go areas. "The sand dunes at north Piha got special mention in the Piha Coastal Management Plan for their high ecological values... It seems nothing short of vandalism to use the sand dunes for effluent disposal." The... regional council has the final say on the plans because the toilets will be heavily used... [The city council's] senior public affairs adviser... says consultants have been hired to try to find a solution acceptable to all. Before then [the bach owner] wants Piha residents to think about other possible solutions which are as environmentally-friendly as possible... [● I r]ecently... had an exciting time at... [the] public toilets, by the busy corner of Great North Rd and Ratanui St. It has several mod cons, such as doors which open and close at the push of a button. I was sitting there minding my business when the door shot open. That pushed my button, and I gathered my wits – and clothes – fast.

...CLEAN clothes, a wash and going to the toilet are about to be a lot more expensive. Metrowater bills are to rise 17[%]. That means most households will pay about \$100 more a year... The increase comes on top of a proposed rates increase of nearly 20[%]. Increased bulk water charges from Watercare Services are being blamed. Metrowater[s] communications manager... says Watercare increases are "significant". And Metrowater also needs to fund a capital works programme to reduce sewage outflows into the harbour and to replace old sewage pipes. The future of Metrowater remains uncertain. The Water Pressure Group says it has thousands of members opposed to the high cost of wastewater charges,

and councillors are divided over its... [value. Two] councillors both resigned from Metrowater's board last week so they could vote on Metrowater's future without a conflict of interest. [One of them] says rates will go up if Metrowater is scrapped, but will still be lower than the present rates and water charges added together. But [the communications manager] says a council report earlier this year shows rates will jump 28[%] if Metrowater becomes a non-profit making council business unit. [The manager] says the water component of rates dropped an average of 20[%] when Metrowater formed in July, 1997, although housing valuations – and consequent rates increases – kept rates bills up.

...Auckland City councillors have voted to bring Metrowater's wastewater charges back into rates – a move which would push rates up 28[%] on top of a 10.5[%] increase already proposed. Yesterday's vote was by the council finance committee, and any change has to be approved by the full city council. All 20 councillors are members of the finance committee, and if they vote as they did yesterday, the change would be approved 11 votes to 9. But two councillors... say they could change their votes if a Metrowater tariff review meets their approval. The city-owned water company will brief councillors tomorrow on a plan to cut its annual fixed charges from about \$250 to no more than \$50 and increase the unit cost of water... If wastewater charges were returned to rates, the city council would pay Metrowater a lump sum – council officers estimate \$75.5 million – for wastewater disposal. The amount charged to ratepayers would vary according to the rateable value of their properties. Some households would pay more in rates for wastewater disposal than they would pay directly to Metrowater, others would pay less... Winners would be big families in areas with low rateable values... Schools, community organisations and charities would also benefit, but most businesses would pay more.

...Papakura residents face an 11.3[%] rise in water and sewage bills, the first increase... by their foreign-owned supplier, United Water. This means a rise of \$48 a year, to \$474, for an average household using 190,000 litres of water... [The new tariffs were being set] in anticipation of wholesale increases... by the region's bulk supplier, Watercare. But [United's] general manager... said its water charges would remain the region's lowest[– although the manager] could not say the same of the sewage tariff, which Manukau City will undercut by \$34 a year. Papakura residential customers will, however, pay about \$36 less a year for wastewater than Auckland City households even before Metrowater raises its tariffs... [In related news,] Waitakere City Council staff, consultants and landscape architects involved in Henderson's... Paremuka reserve and lakeside development rolled out their picnic blankets for a (slightly chilly) celebration last month. Paremuka won a prestigious planning and design award for its development and management plan at the annual awards of the NZ Institute of Landscape Architects and the Landscape Industry Association. The Council has transformed the Paremuka development into an ecological and recreational asset for the City, incorporating [hu]man-made stormwater ponds, now frequented by ducks. "It's a first in N[Z] to take an integrated approach to ecology, recreation, urban development and stormwater quality and flood management," says [the c]ouncil's landscape development service manager...

Waitakere City Council projects featured highly in the A[RC]'s Environment Awards last month. The... Manawa Wetlands project in New Lynn saw it clinch an 'Action Award' for its "huge impact on the local community and environment". The five judges, representing a range of business, rural, community and educational interests, said the project successfully integrates sustainable land and water quality practices with urban and economic growth. "The Council did a considerable amount of consultation during the course of the project and has taken a degraded area that was being used as a landfill and restored it to visually pleasant wetland that provides improved stormwater management and enhances wildlife habitat,"... The Council was also an award finalist in the Education category with its *Dont Trash It, Stash It!* campaign – which aims to raise awareness amongst... children about the consequences of littering[– and]... won a 'Product/Service Award' for its *Sustainable Home Guidelines*.

...[a] Sydneysider... and his wife... started renovating their bathroom and kitchen – and ended up with a household that relies on rainfall for water, energy from the sun and takes care of all its waste. [The Sydneysider] has written a book, *Sustainable House: Living for our Future*, about their experience and opens the house to tours. The book has nearly 200 pages, lots of facts and appendages and the costs in 1996 when the work on the house was done. Much in it can serve as a guide to folk here who care for their environment; much makes economic sense for everyone... The two-level house on a tiny 130 sq m site is still connected to electricity, gas, water and sewerage. No sewage leaves the site, though, and virtually no stormwater. It is not quite self-sufficient in water, but it provides most of the energy for cooking, heating and hot water... and their excess... electricity generation... goes... into the national grid... [The couple] spent \$A165,000 on the bathroom and kitchen – about a third of that on the energy, water and waste water systems... "The eventual cost was way more than I had wanted but, in the end, I accepted that a few extra years on the mortgage was a small price to pay for the satisfaction of knowing that we, as a family, at least had done all that was possible to minimise our contribution to the destruction of the Earth." ...It would have cost... \$20,000... less if what they installed was going into a new house... Their water and energy bills were \$1600 a year and rising; now, less than \$200. The kitchen has fluorescent lights... [and w]indows are sited over work areas. There are recycling bins, and a compost bin for vegetable waste... Clothes are dried in sunshine, when possible, rather than in the clothes dryer. Rainwater goes into a 10,000-litre buried concrete tank and is pumped back into the house... "Waste" water from the toilet and down plug holes is not wasted. It goes into a buried wet compost system which uses soil filters and insects and worms to break it down... Even newspapers and cardboard are composted by the waste water system... It is then recycled after being disinfected by an ultra-violet lamp... A dual-flush toilet uses the recycled water ("a colour like that of weak tea, and it is getting steadily clearer") and it is clean enough to be used in the clothes washer. It also irrigates the garden. Of course all of this work needed local body consents and the book contains advice on dealing with councils.

...FINDING worms down your toilet could be pretty disturbing, a sign of extremely bad housekeeping to say the least. But in the '90s worms, microbes and dirt down your loo are signs of an environmentally conscious homeowner. It's becoming more popular to install self-sufficient, on-site sewerage systems in far-flung residential suburbs and country areas where councils are no longer willing, or perhaps able, to deal with the problem. And it's no longer as simple – or smelly – as digging a nice, deep hole in the ground and putting an outhouse roof over it... While much of the population of the Auckland region has its water and sewage reticulated, the pipelines service only about 25[%] of the region. Rural areas have to rely on rainwater or bores[, and many rural houses still enjoy]... the best views of the bush and coastline... from... a toilet seat at the top... [of those nice, deep] holes in the ground... Most holiday and rural places, though, now have flush toilets inside sending human waste (blackwater) and what is going down the plug hole (greywater) into an underground holding area – usually a septic tank – for treatment and dispersion by soakage into the earth... Heavy solids sink to the bottom... [of] a septic tank... lighter materials float up and separate. What's not broken down – like grease and detergent – stays in this tank and must be removed by a professional septic tank cleaner... [B]leach or disinfectant... is... not... recommended for washing [septic tanks]... Multi-chambered septic tanks improve the quality of the final product. This is done by splitting up the waste water – say, to grey water... and black water... – or by adding filters of some kind... Sometimes the waste goes into more modern dehydrating, incineration or chemical containers... The alternative waste disposal systems in N[Z]... often combine several of the methods described... One treatment system on the market which is an alternative to septic tanks is bioCYCLE, consisting of an 8000-litre capacity, 2.2m high by 2.4m diameter tank, which is buried. It processes wastewater to an odourless liquid which is clean enough to irrigate plants, native bush or lawn (not paddocks, where stock can damage lines, nor among vegetables for eating). A pump takes the liquid through irrigation drip lines... Auckland-based bioCYCLE North[']s... slogan is "turning your 1s and 2s into trees"... The company says... the system suits houses on lifestyle blocks and frequently used holiday homes and, by treating up to 1200 litres a day, will cater for up to 10 occupants... It can be installed for little more than \$8000... compare[d] with the \$5000 to \$11,000 for septic tanks... The bioCYCLE system's plant requires servicing every six months (the first two without charge) costing about \$90 a time. [But the] company says that cost should not make other apparently maintenance-free systems more attractive, because the expected national standard is likely to make maintenance of every system compulsory to ensure it is working efficiently. Its system, however, slows the build-

up of sludge, which delays cleaning out for 15 to 20 years. By comparison... a septic tank leaves at least 60[%] untreated and also needs cleaning regularly – every two years is recommended, every three years is required in Waitakere City and other councils are considering “warrants of fitness” to ensure regular cleaning. Each clean-out costs \$600 in Manukau City, for example... *SAND FILTERS* Works on a similar premise to a septic tank, but uses beds of sand as a filter system. Sand and gravel filters produce a high quality end product. It’s been done for centuries and the modern sand filters are descendants of mid-1800s “sewage farms” where waste was efficiently filtered through sandy soil. Waste water is distributed over the sand and gravel beds, which can be buried, free standing or recirculating filters with an electric pump. One drawback is they need regular maintenance... The Dowmus system treats waste water (from kitchen, bathroom and toilet) and organic waste (food scraps... cardboard... paper and... sanitary products... [– although, I]like any system, sanitary napkins, tampons and condoms cause blockages...) using decomposing organic material as a biological filter. It is much the same process as occurs in a natural wetland – water is purified as it passes through layers of decaying plant matter. Using ordinary household plumbing, waste is carried to a tank filled with a natural ecosystem of micro-organisms, bacteria, bugs, beetles and composting worms, which improve the aeration and drainage of the biomass and help convert the solids into humus. An activity sand filter then treats the waste water to a standard suitable for garden irrigation... Dowmus systems range in price from \$8500 to \$10,500 plus GST, for a system capable of dealing with up to 960 litres of waste water per day... *AERATED TREATMENT SYSTEMS* Introducing oxygen into the holding tank... with a bubbler... increases the aerobic activity of the microbes at work and speeds up the breakdown of waste matter. Aeration systems usually incorporate several chambers and filters. This system doesn’t need much space or land. However, the need for a continuous electrical supply (to run the aerators) can cause problems if there’s a power cut. This type of system goes head to head with Dowmus. It is different in that Dowmus separates fluid from solid in the primary chamber where aerobic breakdown occurs... *COMPOSTING TOILETS* This is like an advanced model of the old-hole-in-the-ground outhouse and is particularly robust. In this system human waste is collected and turned into compost using natural or controlled dehydration processes. Microbes and animals like worms might be added to help the decomposing process. The composted material builds up in a vault and must be removed about once a year after which it can be... dug into the ground... *ELECTRIC TOILETS* Using an electric coil these toilets incinerate human waste and are useful when the land is too small to provide necessary dispersal space or when the soil is unsuitable. The waste is burnt and fumes are removed via a ventilation stack on the toilet’s outside wall. Ash needs to be removed about once a week.

...Waitakere City residents are warming to free firewood provided by the council. The wood is available at Waitakere’s refuge transfer station. The two-year-old service is aimed at families who struggle to buy firewood during winter... The council’s environmental management committee chair[perso]n... says anything that reduces the amount of waste sent to a landfill is good, and helping families out makes the scheme even better.

...The cold of winter is here, and the heating appliances have no doubt already been dug out of the basement or spare room and plugged in or fired up. Wood has been collected and stored, and the fire has probably been lit once or twice – the evenings and early mornings have been pretty chilly a couple of times already. However, it’s not simply a case of starting up where things left off at the end of last winter. Winter is the most dangerous time of the year for fires in the home, not least because many people don’t take fire safety issues as seriously as they should... One of the major dangers comes from heat sources and combustible materials being in close proximity. Heaters should be at least a metre from curtains, bedclothes, furniture or drying washing. Heating equipment should always be installed by qualified trades people and regularly maintained in accordance with the manufacturers instructions. Open fires should always have a fire screen in front of them, to keep children away and prevent sparks from landing on a carpet or hearth rug. Even with a guard, children should not be left unsupervised in the vicinity of open fires or heaters. Ashes should be allowed to cool before being placed in a metal container outside the house. All flames and embers should be extinguished before leaving the house or going to bed and the flue or chimney should be cleaned at least once a year to prevent the build up of flammable material. When refuelling kerosene heaters, only kerosene should be used and refuelling should only be done in a well-ventilated area... Prevention is a first line of defence against fire, but these precautions, however vigilantly they are observed, don’t preclude the necessity to install suitable and sufficient fire detection devices. A smoke alarm should be installed in each bedroom and living area, as well as the kitchen, and on each level of the home... Alarms should be tested every month, the batteries changed at least once a year and alarms gently dusted with a brush or vacuum cleaner every six months. Whilst smoke alarms are an essential tool in early detection of fire, they are only effective if a full evacuation of the house is achieved quickly and safely... Winter’s onset [also] means an increase in the use of... electric blankets... Electric blankets can be a wonderful comfort in cold and damp weather because they not only warm but dry out the bedclothes as well. A manufacturer’s brochure once stated that up to two litres of water can be removed from bedclothes... This was concluded because the bedclothes were weighed before and after a test... From my own experience of testing electric blankets when I was working for the old Power Board my records showed that one out of every six blankets were faulty. Problems included faulty controls, exposed wiring, broken wires touching and arcing intermittently and other hot spots caused by the elements moving out of their proper pattern. A report appeared in the North Shore Times Advertiser which said that the North Shore Fire Service attends fires caused by electric blankets about once every six weeks during the cold period between Queen’s Birthday weekend and November. Their Safety Officer suggests blankets should be checked annually. The Fire Safety Officer is also reported as saying that people wake up between 4 am and 5am – when it is cold and switch the blanket on full. In the morning they wake up again and [forget to switch off the electric blanket in their] rush to get to work, [although they usually have time to turn back the] bedclothes... leaving them all bunched up on the bed. The electric blanket itself may be scrunched. As the result of this many electric blanket fires start in the early afternoon after the weight of the bedclothes or the concentration of heat in one area has started to smoulder. I make motel clients aware of a similar problem when their guests might put heavy suitcases on a bed, switch their electric blanket on full and leave the motel for a period.

...Home owners can now install a wood fire into a timber surround without fear of it going up in flames[– by using a] special ‘Zero Clearance Kit’[, which]... utilises heat absorbent materials and construction techniques that enable the wood fire to snuggle up closely to timber and plasterboard... There has been a strong trend towards making the fire unobtrusive in the home, by setting it into an existing fireplace or creating an inbuilt look in a brand new house. But until Masport developed the Zero Clearance Kit... for N[Z]’s most popular inbuilt wood fire, the LE Provincial... – the LE... stands for Low Emission... [–] inbuilt wood fires could only be installed in traditional chimneys... The LE Provincial is not only the biggest selling inbuilt wood fire in N[Z.] it is also one of the easiest to install, with minimal hearth clearance requirements... The quality cast iron materials used in the construction of the LE Provincial are so good that Masport guarantees the fire for ten years.

...Masport is pioneering a healthier way to enjoy the warmth of a gas fire in N[Z] homes. It’s called Direct Vent technology and Masport is promoting it as the most effective method of eliminating harmful fumes from living areas that can result from a poorly vented gas fire. With Direct Vent, the firebox is airtight and no fumes can escape into the room. All the air required for combustion is drawn through a specially designed twin-sleeve flue and then vented back outside. “Direct Vent is... a must for anyone suffering from asthma...” says... [the] Sales & Product Manager, Gas Heating, for Masport Limited. “...But even if you are not an asthma sufferer, Direct Vent is much healthier...” That’s because a non-vented gas heater doesn’t just leak fumes, it also creates moisture and can lead to dampness inside a home, which is equally unhealthy. Another advantage of Direct Vent technology is that the efficiency of the gas fire is not affected by changes in pressure within the home. Air pressure can vary dramatically due to other appliances, such as clothes dryers, bathroom fans, kitchen rangehoods and even down draughts created by windy conditions outside. Direct Vent also does away with the need for a conventional chimney or vent on the roof since it can be vented through a sidewall. This means that even high-rise apartments can get that warm feeling and enjoy the advantages of a gas fire. Direct Vent can still cater for

those who wish to have a roof vent or mask the flue inside an existing chimney... All Masport Direct Vent gas fires are designed to run off piped natural gas or from bottled LPG.

...Good news guys! There's another remote control to add to that ever-growing collection on the coffee table... Masport research has revealed that homeowners who are used to remotely controlling their TVs, videos and air-conditioning systems are keen for the same convenience to be extended to home heating. Until now the remote controls available with gas fires have only been able to switch the fire on or off. But... Masport... has developed a... remote control... [for the] new Baltimore Premier freestanding gas fire... [that] can precisely vary the flames and heat setting to any level. It also controls the programming function on the thermostat... Furthermore, the Baltimore Premier... features the very latest technology "flame effect" ceramic array, which Masport has spent two years researching and perfecting to ensure it meets consumer demands... Attractive styling is another drawcard for the Baltimore range. The three-sided design, using heavy-duty ceramic glass, affords a good view of the new flame effect log from anywhere in the room, and the black finish cabinet blends with any decor. Masport's technologically-advanced heat exchanger delivers an impressive 81[%] heating efficiency, so that most of the heat stays in the home and does not disappear up the flue... Like other Masport gas fires, the Baltimore range can operate on piped natural gas or bottled LPG... Masport has also designed all its gas fires to continue to operate safely even when electricity is cut to the controls, as in a power cut[– although, obviously, this won't concern you if you've got a back-up power source, such as batteries. Speaking of which, scientists have developed a 'plastic battery (it has no liquids or other non-plastic parts) that is non-explosive, mouldable and will work in a wide temperature range'.

... 'What the rest of the world knows now and what we realised five years ago, was that lithium would rapidly replace the current battery compounds in use today. Lithium batteries are lighter, more powerful, and pack more punch. They are also completely recyclable and contain no harmful or poisonous substances. A fact not lost on the governments of Europe and Japan, who face enormous problems with waste management. The global market is a huge one. And if everyone is going to be switching to lithium batteries? Well, enough said. Pacific Lithium, right now from their plant in Auckland, is producing ultra-high grade lithium. The purest available. This is the product the world's battery manufacturers must have. Better still, we have perfected technology for recycling lithium batteries. As the market matures we will be in the box seat for the demand for this technology. This all sounds fine, you're saying to yourself, but why are we doing it here in NZ, far from the big markets? Well, NZ may traditionally be a great place to grow things, but it's also a great place to grow ideas. And we're proud to be a high technology based industry that's exporting to the world. The Americans and the Japanese have already made the investment (National Panasonic spent 50 billion yen on their new lithium battery plant in Japan). We now invite a limited number of NZers to make theirs.']

...Revolutionary battery developer Pacific Lithium is moving a step closer to its goal, with the reverse takeover of Nasdaq-listed Lithium Technology Corp for \$15 million in cash and shares. The takeover combines two companies with world-class research seeking to commercialise revolutionary battery material and cell-making technology. Initially founded to tap lithium from the sea, Pacific Lithium has since changed tack, focusing on niche production of battery material, based on technology developed by the Massachusetts Institute of Technology... It also earns revenue by purifying high-purity lithium carbonate. Pacific Lithium's co-founder and managing director... told the Business Herald that the merger would bring together the two elements crucial to lightweight battery production, low cost manganese based cathode and polymer technology. The reverse takeover is a precursor of things to come: Pacific Lithium plans to reincorporate, in the US, a private company, called Ilion Technology, which would seek[an] initial public offering and later a Nasdaq listing. Before going public it intends to raise \$US10 million and later \$US50 million. That will be for a new plant in the US and other development costs. Future business development will be done in the US, while N[Z] will be kept as a research base... A battery is made up of three components – the cathode, anode and electrolyte. In the cathode component, researchers have been seeking to replace cobalt or nickel with manganese as the cheaper alternative. That was difficult due to, among other things, obtaining stability when using manganese operating under high temperature. MIT's technology addressed that problem, in theory. What Pacific Lithium did... was to find an efficient and cost-effective way to manufacture... manganese-based rechargeable lithium polymer battery... cathodes.

...Auckland company Pacific Lithium Ltd is on track to revolutionise the development of batteries worldwide, cutting battery costs as much as 75[%]. Pacific Lithium ultimately aims to target the lightweight, high performance Lithiumion/Lithium-polymer batteries to the automotive and marine markets currently dominated by lead-acid batteries... "We see Lithium batteries taking over in a wide range of products, from powerful laptop computers, cellphones and camcorders, to making hybrid electric-powered cars economically feasible..." says [Pacific Lithium's] chief technical officer... "The key is getting new, higher performance lithium batteries produced at a much lower cost than today's generation of lithium batteries." In addition to being cost-competitive, [the chief technical officer] says the new generation of lithium batteries will provide up to five times the performance of traditional technology batteries and could be moulded into specific shapes allowing engineers greater freedom in creating new consumer products. Pacific Lithium... has already completed the first stage of its programme by successfully developing lithium manganese oxide technology, which offers significant cost/performance advantages over existing lithium cobalt-based batteries. Now the company is looking to go to the next stage by producing new ion and polymer materials that are much cheaper. Those plans have received a major boost after Pacific Lithium was awarded one of the first New Economy Research Fund (NERF) investments from the Foundation for Research, Science and Technology (FoRST). The NERF Tender Process attracted a huge level of interest, with FoRST receiving 214 applications requesting \$110 million for the \$11.25 million of funding available for investment. Pacific Lithium was among a small number to receive... \$675,000 in... NERF funding... Pacific Lithium is in the process of merging with Lithium Technologies Corporation, a NASDAQ bulletin board listed company.

...If all goes well on New York's Nasdaq stock exchange next year, [an] Auckland entrepreneur... believes [it] will make more N[Z]ers into millionaires than anyone before him... Such an attitude is ambitious for a business that employs just 40 people in Auckland and 20 in the U[S]. But it is the kind of global vision N[Z] needs to turn around 40 years of relative economic decline, dramatised lately by the crashing kiwi dollar... [The entrepreneur] plans to raise \$US120 million... from the January listing of Ilion Corporation, formerly Pacific Lithium. [Pacific Lithium's co-founder] aims to develop a cheaper, more powerful lithium battery system that could... achieve the company's vision of "a world powered by renewable energy." ...[the entrepreneur] started out in his family's company, T & T Childrenswear, and ran other businesses. "But there was no purpose in just making money. I wanted to do something more worthwhile. This opportunity came along with lithium, and I put a stake in the ground." [The entrepreneur] raised \$2.5 million and started building a lithium extraction plant in the Firth of Thames. Then in 1995-96 the price of lithium plunged when a new source came into the market. Pacific Lithium had to change tack completely. It shelved the Firth of Thames plant and refocused on producing the world's highest-quality lithium and battery materials, initially for cellphones and laptop computers... The company built a processing plant at Manukau and began a joint venture with a Chinese province that has the world's largest unexploited lithium resource. Pacific now imports all its lithium carbonate, refines it, and exports 100[%] of its output, mainly to Japanese lithium battery manufacturers.

...[A group of companies including Challenge is investigating ways to extract chemicals such as high-grade silica (that can be used to whiten, brighten and increase the opacity of paper to stop light passing through it; Challenge was close to applying the chemical as a filter and coating for paper production at its Tasman mill – the silica-coated paper would have specialist uses in high-quality inkjet or laser printing) and lithium from the water that is a by-product of geothermal power generation. The group is using ground-breaking technology that has been patented by an associate of listed investment group Pure NZ.]

...a little Dunedin builder which started out in 1909... [and today] employs 7000 people... built Auckland's Sky Tower and Casino, Wellington's Te Papa Museum... and the city's new WestpacTrust Stadium. It is just finishing Auckland's tallest... office block, the Royal & SunAlliance Centre, in

Shortland St... [and is about to commence work on NZ]'s biggest new hospital, a \$420 million project. [Challenge] Construction's part of the project will bring it \$150 million. Work at Grafton will result in a... 710-bed hospital in a single 70,500 sq m building. The acute inpatient services of Auckland, Green Lane and National [Gals'] hospitals will be housed in the new centre. [Challenge] was well-qualified to get this job: it has built... an estimated \$2 billion worth of hospitals and healthcare facilities around the Pacific Rim[, including]... some of the largest new hospitals in A[US], such as the \$A60 million St George private medical centre in South Sydney and, across the bridge, the \$A55 million North Shore private hospital... But these projects [we]re just small-fry for the country's largest building company... The scope of its work in[cludes]... the \$US1 billion Getty Centre outside Los Angeles (one of the world's largest museums, bankrolled by one of its richest families), w[hich w]as a hard act to follow. Having gone on what one... executive calls "our intergalactic phase," the company is but a shadow of the firm which put up the sail-shaped Burj Al-Arab hotel in Dubai. It has pulled out of the U[S] and Middle East and retrenched its A[US]n operations. But even scaled down, [Challenge] Construction is still a real knockout. If you need convincing: the firm is undertaking the two single largest capital works now on in N[Z] and all in the face of a relatively uncertain future. [Challenge] Construction is a division of... Challenge Building, which is expected to be split away from parent... Challenge and become a stand-alone company. This week... Challenge confirmed that Credit Suisse First Boston had been appointed to [Challenge] Building after successfully selling [Challenge] Paper (to Norway's Norske Skog for \$5.1 billion). It is expected that [Challenge] Building will also be sold. [Challenge Energy and Challenge] Forests could go the same way. What is certain is that [Challenge] Construction... remains at the forefront of the construction industry here. It is our one true star, shining bright as ever... The firm's single largest job is at the Manukau wastewater treatment station, where it is part of a consortium... [that comprises NZ] engineers and consultants B[CH&F]; the world's largest wastewater consultants, Ch2M Hill, of Denver; A[US]n builders Bovis Lend Lease; and French firm Lyonnaise Des Eaux which operates water and wastewater treatment plants worldwide. The... vast 500ha... oxidation ponds will be cleaned and returned to the Manukau Harbour... During the past 30 years, sludge has accumulated on the floor of the ponds. This is being vacuumed up by a fleet of dredges and pumped through long flexible pipelines to a processing area. After shells and silt are settled out, the sludge is conditioned with mixers to give it a uniform consistency. It is then spun in huge centrifuge driers to separate out the water. The solids are being dumped in a 24-hour-a-day operation running seven days a week. The job is scheduled to be completed in 2003-2004. [Challenge] Construction's second-largest job is building a 10km tunnel under the mountains in Fiordland. This is to create a second tailrace to move water between Lake Manapouri and the Tasman... Vertical turbines are driven by water from both Lake Manapouri and Lake Te Anau. The head of water to drive the turbines is achieved not by the usual dam, but by using the 178m difference in levels between the lakes and the sea at Doubtful Sound. The second tailrace tunnel is needed to increase this flow to the sea. The existing tunnel does not move enough water through the power station to achieve maximum power production. To build this second... tailrace, [Challenge] Construction is using a tunnel-boring machine which has an impressive 10m diameter and literally cuts through the rocks under the mountains... Four crews of 16 work this machine round the clock. The workers have their own camp and complete 15 shifts before taking five days' leave.

...[delays in constructing the second Manapouri tailrace are expected to cost Challenge 'millions of dollars due to time-penalty clauses in its contract. The delays are due to problems the borers are facing while passing through the multiple faultlines which are a feature of NZ's Southern Alps (apart from the risk that the soft faultline rock will cause the ceiling to collapse, it allows water to enter the tunnel, threatening the borer's sophisticated electronics) and the hardness of the remaining rock (the boring machine's teeth have to be replaced every few metres).'] However, the lessons learnt in NZ will enable tunnels to be bored through other hard rock mountains – such as those in central Europe – so the company may be able to recoup some of its lost profits by acting as advisers on those projects. □ As Manapouri's second tailrace nears completion, Meridian Energy has unveiled the g[r]andest plan yet for the great Waitaki...

When the state-owned power generator ECNZ was split into four companies[, the newly formed] Meridian Energy found itself with one of the jewels of N[Z]'s energy system, the Waitaki River. The Waitaki catchment covers a vast area of the South Island, with an interconnected series of lakes and canals giving Meridian the means to use the same drop of water to spin turbines at eight different power stations. Between 1935 and 1985, the Government spent billions on works designed to extract as much electricity as possible from the river. Ministry of Works engineers built a network of stations – Waitaki, Tekapo A, Tekapo B, Ohau A, Ohau B, Ohau C, Benmore and Aviemore. Now Meridian has taken the mantle from the Ministry of Works and wants to use the last untouched stretch of the Waitaki to complete the chain. It is calling the ambitious, \$1.2 billion scheme Project Aqua. If built, Meridian will control the river from the snowy heights of the Mackenzie Basin down nearly the entire length of the Waitaki to the coast near Oamaru... [T]he Waitaki Power Station, commissioned in 1935 and one of the last big hydro works in N[Z] built with picks and shovels, [is] a place where [labourers] shifted more than half a million cubic metres of earth and rock to build the massive weir. Meridian hopes the future of electricity generation on the Waitaki will soon take shape just a few kilometres downstream of this historic, yet still functioning, monument to 1930s engineering. A 62km canal will begin near the town of Kurow, diverting more than 75[%] of the water and sending it through a series of six small power stations before rejoining the river a few kilometres from the coast. These stations will supply as much power as the Clyde Dam – around 8[%] of NZ's entire energy needs, or 570MW. It is the biggest single-generation project planned for the next few years. But building Aqua will be different to how the other Waitaki hydro projects were built, for Meridian has to do this one by the book, and there is a new book – the Resource Management Act. The act is why Meridian is in the process of commissioning thousands of pages of scientific reports, investigating the effects of Project Aqua, while consulting with the locals and flying journalists (including this writer) to the site for media tours. Over the past 50 years, Government engineers moved from project to project, building impressive dams and power stations to supply the country's burgeoning need for electricity[('Reefton became the first town in NZ to have electricity in 1887')]. But demand and supply were not closely linked – an oversupply of electricity meant very cheap power for N[Z] and, in the past few years, little or no incentive to build any new stations. The numbers Meridian bandies about are impressive. It says the project will irrigate 39,000ha of North Otago land, inject \$145 million annually into the regional economy and create 1800 fulltime jobs. Around 30 million cubic metres of earth must be shifted for the project to succeed. Meridian[s] chief executive... makes no bones about the fragility of the plan – if [they] cannot get permission to take sufficient water out of the river, the canal will never be dug, and the river will remain as it is... "This project is pretty finely balanced economically... One of the misconceptions is that there are huge profits in this – ...I can absolutely demonstrate that... there are not... [However, y]ou can't spend \$1200 million and get nothing back. You've got to earn enough to pay the interest on the debt, enough to pay off the asset and enough to pay a fair return on the equity..." ...One crucial factor going into the Project Aqua equation is the future cost of wholesale electricity – Aqua will generate it at a cost of between 4c and 4.5c a kilowatt hour. Average wholesale prices for power in the past week ranged between 2.48c and 3.06c per kilowatt hour. The looming depletion of the Maui natural gas field means that thermal power stations – such as those at Huntly and Otahuhu[–] will find their fuel bill becoming more expensive... [Another consideration is that] the South Island will soon be at serious risk of power cuts in the event of a dry year. Energy demand is growing in the South Island, and if the rivers run dry there will not be enough power available from the North Island thermal power stations to come to the rescue. [The]... mayor of the Waitaki District, based in Oamaru, supports Project Aqua, and believes it will be built. But [the mayor] is not an unquestioning cheerleader for Meridian. The memory of high-handed actions by previous governments lingers in this part of N[Z]. "I like to think positively about these developments, but positively without forgetting the things that have happened in the past, when there was some reasonably rugged land acquisition and people were very poorly compensated... I suppose that's in the back of my mind when I think of these things." [The mayor] is inspired by the irrigation plan that will accompany Aqua, with possibly 40,000ha... opened up for more

intensive agriculture and predictions of 1500 new jobs. [The mayor] puts the curious Aqua observer straight onto... an Oamaru architect... if... asked about the reasons for opposition to Aqua... [The architect] is president of the Waitaki River Users' Liaison Group, an umbrella organisation formed to respond to the development... "North Otago, in effect, provides the largest chunk of energy, through hydro, to the country. From that you have to look at what has occurred in the past and ask, 'What has North Otago got out of that?' The answer is three lakes we didn't have before." Meridian wanted to take three quarters of the river's water to use for its power stations, leaving very little to support the popular fishing area. "Surely it is time to leave some natural river section in there for purposes other than just generating income." [The architect] is sure the nation will benefit from Aqua, but feels the local community will "get dorked again". "We think we are sacrificing this great river for the national interest again and again and again. No one is building us a new river." It is the only river in N[Z] that has an adult run of mature chinook salmon, brown trout and rainbow trout.

...A noisy debate pitting Pacific Northwest salmon fisher[s]... against four hydro-electric dams is set to grow louder this month when two federal reports spell out ways to save the dwindling fish stocks. The number of salmon returning to the area from the sea to spawn each year has declined from an estimated 10 to 16 million a century ago to about a million today. In the first report, due out this week, the National Marine Fisheries Service will set binding guidelines for all federal dams in the Northwest, including the four in question on the Lower Snake River in Washington – Lower Granite, Lower Monumental, Little Goose and Ice Harbour. The second report, by nine federal agencies, will make nonbinding recommendations to help salmon recovery throughout the Columbia and Snake River basins, an area that extends into six states and Canada. Dam companies and environmentalists are already promising action if they are unhappy with the reports. Thirteen species of salmon are listed as endangered, and environmentalists, Indian tribes and commercial fisher[s]... claim the dams are their biggest threat. But the dams, among some of the biggest structures in the world, help to power cities from Seattle to Los Angeles, and are central to much of the region's economy.

...LOS ANGELES – Soon after moving to Fallon, in Nevada, [a wife's] husband... started developing skin lesions on his arms. As his condition worsened over the course of a week – it got so bad it began to resemble psoriasis – the couple suspected that it might have something to do with the water supply. They had previously lived in the countryside outside the town, and knew that the water extracted from their private well there was so salty it killed their plants and made it almost intolerable to take a shower. What they did not know at the time was that Fallon and the surrounding area has the highest concentration of arsenic in its drinking water of anywhere in the U[S]; twice as high, in fact, as the federal Government's long-standing legal limit, and 10 times higher than safety levels mandated in most of Europe. Lesions like [the husband]'s can be a precursor to chronic rashes, liver spots and full-blown skin or bladder cancer – all well-documented symptoms of arsenic poisoning. In this case, [the husband] followed his hunch, switched to bottled water, and the problem with his arms subsided. The city has since sent out a number of flyers alerting its citizens to the problem with its water. But his wife, for one, is far from reassured. [The wife] wants to know why children are still given tapwater in Fallon's elementary schools (her two, aged 7 and 5, are under strict instructions not to touch it and take juice to school instead). [The wife] wants to know why the city fathers have bitterly resisted pressure to install a treatment facility and clean up the water supply. [The wife] also cannot understand why [America's] President... has just scrapped new federal standards for arsenic in drinking water – one of the more controversial environmental moves of his Administration. [The wife] also has asked urgent questions about a cluster of leukaemia cases that have broken out in Fallon, affecting 12 children. [The wife] wonders, given the official attitude to arsenic and the profusion of industrial, military and mining interests in this part of northern Nevada, what other poisons might be out there that [residents have] not been warned about... In the dying days of the [previous Democratic] Administration, new rules were at least issued, tightening the legally acceptable level of arsenic in drinking water from 50 parts per billion to the European standard of 10 parts per billion. As a result, Fallon, whose level is around 100 ppb, was ordered to install a treatment facility by 2003 and comply with federal standards or else face fines of \$US27,000... a day. But that has now been undone by [the Republican] President... whose Administration announced last month that it was revoking the new rules on the grounds that the medical risks were not sufficiently proven to justify the costs of installing expensive filtering systems in largely rural, impoverished communities... Fallon is too small to demonstrate the effects of arsenic conclusively – particularly given the controversies surrounding jet fuel from the neighbouring air naval station, mercury from mines near the Carson River, nickel carbonyl from a local car-parts factory, and other poisons coursing through the local community. With just 8200 residents, anything short of a spectacular jump in the number of cancers is likely to be statistically insignificant and lost in the noise of other illnesses and other causes. The cluster of acute lymphocytic leukaemia cases is spectacular (24 times the expected norm), but according to the best scientific knowledge, it is unrelated to arsenic and its cause is still being investigated. City officials find themselves caught between the embarrassment of national exposure as the arsenic capital of America, and an almost preternatural reluctance – driven largely by fear of what it will take to fix the problem – to admit there is anything wrong at all. [The] Mayor... insists there are no documented cases of illness, and stands by the quality of what comes out of his municipal taps. "It's pretty good water... It has naturally occurring fluoride. In fact, it's real pure – outside of the arsenic." Old-timers around Fallon, a farming community built a century ago on reclaimed land from the Carson River, even go so far as to say it is the arsenic that has kept them alive into their 70s and 80s. "Don't get me wrong," [the] Mayor... counters, "arsenic at some level probably is harmful. But why are we treating the water if no one here's been harmed?" Despite his rosy views, however, most Fallon residents have long since switched to bottled water. "I wouldn't give that water to my dog," was a common refrain ...a[n]d it tasted "mouldy, like it's been sitting for ever."

...Never mind whether they're drinking our beer over there, Americans may soon be sipping Waitakere's finest. The west's tap water came out top in a blind tasting at the American Water Works Association annual conference. [The mayor of Waitakere], the keynote speaker at the conference, says after a series of tastings Waitakere tap water was declared the clearest, purest and most drinkable. "Water's the stuff of life and we've got the best there is... It was an absolute triumph for Waitakere and our water company Eco-Water. We were able to demonstrate not only how we've done things but the taste of the product won hands down." [The mayor] says the win has boosted N[Z]'s clean, green image among hundreds of delegates from the U[S], Asia and the Pacific. And [the mayor] believes Waitakere tap water could find a ready market in the U[S] with its "incredible" taste. "We've always felt that the export potential of N[Z] water to the rest of the world is yet to be tapped. It could very well become our greatest export in the future." At the conference, [the mayor] talked about Waitakere declaring itself an Eco City, its approach to water and wastewater management... [The mayor] says many of the cities at the conference are likely to follow Waitakere's lead in water and conservation issues. "With water we have left a lasting image, that in N[Z] there is a city... w[here] a wonderful resource [is] used and managed very well,"...

Waitakere City Council is not considering any changes to the current system for water despite claims from a group call[ed]... Citizens Against Privatisation... [The] general manager of Ecowater... rejects any suggestion that the system for water charging is to change. "They are completely wrong. I can't imagine why C[itizens Against Privatisation] would be doing this, and confusing people, especially after they have been told, time and time again, that this Council does not intend to make any changes to the way it charges for water usage. The only possible explanation is that they are confusing Waitakere's situation with Auckland City (which runs a commercial water supply operation in the form of Metrowater)." The Council's water unit Ecowater is completely different from Metrowater. It is... not... commercially run... [The manager] also points out that Waitakere's drinking water recently won an international "taste" award, and has an "A" grading from the Ministry of Health. "We are determined to maintain that... Of course we could drop costs by dropping the quality of our water, but I don't think most people want that."

...Waitakere City is looking for assurances that last month's problems with tainted water will not happen again. Three of five water supply lakes in the Waitakere Ranges were closed late last month by Watercare... after residents in parts of Waitakere, Auckland, North Shore and Rodney

complained of water that tasted and smelled unpleasant... Watercare said that stocking water in several Waitakere Ranges supply lakes... may [be causing]... the problem. The insulating effect of the extra water is thought to have contributed to higher-than-normal lake temperatures. This helped create favourable conditions for a particular algae. "What is certain is that now it has happened, we know it can happen again. So, we want assurances that the emergence of similar conditions in future, will be responded to and similar problems prevented,"... says... the... General Manager of EcoWater, the Council's water unit... However, despite the unpleasant qualities, the Medical Officer of Health repeatedly gave assurances that the water was safe to drink. Once Watercare isolated these lakes from the water supply network, the City's water was drawn from the remaining two water supply dams, which helped to dilute the tainted water in our network.

...Auckland City will join other councils in the region in supporting a community water-quality programme. Called Waterwatch, it will bring together schools, community groups, landowners and residents to test the quality of local streams and rivers to improve water quality. The council has approved \$50,000 to set up the programme and \$10,000 a year to maintain it... Residents will be asked to look out for water bugs, algae, pollution and litter as part of the surveillance programme.

...When the Mangere sewerage plant opened many years ago, [the then]Auckland Mayor... drank a glass of the treated water... As a beverage it didn't catch on. Who in their right mind would choose to drink treated effluent, however pure, when there was an endless supply of A-grade water flowing from their taps? [The] stunt came to mind yesterday when a Three Kings resident rang to say that Auckland City bureaucrats were continuing a five-year campaign... to switch off water from the protected Waitakere dams, and... force him and 40,000 of his neighbours, to drink... lower-grade bore water from beneath the quarry and the three rubbish dumps of the Three Kings hills. In a report to tomorrow night's council meeting... the manager of utility planning, recommends the council agree "it is satisfied with the water quality" and "that the water is safe to drink." This is a view... two of the consultants to the council-owned water company Metrowater... continue to question. In a late plea to the council they "highlight the fact that the information available is insufficient to draw the conclusion that this water source is safe for human consumption in the long term." ...They point to very high nitrate levels in samples and worry about the health consequences for the vulnerable, such as infants. Another concern is where the nitrate comes from. One suspicion is... fractured sewerage pipes. If this is the case, there are concerns that the supply could become vulnerable to disease... Putting aside the health considerations for a moment, it is something of a scandal that the council even bothers to waste any more ratepayer money on reports and tests and hearings into the Three Kings water source. With the water supply dams... 70[%] full and the Waikato pipeline to come on stream by[next] March... the Three Kings source, whatever its quality, is not needed. Nor will it be, except in the highly unlikely case that this winter we experience a once-in-200-year drought like... 1994... It was in the aftermath of 1994 that the city went in search of additional water sources. Mt Wellington, Western Springs and Three Kings were singled out. Three Kings proved the most promising. It fitted in with the plans of the scoria mining company Winstone Aggregates, which wanted to lower the water table in its Three Kings quarry so it could mine deeper. As for Auckland City, it saw the Three Kings source as the chance to break Watercare's regional water monopoly with a competing water company of its own. However, the circumstances that gave birth – and some sense – to the Three Kings water project, soon changed. Auckland City became part-owner of Watercare. And the region, instead of looking for bitsy solutions to future water supply needs, voted to plug into the mighty Waikato instead. Despite these changes, those pushing the now-pointless Three Kings project soldiered on.

...The Three Kings water treatment plant is nearing completion and should be operational before Christmas. The plant's commissioning has involved close liaison with the Health Department to ensure it will operate with high quality procedures, and that the water supply will meet N[Z] drinking standards. By tapping into the Three Kings aquifer which flows through the volcanic strata beneath the quarry, Metrowater is using and developing the water resource in a sustainable way as required by the Resource Management Act. This valuable water source has not been used for supply purposes before... Diatomaceous earth filtering systems, which will remove particles as small as one micron (Giardia is 5-7 microns and Cryptosporidium is 2-3 microns), are being used... at the plant... When it is operating the plant will supply on average 5,000 cubic metres of water per day and will serve almost 40,000 consumers... If the... fully automated... plant shuts down[– due to a computer fault or whatever –] water will continue to be supplied from existing Watercare points, minimising customer inconvenience. [By the way, a NZ company has developed a 'quick, cheap, testing kit which can be used to check for the presence of giardia and related contaminants in streams and other bodies of water.']

...News that... Sydney's water is contaminated with giardia has its citizens fizzing with anger. Aucklanders know exactly how they feel. It is a disaster by any standard, and Auckland's power woes set the standard for urban catastrophe... And like the source of Auckland's problems – badly maintained cables – the cause of Sydney's contamination is equally mundane: quite a number of dead dogs in an open canal feeding into the water supply. Traces of the parasite... were found even on the outskirts of the city, making all water unsafe... That means a population the size of N[Z] have to boil all their water for at least one minute, leave it to cool and put it in a container in the fridge. That water must be used for drinking, cooking, making ice, washing and pets' drinking water. Could such a disaster happen here? Auckland's Watercare Services last night said no. Auckland water was treated to a higher standard and the system was sealed once water left the reservoir. The fiasco has embarrassed officials, politicians and even the A[USn PM]. In a cruel twist of fate, Sydney is hosting the U[S] Secretary of State... Already politicians are promising a blood-letting as an inquiry is launched.

...Sydney's water supply is expected to be given the all-clear tomorrow after flushing to remove contamination being blamed on dead animals... "I'm told... that the search of the 23km of... open canal... between the Nepean Dams and the Prospect Water Filtration Plant... identified a number of dead... dogs... Now how they've got in there, goodness only knows, but they've either fallen in or been thrown in by uncaring owners... [But] the source of the contamination... [has] been shut out of the system... As a consequence of the bypass Sydney is now being supplied with uncontaminated water[," NSW's]... Urban Affairs and Planning Minister... said yesterday.

...WELLINGTON water has been declared safe despite the discovery of... giardia, which has crippled Sydney's water supply. The bug... was detected in low levels – one cyst per 100 litres – in treated water at the Wainuiomata plant on Monday. The plant is one of three major sources of the city's water. Monthly tests also found higher rates than usual of the bug in the Wainui River, one of the rivers feeding the plant. It's the first time giardia has been found in the treated Wellington supply, although other centres, including Dunedin... Timaru, Wanganui and Nelson... have had a problem with it in the past... The Wainui River flows through a catchment of hilly bush country. Deer, pigs, goats and possums are believed to be the source of the infection... The Wainui River intake was shut on Monday and the plant closed on Thursday. Wellington is now being supplied by the Te Marua Plant, at the head of the Hutt Valley, and the Waterloo plant, fed by underground aquifers. [The]Wellington Regional Council utility services manager... said chlorine [sh]ould have killed giardia in the treated water... [The manager] would not speculate how giardia got through the treatment process. Using sand filtration, the plant was commissioned in 1993 to screen out the bug, as well as... cryptosporidium. All plants were now being tested daily and would be monitored weekly once the immediate problem was over. Wellington['s] Medical Officer of Health... said there had been no recent increase in rates of giardia in the region. "From our point of view, public health has not been put at risk."

...THE latest contamination tests of Sydney's major water filtration plant at Prospect were clear, but there [i]s no end to Sydney's water crisis in sight, the Health Department said yesterday... After three clear readings the plant would be considered free of the parasites... However, NSW['s] chief health officer... said all Sydney's other dams and filtration plants would have to be assessed... [T]he Warragamba filtration plant and the Orchard Hills filtration plant were still contaminated with... cryptosporidium and giardia... Before the latest tests, an expert had claimed the reported degree of contamination of the city's water supply was unbelievable. [The c]ivil engineer... was reported in the *Sydney Morning Herald* as

saying the levels of... both parasites... found... by Sydney Water were “as high as you would find in pure raw sewage, probably higher”... There has not been a reported increase in illnesses related to the parasites since the first contamination scare in July, said the NSW Health Department.

...The three million residents of Sydney appear to be coping with the health threat from their contaminated water supply. Health department surveys had recorded no deaths or increase in illness due to giardia and cryptosporidium since the parasites were first discovered... [The NSW] Health Minister... said the health survey results were heartening... [because w]hen a cryptosporidium outbreak hit the U[S] city of Milwaukee in 1993, it killed more than 100 people and made an estimated 400,000 ill... [T]he latest tests showed no parasites in Sydney’s water supply despite high levels on Friday, although residents were urged to continue boiling water for the next two weeks. Clumps of parasites were thought to be working their way through the system, hence the variable readings, [the minister] said.

...Sydney Water officials mismanaged the city’s contamination crisis, misled the public and might have tried to cover up their mistakes, a damning report released yesterday found. [The NSW] Premier... moved to place Sydney Water under stronger Government control following the release of the report... “It confirms that the handling of the water crisis from the very start was botched by the senior management... of Sydney Water,” [the Premier said. The Premier] also announced a \$A15... rebate for water users in affected areas and a freeze on water rates for the next quarter, although there was no guarantee landlords would pass on the rebate to tenants. Sydney remains in the grip of its second water scare in two months, with millions of residents forced to boil drinking water... Both... the... Sydney Water chair[person and its]... managing director... have since resigned their posts and the Government said two more senior managers would be asked to explain their roles in the crisis.

...*Rivers that will run the elections* Seven years ago, in the run-up to the... State election, the then [NSW] Government secretly blocked plans to screen a specially produced video called *River Running Out Of Time* on commercial television. The video... commissioned by the old Sydney Water Board... revealed the environmental plight of the Hawkesbury-Nepean river system, portraying the city’s lifeline as being destroyed by human development. The production had the potential to shock and anger many viewers. This and the sheer immensity of the challenge to overcome two centuries of environmental neglect and destruction explain the political sensitivity. Now another election looms in March next year and the health of the Hawkesbury-Nepean and other rivers in NSW is likely to be high on the agenda... [– but unlike seven years ago,] the problems of [NSW’s] waterways are beyond suppression. The bugs plaguing Sydney’s water supply are giving... city people a crash course on the importance of catchment management. Yet for a decade... rural... people have lived with their dams being taken over by toxic blue-green algae... have watched their soil eroding and washing away... have seen their streams choked by silt and weed infestations, and polluted by human sewage and agricultural run-off. In the city, thanks to giardia and cryptosporidium, the consequences of catchment decline are finally having a big impact at the tap... though the extent of the problems still overwhelms community enthusiasm... This week, the Healthy Rivers Commission released its report from an 18-month investigation of the Hawkesbury-Nepean’s woes, an inquiry that is part of the State Government’s \$117 million water reform package. The author is... a water industry veteran who headed the Water Board in the mid-1980s. “It is uncomfortable for everyone, isn’t it?” says... [the author and] commission chief... of his blueprint for rescuing the river system that feeds water to the nation’s biggest city. “Traditional planning is currently directed far more towards land, its use and development. The result is that land is favoured over water.” The evidence of catchment decline has mounted even during the time that [hi]s report has been compiled. On the Southern Highlands, a major reservoir has been devastated by the catastrophic collapse of the naturally filtering Wingecarribee Swamp, a heritage area, as a result of peat mining to mulch city gardens. The Cataract River in Sydney’s south now loses most of its water through cracks caused by underground coal-mining directly beneath the once vibrant stream... [Three years ago, a local] historian... predicted the kind of crisis that is now destroying faith in the water supply. [The historian] lays blame for a “growth at all costs mentality” on other Government agencies, such as the departments of Housing and Mining, rather than Sydney Water. In her book *Losing Ground: An Environmental History of the Hawkesbury-Nepean Catchment*... [the historian] concludes: “The ultimate real costs of that [mentality] have not yet been calculated or even envisaged.” The costs certainly are being envisaged now, although the calculations will take years to tally. Tonight... a former vice-president of A[US]ns for an Ecologically Sustainable Population, is launching his new book, *This Tired Brown Land*... [It] recalls the suppression of the Water Board video... seven years ago, describing the production as a “wake-up call to politicians and planners to start taking Sydney’s growth seriously... The notion that there is some easy solution to complex environmental problems caused by overpopulation is surely almost impossible for any serious person to hold these days,”... [The commission chief]’s report acknowledges that solutions are not easy and... tough, sometimes costly, decisions are needed. “If the costs of protecting river health are not recognised now, we can be certain they will grow and... we will soon have no choice but to face them.” ...This weekend marks the start of a new focus on bringing the people of the city face to face with their water catchment, its problems and ways to solve them. The occasion is the launch of Olympic Landcare, a creation of Landcare A[US]...

An ancient underground water basin the size of Libya holds the key to A[US] avoiding a water crisis as climate change bites the drought-hit nation. The Great Artesian Basin is one of the largest artesian groundwater basins in the world, covering 1.7 million sq km and lying beneath one-fifth of A[US]. It holds 65 million gigalitres of water, about 820 times the amount of surface water in A[US], and enough to cover the Earth’s land mass under half a metre of water, says the Great Artesian Basin Co-ordinating Committee. And it is slowly topped up with 1 million megalitres a year as rain filters through porous sandstone rock. “There is probably enough water in there to last A[US]’s needs for 1500 years, if we wanted to use it all,” says... a hydrogeologist who has just completed the Great Artesian Basin Resource Study. But [the hydrogeologist] and other experts warn that access to the basin’s water supply is under threat from declining artesian pressure. If artesian pressure falls too far, due to excessive extraction of water, the ancient water source will be unreachable, except by costly pumping. The basin lies as much as 2km below ground, and... was formed between 100[million] and 250 million years ago... Basin water is extracted through bores and is the only source of water for... A\$3.5 billion... worth of... mining, tourism and grazing in outback Queensland, New South Wales, South Australia and the Northern Territory... Since the basin was tapped in 1878, about 87 million megalitres has been extracted and up to 90[%] of it wasted. As a result of falling water pressure, more than 1000 natural springs have been lost and one-third of the original artesian bores have ceased flowing... [In further news from AUS, a Sydney resident] who bashed a retiree [it] wrongly accused of ignoring water restrictions has pleaded guilty to [humanslaughter. The 37-year-old], of Caringbah, punched 66-year-old Ken Proctor in the face as [Ken] was watering his roses at Sylvania in October...

The Sydney water crisis flows into court this week with hundreds of residents and businesses suing Sydney Water for damages... [Ironically, next week Sydney hosts] a water conference[, that’ll be attended by a]... 13-strong Israeli delegation... [which includes the] managing director of the Israel Municipal Water Works Administration[– who, together with the other delegates, is]... inspecting water services technology and administration in Auckland and Tauranga this week... The delegation... has [already] visited the Ardmore filter station, the Hunua Reservoir and... met officials from Watercare, Metrowater and the Waitakere City Council. It[’ll visit]... Tauranga’s world-leading water treatment plant... [today. The director] said yesterday that... Aucklanders are not alone in their anxiety over the costs of water and who controls water services. Israel is going through similar angst... The Finance Ministry wanted complete privatisation while the Interior Ministry wanted the infrastructure to remain in public hands. “That’s my opinion also. Part-outsourcing [contracting out the operation of a plant] is okay, but to sell the infrastructure to a private company, then find yourself in 10 years with infrastructure that doesn’t work, is not. Finance people, they always want to have everything in private hands.” ...Jerusalem was Israel’s first major city to begin “running water to economic standards,” although it could not be called commercialisation. Beesheba had just franchised its water services to a consortium involving a division of Thames Water... the British company which is involved in the joint venture with the franchise... run[ning] Papakura’s water services. It is also advising Watercare on its Waikato River pipeline scheme.

...Waitakere City wants Watercare to keep the tap turned off on the Waikato pipeline unless there's an emergency. The finance and policy committee has voted to ask Watercare why it can't defer commissioning the pipeline until there is a water shortage. [One councillor... says its too late to stop the pipeline now but the committee is concerned that Waitakere has to pay for the water regardless of whether it is needed. "It's a huge cost and it will be met by the region. We say, 'Don't commission it'," [the councillor] says. Work on the \$155 million pipeline begins next month... Water will be treated at a plant near Tuakau and will be piped 38 kilometres to connect with Auckland's supply system at the Ardmore treatment station. The rest of Auckland will get Waikato water once the pipeline is open, but Waitakere City residents will continue to get their water from the five Waitakere dams – unless there's an emergency. It's part of a deal struck by the then council with Watercare in 1998 when it withdrew its appeal to the Environment Court. The pipeline won court approval at the end of 1998. Watercare's communications manager... says the pipeline has to be commissioned because the water is needed and it's the only scheme that can meet drought standards. "Watercare has a legal responsibility to ensure Auckland has sufficient water supply," [the communications manager] says.

...No one takes responsibility for the quality of water we drink... Watercare Services Ltd... [got] the consent it need[ed] to build the Waikato pipeline to augment Auckland's water supply... [when] the Environmental Court dismissed the appeals by me and a Papakura tomato farmer. The court ruled that the suitability of the water for drinking "is not relevant" and that protecting the public health is an "ulterior purpose" as far as the Resource Management Act is concerned. The decision begs several questions. What are the Crown's obligations to ensure healthy drinking water? How can public opinion over health risks and other issues of public interest be considered? Protections are needed that go beyond the management of immediate environmental effects. For example, the... construction of cellphone transmitter aerials have... raised broad public health concerns that go way beyond the... visual impact of a shoebox-sized object on a post. Yet [that is] the narrow environmental effect... that seem[s] most relevant in a planning hearing. What about the big picture? What about the people? Another example is a recent Britomart appeal hearing which defied common sense. To the public it seemed that legal consideration of the whole Britomart development had been collapsed into the single issue of whether it was acceptable, or not, to drain water from the six-storey-deep home destined to take the development's foundations. It seemed the only thing the Environment Court was worried about was some muddy water, where it had been and whence it would be discharged... Interestingly, in that case, the Environment Court was persuaded to consider potential adverse effects from the possible development – not just the muddy water. It may be that many of us have unreasonable expectations of the R[MA]. It has become the backstop for the concern of community groups disappointed or disenfranchised by the lack of care exercised by regional or local councils responsible for resource applications. An appeal often results when a council has not taken consultation and participation seriously enough. It is not unknown for a council to shelter behind the specific natural resource duties imposed by the R[MA] and not consult people directly about the bigger picture. How many times have we read calls from this newspaper and from individuals for Auckland City Council to survey ratepayers over Britomart? All have been ignored. To be fair, there is no legal obligation on a council to conduct such a poll, nor is consultation defined. Perhaps that is a gap in our legislation. In the U[S], local councils must seek a popular vote on any bond issue necessary to raise money for capital works. This gives ratepayers the opportunity to vote for, or against, public works – quite apart from consideration of environmental effects. In any case, the much-criticised R[MA] is under review again, so its future emphasis is uncertain. The Minister of Environment... told the N[Z] Water and Waste Water Conference in September that the Waikato River contained "higher levels of giardia and cryptosporidium than we expected" and noted that "one thing seems highly likely. We are going to need to ensure the quality of our drinking water." Every N[Z]er must be concerned by the inadequacy of our drinking water legislation. The only safety net we have is the water supplies protection regulations made under the Health Act in 1961. In 1994, at the time of the Auckland water shortage, the cabinet "noted the limitations of the regulatory powers available to protect public health in the existing legislation." So says a Ministry of Health report after a four-year review of drinking-water regulations. In fact, reports are the only thing that review has produced as it has ping-ponged between the Ministry of Health, the Department of Internal Affairs, Treasury and, lately, the Ministry of Commerce. Again it seems that public health and the public interest take low priority while the ideological battle over ownership and control of water rages in Wellington. And don't forget that the 1995 N[Z] drinking water standards are entirely voluntary. In this extraordinarily unregulated environment, Auckland residents owe a vote of thanks to Manukau City Council, which ha[d] been negotiating with Watercare for months over the treatment of Waikato River water. The Manukau agreement was signed just one day before the Waikato pipeline appeal hearing began. It requires the establishment of a microbiological advisory group, demands weekly raw Waikato water testing (which has started) and creates a process for evaluating the process and tender for treatment technology. The Environment Court says: "The standard to which the water is treated before delivery to ultimate users is a matter between Watercare as the bulk supplier and the territorial authorities or their water trading enterprises who purchase water from it." So, where now for public health and drinking water quality? ...Do we all have to buy our own water filters? Surely not. There must be nationally enforced water quality minimums. We cannot be reliant on sporadic acts of care from the odd vigilant council.

...North Shore City Council is forecasting a \$300,000 windfall from its water account this year, which is great news in the short term but the reasons for it raise major concerns about Auckland's long-term water management. All councils in the region buy water from Watercare Services and sell it to residents and businesses in their area. For most of the year councils pay Watercare between 30c and 40c a cubic metre. But when the region has used enough water for Watercare to cover its budgeted costs for the year, the price suddenly drops to less than 3c a cubic metre, which covers the cost of treatment chemicals and electricity... [This] year... the... price is forecast to fall... with two or three weeks of the financial year to run. The North Shore council could pass that saving to customers or plough the windfall surplus into upgrading water-reticulation infrastructure. It has opted for upgrading. So what's the problem? The message in this pricing is that the more water is consumed, the cheaper it becomes – exactly the opposite of the efficiency and environmental objectives adopted in other western countries. For example, the Sydney Water Corporation is required to "give equal weight to demand side management as the basis for planning the future provision of water..." and to reduce per capita consumption of water by "at least 35[%] between 1990 and 2010." Water is a renewable resource but it is available in finite quantities, and at a cost. Drawing gravity-fed, low-contaminant water from the reservoirs in the Hunuas and Waitakeres is undoubtedly cheap. But the next bulk supply source for Auckland comes at a much higher price. The Waikato pipeline... is planned to carry 10,000 cu m a day in its early years, although its maximum capacity is 150,000 cu m daily. A 6[%] cost of capital amounts to an annual operating cost of \$10 million excluding treatment, staff and electricity costs. That means the cost of the water delivered by the pipeline for the first few years will be at least \$3 a [cu m]... The most significant impact of consuming more water is the increased volume of wastewater that has to be treated. The... Mangere treatment plant upgrade... [proves that over-c]onsuming cheap water comes at a high price... yet no demand management strategy is seriously being considered for the Auckland region. Watercare is not to blame. Local Authority Trading Enterprises (Lates) are required by law "to act commercially." Watercare's statement of corporate intent includes environmental targets but experience suggests they come second to the need to act commercially. As a director of the publicly owned Northern Disposal Systems rubbish company I experienced Late priorities when I advocated an increase in the price for rubbish dumping. My aim was to reduce rubbish and lengthen the lives of existing landfill sites – a strategy adopted in N[SW]. But my fellow directors suggested such a strategy would not be commercial because it would lead to reduced revenues – given the competition – and would be unlawful... Interestingly, Metrowater has been able to achieve some degree of water use reduction through its adoption of separate wastewater charges. I am advised there could be room for reductions of water use in the vicinity of 20[%] with the right price signals. Unlike Lates, councils cannot charge for wastewater by volume. The careful single occupier of a \$70,000 home pays the same wastewater charge in North Shore City as the family with three toilets in a \$750,000 home. A Government review of water legislation is looking at demand management

policies, according to [the]Energy Minister... in a speech to the... conference of the N[Z] Water and Waste Association. That announcement is welcome. However, I am concerned that the economic and environmental importance of demand management is not appreciated and will not be given the weight necessary. There is still too much emphasis on commercial objectives. Auckland councils and Watercare could do more to implement demand management strategies. Councils can use fixed charges (for maintenance of the water) and variable charges for use so that large users – for example, homes with pools – would be charged more. Cooperation between the region’s councils would be required... While some cooperation can be expected, specific water reforms will be needed for certain results. All local bodies should be required to adopt... consumption reduction targets. Councils need the power to charge for wastewater on a usage basis without having to go to the expense of establishing a Late. And the legislation governing Lates needs to be broadened to require accountability across commercial, natural resource sustainability and consumer priorities. Despite Sydney’s cryptosporidium outbreak, we can learn from the Sydney Water Corporation’s main objectives...

Mt Roskill and Mt Eden residents awoke yesterday to find they had no running water after vandals... used a hacksaw to attack a Mt Roskill pump station’s main pipe, cutting off water to more than 1000 households. Metrowater[’s spokesperson]n... said the damage was discovered around 8 am, after residents complained to the company that they had no water. When emergency contractors arrived at the Duke St station, water was gushing from the main, which was switched off so it could be repaired. However, the damage was worse than first thought and the main pipe burst around 10 am when the water was turned back on... [T]he water had to be switched off at the reservoir feeding the pump station, before a digger could begin repairs. “They’ve done a fair bit of damage and gone at it with a fair bit of intent because it’s not easy to damage pipes of that size,” [the spokesperson] said. Metrowater brought in water from surrounding areas while repairs were undertaken but pressure was reduced. All households now had running water but an attempt to reinstate the supply late yesterday afternoon failed and repair work would resume this morning. Police were investigating the incident, which... was the first attack of its kind on a Metrowater pump station. The computerised alarm system was also attacked so the company was unaware anything was wrong until residents phoned in... “I can’t imagine why anybody would want to attack the city’s water supply and inconvenience so many people. You can guarantee there will be a step-up in security now that this has happened,”... The Fire Service was called to pump water out of one resident’s garage and clean up minor flooding around the Duke St station.

...[‘in 1992, Chicago’s CBD lost power after a “cave-in flood” of office basements.’ ‘Flood hazard information influences attitudes towards floods, home building, and the prudent use of land. Partly for this purpose, a comprehensive national programme for managing flood losses was started by the US government in 1966. As one part of this program, the US Geological Survey prepares and publishes maps showing areas subject to relatively large floods. These maps and other information on floods are provided by the local office of the Geological Survey. Individuals can also play a significant role in reducing losses due to flooding. Homes and other buildings can be designed to include provisions for movable bulkheads that can be placed in windows and doors in times of flood warning, placement of electrical and plumbing systems to avoid damage by floodwaters, and arrangement of storage space above flood levels. The belief that deforestation and land cultivation greatly increase the frequency and magnitude of floods led to the conclusion that floods could be prevented or reduced by reforestation or soil conservation. It was thought such measures would increase the rate at which rain or snow infiltrated the soil and increase the capacity of the soil to retain the infiltrated water. Research in the 1950s and ’60s showed that such land treatment measures increase the infiltration capacity and, to a limited extent, the water storage capacity of the soil. But research also revealed that the effects of these measures are small compared with the intensities of storms producing large floods of major rivers. Hence, land treatment alone isn’t a feasible measure for reducing large floods. In the case of coastal floods, there’s no practical way to provide full protection on most exposed shorelines. The buildup of beaches and sand dunes by means of artificial barriers may provide a partial solution, but also may seriously interfere with the natural beauty and recreational value of beach areas. For these reasons, the principal ways to reduce damage from floods due to hurricanes and other sea storms are adequate warning systems, evacuation plans, proper building design, and zoning of the more hazardous areas. In the case of river floods, various measures can be taken to reduce flood damages, including confining river water, storing the water, or increasing the channel capacity. Another means of increasing channel capacity is to provide alternative channels, called *floodways*, that come into play only during great floods. Floodways have been built at key points in the Mississippi River valley and in the Sacramento River valley in California. Excessive damage when great floods occur can be avoided by regulations that prevent misuse of floodplain lands. Measures for such control are becoming more important as floodplains are more intensively developed. They include zoning ordinances, which specify the kind of use that can be made of a particular area, and building ordinances, which specify the elevations and type of construction permitted in vulnerable areas – e.g., high hazard areas frequently are zoned for uses such as riverfront parks.’ ‘Levees or dikes are used to keep flooding streams in their courses. In the US the Tennessee Valley Authority, the Missouri River Basin project, and other projects aim, among other things, at flood control. But floods are important in modifying surface features of lands bordering rivers, and in some places, notably the Nile Valley, annually deposit a fertile layer of silt, upon which agriculture depends.

...Ancient Greeks erected over natural springs columnar shrines dedicated to nymphs or deities. More recently, fountains have been used to dominate city squares in the U.S. and Europe, and have provided focal points in town planning. Outstanding examples would include the fountains in Paris at the Place de la Concorde, in London at Trafalgar Square, and in Rome at the Piazza dell’Esedra. The famed Trevi Fountain in Rome, probably the most dramatic of baroque fountains, pours out 17.5 million gallons of water every day. The ancient Romans furnished sources of water to people in the streets, to town houses, and to villa gardens by creating artificial jets of water from their great system of aqueducts. Building upon the Roman tradition, artists and craftspeople of Renaissance Italy erected magnificent fountains, manipulating the vocabulary of ancient art forms to create architectural and sculptural decoration. Virtually every village square in Italy has its own fountain, be it splendidly designed or simply a jet of water spouting into a basin.

...the addition of minute proportions of fluoride to drinking water to prevent or reduce dental decay is favored by even the most conservative medical organizations. However, there is still significant opposition from those who are concerned lest there be possible long-term toxic effects from fluoridation.’

...some people want ‘fluoride-contaminated water forbidden because of fluoride’s toxicity to valuable enzymes. The first proposal for fluoridation of public water supplies came from Gerald J. Cox, PhD, a research fellow at the Mellon Institute. On 29 September 1939, in a speech to the Western Pennsylvania section of the American Waterworks Association, Dr Cox said, “The present trend towards complete removal of fluorine from water and food may need some reversal.” Dr Cox then suggested that fluoride be added to water supplies as a means of reducing tooth decay. Scientific literature up to that date contained several references linking fluoride with teeth and bones. Dr Cox based his proposal of artificially adding fluoride to public drinking water specifically on an article in the *Journal of Dental Research* which appeared a year earlier. It was by Dr Wallace D Armstrong, Professor of biochemistry at the University of Minnesota and P.J. Brekhuis. Their analysis of tooth enamel showed more fluoride in healthy teeth than in decayed teeth. However Dr Armstrong published another article somewhat later (1963) which reassessed his original findings. In fact his reinvestigation convinced him that they had misinterpreted their earlier data. Dr Armstrong states “The sound tooth of an older person demonstrated that its composition had been adequate to resist caries (tooth decay)” and that “fluoride content of enamel increases as a person grows older”. “Age as a factor in fluoride content was not then (in 1938) appreciated”. Thus it appears that the evidence on which Dr Cox had based his recommendation that fluoride be added to drinking water had, after 24 years, been retracted. However Dr Cox went on to become a member of the Food Nutrition board and the National Research Council from which position Dr Cox advocated the idea of fluoridation. Then in 1944 Dr Cox became employed as a research scientist for Corn Products Refining & Co. of Argo, Illinois, a company involved in sugar processing. Companies involved in the sugar industry had in 1943 set up the Sugar Research Foundation Inc. which among other things embarked on a dental caries research programme. The Foundation’s scientific director acknowledged that the dental caries research programme was “to find out how tooth decay may be controlled effectively without restriction of sugar intake”. Fluoridation was just such a proposal and from that date the Foundation started making research grants in support of fluoridation and to actively promote it. Two such recipients of grants were the

Dental Schools of Harvard and Rochester University and these two have been among the most vocal promoters of fluoridation to this day. During 1969 a doctor sought a chance to speak at the American Dental Association symposium on fluoridation. The doctor was going to present a scholarly summary of his findings of the mounting evidence showing the possible side effects from taking fluoride-treated drinking water. The doctor received this reply from the secretary of the Council on Dental Health of the American Dental Association: "The type of presentation you are suggesting might have been appropriate a generation ago when the early studies on fluoridation were being carried out. The theme of the symposium is not controversy, but additional documentation of the universality of experience of the safety and effectiveness of fluoridation, world over. Presentation of the type of paper you propose would be an insult to the scientific community today." Other equally qualified people who have come forward with evidence adverse to official policy have met with the same result.'

... 'experts recommend people consume only a small amount of fluoride because teeth will only absorb what they need.' 'Under normal conditions, a human absorbs small quantities of fluorine in its food (foods richest in fluorine are fish and tea; small amounts of it are present in meat, egg, cow's milk, and fresh vegetables) – but the most valuable source is drinking water containing not less than 1 mg. fluorine per litre.']

...A group of Onehunga residents is demanding the area's spring water be fluoridated. But not all in the area support the call, among them an Onehunga micro-brewery that says it would be a crime to add chemicals to the local water... "The water out here has been recognised since Captain Cook landed for its purity and quality..." Onehunga gets water from a series of local springs, rather than the city's main supply. The springs' naturally low fluoride levels have never been topped up to the level recommended by city health authorities. The state of the water harks back to the days before councils amalgamated in 1989 and the then-Onehunga Borough Council held a referendum which voted against fluoridation. Now a group of parents, teachers and Plunket and dental nurses, worried that their children are missing out on the health benefits of fluoridated water, are insisting they get the same as everyone else in the city. A spokes[person] for the group... said it had been well documented that fluoride in the water made a big difference to dental health, particularly to the socially disadvantaged... The group has asked the Maungakiekie Community Board to take its concerns to the Auckland City Council. Auckland's medical officer of health... supports the move. "My view, and the view of the Ministry of Health, is that water fluoridation is the most effective and efficient way of reducing diseased teeth,"... A spokes[person] for Metrowater... said the company was simply operating on the wishes of the last local referendum. "If they want fluoridation they've got to... have another referendum. We'll go with the opinion of the majority of residents and we don't mind either way."

...To fluoridate or not to fluoridate the local spring water? That was the question that the people of Onehunga had to decide. Their will prevailed. The Auckland City Council voted 10-9 to retain the status quo, but not before passions were raised by both supporters and opponents of fluoridation. A referendum of sorts was held among Onehunga residents. In a turnout that was about as high as you can expect to get for a stand alone postal ballot (about one-third of ballots were returned), there was a two-to-one rejection of fluoridation. A majority of members of the Maungakiekie Community Board and various commentators... believed that the residents' poll should have been overridden on the grounds that the evidence in favour of fluoridation was "irrefutable," and on the claim that many fluoridation supporters for one reason or another forgot to return their ballots. To undermine the referendum, community board proponents even produced the results of a previously secret five-month-old telephone survey that appeared to contradict the referendum result. To get such a different result, the people sampled by telephone were almost certainly asked leading questions that virtually obliged agreement. As a political economist – and as an Onehunga resident who is equally happy to drink fluoridated or unfluoridated water – these kinds of anti-democratic rationalisations worry me. The referendum non-response rate was most likely due to a combination of public ignorance and indifference. Most people had no opinion. Of those residents who did have an opinion, the weight of opinion was clearly and substantially against fluoridation... All of Auckland benefits if one part of Auckland has unfluoridated water. Call it an experiment. Keeping Onehunga unfluoridated means that researchers will be able to study the effects of fluoridation over the long term. Onehunga serves as the study's control group. A continuation of the status quo also means that both supporters and opponents of fluoridation can choose to reside in a place that suits their preference. As economists say, "The customer is always right." That maxim applies to public goods such as water as much as to pizzas and meat pies. We need expertise in public health, just as in economics, statistics and other branches of science. But we also need humility from our experts. According to one claim advanced in the Catching the Knowledge Wave project, the world's knowledge now doubles every seven years. Who knows what this exponential growth of knowledge will reveal about fluoride? The more we know, the more we upwardly revise our estimates of what we don't know. A future knowledge society will be less certain about what is true and what is not true than... societ[ies] of the 20th century [– the century when] too many of our decision-makers believed they knew everything there was to know.

...As the power comes back on the experts follow the trail to disaster... [Yesterday America's] northwest was close to normal two days after a huge blackout. The probe into how the eight-state, two-nation blackout began centred on an area just south of Cleveland, where a leading investigator said three transmission lines failed just before the huge outage... ['Cutbacks on maintenance' may ultimately be blamed, but] the North American Electric Reliability Council... suggested human error might have been the reason the problems were not isolated before they knocked out power from Michigan to New Jersey to Ontario... 100 power plants were "tripped" or automatically shut down by circuit breakers that sensed voltage fluctuations... The blackout was the biggest in U[S] history... An estimated 35 million US and 10 million Canadian residents were left in the dark...

London['s] Mayor... has led angry demands for answers to how a power failure paralysed the capital, leaving 500,000 commuters stranded... [The mayor took 3] hours to get home after the blackout. National Grid Transco... was still investigating the cause but described it as a freak occurrence.

...Power went out across Italy yesterday, disrupting travel nationwide and cutting short an all-night festival in Rome. Most of Italy's 57 million people were left without power for hours... [P]arts of the south were still without electricity... The national grid authority blamed the blackout on a malfunction of supply lines from France. ■ Italy and France have an exchange scheme to help deal with peaks in demand. ■ The failure appears similar to the problems that caused blackouts in the north-eastern U[S] and London last month, and... a few days ago... [when] 4 million people in eastern Denmark and southern Sweden were without electricity for more than three hours after a rare outage plagued parts of Scandinavia.

...['last month's London blackout was caused by an incorrectly fitted 1 amp fuse.' In local news, when a Ngaruawahia resident]'s power surged and her radio went off [it] had no idea her 6-year-old son was climbing a power pole up the road... 11,000 volts struck him, causing burns... which cover 60[%] of his body, [and] will... scar him for life... WEL Networks... said the... pole complied with standards and the boy should not have climbed it.

...Levy... just as unpopular as 'fat tax'... Farmers have vowed to continue to fight against any levies for research into greenhouse gas emissions...

The U[S] and E[U]... faced international outrage yesterday after triggering the collapse of UN climate talks, leaving the fight against global warming in disarray. Activists and poor nations poured scorn on the failure of the richest countries to agree on ways to reduce the buildup of greenhouse gases in the atmosphere. "The failure of these talks is a disaster. No words can truly express our anger," said the Friends of the Earth group, describing the breakdown as a fiasco... The Sierra Club campaigning group said the US bore the greatest responsibility for solving the global warming problem. "The US emits almost a quarter of global warming pollution despite having only 4[%] of the world's population. While other countries are not blameless, the US deserves special recognition as the world's only superpower and biggest polluter." ...Experts said failure to cut emissions of greenhouse gases would bring more storms and floods of the kind that ravaged parts of Asia and A[U]S last week. "Time is running out. It has run out," said... [the] President-elect of Palau, one of the Pacific islands most vulnerable to rising sea levels. N[Z]'s representative at the talks, [the] Energy Minister... was more optimistic, saying [it] hoped a deal could be struck when the talks resume in... May...

The U[N] talks aimed at imposing realistic greenhouse gas reductions unravelled catastrophically... Faced by implacable opposition from his European counterparts, the head of the British delegation... found himself isolated in his bid to broker a deal with the U[S]. His attempt to save the

planet had collapsed and the enraged head of Britain's climate change delegation stalked furiously from The Hague's convention centre. "I am gutted," [Britain's Deputy PM] said. Shortly afterwards, [the British delegation head] was followed by... [the] head of the Danish delegation. The climate convention had begun to disintegrate. Only a few hours earlier, an ebullient [British Deputy PM] and equally enthusiastic British Environment Minister... had said that they were close to brokering a deal between the US and the E[U], the two major opponents in the talks... On the one side stood a US-led umbrella group. On the other the EU nations and the developing world. The US camp had travelled to The Hague seeking to avoid cuts in carbon dioxide emissions from cars and factories. Instead they wanted to fund carbon sinks – forests and plants that absorb carbon dioxide – as a substitute for halting their profligacy with petrol and the energy inefficiency of their industries... Europe was committed to the idea that the developed world had to reduce its burning of fossil fuels and considered the US carbon sink plan as a bid to avoid global responsibilities. Delegates received few satisfactory answers to their questions about the carbon sink plan.

...The first evidence that millions of tonnes of a greenhouse gas 20 times more potent than carbon dioxide is being released into the atmosphere from beneath the Arctic seabed has been discovered by scientists. Details of preliminary findings suggest that massive deposits of sub-sea methane are bubbling to the surface as the Arctic region becomes warmer and its ice retreats... The Arctic region as a whole has seen a 4C rise in average temperatures over recent decades... Underground stores of methane are important because scientists believe their sudden release has in the past been responsible for rapid increases in global temperatures, dramatic changes to the climate, and even the mass extinction of species.

...Thousands of people evacuated, two killed and a likely damage bill of tens of millions of dollars. That was the toll in the Bay of Plenty last night after heavy rain caused the second set of devastating floods to hit N[Z this year. Meanwhile, the US]... has rejected an invitation to reopen climate talks with the E[U], killing the latest effort to forge an international strategy on global warming. "Without additional convergence between the parties on important issues, a further ministerial meeting would not be useful at this time," said [the]US Under-Secretary of State... Norway had offered to host a meeting in Oslo at the end of this week between the EU and a US-led "umbrella group," which includes Canada, Japan, and A[US].

...The US] has abandoned the 1997 Kyoto treaty to fight global warming, dealing a blow to European hopes to salvage the pact. "The President has been unequivocal. [It] does not support the Kyoto treaty," [a]White House spokes[person]n... told reporters. "It is not in the U[S]'s economic interest,"... Asked whether the U[S] would withdraw from the treaty, [the spokesperson] said it had never come into force, and therefore "there's nothing to withdraw from." Asked if Washington had abandoned the pact, [the spokesperson] said, "Given the fact that it was voted 95-0 against in the Senate, it's a clear sign that there is little support, if any." [The spokesperson] was referring to a nonbinding resolution, passed before the Kyoto Protocol was reached, that said the Senate could not support any global warming pact that did not bind developing countries along with developed countries. The E[U], which said last week the global warming issue was an integral part of US-EU relations, expressed concern over the [Republican] Administration stance. Democrats and environmental groups denounced it. "The new President came to town saying [the former Texas governor] would change the tone and change the climate in Washington; I guess we didn't realise it was the real climate [the new President] wanted to change," said [the]US House Democratic leader... The pact, signed by[the Democratic] President... in 1998[, was] never introduced in the Senate for ratification... Already this month, the President broke a campaign promise by announcing [it] would not ask US power plants to cut emissions of carbon dioxide... [The President]'s... decision followed intense lobbying by coal and oil companies and congressional conservatives who opposed regulation. [The President] today has talks in Washington with German[y's] Chancellor... who asked [the President] in a letter last week to abide by the agreement. The EU[']s Environment Commissioner... said: "It is very worrying if it is true that the US intends to pull out of the Kyoto Protocol." An EU spokes[person]n said the US had not yet replied to its request for high-level meetings to settle differences over the treaty.

...E[U] leaders say parts of the Kyoto Protocol on curbing global warming could be renegotiated to suit the [U]S... The... P[M] of Sweden (which holds the rotating EU presidency), and EU Commission president... say it would be "a tragic mistake to tear the agreement to pieces and start over again." "We lose time and all of us become losers," they wrote in a joint column in the Swedish regional daily *Goteborgs-Posten*... "The longer we wait, the more difficult and the more expensive it will become... If certain parts of the agreement prevent the U[S] from ratifying it, we should negotiate about those parts rather than bury the entire agreement." Japan's Kyoto news agency reported at the weekend that [the]US Deputy Secretary of State... was considering a substitute for the Kyoto treaty which would... involve developing and industrialised nations. The two European leaders reiterated that the 15 EU countries would ratify the Kyoto Protocol with or without the US.

...SOME 40 years ago, [a]celebrated British playwright... wrote a "Damn You, England" letter to a London newspaper... from an address on the French Riviera. Such letters are being written mentally all over Europe at present, only they are addressed to the U[S]. "Damn You, America" has become a popular theme since [the US]President announced h[is administration] was not prepared to sign the Kyoto Protocol... Seldom has such anger been felt in recent decades towards Britain's trans-atlantic cousins. True, the French have resisted Americanisation with loud and clear signs since the presidency of Charles De Gaulle (1958-1969). But turn on the television in France today and the odds are you will find yourself watching a dubbed American film – just as you can't miss McDonald's on the Champs Elysee. But this is real hostility. The Kyoto news was the last straw for a continent that had watched from across the water as [the US administration] unveiled tax cuts designed almost entirely for the rich, new plans for assaulting the meagre welfare benefits of the poor, and the increasingly hawkish stand on Russia and China. In Britain, the [Republican] US administration is seen as a Rip Van Winkle gang that has been asleep since the fall of the Berlin Wall and wishes to revive old memories.

...I'M NOT sure when it hit me. Maybe it was when the [US] administration announced two weeks ago that it would not be sending the Kyoto Protocol to the US Senate for ratification. Or maybe it was when the Netherlands had the world's first real gay marriage last week, with all the attendant rights of straight marriage, weeks after the Vermont House of Representatives voted to outlaw the practice. Whatever the tipping point, I have been struck by the huge – and growing – gap between the political, social and cultural values of the U[S] and Europe. Truth be told, I've been suffering a bad case of Euro envy. A year-and-a-half ago, I returned to the States after more than six years as a foreign correspondent. And like many expats who come home, I've been wondering why my native land seems so out of step with the other industrialised democracies at the dawn of the 21st century. The... "values gap" threatens to undermine the Atlantic alliance and, one day, America's claim to global leadership. Why is it surfacing now? The reasons go beyond any one American leader, to the burgeoning post-Cold War order. [The US President]'s penchant for unilateralism hasn't helped. But Europeans have long been horrified by America's embrace of gun rights, our incidence of violent crime and our infant mortality among the poor. [USer]s have criticised European dependence on the welfare state and US taxpayer dollars to equip a military that supplies their security. The changing landscape of the post-Cold War world has made the rifts more apparent and the Europeans less likely to ignore them. When Europe faced the Soviet Union, far more pressing issues than US domestic politics worried the Old World. Today, the common military threat has faded. On the continent, says... the French International Relations Institute, "there's a sense of 'who do you think you are?'" Crucially, just as the need for American protection waned, Europe's own sense of self grew. "We have developed a European identity, a European social agenda. We are inventing a European model," says [the institute]. As a result, while European criticism of America used to centre on what America did... now it's based on what America is. In a globalised world, all politics are global. As [the]... coordinator for German-American relations at the Foreign Ministry in Berlin, puts it, the global reach of the media, the internet and non-governmental organisations means every domestic issue has the potential to become a source of international conflict... Human-rights organisations and thousands of demonstrators bear down on US embassies with each controversial execution in America... Last week... [the] vice-president of the Council of Europe Parliamentary Assembly, went to America on a fact-finding mission to study U[S] support for the death penalty... "We hope America will follow our example, (decree) a moratorium and eventually abolish the death penalty." The U[S] following Europe's lead? That's a switch. But for [USer]s who prize

our position as a global leader, there's an even more ominous possibility. Even without posing an economic or military challenge, united Europe will eventually present a moral rival to American leadership. That alone would give the world something it never had during the face off with the Soviet Union: an appealing alternative. ■ ...here's [some] things we've learned about... [America's 43rd] President... Dubya. 1. When the chips are down, [the President] can sometimes string together a full sentence... 2... his view of "abroad," as in his pre-primary remarks: "When I was coming up, it was a dangerous world and you knew exactly who they were. It was us vs them, and it was clear who them was. Today, we are not so sure who they are, but we know they're there." ...The charm [Dubya] hoped to work on "abroad" has so far brought spats with Russia, China, South Korea and Taiwan. That's for starters... 3. [Dubya] doesn't speak Spanish as well as [it] had us believe during the election campaign. 4... Not a lot of the Sixties rubbed off on him: [the former alcoholic] was having too good a time as it was... 5. [The former Texas governor believes it] can get the job of President done in a 9 to 5, four-and-a-half-day work-week. 6. [Dubya] tells his staff to do likewise, unless there's a big crisis playing out in another time zone. 7. [Dubya]... is a master of the political feint, loudly announcing "concessions" to one constituency or another (an end to US aid to charities that condone abortion, renouncing the Kyoto global warming treaty), that leave US policy utterly unchanged... [Dubya] still doesn't understand why Europe created such a fuss over his renunciation of Kyoto. [Dubya] thinks it was just common sense (and worth a few votes at home) ...8. The [guy] who brought you "teach a child to read and [it]... will be able to pass a literary test" is making education his presidential priority. No wonder... 9. [Dubya]... has a thing about *Bibles*: the book that most changed him, [the then Texas governor] said, in an election debate ...10. Dubya earned \$US900,000 last year. [11. Dubya] has a lot of richer friends, and many are now in Government... His Vice-President[– who]'s heart condition turned out to be a lot more serious than presented during the campaign... [(denying that the Vice-President] had had a heart attack in February was the one time [Dubya] was caught lying[–] ...earned \$US36 million last year. [12. Dubya]'s not as dim as you think. Or how would [it] have earned all that money? [13. Dubya]'s not as bright as [it thinks – or the son of a former President] would have made it to the White House sooner... 14. The [President]... hasn't had a day off sick... 15. His favourite brand of cowboy boots costs \$US600... a pair. 16. [Dubya]... flies off the handle if a mobile phone rings when [it's speaking. 17. Dubya]... paid \$US240,342 in income tax last year. No wonder [it] wants tax cuts... 18. [Dubya]... is expert at "spinning" the facts: [the President] did not actually get the tax cut [it] wanted through Congress, but you wouldn't know that from the official rejoicing... 19. [Dubya]... will not be concreting over the Alaska National Wildlife Reserve to drill for oil, after all – not because [the President] thinks it's a bad idea, but because Congress won't let him.

...The U[S] took a big step towards opening up Alaska's arctic wilderness to oil exploration yesterday when a vote in the House of Representatives... threatened one of the most unsullied pieces of open space in the world. The vote to permit exploration on a limited section of the Arctic National Wildlife Reserve, passed by a margin of 223 to 206, handed an important victory to [the]President... and his many backers in the energy industry. The issue has been a lightning rod for environmentalists worldwide. After several rounds of furious lobbying and deal-making, lawmakers chose to ignore opinion polls showing strong public opposition to exploration of the refuge. They brushed aside the arguments of advocacy groups who said the environmental havoc wreaked by the oil companies will yield no more than a six-month supply of oil over several years... [T]he vote was described by the *New York Times* as a "crushing defeat" for the environmental movement. The energy package passed by the House included \$US33.5 billion of subsidies... Only 25[%] was earmarked for conservation and the development of renewable energy sources.

...MAYBE [the US President] has done the world a favour. When [Dubya] renounced the Kyoto treaty on greenhouse emissions (because it would hurt America) [the Republican] helped to peel away the mask of sanity from Uncle Sam, revealing him for what [it] is, in all his savagery and nonchalance – a glutton and a psychopath. Forget the Taleban, [Libya] or the beastly [Iraqi dictator], it is the U[S] that is out of control, the wildest rogue nation of all. The assertion of America's lifestyle rights, come what may, over any other consideration – including the survival of future generations – was made during the week of the Oscars. Catching a transit-lounge glimpse of this spectacle, I marvelled at its imperial might, its furious flame-fanning of consumer desire. The desire for beauty (although of an exterior kind), wealth, fame, luxury and crappy movies... And therein lies the beguiling genius of Uncle Sam – the dissemination of illusions consumed as reality. Not just in movies, but in its products, politics and foreign policy. American is the land of... opportunity. Yes, but the deck is stacked. The richest 1[%] has more financial wealth than is possessed by the poorest 90[% of USer]s combined; the starkest inequality among major Western nations... The impact of such division percolates through the country. You see it the moment you land at the airport and feed a credit card into the trolley machines: the tattered touts, the stretch limos, the battered buses, the bright lights of Tiffany's. What's unseen is worse... 40 million US citizens are not covered by any form of health insurance, a figure that is increasing each year. Public education and welfare are all on the decline. Basically, the US is a republic of lobbyists attached to a global public relations machine bent on turning the whole of life into a series of paid-for, staged events, like guzzling fake food in themed restaurants, while displaying designer sportswear, and chattering about... special effects as we wash down Prozac... [–] the most prosperous nation on earth exhibits the highest rates of clinical depression[–] ...with a Starbucks soy latte, and remain largely oblivious to the deeper tragedy taking place on the late great planet Earth. [Dubya] is not an original. [It] is pursuing the doctrine formed by his father on the eve of the Earth Summit in Rio de Janeiro, 1992, which laid the groundwork for Kyoto. [Dad had said it] was prepared to talk about the environment, but – here's the rub – "the American way of life is not negotiable." Got it? This mantra should be burned into the brains of six billion earthlings, because the American way of life is now diminishing the life of everyone else. In disaster-movie speak, it's Planet Hollywood versus the world. Already, with less than 5[%] of the global population, the US uses almost 30[%] of the planet's resources. Its emission record is the world's worse, spewing 20 tonnes of greenhouse gas a person a year... The US consumes a quarter of the world's oil, a third of it's paper, and 40[%] of its beef and veal. The reason given by the US President... for his abandonment of Kyoto was uttered with commendable brevity: "Emission controls do not apply to the developing world." So? In most cases, their energy use is minuscule, only 5[%] of per capita emissions of the West, while its inhabitants are climate fodder already, living and dying on the frontline of hurricanes and floods. Emissions from developing nations will rise, but let's not overlook the reason. Their farms, factories and infrastructure are throbbing to service the appetites of distant consumers, whether it's Kenya airlifting flowers to the Netherlands or Korea shipping cut-price cars. The source of the fumes ascending from their smokestacks is us. Meanwhile, the... land of the free... [(which deserves] an Oscar from the World Academy of Jailers for holding the highest proportion of its citizens in custody[)]... is also the land of the fat – its citizens are plagued with obesity. While many may deny the existence of global warming, the overwhelming advice of the scientific community is that we should prepare now for rising seas and disruptive weather. This year the Intergovernmental Panel on Climate Change... reported that the 1990s were the hottest decade since... records were first taken, and that 1998 was the hottest year. It foretold "future large-scale and possibly irreversible changes in Earth's systems." This report broke new ground by citing the cause of the warming as "mostly due to human activity." And this activity is not about to wind down. The American way of life may not be negotiable but, more frighteningly, it is also inescapable. And the nation that runs the world is ruining the world as it runs amok in Armani, dazzling us with... gangsta rap, making us sick with fast food, workaholia and porno violence, as its hordes of silent seamstresses in tropic locations stitch [designer logos] on to our Y-fronts. All for the glory of shareholder value... It's worth it, you say, it's worth it... Will globalisation accentuate future blindness, or can it also trigger a countervailing wave of enlightenment? ...At its deepest level, globalisation is about sharing, just like the internet, and once understood will incite a value revolution of such sweep that within 100 years the main business of business will no longer be business, and politics will no longer be about swapping preferences, placating nutters and jailing refugees. The total goal will be planetary restoration – social, economic, ecologic. The question to ask ourselves as we journey into the 21st century is this: is each of us at heart a business[perso]n, or is each of us at heart a human being? The fate of the Earth will hinge on our answer.

...Global warming is helping cause an unprecedented series of famines that is pushing the world beyond its ability to cope... The warning [is] the starkest yet by the UN on how climate change is affecting world food supplies... The... UN's F[AO] is predicting that this year's total world harvest will fall for the fifth year in succession, while the global population continues to grow. Food stocks are falling well below critical levels and prices are soaring. The escalating crises will add urgency to a new round of international negotiations on combating global warming under way...

Plan B emerges from the mire of Kyoto... Now the experts are warming to 'contraction and convergence' to save the planet.

...Environmental ministers meeting in Germany reached a last-minute compromise deal last night to salvage the Kyoto accord... "It's a brilliant day for the environment. It's a huge leap to have achieved a result on this very complex international negotiation," Brit[ain's] Environment Minister... said... Japan, Canada, Russia and A[US] had finally backed a compromise accord being pushed by the E[U] to avert a potentially disastrous failure after the collapse of a summit at The Hague... and withdrawal of the U[S] from the Kyoto negotiations this year... The deal ironed out remaining differences on technical issues necessary to turn the protocol into a workable treaty that could be brought into force next year. Japan had demanded a softer approach on compliance mechanisms than the E[U]. Japan, Canada, Russia and others had already won concessions... on counting carbon-absorbing forests towards their emission reduction targets. That will mean the global cut in emissions is only about a third of the original goal of reducing greenhouse gas production by the 30-odd most industrial nations to an average of 5.2[%] below their 1990 levels by 2012.

...A 3km high "brown haze" of human-generated soot and greenhouse gases is blanketing Asia, damaging health and altering rainfall patterns... [-] future... rainfall over north-west India, Pakistan, Afghanistan, western China and neighbouring regions could be reduced by... 40[% (research)]... in India already shows that the haze may be reducing winter rice harvests by as much as 10[%] -] ...according to U[N] scientists. They say the effects are being felt around the world, because the particles in the haze can travel halfway around the globe in a week. The findings come on the eve of the World Summit on Sustainable Development... in Johannesburg... But they are unlikely to be debated at the conference table, although the experts who discovered the cloud fear its impact will intensify over the next 30 years as south Asia's population rises to an expected 5 billion.

...Delegates to the Earth Summit meeting to save the planet's rapidly dwindling resources have apparently not led by example. The 45,000 participants are expected to generate 300 to 400 tonnes of rubbish, only 20[%] of which will be recycled, the *Guardian* reports. It says hundreds of groups have produced mountains of pamphlets, press statements and brochures to draw attention to a multitude of causes. Organisers estimate that around five million sheets of paper will be read - or thrown straight into the bin. "We never had any illusions this would be a green summit," said... [the] Environment Minister in the local Gauteng provincial Government. At one point, Gauteng... and the U[N] had hoped to offset the 300,000 tonnes of carbon dioxide generated flying delegates to Johannesburg and shuttling them around the city by raising US\$3 million... from participating countries, corporations and individuals to fund 16 projects that help cut carbon emissions. So far only US\$300,000 has been raised.

...Green campaigners and aid groups were incensed yesterday at the Earth Summit's draft plan for tackling global poverty and protecting the environment, saying greed had gutted its ambitions. But corporate representatives said they thought the deal was fair, and politicians argued they had backed the best available compromise in a complex world of competing interests. "Nothing for the poor, nothing for the climate," said a joint statement issued by WWF, Oxfam and Greenpeace. "The Johannesburg World Summit will go down in history as a missed opportunity to deliver energy to the two billion people on this planet with no access to energy services, and as a failure to kick-start the renewable energy revolution that is required to protect the climate." The 10-day summit, due to endorse the draft plan at its close overnight, is officially called the WSSD, for World Summit for Sustainable Development. But WWF declared the initials really meant "the World Summit of Shameful Deals"... Oxfam, said the blame lay squarely with political leaders, who were well out of step with world opinion. "Most of them lacked the guts and will to achieve a brave and far-reaching agreement that might have effectively tackled the problems of poverty and the decaying environment." The draft, a raft of non-binding goals, covers action for providing fresh water, sewerage and electricity for the very poor and slowing the planet's loss of biodiversity and depletion of fisheries and forests. But few of these aims have deadlines, and details about how they will be achieved are sketchy... The... EU Environment Commissioner... denied that the action plan was meaningless[, saying that] "extremely important" goals had been establishing a deadline of 2015 for providing clean water and sanitation and for improving management of hazardous chemicals. The plan "provides direction for countries and also concrete actions. Don't underestimate the effects of this. You cannot say that from now on the whole sustainable development issue is marginalised, it is there and we have a document to work on". But a dissenting political voice was... Ecuador[']s President... whose country is poor but also home to the Galapagos archipelago, a world environmental treasure. "The biggest polluters are portraying themselves as environmental paragons and do not want to agree to a compromise for saving the planet or adhere to official goals on development aid."

...They flew around the world in pollution-spewing jets... d[rove] around in luxury cars... ate expensive food in Africa where many go hungry, and worked out a plan to "Save the Planet". But experts say a blueprint by the widely maligned negotiators at Johannesburg's Earth Summit will not radically change the world. It may, however, help a bit. Negotiators representing about 190 nations aimed to help halve poverty by 2015 by promoting environmentally friendly economic growth which does not repeat the polluting mistakes caused by 200 years of industrialisation in the rich West. But many delegates believe the worthy new targets set in Johannesburg... will fail to be fully implemented. Friends of the Earth gave the summit a "must do better" rating. From presidents to prime ministers, leaders said the key now would be to implement the deals, brushing aside criticisms of a gargantuan text which includes few pledges of new cash to help the developing world. And many criticised it as hot air... Even politicians are sceptical that summits with an agenda spanning water, energy, health, agriculture and biodiversity as part of an assault on poverty can achieve much. "We deal with everything and there is a risk at the end of the day that it means nothing," said... the... Danish P[M]... In some key areas such as promoting clean energy like wind and solar power, [the blueprint] lacks targets... "You cannot measure the value of this summit by the documents it produces. There is a lot of discussion, a lot of negotiation, a lot of friendships are made[.]"... said... a Guyana delegate... "Maybe this will be seen as an historic event five years down the road." But many wonder if the money could be better spent. "This summit and all the preparations probably cost the world a billion dollars: it would have been better spent buying 500 million solar cookers," said... [the] head of the non-governmental organisations' energy caucus... [T]he \$4 solar cookers - silver reflectors mounted on cardboard - could save 500 million [Last] World families from foraging for a tonne of firewood each year and prevent millions of cases of smoke-related diseases from fires.

...N[Z] w[as]... hailed as a model at the W[SSD]. With thousands of delegates, it was one of the largest conferences ever held. Heading the N[Z] local government contingent was Waitakere[']s Mayor... who delivered a keynote address on "How Leading Cities Lead the World." [Waitakere's mayor] shared the podium with the mayors of Curitiba and Freiburg and Germany's Minister for the Environment. Waitakere - the self-styled "Eco City" - was held up as an example of how communities should approach environmental issues... "I wanted to showcase the difference that acting locally has made in N[Z]. Every night the world news swirls around with violence, terrorism and racism and frankly makes people miserable and traps the world into feeling that we can't do a damn thing about it. Well, I told the world that we can, and we have. Over the past 20 years, in Waitakere we've turned things around at a very basic level. We've drastically reduced rubbish and water consumption, put the brakes on pollution and generally improved the quality of the environment and through that the lives of our citizens. Those are messages we are telling the world, with really simple, concrete actions to back them up... We don't have to be trapped into inaction - we can act locally and make a difference..."

...[the] lucky-to-be-alive Waitakere Mayor... escaped within an inch of his life when his driver was attacked by... car-jackers an hour after dropping him off at the airport in Johannesburg. The driver, a [guy] from Victoria, suffered deep lacerations to his hands and arms after being slashed by a machete as thugs tried to grab his van keys. The attack has made the mayor realise in hindsight how dangerous his trip to the world

summit had been. [The mayor admits it] had originally felt security had been a “little bit over the top” despite N[Z]’s original Israeli bodyguards quitting on the first weekend, saying they feared for their lives... [The mayor] ignored suggestions by American mayors to travel to Johannesburg with bodyguards, saying the N[Z] delegation decided to go it alone. The large Kiwi delegation even worked late and travelled unguarded to their hotels at night, which [the mayor] admits made them feel “somewhat at risk” given Johannesburg’s reputation. But... the bodyguards refused to stay at night. Luckily, [the mayor] escaped unscathed, even after marching unprotected with demonstrators down the main street to “hear the other side”. [The mayor] decided to march because tight security at the summit made locals angry they didn’t have a voice... “I wasn’t scared. I just thought it was a pretty aggressive march of the homeless and marginalised people of Africa. That was an amazing experience. They were basically saying they wanted a chance to make the world leaders realise that poverty is a real thing.” ...The 65,000-strong summit, which included more than 100 world leaders, focused on several issues including... health and how to develop resources more efficiently while not poisoning the environment.

...Moisture in the home is the number one enemy of home owners, according to the Building Research Assoc of N[Z]... A damp house needs more energy to heat... while... too much... humidity... makes the air stuffy and increases odours... BRANZ... say[s]... moisture is best removed by continuous ventilation... A ventilating fan will remove the vapour... [from] the main sources... – the kitchen, laundry and bathroom... [–] and ideally it should be ducted outside rather than into the ceiling space. The drawback of a ventilating fan is that it will remove warm air as well as moist air so it should not be left on too long... It is impossible to totally eliminate water vapour, and... [because] dry air... can irritate throats and noses... nor should it be the goal. But... [a] dehumidifier will remove an amazing amount of water vapour from a house – up to... 12 litres a day... [However, in] many regions of N[Z], a DVS (domestic ventilation system) from Home Ventilation Services is fast becoming the preferred method of solving condensation problems... A DVS... fully installed from \$1175.00 including GST... is generally cheaper to run, quieter, requires less maintenance and takes up less space than a dehumidifier[(priced from \$300 to over \$1000)], and is effective in any size of home... The main part of the DVS unit is located in the roof cavity of the home. All that is visible within the home is a slim unobtrusive diffuser in the hallway ceiling and some speed controls the size of a light switch. The ultra quiet fan unit is gently pushing fresher, drier, cleaner air into the home 24 hours a day (temperature permitting), which in turn displaces and replaces the damp air being created within the house... *The benefits of a DVS* ● Controls condensation, mould, mildew and dampness problems ● Better utilises existing heating... With appropriate heating, a DVS will provide... a uniform ambient... background heat throughout your home... [S]ome say their home is warmer with a DVS installed... ● Ventilates your house securely, no need to open windows... ● Custom-made to suit your style and size of house... ● Very low maintenance, no water containers to empty ● Power consumption from less than 7 cents per day (20 watts) in a typical 3 bedroom home... Most DVS owners notice no difference in their heating bills... ● Creates a healthy home...

For health reasons, some international organisations recommend that houses be ‘kept at a constant 24°C’. Although it might not be possible to ensure that every existing house has the necessary equipment to maintain a constant interior temperature (assuming a constant supply of power is being maintained) – be it 24°C, 22°C (r:p725, ln51) or 16-20°C (r:p408, ln27 + p1983, ln2) – there ought to be no excuses for producing new housing which lacks such technology. Even if a house is well insulated and heat pumps are used, maintaining a constant interior temperature may require more power than a house would otherwise consume – but such a house wouldn’t need to be supplied with electric bar heaters (or other forms of heaters – e.g., convection, oil column, fan, gas; electric ‘bar heaters can be dangerous for children, oil column heaters take a long time to heat up, fan heaters are good for small spaces but dry out the air, gas heaters provide a moist heat – which can cause condensation – and may also fill a room with carbon dioxide’; note that in the past year at least five people have died in NZ from carbon monoxide poisoning after bringing outside gas heaters or barbecues inside to keep themselves warm), including electric blankets, thereby eliminating the need to use power to manufacture, transport and operate such appliances (in addition, there should be a reduced requirement for the manufacture of medicines – plus less visits to doctors and days off work – and, perhaps, no need for items such as dressing gowns or slippers).

To efficiently maintain a constant interior temperature, windows and doors need to be kept closed (the temperature control system could be designed to turn itself off if sensors show that a window or door has been left open for, say, longer than a minute – and automatically restart once the window or door has been closed). Although keeping windows and doors closed helps to keep out unwanted insects, householders would have the choice of whether or not they want their home kept at a constant temperature or to have fresh air flowing through it (though the equipment which keeps the interior at a constant temperature might include a ventilation system to continually replace stale air with fresh air – this will, however, increase power usage) – and, at certain times of the year (i.e., when the outside temperature is equal to the desired interior temperature), there’ll be no need to use the system at all, or only during night hours (so, when residents get up in the morning – or during the night – they aren’t suddenly going from a warm bed to a cold room).

Single-storey homes with a minimum of rooms help to keep the amount of power they use down to a reasonable level – and, if the Manufacturing Ministry is responsible for producing everything that goes into a house, it might be efficient to link the heat pump, water heater and refrigerator into one system. The necessary piping and vents could be attached to, or even be built into, the house’s walls, but the easiest solution may be to place them under the floor (if houses are made by joining a top/outer shell to a bottom/inner shell, the outside walls could be designed to extend below the floor level – and the outer shell’s lower rim can slot into an earthquake-absorbing or hurricane-resistant base sitting on, or embedded in, the ground – thereby creating space for pipes and related equipment to be contained and easily accessed when necessary; the depth of the area under houses would have to be sufficient to allow workers to at least move about on their knees when they tend underfloor piping and equipment – i.e., 2ft to 1m). Condensation would be less of a problem in compact houses which have constant internal temperatures and no laundries (r:p2205, ln63), but in districts that have high humidity some form of moisture-removing equipment may need to be included. It could be possible to also link such equipment with the heat pump, etc., but it might be easier to keep the dehumidifying equipment separate – especially if the best solution is to place such equipment in the ceiling/roof. However, if the kitchen and bathroom have steam extractors – as they should – it might be practical, and electrically efficient, to link the dehumidifying and steam extracting units into one system (wires and pipes could be incorporated into the walls, perhaps with removable covers for easy access, but it wouldn’t hurt anyone if the necessary wiring and piping was visible inside the house – i.e., running across the underside of the roof or down interior walls; alternatively, they could be run over the outside wall).

In a moneyless society, energy resources would belong to the community and the power they generate will have to be provided freely to users (when beginning to set up such a society, ministries could immediately receive their power for no cost and households can receive free power up to a certain level – calculated by working out how much power a person ought to be using and multiplying that figure by the number of people living in each house or apartment – then charging households for whatever power they use above their allowable total; the cut-off point and price of overuse should be set to discourage unnecessary power use, and depend on each district’s capacity to supply power – which means the price within a district may still rise or fall with the change of seasons). Furthermore, the various methods of generating power won’t have to compete with each other – except to justify their continued use! The practice of generating power via non-renewable, polluting resources ought to be considered so unacceptable as to warrant closing down such stations immediately where possible (e.g., if a district can already provide enough energy to meet its own needs via renewable sources; if a district can utilise a neighbouring district’s excess renewable-source-generated power), or as soon as a district’s capacity to generate power via renewable sources has been increased – though the Energy (or Utilities) Ministry ought to be more concerned with providing energy-generating facilities to districts that lack them than building new power stations in districts that don’t. Villages that lack power can be provided with generators (preferably dual purpose – i.e., able to utilise solar or wind power when available, then use diesel when they aren’t) so they are able to link up with the outside world via TV and other

communications equipment, have lighting at night and be provided with ovens/stoves (thereby eliminating the need for villagers to burn wood or other fuels for cooking; until a village has a generator, its local vegetation could be totally or partially protected by sending firewood to it from First World districts – most of which ought to be able to minimise or eliminate their need to burn wood), refrigerators and maybe even freezers – such equipment could initially be kept in a communal area for shared or rostered use, and the available appliances ought to be distributed evenly between villages (i.e., if, for example, there are only enough fridges available to initially provide each deprived village in the world with one, then efforts should be made to ensure that each has one fridge before any such village is issued a second fridge; then that each has a second before any receives a third, and so on). The generators can be used to pump water to the village, treat it if necessary, and even to provide hot water. If a village's generator(s) provides enough power, electric heaters could be issued to each residence (thereby eliminating the need for villagers to burn wood for heating); or, if there is a limited number of electric heaters available, they could at least be issued to residences housing young children, the sick or elderly (note that in NZ and other First World countries, some people – particularly pensioners – 'go to bed early to save on heating' and other energy costs).

Districts that already have satisfactory power infrastructures should replace inefficient appliances with energy-saving alliances as they become available via the Manufacturing Ministry's factories (those producing inefficient appliances could cease production immediately – although production of components to maintain existing inefficient appliances would have to continue until all such equipment has been completely phased out). Households connected to a natural gas pipeline – or that have appliances connected to LPG cylinders – can be charged for gas usage at an equivalent rate to what is charged for electricity usage, but the production of such equipment also ought to be phased out (i.e., the Energy Ministry will cease connecting households – and factories, etc – to the gas system, and replace gas appliances with electrical appliances when they reach the end of their working lives: sooner if there are excess electrical appliances and workers available to install them). It might be possible to convert parts of the gas pipeline system to carry water – potable or waste – but unusable (or non-required) sections would have to be removed from the ground when it is practical to do so (i.e., unless the pipes are hazardous, their removal can be delayed until the Energy Ministry has no more urgent projects to complete). The Energy Ministry ought to take a similar approach to the use of coal, wood or other fireplace (open or closed) fuels in such districts. This means that eventually there should be no gas, coal, or nuclear industries, no one will be employed to collect, chop or distribute firewood, and there won't be any chimney-sweeps either!

Ending the manufacture of unnecessary products and packaging will decrease the amount of power used by each district (and power requirements can be further decreased by eliminating inefficiencies – be they during power production, delivery or usage). However, any savings may be completely offset by increased production of essentials – at least until an adequate supply of essentials is available worldwide (note that factories which mostly utilise robots – and don't need to run 24-hours/day – could be operated at night, when overall power demand is decreased). Many or all districts might have to continue trading material resources indefinitely, but there is no reason why every district can't eventually be completely self-sufficient in power generation – especially if heavy users (e.g., the Manufacturing Ministry; the Food Ministry) recycle energy as much as possible. The type of renewable energy resource utilised by any particular district would have to depend on what is most accessible to it – some could use just one source (either wind, waves, fast-moving rivers, ocean thermals, solar, or some other source – but, preferably, not geothermal), others a variety of sources – and what is most efficient (which depends on how the amount of energy required to produce the means of power generation compares with the average output produced by the generator during its expected lifetime). Because of the effect hydro dams have on the environment they initially flood, and their potential to eventually flood larger regions with drastic consequences, they should cease to be produced – unless a dam actually enhances the surrounding environment (e.g., if it is built in an otherwise barren valley); the effects of its collapse are likely to be minimal; or the stored water is also needed to supply taps (in which case the stored water being drawn into pipes to be sent to the city could also drive turbines to generate power for the system's personal use and exterior use – such turbines can even be situated at numerous points along a pipeline so that the energy contained within a segment of water being forced through the pipe is reused more than once).

It eventually might become possible to safely produce satisfactory amounts of power via equipment such as the *Radiant Energy Device* (r:p2221, ln37), the *orgone accumulator* (r:p2222, ln10), the system envisaged by Nikola Tesla (r:p2222, ln54 to p2223, ln25) or some other invention (e.g., *fuel-cell power stations*; solar power stations in space; power stations that will efficiently create or capture lightning, then enable the resulting energy to be utilised; a source yet to be discovered). Alternatively, *perpetual motion* machines could eventually become the preferred means of power generation. If improvements are forthcoming in the production of superconductors, the day may arrive when such materials are used to generate all of the power in every district – perhaps utilising a series of *free energy* power stations (e.g., one for each suburb, plus one for each industrial zone or major industrial facility – especially hospitals and schools), with each station using the power it generates to run itself as well as supplying the district grid. If each station was also capable of storing some power (e.g., in a bank of rechargeable batteries), computers could draw on that power supply to automatically increase or decrease a station's power output depending on demand (be it from within its allotted supply area or from elsewhere in the grid) and, if the capacity of the entire system is greater than the district's maximum requirement, the system will be unaffected if one or more stations are out of operation due to routine maintenance or an unexpected breakdown – and, if for some reason the entire system crashes, the first station to be restarted will have a source of power to do so. A system which is capable of providing more than a district's maximum power requirement (i.e., the amount of energy required if everything electrical within the district was simultaneously being used to its fullest potential) would mean the Energy Ministry won't have to continue fitting electricity meters to houses to keep a check on whether any residents are overusing power – but while meters continue to be read, those that are inside houses should be transferred to their exteriors for easier access. Even if room-temperature superconductors can't be produced (or haven't already been produced), and each power station has to divert some energy to keeping the conductive material at a low temperature, it may still be possible to produce power stations that are more efficient than – or at least as efficient as – any currently available means of power generation.

Even if free-energy power stations become a reality, it would seem to be practical to have at least some organic – or, less preferably, PV – solar cells on the roof of every house (this should be considered impractical if the energy required to produce the necessary volume of cells and associated equipment is greater than the average output of the cells during their lifetime; or if an environmentally sound means of producing solar cells isn't developed). This will enable each household to have an emergency, albeit limited, power supply (the power produced only needs to be enough to provide lighting and communications equipment in the event of a major grid failure – because the type of food kept in the fridge ought to remain edible for a few days without constant cooling, and residents can prepare raw meals instead of using their oven; residents may also wear more clothing or exercise for short periods if they get cold) – at least while sunlight is available (though the system could include at least one rechargeable battery) – and utilising otherwise unproductive space (especially if the alternative is to build a *solar farm* on land that could be used for other purposes; note that, if it doesn't block sunlight, glasshouse roofs and windows – r:p2265, ln32 – could contain solar cells to produce some of the power used for farming purposes) as well as decreasing the amount of power that has to be produced by generator stations during daylight hours (any unused solar power would be fed straight into the grid). Alternatively, each house might be supplied with a mini wind turbine or mini free-energy generator (but still be connected to the district grid – so that if ever a house's generator fails, it will only be without electricity if the failure coincides with multiple failures of the district's power stations).

If future house roofs lacked gutters, rain would run down the sides of houses – thereby helping to keep them clean. However, the problem of where that rain goes when it reaches the ground will always be an important consideration for urban areas. At present, the preferred solution is to collect rainwater via roof gutters and downpipes, then divert it into pipes which eventually drain into local waterways and harbours. An alternative solution would be to provide every house with a sufficiently-sized water tank so that some of the rain which falls on a roof (if the gutters were located lower down the side of each house, as opposed to just below the roof-line, this would aid both natural exterior cleaning – especially above arms' reach – and the amount of water collected) can be used by the building's tenants – even if this water is only used by toilet cisterns (although houses can be fitted with a filter, distiller or

other form of purifying equipment, on a single tap so it can be used for drinking-water) and in the unlikely event that normal water supplies are disrupted (hot water tanks could be another source of emergency water, but using elements to heat water only when required is a preferable option – especially if houses have rain-water tanks). This alternative still needs to include a system of pipes capable of collecting excess roof rainwater, plus rainwater which lands on roads, footpaths, etc. – but it doesn't make sense to then dump the rainwater into the sea, especially since clean water still needs to be pumped to houses (because, even if household rainwater storage tanks were larger, hardly anywhere in the world receives rain regularly enough to guarantee a year-round water supply). The Energy Ministry should build a facility near the end of each stormwater pipeline outlet which can remove any impurities from rainwater then pump it back to houses (and other buildings) via the potable water pipeline system. Such facilities ought to be capable of processing all of the water flowing through their stormwater pipes – but if a period of rainfall is so heavy or prolonged that the potable water pipeline system is being oversupplied, excess rainwater can be piped to farms for use as irrigation (the pipes used for this purpose can double as storage tanks, and only when they are full would the excess rainwater be allowed to overflow and continue to a traditional outlet – or, perhaps, to managed forests; rain collected from glasshouse roofs would be fed into the same pipes, or go into extra tanks – such tanks being placed either adjacent to each glasshouse, inside them, or underneath them). If no rain is falling, or the level of rainfall is below the volume required by the potable water system, that system would then draw on water from other sources (e.g., natural springs – 'all of Christchurch's water comes from artesian wells'; rivers; lakes; storage dams; desalination plants – the latter being preferable to towing icebergs or 'large plastic bags filled with water' through the oceans because they are able to extract essential minerals and metals in addition to salt).

Auckland's water storage dams can be classified as being relatively safe from a public perspective because, if any of them collapse, loss of human life is unlikely and the damage caused to the environment would be minimal. However, the district shouldn't build any more, or replace the existing ones if any of them do collapse or outlive their usefulness. Furthermore, when the Waikato River pipeline has reached the end of its lifetime, it shouldn't be replaced either. Instead, a desalination plant ought to be built on one of Auckland's harbours to produce potable water from seawater whenever the district's supply of spring and rainwater is insufficient. Desalination plants can be operated full-time in districts which lack sufficient supplies of spring, river or lake water – even if their product has to be pumped a long way inland. Incidentally, there ought to be no more fountains built in future (and those already in existence can be turned off) – except for suitably located public drinking-fountains. Furthermore, fluoride shouldn't need to be added to public water supplies if, in future, people have healthy diets, receive regular (and free) dental care, and every parent takes an interest in the condition of its children's teeth!

Household water meters wouldn't be warranted in a moneyless society (although the water system could still utilise meters – or fibre optics – at various points as a check for leaks) – especially if children are taught to use water sparingly, and continue to do so as adults (at least one actor's 'favourite indulgence is having two or three baths a day'!). The only reason why someone should have more than one shower or bath a day is if it gets very dirty more than once a day – but the majority of people don't need to have a single shower or bath each day because, even if they get sweaty a lot, most days sufficient cleanliness can be achieved via a flannel (or sponge) and a basin of water. It also isn't necessary to flush a toilet every time one is used – if the previous user has flushed the toilet and the current user only urinates, that user could leave the flushing to the next user – 'if it's yellow let it mellow, if it's brown flush it down' (household toilets still ought to be dual-flush, and public urinals have buttons so they're able to be flushed when necessary as opposed to self-flushing whenever their cistern has filled). By the way, if a guy who only wants to urinate finds a toilet-seat down, it should lift the seat (placing a piece of toilet paper between the seat and its hand to avoid also picking up germs) and then leave the seat up when finished – because the next user might be another guy; if a gal finds a toilet seat up it should lower the seat, then leave the seat down (unless spiders are a concern) in case the next user is another gal. However, if boys are taught to sit down when urinating (even puppy dogs can be conditioned to urinate like a bitch – i.e., without cocking their leg – if they aren't raised with adult dogs), toilet seats wouldn't need to be raised or lowered (and, in addition, it won't be necessary for public toilets to have urinals – which can cause urine to splash back on to trousers, shoes or the floor, and some people find urinals difficult to use if strangers are standing beside them).

Because it is possible to extract pure water from household and industrial sewage, it might seem ideal for dry districts to recycle (by properly treating) their water as much as possible – merely replacing the small volume of water that even an enclosed system is likely to lose – rather than pump water long distances from a lake, river or desalination plant. However, if every district has a constant supply of water, and harmful industrial compounds are removed by the Manufacturing Ministry (r:p2203, ln15) before its waste water enters the sewers, sewage will eventually only contain biodegradable compounds (via toilets and sinks), meaning every district could use its sewage to fertilise its farmland. The sewage would be either: (a) pumped directly to and throughout the farmland area (perhaps having one main pipe which is periodically fed by secondary pipes that come from different sections of the city), with valves being opened to allow the sewage to flow to whichever field, glasshouse or hydroponic system that needs to be fertilised (measures can be taken to control any odours, but they would be contained within closed systems such as glasshouses – if not, the farmland ought to be far enough away from housing that such odours aren't a problem – while farm workers can wear masks), with any excess sewage either being allowed to flow freely through managed forests or properly treated when it reaches the end of the pipeline before being used for irrigation or released into the environment (recycling the remaining sludge or dried compounds in a suitable way – e.g., burning it for power generation; using it as filler in construction projects, or – if possible – as an ingredient in the production of construction materials, roading and other solids); (b) piped to facilities where it can be loaded into mobile tankers – which then deliver it to specific fields or glasshouses as per the Food Ministry's requirements (with any excess being dealt with properly). Even if sewage has to be partially treated before it is used as fertiliser, that should still be done – because this is the most efficient means of handling such waste, and doing so means suitable waste plant material can be turned into plastic, paper or other products instead of compost. Note that if sewage treatment (plus stormwater) stations are built with dual systems, one could normally serve as a back-up – in case the other breaks down or is being serviced; and both could be operated when flows are heavy.

Modern utility companies waste a lot of time digging holes to access their respective pipes or wires whenever they have to be serviced, repaired or replaced – then recovering the pipes, etc., with dirt afterwards. If utility services were all being handled by one ministry, the likelihood that diggers will accidentally damage one utility service supply line while working on another should be eliminated, and an easier system for handling pipes and wires could be adopted. Wherever possible, pipes and wires should follow the same route – and, as much as possible, they should be placed underneath footpaths. After all, it is more practical to dig up a footpath than a road! However, if pipes and wiring were to be placed in the same ditch, and that ditch wasn't refilled with dirt but instead was covered by large removable paving slabs, each time a section of pipe or wiring has to be tended to, workers could simply lift off the relevant slab then put it back in place afterwards. Such paving slabs would need to be made out of a tough and durable but lightweight material (as opposed to using concrete, which is heavy and can crack), be wider than the ditch – so they don't fall into it – and should have two underhanging walls to stop soil from falling into the ditch from its sides.

Having localised power-generating stations would reduce the need to utilise high-voltage wiring, but if the wires that link such stations still have to carry voltages which makes it unsafe – for utilities workers – to place them next to pipes, rather than string them high in the air or bury them deep in the ground, strips of land can be dedicated to the Energy Ministry in much the same way that areas of land are currently used for roading or railways. The wires could run above ground – meaning that they will be easy to access for repairs, maintenance or replacement – or be buried to a shallow depth (if they can be encased in an electromagnetic dampening material, this should not only decrease the width of the strip of land but it might also be safe for the public to use the land as walking or cycling trails). Such wires may still have to go deep underground or be held by pylons wherever their routes traverse waterways or roading.

MOVE

The argument is often heard that, “because [we] can land on the moon,” we should also be able to design and produce an efficient nonpolluting automobile or a good public transport system... The [blame for the present lack of an efficient nonpolluting automobile], of course, rests with the motor vehicle manufacturers. They prefer to stay with the existing technology as long as possible. If the industry does change, it will be because of a possibility of significant fuel savings and superior performance... plus multifuel capability... [T]he successor to the internal combustion engine will either be a gas turbine of very advanced design or a Stirling cycle[or] Rankine cycle engine... Unlike gasoline or Diesel engines... these... external combustion engines... can burn *any* fuel (liquid or gas). Stirling or Rankine engines could also burn pulverised solid or slurries, such as powdered carbon... During any manufacturing changeover period there will be at least ten years during which both kinds of engine... – ...the internal combustion engine... [and the] external combustion engine... – ...are produced simultaneously. For at least fifteen years subsequently, both old and new types would still be in service. Many futurists unfamiliar with the auto industry (or any industry) are rather contemptuous of such mundane interim possibilities and project – or prefer – a direct shift to electric cars. Numerous advantages are casually claimed for electric propulsion, including... [l]ow operating cost[, ease of operation, low maintenance and long life]. Apparently, the last three advantages are based on analogy with simple electrical household appliances, compounded by widespread misinformation about just how long conventional automobiles do last... [(M]ost people guess about seven years. The truth is that the *median* age of automobile scrappage in the U[S – where ‘an average of 8.5 million cars are retired from use each year’ –] has consistently ranged between eleven and twelve years. Trucks are about the same. Buses last twenty years or more.[)] ...The sad fact is that all the claimed benefits are totally hypothetical... More than one may be illusory. More important, the electric car cannot be a practical reality without a substantial improvement in electric storage batteries or fuel cells. (The latter would be of no interest without fossil fuels, however.) ...If the... [s]o-called “advanced” storage batteries using exotic electrochemical combinations such as lithium and sulfur... ever emerge into production, there is little doubt that the cost of the combined motor-control-storage-system would be at least three times – and possibly as much as ten times – as much as a comparable gasoline engine and transmission combination. For the same weight, they will provide less power and less range... There will probably be a future for electric cars later, however, because the electronics industry will eventually solve a very difficult technical problem: how to provide *external* power to a moving vehicle without unacceptably high losses or awkward mechanical contacts. Only by this means can transportation be truly systematized and begin to get away from the pattern of individually driven and powered machines competing with each other for space on the road and dissipating most of their energy in useless and wasteful stops and starts. Almost certainly the best method will be to provide energy in fairly large increments or “pulses” and not on a steady continuous basis. The old overhead wire or third-rail devices used by trolleys and subway trains are inadequate for obvious reasons (aesthetics, cost, inflexibility, risk of accident). The science fiction idea of picking up power from a microwave broadcast beam covering a wide area can also be discarded at once: the efficiency of transmission would be too low, and intensity levels that would be safe for humans would be inadequate to operate a vehicle... What I envision is a small, lightweight vehicle driven by air-cooled electric motors, probably in the wheels. It would have a... solid-state electronic power control system and a high-capacity energy pickup unit under the car. It would also have an intermediate storage capacity good for distances of 30-50 miles. The storage system could be either an electrochemical cell (e.g., lithium-sulfur) or a high-tensile ceramic flywheel. In the latter case, the flywheel would actually be the rotor of a specially designed motor-generator unit capable of converting pulses of current from the external pickup into kinetic energy of rotation and also capable of converting rotational kinetic energy into electric power for the wheel motors. The wheel motors would also operate, in reverse, as regenerative brakes, converting the kinetic energy of the car itself back into electricity and storing it. Recharge would have to take place automatically as the car passed over special... units in the road. Since fairly close tolerances are likely, I would expect the car to synchronize with and temporarily “lock onto” a moving cable in the roadway... A single pass might require 60 seconds or so and provide enough energy for 2 miles of driving. For densely traveled routes the vehicle would remain permanently locked on the external guide cable, except for turns. Within cities, a certain number of off-street “full” recharge locations would also be likely, probably at parking facilities. The cost of each refill would... probably... be by... electronic funds transfer... Computers could also check the registration of passing vehicles, automatically checking for cars reported stolen or in violation of traffic regulations, thus discouraging car theft and irresponsible driving. Obviously, such a vehicle would be of marginal utility away from a network or grid where it could readily obtain power... Thus the system is, of necessity, urban in orientation. Such a system would still be far short of a fully automatic (driverless) transportation system... Unfortunately, the notion of electronically controlled vehicles acting like chauffeured limousines is probably fanciful. It would be intolerably lavish in use of both energy and capital – and very possibly technically infeasible – to have individually owned units utilizing a common network; a private vehicle being shuttled empty from a dropoff or pickup point to a remote storage location would be excessively wasteful. On the contrary, it seems to me that if passenger cars ever become fully automatic, they will also inevitably become part of a public transportation system. When that happens... the distinction between taxis, limousines, jitneys, and buses will be one of size and route only. Small vehicles will provide individualized service at a higher price; larger vehicles will provide cheaper group service on limited routes and/or times. The customer will call for individual service by utilizing automatic special purpose telephones located on all street corners, inserting [a] magnetically coded credit identification card... and specifying by number code the size and type of vehicle desired. The nearest empty car of the appropriate type will make its way automatically to the point at which the call originated, ready to be activated by the *same* credit card... A system of the kind described would require only a fraction of the number of cars now in service in [First World] countries, since each car would be much more fully utilized... and designed for ultralong life... Maintenance would be centralized. Electronic controls and automatic electric power distribution would... be comparable in magnitude and cost to the present traffic control and fuel refining and distribution system... A few years ago there was a great flurry of interest in new forms of high-speed... transportation systems... between major cities... Some concepts involved creating new, totally enclosed, and possibly evacuated underground guideways. The advantages were thought to be protection from all possibility of external interference and theoretical elimination of all curves, so that extremely high speeds could be achieved. Unfortunately, the cost of digging thousands of miles of tunnels would negate these hypothetical advantages. Another, probably prohibitive, problem is seismic instability: Even a minor earth tremor could destroy the integrity of an arrow-straight... tunnel... The more practical answer... appeared to involve surface routes... but... the air-suspension system ground effect machine... can be disregarded as a serious contender... Although several experimental units have been built in different countries, they cannot be justified economically except at speeds higher than can be attained on realistic routes. They consume too much energy for too little benefit.

...The British and French Government’s decision to go ahead with the Concorde project may well be... an example... [of spending] community... money unwisely so as to... gain... prestige... At best, only a few people will fly in it, for a saving of only a few percent of their travelling time, and

even then they would not use the craft if they had to pay the full cost of the fare... For less than one-thousandth of the total investment it would have been possible to develop a cheap electric bicycle that would have provided short-haul transport for millions... Or, if one wants to write off huge amounts of capital to provide jobs, the Severn Barrage could have been built and amortised, thus providing cheap electricity forever. - 1979

...we have produced permanent magnets so strong that they break before you can pull them away from an iron surface. More than half of those we have made are no longer here on Earth; they rest in endless silence on the moon, in the electric motors of the Lunar Rovers, relics of the Apollo project... Short of space travel there's no more efficient way of transporting people and goods at high speed than by magnetic flight in vacuum underground... A tunnel doesn't require the acquisition and destruction of property... can provide... zero-drag and [be] quiet even at high speed, safe from weather and vandalism... and because of the predictability of the environment, the technique lends itself to automation... [If you move] a permanent magnet slowly downward toward a nail resting on a surface[, for] a while nothing will happen, but then suddenly the nail will jump up and plaster itself against the magnet. If you replace the permanent magnet by an electric one, and control its current through a simple computer that senses the position of the nail, you can make the current decrease if the nail moves up, and increase if it moves down. In that way you can make the nail hover indefinitely in mid-air. That is called "attractive magnetic levitation," and though it sounds risky, given the reliability of modern electronics it can be made quite safe. Already by the late 1970s three different organizations... had demonstrated full-size railcars that... [were] suspended with a clearance of a finger's breadth from a steel rail, by controlled magnetic forces. The Krass-Maffei version exceeded 250 mph on its test track, and... Japan Air Lines... is building a magnetic-suspension railcar line to connect the city of Tokyo to its main airport... The concept of high-speed wingless "floaters" riding a cushion of magnetic fields is really quite old-fashioned: Emile Bachelet, a French engineer, invented it in the early days of this century and demonstrated a successful working model at a Paris exposition in 1914 to crowds that included the young Winston Churchill. In the 1930s a Princeton professor, Edwin Northrup, carried out experiments on magnetic flight and published his results... In magnetic flight, a magnet moving at high speed near to, but not in contact with, a conducting surface... generates eddy currents in it. The currents provide fields that repel the magnet. It's simple, passive, and self-correcting... To provide acceleration, transverse coils are located along the right-of-way, and a computer controls their currents as necessary to make the vehicle speed up, coast, or slow down, sensing its position and speed by its interruption of light beams at intervals along the line of flight... Using no fossil fuels, but only electric power in small quantities, a floater car in vacuum will fly at much lower cost than any of its competitors. An aircraft must spend more energy per mile the faster it flies, whereas for a floater the energy cost per mile of travel actually goes down slightly with increasing speed... [However, f]ixed-routing transport systems of any kind won't compete with aircraft over long distances. Planes will always retain the advantages of zero-cost rights-of-way and the ability to adjust seasonally, or even daily, to changing patterns of passenger demand.

...as is often the case when institutions and nations reach the dinosaur stage, individual voters and small-scale towns and states [a]re ahead of the national and corporate leaders. Riders flocked to unprepared mass transit systems, as for example in Milwaukee, where ridership soared by some 20[%] in 1980. Environmentalists and public-interest groups had lobbied mass-transit funds into the [39th Administration's] energy plan and called for spending \$13 billion on mass transit to increase capacity by 50[%]. The bottleneck was Detroit, which had long since deemphasized buses. (General Motors had actually bought Los Angeles' rapid-transport rail system in the 1920s in order to tear it up and thus increase the sale of private autos.) Citizens demanded that Chrysler begin making buses as a quid pro quo for its bail-out by the taxpayers, and traffic surveys showed that Americans were, on the whole, trying car-pools... as well as... driving within the 55-mile-an-hour limit...

Faster-than-light Travel... It is foolish to speculate about what humanity will be like 30 million years from now. We are just beginning to understand our own genetic structure, and in the far future we may well choose to alter ourselves rather than our environment. If it should turn out, however, that our descendants decide to expand... throughout... [and] out of our own galaxy, the kinds of spaceflight technology we[currently] have... simply will not be adequate for the task. The distances that will have to be traversed by... starships during the colonization of our galaxy are typically five to ten light years, and the time involved [using existing technology] is a little more than a century. If we want to discuss travel to another galaxy, however, this mode of transportation just won't work. The nearest galaxy is 2 million light years away, so that with travel at 10[%] of light speed, it would take 20 million years to bridge the gap. During this time the ship would be in free space with no energy source at all. It seems pretty clear, therefore, that if the laws of physics are such that faster than light travel is impossible, the human race will never expand out of the Milky Way. Therefore, the question we have to ask is how firm the speed-of-light limit is. The increase of mass with velocity has been well documented experimentally. Large particle accelerators are designed to take this effect into account, and governments routinely spend millions of dollars to build and operate them. This would hardly be the case if there were a flagrant violation of Einstein's prediction. On the other hand, it is undeniably true that the basic theory underlying all of our understanding in this area – the general theory of relativity – is the most poorly tested of all our generally accepted theories of physics. This is something of an historical accident. It turns out that most of the effects predicted by general relativity are so small that they are very hard to measure. Only now are our experimental techniques getting to the point where the theory can really be put to the test. In a decade or so, when the present generation of experiments of general relativity have been completed and analyzed, we shall have a better idea of the validity of the theory. It may turn out that the theory is correct, or it may turn out that there are regions where the theory needs to be replaced by something more complete. So even in the near term, there is some chance that a way around the speed-of-light limit will turn up. It is important to emphasize that we are discussing here a "way around" the limit. We shall never build a spaceship where someone climbs in, steps on the pedal, and accelerates smoothly past the speed of light. There is simply too much evidence supporting the conventional argument for such a thing to happen. What I am suggesting is that it may turn out that general relativity fails in such a way that it becomes possible for an object to move from point A to point B in less time than it takes for light to make the trip, but without the object actually being accelerated through the light barrier. I am suggesting, in other words, that it may be possible to sneak around the light barrier without violating any laws of physics... One device for doing this is routinely used by science fiction writers. It's called hyperspace, space warp, or something equivalent... I have to emphasize that there is absolutely no reason to expect such... faster-than-light travel... to come about on the basis of our present knowledge... I just feel that it is presumptuous of us to suppose, on the basis of three hundred years of experience with science, that barriers that appear insurmountable to us will remain insurmountable 30 million years from now... One of the main problems with any conventional fuel carried on board a spacecraft is the rather small amount of energy that can be obtained from it. For example, it takes 250 kilowatt-hours of energy to move a kilogram of matter from the earth's orbit into deep space. This corresponds to the energy tax imposed on interstellar travel by our sun. For comparison, a kilogram of the best chemical fuel will yield 3.2 kilowatt-hours of energy when it is burned. The conversion of mass to energy via fission or fusion does better, but even in nuclear burning, a large fraction of the original mass winds up as "ashes," serving no useful purpose as far as propulsion is concerned. It would be much more useful to find a way of converting *all* of the mass in the fuel to energy. A kilogram of matter converted completely to energy, for example, would yield no less than 25 billion kilowatt-hours. This has been recognized by those who think about spaceflight, and it is recognized that the ultimate fuel for spaceships will probably be antimatter. One of the great discoveries of modern physics is that for every known type of subatomic particle, it is possible to create an antiparticle... ([which]... has the same mass as the particle, but all of its other properties... are reversed...)... When a particle and an antiparticle come together, they undergo a process called annihilation. The original particle and antiparticle disappear... and in their places are a collection of highly energetic lighter particles... For technical reasons, it is easiest to store protons and antiprotons for use as fuel, so most antimatter ships would have two storage areas

– one where each of the particles are stored, and a combustion chamber where they are allowed to come together. This is the design of the starship *Enterprise* on “Star Trek,” so it is not an unfamiliar concept. There is an important drawback to using protons, however... Since proton-antiproton annihilation produces particles whose velocities are below the speed of light, the exhaust velocity from the combustion chamber will be less than its maximum allowed value... Consequently, even though antiproton drive would be an enormous improvement in interstellar propulsion systems, it is conceivable that we could do better if we could find a massive and easily controllable particle-antiparticle pair that would produce only photons upon annihilation. Theoretical physicists have speculated for decades about the existence of such particles, but at the moment there is no generally accepted evidence that any have ever been seen. The hypothetical particle is called the magnetic monopole... Theorists believe such a particle should exist because of a curious asymmetry we find in nature. We know that there is a fundamental connection between electricity and magnetism, and we know that single, isolated electrical charges exist in nature. The electron and proton are examples of this. There has never been, however, a single isolated magnetic pole. Whenever we find a north magnetic pole in nature, there is a south magnetic pole associated with it... but... [i]f nature is symmetrical as far as electrical and magnetic effects are concerned, we would expect that a single magnetic pole – a magnetic monopole – should exist. If this should turn out to be the case, there... would be two kinds of monopoles – north and south, and one would be the antiparticle of the other. This means that if a north and south monopole are brought together, they will annihilate. Consequently, monopoles would be candidates for antimatter engines... [O]nce a single monopole exists, it is easy to manufacture others... An accelerated monopole could be directed against a target where, a certain percentage of the time, it would create another north-south pair. The new monopoles (and the original one) could then be guided around to the entrance of the accelerator by magnetic fields, accelerated, and used to create still more pairs. This means that an interstellar ship could “refuel” at any place in the galaxy where it could find enough energy to run a small accelerator. We could even imagine an interstellar network of “monopole stations” similar to the coaling stations that dotted the oceans during the past century. - 1981

By the middle of the next century... consumer response to human-powered vehicles will become steadily more positive... [As a consequence,] vehicles that enormously magnify the power of human muscles will slowly supplant the car in the inner city and will ultimately revolutionize city travel. Cam-driven, super-lubricated wheels, located beneath membrane frames that weigh just a few pounds, will allow human drivers to maintain speeds of thirty miles per hour for more than an hour without getting out of breath. Whereas a bicycle requires the driver to pedal with the whole leg, these vehicles will work from a simple back and forth movement of the feet, requiring as little exertion of energy as the pressing of a clutch. The industry may be hampered at first by liability problems, for such new-fangled vehicles will share the road with larger automobiles. Some cities could conceivably ban cars... [– although, with] the cost of traditional automobiles rising even faster than the rate of inflation, many people will not be able to afford them [anyway]... Moving sidewalks will not gain widespread acceptance as urban transportation until the Variflex Moving Sidewalk is developed for practical use... This particular sidewalk functions under a variable width, variable speed system. It travels at slightly faster-than-walking speed on approach and departure, but accelerates from about two miles an hour to over ten miles at maximum speeds. Cross walks will have slow zones. More complex systems will add speed lanes, creating multiple-sidewalk highways. They will replace sidewalks in shopping areas [– ‘we could shop all day and not wear our feet out’ –] airports, and large public buildings. - 1982

...Greens would make mobility without the car a real and far from inconvenient possibility[– but via bikes not moving sidewalks! ‘The average annual distance people are now travelling exceeds 10,000km per capita –’ but s]omething like 70[%] of journeys are less than 8[km] in length or, put another way, would take less than half an hour by bike. In inner London it is already faster to commute by bike than by car, bus or train. Sadly, casualties among cyclists are nine times higher per mile than among motorists... [Yet, in] contrast to the billions of pounds spent on roads, as little as a few thousand pounds invested in cycle lanes would make cycling safer and would boost mobility. Bikes create no fumes or pollution, save on fossil fuels and are healthy to use. The carrying of bicycles on public transport could be free and the provision of cycle parks the duty of local authorities... The Green Party would... increase fuel taxes in a move to persuade citizens to use public transport. We would include a third-party insurance levy in the price of fuel and ban the building of town-centre car parks. Where possible, the use of the private car in city centres would [also] be banned. Citizens would benefit by having cleaner cities... and... there would be fewer accidents... - 1990

Mazda’s latest “fantasy prototype”, the 35kg suitcase car, takes one minute to assemble and cruises at 20km/h. Perfect for tired sightseers, but hopeless as a getaway car!

...FUTURISTIC CAB. [A] former Jaguar designer... harbours plans to build a luxury car. But to do that [it] must first establish a company that has the proper base to support such a project. ¶ And [the designer reckons it] has the right idea by establishing a company to build a decent, modern, taxi cab. ¶ It’s called the Hermes and uses a high efficiency gas turbine running at 13,000rpm to drive a generator that powers small electric motors on each rear wheel. At the same time, the generator is charging a set of underfloor batteries. Once the batteries are fully charged the turbine shuts down and the Hermes will travel for 50 kms before the batteries need re-charging again. ¶ The cab is built on an aluminium floorpan and uses lightly stressed aluminium and glass fibre body panels. ■ ...A prototype bus that runs on electricity and CNG... has won an environmental award... The Yellow Bus company built it and ECNZ sponsored the project[headed by]... a lecturer in the department of electrical and electronic engineering... [and a colleague from] the... Auckland University engineering department... [The bus] looks and drives like any other bus but is heavier, mainly because of the batteries it carries. Most of the power comes from the batteries, with only 30 of the required 150 kilowatts covered by a CNG component. It is maintenance free... and... very safe... The design requirements were that it have minimum noise and pollution emission – and it succeeds... [I]t makes as much noise as an average car, even when it is grinding up-hill. “It also compares well with electric buses being developed overseas, in terms of the range it can travel, speed and economy.” [The lecturer] says American cities have legislated to replace a percentage of internal-combustion vehicles in an effort to reduce air pollution[and it believes NZ] should be making similar moves.

...Here in the final years of what must be the most violent century in all of recorded history, whe[n]... little children starve while food surpluses rot, some people still find it surprising that in the field of ideas and inventions the “real world” of war, murder, suppression and other black arts does not intervene. Somehow, in this best of all possible viewpoints... good ideas and inventions will... find their way as commodities into our “open society”... because there is so much “freedom of information”. One’s attention is directed to satellites, cat scans... the Hubble telescope and assorted other technomiracles. These, the argument goes, are reason enough to support the assumption that it is now virtually impossible to suppress anything. But is it? ...the answer is a resounding NO. Any technology gets developed when there are enough interests to see that it gets developed and suppressed when those championing the technology are not powerful enough to make it past the “vested interests”. Case in point: The engine that runs on water. In our research we have discovered numerous examples of inventors who have developed practical and economically viable ways of cracking water on board a car into its constituent gases... then recombining them in the engine with a spark to create an even more powerful explosion in the cylinder than is obtained from petrol. Such a device renders the internal combustion engine completely non-polluting (with the exception of some nitrogen oxides)... Archie Blue of N[Z] developed such a device... The Royal Automobile Club in the UK vouched for his device and stated publicly that the inventor’s car, a Mini, was getting 100 miles per gallon on water ALONE. The device worked so well that a group of English investors in the Channel Islands backed Blue, having brought him to the UK, tested the device and... then the whole thing stopped. Archie returned to N[Z] and stopped publicising the device. When [Archie] died in 1991 his secrets died with him – especially the secrets

of possible “over unity”... [THE WEEKEND] EDITION OF THE “CHRISTCHURCH STAR,” APRIL 29, 1978... [ran a front-page article that said:] *Mr Blue spent seven years developing his “water car” unit, which... can be built for under \$100. “It could put all the service stations out of business,” [Mr Blue] said today... Mr Archie Blue [also says himself] and his Guernsey partners... have been offered \$500 million for the patent by Arab interests...* Archie Blue was reputedly paid \$2 million for his invention, though his daughter disputes this. In any event, [the daughter] apparently never saw any of the money. And when her father died, [the daughter] and her husband cleaned out his laboratory and “took a lot of junk to the tip”. This junk, presumably contained some of Archie Blue’s working models of a water to hydrogen converter. Was Archie Blue’s invention suppressed? Probably. But much more to the point is why, with the earth beginning to destruct, with people literally choking to death on the fumes of the petrochemical industry, isn’t someone else taking up where Archie left off? Even if “over unity” is currently not achievable – and there is no doubt in this writer’s mind that it is achievable – hydrogen converters are simple to build and mass produce, cheap and potentially valuable in reducing car emissions... Why aren’t people now pooling resources, starting companies and making the damn thing? In every instance where we uncovered stories of people who had developed water to hydrogen converters for cars, they were unceremoniously stopped in their efforts, sometimes violently. To assume that the oil companies, with their billions of dollars in resources, cash and private armies will consent to the development of hydrogen conversion is, to but it mildly, naive. Unless, of course, a new market is developed for sand. For years Mercedes Benz and Audi both developed and reportedly perfected cars that ran on hydrogen, and then in 1993 inexplicably dropped their projects. The University of Melbourne had a long term hydrogen project going and cars running on it... A... Sydney inventor... successfully demonstrated his special carburettor and water cell in a Ford Prefect, using a couple of conventional 12-volt car batteries to provide the electric power. [The Sydneysider] claimed the kit could be produced for... \$400 a car, but production never started... [An inventor] of Los Angeles developed a revolutionary hydrogen extraction process during the mid-70’s. This unit was said to easily extract free hydrogen from water and yet be small enough for use in automobiles. In 1976 two independent labs in LA tested this generator with perfect results. [The person] who began the Budget car rental system purchased rights for this device... One of the most controversial figures of his kind... created a sensation when [the figure] began demonstrating his water-to-gas miracle... [in] the 70’s... Chemists at Havoline Chemical of Michigan and the University were among the first to test his fuel. According to both, it actually worked better than gasoline... According to [the inventor], his secret lay in using a small quantity of ‘conversion powder’ which was processed from coal... While it cost [the inventor] over a dollar a gallon to make his fuel in small quantities, [the inventor] claimed that it could be produced for a few cents a gallon if mass produced... [T]he inventor... continued to put on his demonstrations for years and claimed the auto manufacturers, Government, and private companies just weren’t interested in his revolutionary fuel... In the mid-70’s a Dr... of United International Research presented his Hydro-fuel mixture concepts at a meeting of petroleum refiners in Houston, Texas. According to reports, this fuel was a mixture of 45% gasoline, 50% or more of water, and small percentages of crude alcohol and United’s ‘Hydrelate’. This latter chemical was a bonding agent which kept the fuel’s ingredients mixed. Even though it was estimated that a hundred million gallons of gas a day could be saved through the use of this product, no one seemed to be interested... [‘Like alchemists turning metal into gold, an Indian family makes petrol from a secret herb, water, lemon juice and salt as easily as making tea. It all began when the father remembered a strange leaf which burned brightly near a childhood picnic fire. The father took a sample of his petrol to the Indian Institute of Technology in Madras, where it was found to be more efficient and produce less pollution than real petrol. The secret herb found somewhere in local mountains – the father was once kidnapped and tortured for 3 days to give up his secret but refused – which turns water into petrol is either a discovery with the potential to transform the world economy or a fraud.’ Lack of official interest in – or suppression of – inventions seems to also have occurred] in the field of carburetion... G.A. Moore... held... some 17,000 patents... 250 of [which] were related to the automobile and its carburetion. While industry relies on his air brakes and fuel injection systems, it has completely ignored his systems for reducing pollution, gaining more mileage, and improving engine performance in general. As far back as the mid 20’s Moore’s systems were found to be capable of virtually eliminating carbon monoxide pollution. Persons involved in the automotive field viewed Moore as an authentic genius and could not understand why the industry ignored his advanced automotive designs... In the late 30’s there was an inventor in Winnipeg, Canada, who developed a carburetor which got at least 200 mpg by using superheated steam in its system. C.N. Pogue was quite open about this work until very professional thefts indicated his invention was in danger... What eventually happened is still unclear. In the early 40’s there was another inventor who developed a design that cost him many years of heartache and ‘dead ends’. John R. Fish was cut off from every direction, and when [the inventor] finally resorted to selling his carburetors by mail, the post office stopped him. In tests by Ford, they admitted that his carburetors were a third more efficient than theirs, yet no one helped. As late as 1962... a ‘Fish’... [was used on a] winning Indianapolis 500 car... In the early 70’s a small concern in the L[A] area turned out a number of remarkable Variable Venture Carburetors. Most of these were hand made for racing cars. Buying one of their less sophisticated prototypes, a young college student mounted it on his old Mercury ‘gas hog’. Entering it in a California air pollution run, the student won easily. Not only did the carburetor reduce pollution, it gave almost twice the mileage. Within a week the student allegedly was told to remove his carburetor – it was not approved by the Air Resources Board. Due for production in 1975, the simpler Kendig model has yet to be produced... L.M. Beam, who had had his super-mileage carburetor bought out back in the 20’s, worked out a catalytic vegetable compound that produced much the same results... At one cent a gallon [Beam] guaranteed his W-6 formula would save at least 10% in fuel costs[. However, Beam’s invention was r]efused and rejected by State and Federal certification agencies (Air Pollution and Environmental Pollution agencies)... In his, “Suppressed Inventions” [an author] spoke with Mr Beam and found that the shadowy trail seemed to lead to a major oil company – but, of course, little could be proved. [The author] tells of a later device which used the same principle. [An inventor] of Gratz, Kentucky, could supposedly get 115 mpg out of his big 8 cylinder Buick, using his vaporizing arrangement. Typically, this device was assured of obscurity when Detroit interests bought it in 1950. In the early 70’s there was a device made by Shell Research of London that was a bit more sophisticated in design. Vaporizing the gas at around 40 degrees centigrade a certain amount was allowed to go around the vaporizer to reduce pressure losses. The ‘Vapipe’ unit was supposedly not marketed because it did not meet Federal emission standards. Another advocate of vaporizing gasoline... [lived in] Lucerne Valley, California. According to a Sun-Telegraph of 11-2-74, [this inventor claimed to have taken]... a 10,000 mile trip across the country in his 1949 Buick for \$10 worth of carbide. Building a simple carbide generator, which worked on the order of a miner’s lamp, [the inventor] said that a half pound of acetylene pressure was sufficient to keep his car running... all day on a gallon of gas... Because acetylene was dangerous, [the inventor] put a safety valve on his generator and ran the outlet gas through water to ensure there would be no ‘blow back’... In 1975 UCLA experimenters ran liquid hydrogen to a standard propane regulator and mixer atop a standard carburetor. In the carburetor they used water to lower combustion temperatures and to act as a combustion and backfire control. (An ‘approved’ gas mixer or carburetor is necessary in California)... Many believe that hydrogen is the ideal motive force. Containing no carbon, H₂ can be burned safely in any enclosure and broken up into safe components whatever the conversion. A number of minor experimental successes proved the worth of these conversions over the years. Some simply hooked up a mixing chamber instead of a carburetor on their car, and they experimented with combinations of oxygen and hydrogen until successful. In 1972 a UCLA team built an automobile to compete in a ‘clean air’ race. Using a stock gasoline engine, they lowered its compression rate and made a few alterations to allow for a greater heat build-up. Next, they recirculated part of the exhaust gas to decrease the excess oxygen and slow the combustion process slightly. The result was a success. The only real problem was in the bulky, quickly exhausted tanks of fuel. Billings Energy Research of Provo, Utah, solved the bulky tank problem a couple of years later when they built a hydride storage system. Hydrogen is chemically locked in powdered iron titanium and is released when heat from the engine’s cooling fluid warms it. With this... there is little reason for our continuing dependence on fossil fuels... With the advent of the fuel crisis of

1973 there were a number of experimentors who found solutions involving the use of ultrasonic fuel systems. Much of this work involved using sonic transducers to ‘vibrate’ existing fuels down to much smaller particles. This procedure simply increased the surface area of the fuel and made it work more efficiently... [An inventor working in this field] was one of the first persons to proclaim the fact that water could be mixed with gas and used as fuel with these units... When the word suddenly got out that the super fine S-onized water would mix perfectly with up to 70% oil or gas, there was congratulations from many sides (June 17, 74, Newsweek, etc). Later there was nothing but silence again. Later in 1975 [the inventor] was interviewed again and explained that Detroit was so myopic that they would probably turn down even the wheel [– ‘used first in the Tigris-Euphrates Valley about 3500 BC’ –]if it were a newly offered invention... [A] Portuguese chemist... gave a demonstration to Navy officials that proved his additive could reduce fuel costs down to 2c per gallon. It allowed ordinary gasoline to be mixed with water without reducing its combustion potentials. When Navy officials finally went to negotiate for the formula, they found the inventor missing and his lab ransacked. (Saga 5-’74)... The Pacheco Bi-Polar Autoelectric Hydrogen Generator... could revolutionize the field of energy... [It] is a unique system which separates hydrogen from seawater (the element’s natural storage tank) as it is needed for use. The... patent (#5,089,107)... teaches the on demand autoelectrolytic separation of 99.98% pure hydrogen from seawater at both electrodes of the generator, and the simultaneous use of the hydrogen’s carried energy... The oxides of the two metals used in the system which produce hydrogen at both electrodes are also recyclable (with a minimal 0.25% loss)... [Its inventor] has built prototypes which have successfully fuelled a car, a motorcycle, a lawn mower, a torch, and a boat (with the ocean serving as its inexhaustible fuel tank)... His generator was... exhibited in Canada at the 1990 Green Energy Conference, and at many other notable conferences where [the inventor] received several awards for his work... As a young [guy] in his native country Bolivia, [the inventor] was fascinated with the idea of developing a super battery. While experimenting in his makeshift laboratory, [the Bolivian] lit a match and the bubbles forming in one of the beakers ignited and blew a hole in the ceiling. [The Bolivian knew that it] had made a discovery but was not sure what [it had discovered. The Bolivian then] abandoned his work with the battery and proceeded to develop his hydrogen. In 1943, while on a Good Will Tour of South America, the Vice President of the U[S] witnessed his generator running an automobile. [The Vice President] invited him to bring the generator to Washington where, later in that year, [the Bolivian] demonstrated it to scientists and representatives from the U.S War Department at the Bureau of Standards. [The Bolivian] applied for a patent, but because the U[S] was at war, all patents were sealed and available only to the military. Later, his lawyers advised him to shelve his patents because, at that time, oil was plentiful and cheap and there was no need to develop an alternative source of energy. [The Bolivian] became a U.S citizen and brought his family to his newly adopted country, knowing that one day, the time would be right for his invention... During the oil shortage in the 70’s, [the Bolivian] decided it was time to apply for his patent again and received a U.S and several foreign patents. But, [the Bolivian] soon learned that neither the energy industries, the heavily subsidised utilities, nor the Department of Energy were interested in developing clean, abundant, safe energy from the hydrogen. Determined to bring his invention to the people, [the Bolivian] built prototypes and demonstration models to show government and industry officials. Many came and saw, said they were impressed, promised to help, but none ever did. In 1974, with the hopes of acquiring government backing, [the Bolivian] demonstrated his pollution free hydrogen fuel cell to[a member of] Congress... who today speaks often of the wonders of hydrogen fuel. With no outside power source, the self taught chemical engineer connected the fuel cell to an alternator unit with a 3hp, 1000 watt generator with a 4 stroke engine. The demonstration was a success and the excited congress[perso]n promised to bring it to the attention of Washington officials. Upon leaving [the congressperson’s office, the Bolivian] invited him to participate in another demonstration at the Jersey Shore. [The congressperson] was invited to take part in a history making voyage, the first power boat ride, “fuelled by... seawater.” Many newspapers were invited as well. But, [the congressperson] never showed up, nor did very many newspapers. [The Bolivian] never heard from the Congress[perso]n again, but his voyage was... a... great success. History was made on July 27th, 1974 when a 26 foot in-board power boat ran for nine hours using... seawater for fuel, putting back into the ocean as its waste, clean water. In an effort to overcome the scepticism [the Bolivian] was facing and the Ph.D [the Bolivian] could not add to his name, [the Bolivian] had his invention analyzed by several independent laboratories. It passed all tests but when [the Bolivian] tried to introduce it to the automobile industry and the oil companies, the response was either cool or non-existent. After a 2 hour meeting with one of the oil companies, [the Bolivian] was told that developing the generator would be against their interests. In 1977, [the Bolivian] built a prototype unit which provided hydrogen, electric and thermal energy... for cooking and heating... a 1,000 sq ft home in West Milford. The New Jersey Commissioner of Energy, and several of his staff came to see and were impressed. The Commissioner wrote a letter of recommendation to the D[OE], but again nothing happened. In an effort to bring the generator to the public’s attention, [the Bolivian contacted a producer] who... wanted to do a TV show about the generator, but the idea was axed by the station. It was during this time that [the Bolivian]... was the recipient of a plaque and award from the Commissioner of the Patent Department and 2 consecutive Hall of Fame awards from the Inventor’s Club of America in 1978 and 1979. In 1980, [the Bolivian] was contacted by 60 minutes who promised to help him show his invention to millions of Americans. The 60 Minutes crew arrived in West Milford and taped the generator producing hydrogen fuel for a bunsen burner, and a torch which cut through a 3/4[in.] thick steel plate... The last of his demonstrations involved running a lawnmower with the fuel. Because [the Bolivian] was going to be on [TV], at the last minute, [the Bolivian] decided to buy a new one, and did not have time to test it out. The engine choked due to the excessive amount of gas being produced but the 60 minutes crew assured him that they had enough material to present an entire show with the successful demonstrations. Later when the show... was aired, [the Bolivian] was devastated as the show had a completely different focus. The only demonstration aired was the lawn mower, and it was used to provide an example of an independent inventor’s non-working invention. In 1986, with increasing concerns about the environment, [the Bolivian] wrote to the D[OE] about the generator but received only a fact sheet in response which provided information on the drawbacks of hydrogen fuel based on the problem of storing it in liquid or gas form. [The Bolivian] wrote back explaining that with his system, there was no need to store the hydrogen as it is produced on demand. His detailed response was ignored... [A designer produced] a remarkable air-powered flywheel that [it] claimed could propel an auto for 2c per mile. Using a principle of “ratio amplification of motion” in a closed system, the motor was easily attached to electric generators for pollution-free variable power systems... Back in 1816 a Scottish clergyman, Robert Sterling, designed an external combustion engine that ran on hot air. Since that time, many experiments have been made trying to perfect his idea... Because air is non-polluting and does not tend to heat nor contaminate engines it is used in, it is an ideal power source. The one major problem, however, has always been just how to store enough compressed air for lengthy travel. Air has been used for years to power localized underground mine engines, and even a number of experimental ‘air autos’ have been successful. In 1931 L A Engineer R.J. Meyers built a 114 lb, 6 cylinder radial air engine that produced over 180 HP. Newspaper articles reported that the Meyers vehicle could cruise several hundred miles at low speeds. Compressed air stored as a liquid was later used on advanced air auto designs in the 70’s... In 1973 [an inventor from] San Diego, California, thought up a simple air car design. Using a scuba bottle full of air, [the inventor] ran a hose to an air impact wrench. The wrench shaft was, in turn, hooked to the wheel... By using a battery to pump up his tank, [the inventor] was able to go some distance at speeds up to 50 mph... In 1975 there was a breakthrough of some significance in the British Atomic Energy Research Lab at Harwell. There they came up with a working fluid pump which was nothing more than a container with an assortment of pipes and valves. This means that solar energy should be capable of pumping water – or your hot springs or hot air supply can furnish pumping power... In the 1930’s in Wollega, Holland, there was a 21 year old inventor who developed a piston engine which reportedly could run for three months before needing recharging. The engine was remarkable in that it ran on hot compressed air. [However, before the 21 year old] had a chance to market the engine, [the inventor] was sent to a mental hospital, and his

working models disappeared[(the most recent model of a 'car that is powered by nothing but air has a range of 120km and a top speed of 70kmph – using \$2 of compressed air')].... Russell Bourke was probably one of the true geniuses in the field of internal combustion engines. Upon noting the incredible waste of motion in the standard auto engine, [Bourke] set about designing his own engine in 1918. In 1932 [Bourke] connected two pistons to a refined "Scotch yoke" crankshaft and came up with a design using only two moving parts. For over thirty years this engine was found to be superior in most respects to any competitive engine, yet it was rejected by all of the powers that be. This amazing engine not only burned any cheap carbon-based fuel, but it delivered great mileage and performance. Article after article acclaimed his engine and its test performance results, yet nothing ever came of his many projects except frustration and blockage... [An inventor and his brother] struggled for years in Vermont to get backing to perfect his amazing engine... [which] manages to use even the harder to burn heavy gasoline molecules. Current engines are said to waste these, and, since they make up to 25% of the current fuels, the use of the heavy molecules was a great step forward. According to a 'Los Angeles Examiner' article (Dec.29, 1974), the cams, timing, and so on were altered on stock Detroit engines... With such publicity, the EPA was forced to examine the situation, and of course, they found that the motor designs were not good enough. Few persons believed the EPA, including a number of Senators. A Congressional hearing on the matter in March 75 still brought nothing to light – except silence. [The brother]s were interviewed by newspapers and auto manufacturers across the world, and even though they... [achieved] 80% more mileage... [by merely modifying] the basic Detroit designs; Detroit was not interested... ['Gas turbines are a form of internal-combustion engine in which air is compressed, heated by means of fuel sprayed into a combustion chamber, then expanded in a turbine to produce enough power both to drive the compressor and to provide a surplus. They are much used for aircraft propulsion, having a high specific power output (i.e. high power for low weight). The steam turbine was invented 2,000 years ago by Hero of Alexandria, but the first practical one was devised by Sir Charles Parsons in 1884, and contributions to its development were made by the Swedish engineer de Laval and others.'] In 1907 a Stanley Steamer car travelled down a Florida beach at 170 mph before a bump sent it out of control. Losing ground to cheaper gasoline vehicles, a number of the old steamers were resurrected and run during the [WW2] fuel shortages. Even in the 50's a Stanley engine carried one researcher and his newer car across the US for \$6 worth of kerosene. The Doble Steam Auto was probably the first steamer of modern design. Instead of allowing the steam to escape, it recirculated it so that an owner conceivably could drive a thousand miles before refilling the twenty-five gallon water tank. With less than a minute warm-up owners could get performance equal to the best gasoline automobiles. The amazing Doble engines were guaranteed for 100 thousand miles, and some owners reported having got a phenomenal 800 thousand miles from them. From his first auto show Doble got 27 million dollars in orders. The War Emergency Board of the period 1917 plus discouraged production completely, so Doble was forced to survive abroad building steam trucks for an English firm. Steam power plants have been no problem. Kinetics Inc. of Sarasota, Florida, had a superb engine developed for cars of the late 60's... One of the most advanced steam turbine designs came from the DuPont Laboratories in late 1971. They used a recyclable fluid of the freon family... Using more basic designs, Sundstrand Aviation put one of their steam power plants in a Dallas city bus. At the same time... three Oakland Buses... [were] equipped... with similar 'Doble' designs. Lear Motors Corp. of Reno, Nevada, spent millions on advanced steam designs until it was apparent there would probably be little financial reward in the end... About as close as anyone came to putting a production model on the market in the 70's was the attempt by [an inventor who, u]sing Swedish Sullair rotary compressors for motors... mounted his system on a standard Datsun and got a contract for at least a hundred more. Later modifications included a gyrator engine, which was actually a pump motor working backward. One of the few new steam engine designs able to be directly tied to the drive wheels of an auto is the KROV design of 1973. Claiming at least a one-third advantage in economy over conventional gas engines, all this engine needed was financing... In the early 70's [an inventor] in Rialto, California, developed an unusual steam engine design that was purported to get 50 miles to the gallon. The engine, which used only 17 moving parts, weighed less than 50 pounds and eliminated the usual transmission and drive train in an auto. After contacting Detroit interests, the inventor claimed [it] was required to sign forms releasing these interests from acknowledging his claims to the design before they would even look at [the design]. After a Sun-Telegraph article on the project, his factory was fire bombed to the tune of \$600,000. After letters to the White House, the inventor finally gave up... I recall that one enterprising [inventor] sold a kit to convert gas engines to steam engines during... [WW2. This inventor] ran around L[A] in a converted Model A Ford until [it] dropped from sight. In the 60's there was a similar conversion kit put out by a small company in Oregon... Aside from a token steam project by Ford, the steam auto was ignored right up to the time of various Senate pollution control committees of the late 60's. Typically, the representatives of the auto industry alleged that steam engines were not dependable, safe, or necessary – especially since Detroit would soon have good minimal engine emission designs... One of the most astonishing engine designs of the 60's was the Papp engine which could run on 15c an hour on a secret combination of expandable gases. Instead of burning a fuel, this engine used electricity to expand the gas in hermetically sealed cylinders. Far from being complex, the first prototype used a ninety horsepower Volvo automobile engine with upper end modifications. Attaching the Volvo pistons to pistons fitting the sealed cylinders, the engine worked perfectly and showed an output of three hundred horsepower... In 1969 [an inventor] became disgusted with his ailing automobile and decided to gamble a couple of hundred dollars on putting together an electric car. Using an ancient ten horsepower electric truck motor, [the inventor] figured out a unique system to get peak performance from this motor; [and] actually ran his 1961 Mercury from this power plant. Estimating that his electric car costs him less than \$100 a year to operate, the inventor was sure that larger concerns would be very interested, and... could hardly believe the lack of response [it] received from his efforts... [His] invention actually cut energy drain on electric car starting by 75%. By weakening excitation after getting started, there is a 100% mileage gain over conventional electric motors... ['An electric car held the world land speed record at 66 mph in 1899; this was increased to 85 mph two years later – present day electric cars have reached 150 mph. The reason for the relative lack of commercial success of electric vehicles up to the present lie in the battery specifications required in order to produce a performance even approaching those of internal combustion engines.' 'Electric motors vary in size from small electric clock motors to sizes which develop 40,000 HORSEPOWER or more – used to propel ocean ships.' (Editor's note: some 'bacteria swim by being turned at the base by a small rotary motor – the motors are small electric engines powered by a current of protons.')] One of the startling electric motor designs of the 1970's was the E M A motor. By recycling energy this astounding motor reportedly was able to get a better than 90% efficiency. Using a patented Ev-Gray generator, which intensified battery current, the voltage was introduced to the field coils by a simple programmer. By allowing the motor to charge separate batteries as it ran, phenomenally small amounts of electricity were needed. In tests by the Crosby Research Institute of Beverly Hills, Ca., a ten horsepower E M A motor ran for over a week on four automobile batteries... When [its inventor] demonstrated his radically different motor to physicists and engineers in 1976, their reaction was typical. They admitted the motor worked remarkably well but since it was beyond the 'accepted' laws of physics they chose to ignore it... At an inventors workshop (I. W. International) an amazing electrical auto engine was shown by[its] inventor... Using what [it] called "liquid electricity", [the inventor felt that his engine] could power a large truck for 25,000 miles from a single portable unit of his electrical fuel. Liquid electricity[also] violated a number of the well known physical laws... Any mention that an electric car could be made which could regenerate its own power as it was driven was a joke to most 'experts'. Yet, in 1976, this author actually saw such a car function. Using various standard automotive parts and an electric golf cart motor, [the inventor]'s first model functioned perfectly. Once this remarkable auto reached a speed of 20 mph, it regenerated all of its own electricity. In normal stop and go driving, it gave several hundred miles of service between recharges. The secret to the system lay in the way that the inventor wired the batteries to act as capacitors once the car was moving. Four standard alternators acted to keep the batteries recharged[(in 1990, a 'Japanese company claimed to have perfected an electronic car battery which was capable of maintaining consistent power for 6 hours and would recharge itself in 30 seconds'). Yet another inventor]... and his partner spent only 45 days and around \$500 to put together a car that confounded experts. A

small 7/8ths 12 v-motor provided the initial power. Once going, a hydraulic and air system took over and actually recharged the small electric energy drain. The Montebello, Ca. inventors were, at last reports, very determined that the auto industry would not bury their “super power” system. What happened? ...One inventor in the 20’s used an electric car which ran off high frequency electricity which [was] generated at a distance. Using principles similar to... Tesla’s ideas, [that inventor] simply broadcast the re-radiated atmospheric energy from a unit on his house roof. Henry Ford, acting for himself and the other Detroit oil “powers”, quickly bought and quietly shelved this invention. John W. Keely reportedly used harmonic magnetic energies from the planet to run his mysterious motor. Later, [an inventor] of Lake Isabella, California, worked out a motor thought to be similar to Keely’s. In the late 40’s it was demonstrated for many persons, including Naval scientists. After a round of “dead ends”, it, too, vanished into the pages of the past... In... “Suppressed Inventions”, [the] author... tells of [an inventor from]... Kentucky, who turned down a GM offer of 35 million dollars when they wouldn’t guarantee to market his amazing magnetic engine... built... from old washlous machine parts... In the 70’s it was found that ceramic permanent magnets could replace conventional field coils in electric motors. This resulted in low current drain, high performance, and freedom from burn out, an ideal prescription for electric cars. Two 6 V batteries are supposedly enough to run a 1 1/4 hp motor 50 miles at 30 mph... A retired electronics engineer... of Madison, Florida, invented a motor which apparently ran by means of six tiny electromagnets and a secret timing device. Requiring no fuel, the engine of course emitted no gases. It was so simple in design that it required very little maintenance and a small motorcycle battery was the only thing needed to get it started. Typically, most persons who had professional background in this field felt that the machine must be a farce and viewed it and the inventor with suspicion. After seeing the machine run a power saw in the inventor’s workshop, a number of persons were forced to expand their thinking somewhat... In the June 1973... issue of “Probe” there was an article on an electromagnetic engine that was fuelless... T. Townsend Brown was... [a] soft-spoken scientist[who] had a solid clue which could lead to fuel-less space travel. His saucer-shaped discs flew at speeds of up to several hundred miles per hour, with no moving parts. One thing [Brown] was certain of – the phenomena should be investigated by the best scientific institutions. Surely... the science establishment would admit that [Brown] really had something. Although the tall, lean physicist... was a humble [person, even shy, Brown] confidently took his good news to a top-ranking officer [the physicist] knew in Washington DC. “...experiments in Paris proved that the anomalous motion of my disc airfoils was not all caused by ion wind... They conclusively proved that the apparatus works even in high vacuum. Here’s the documentation...” ...That year Interavia magazine reported that Brown’s discs reached [the aforementioned] speeds... when charged with several hundred thousand volts of electricity. A wire running along the leading edge of each disc charged that side with high positive voltage, and the trailing edge was wired for an opposite charge. The high charge ionized air around them, and a cloud of positive ions formed ahead of the craft and a cloud of negative ions behind. The apparatus was pulled along by its self-generated gravity field, like a surfer riding a wave.[A] Fate magazine writer... in 1958 also described Brown’s metal discs, some up to 30 inches in diameter by that time. Because they needed a wire to supply electric charges, the discs were tethered by a wire to a Maypole-like mast. The double-saucer objects circled the pole with a slight humming sound. “In the dark they glow with an eerie lavender light.” Instead of congratulations on the French test results, in the Pentagon... [Brown] ran into closed doors. Even his former classmate from officer’s candidate school, [now an] Admiral... discouraged Brown from continuing to explore the dogma-shattering discovery that the force of gravity could be tweaked or even blanked out by the electrical force. “Townsend, I’m going to do you a favour and tell you: Don’t take this work any further. Drop it.” Was this advice given to Brown by a highly-placed friend who knew that the US military was already exploring electrogravities? (Recent sleuthing by [another US] scientist... uncovers a paper trail which leads from Brown’s early work, toward secret research by the military and eventually points to “Black Project” air craft... The B-2 seems to be a culmination of many of Brown’s observations...)... Were... repeated breakins into Brown’s laboratory meant to discourage him from pursuing his line of research? Brown didn’t quit[, perhaps because the physicist]... wanted to know “Why is this happening?” [Brown] was convinced that the coupling of the two forces – electricity and gravity – could be put to practical use. The arrogant academia ignored his findings... Perhaps [Brown] would not have had the heart to continue his lonely research if [the physicist] had known in 1956 that nearly thirty more years of hard work were ahead of him, and [that it] would pass over in 1985 with the frustration of having his findings still unaccepted. The last half of his career involved new twists. Instead of electrogravities, at the end of his life [Brown was demonstrating] “gravitoelectrics” and “petrovoltatics” – electricity-from-rocks. Brown’s many patent’s and findings ranged from an electrostatic motor to unusual high-fidelity speakers and electrostatic cooling, to lighter-than-air materials and advanced dielectrics. His name should be recognized by students of science, but instead has dropped into obscurity... Brown fought an uphill battle all his life, at great cost to himself and to family life. His cause included getting the science of advanced propulsion out into public domain, not hidden behind the Secrecy Act and a wall of classified documents. [Brown] died feeling that [the physicist] had lost the battle... Too late to comfort him, some leading-edge scientists of the mid-1990s are now resurrecting Brown’s papers. Or what they can find of his papers... A number of researchers contend that if the poles of the atomic fields in matter are arranged in a linear polarity, one can produce an anti-gravity effect. This is the principle a magnet works under when its molecules are in alignment. The perfect example of this principle in application is the bumblebee. Flying against all aerodynamic principles, the wings purportedly produce enough electro-static polarity bands around the bee’s body to carry it aloft. According to some theories anti-gravity can actually come from creating any system which will use the confusion of matter against the orderly flow of energy... By orienting the poles of the atomic structure of matter instead of the molecular structure (magnet), even non-ferrous metals can gain attraction repulsion qualities. We should shortly be using propulsion units which are little more than diaphragms of matter sending out discordant vibrations – out of harmony to the resonance of space... While the electrical resistance of various metals has long been affected by super cold temperatures, it was not until the mid-60’s that scientists found a ‘breakthrough’. Niobium with tin zirconium or titanium were found to produce super-conducting magnets ten times as strong as ordinary magnets... [S]uch super-conductive characteristics could allow a super magnetic shield for space ships. This would, in effect, act as a ‘force field’ protector against dangerous protons and radiation. Super-conductive wire, of course, could allow frictionless gyros, and ultra small computers and electrical circuits. When larger super-conductive metals act to repel magnetic fields, we have an actual ‘levitation’... Threatening to hang the 58-year-old... and to harm his family if [it] did not co-operate, Adolf Hitler forced an Austrian inventor to build a flying craft which levitated without burning any fuel... The work was based on Schauburger’s discovery of how to develop a low-pressure zone at the atomic level. This had happened in seconds when his laboratory device whirled air or water “radially and axially” at a falling temperature. [Schauburger] referred to the resulting force as diamagnetic levitation power. [It] emphasized that nature uses indirect – what Schauburger called reactionary – suction force... After their research headquarters was bombed, they were transferred to Leonstein and started a flying-disc project to be powered with his trout-inspired turbine which rotated air into a twisting type of oscillation resulting in a buildup of immense power causing levitation. A small model which crashed against the ceiling glowed blue-green at first as it rose, then trailed a silvery glow... [The] devices were no more than lab... models by the end of the War. However, the [US] military officers who showed up a few days after the model hit the ceiling seemed to know what [the Austrian] was doing. They seized everything. [The Austrian] was interrogated by a high-ranking officer, and put into “protective custody” for six months... because of his knowledge of atomic energy. (Even though his research was directed toward implosion – which was labelled fusion – rather than toward the destructive fission approach to the atom.) A few tantalising bits of lore about Hitler’s “flying saucers” rose into public awareness years later. The July 27, 1956 Munich publication Da Neue Zeitalter said that “...this new motive power – implosion[–] ...generated light, heat and motion... with the use of only air and water...” The first [remote-control]ed flying disc was tested February 19, 1945 near Prague... [–] the disc could hover motionless in the air and could fly as fast backwards as forwards. “This ‘flying disc’ had a diameter of 50 metres.” ...the craft test-flown near Prague... rose to 15,000 metres in three minutes. It then flew

horizontally at 2,200 k[m]/h... There is no doubt... Schauberger knew how to build an implosion device which levitated. His problem was how to brake it. Test models generated so much energy that an entire engine lifted itself off the floor, levitated in the high-ceilinged test hall, and crashed against the ceiling... Did anyone carry on the levitation-craft work after Schauberger's wartime research team was split up? The answer may be buried in some country's classified defense files. After the Far East Treaty was signed... attempt[s] to get his implosion generator funded and developed was derailed... Pythagoras was the first person history records as working out a reasonably sound harmonic musical scale. [Pythagoras] was also convinced that certain modes or keys had profound effects upon emotions. The 'Hard Rock' music of the 70's then was probably far worse on the listener's well-being than the less chaotic music [Pythagoras] warned his disciples against. The early Greeks had great knowledge on the use of vibrations, and the priests were able to build highly unique sound chambers to use in their rituals and religious ceremonies. Many persons have felt that all elements have certain keynotes and, if such a keynote is duplicated, it can disintegrate the compounds into their various parts. The mystical principle that two exact things cannot occupy the same space at the same time is valid whether applied to a mind system or to a wall of Jericho. According to a number of ancient records, round metal discs of certain shapes and resonance could lift... objects if sounded... Indian Sanskrit records are usually more detailed and indicate a science of acoustics far ahead of ours. The 716 ancient stone discs found in China by the Russians in the 60's were said to vibrate in a peculiar manner when struck... [A w]ell-known occult writer... explained in some of her works, that the gigantic stones moved by the ancients were rendered weightless by a simple application of natural magnetic law... [One researcher's e]arly work... found a direct relationship between the output frequency of the brain and intelligence. The Energies Science has yet to understand what we could call the 'other energies'. These energies – or let's say, 'this energy'[-] can be operated at great distance without any 'grounding' actions by physical bodies. It can even be reflected by mirrors and transported, concentrated, and increased by sound. The mystics referred to this other energy as 'life force', and 'Prana'... and the ancients referred to it in various ways as the 'binding force'... [More recently it has been] called... the X force... 'Odic Force'; [and]... 'the mumia'... Townsend Brown[']s... new principle of propulsion... started with a charged condenser on a string and led into miniature flying saucers. It was found that the closer the condenser plates, the wider the area they covered, and the more voltage difference between them, the greater the resistance to the effects of gravitation. Brown... is thought to have concluded that three large condensers under a saucer (120° control) would be sufficient to make practical flight possible. Theoretically, the condensers act in creating a modification of the gravitational field around a craft and, by using a "Caduceus" coil to change field polarity, directional guidance can be attained. As late as the early 1970's one inventor in the Northwest demonstrated similar anti-gravity discs before Portland TV Channel 8 viewers. His 'Sicorsci Aviation' spent seven million dollars on the project before it faded away. These and other propulsion systems were all but ignored, officially. They went against the notions of gravity, for one thing, and for another, how would the powers that be make money from them? Jets cost millions... these systems were too simple. - 1994

RUSSIA HAS UNVEILED a fuel-efficient transporter that could revolutionise world travel. A cross between a flying boat and a hovercraft, the "ekrano-plane" was for decades a far-fetched mystery, glimpsed only by military satellites as it skimmed on an air cushion over land and sea. It can carry 400 passengers at a cruising speed of more than 480 km/h, fly off water, land or ice, and soar to thousands of metres to avoid bad weather. It has a range of 16,000 k[m] and uses only one-fifth of the fuel required for a conventional aircraft... [Incidentally, in the US, t]ransportation sources consume about 200 billion gallons of fuel each year. They also produce over half the air pollution generated by the combustion of fossil fuels. An improvement of 5 miles per gallon in American automobile mileage would cut carbon dioxide emissions by nearly 100 million tons a year. Energy-efficient automobiles including electric vehicles... would cut automotive carbon dioxide by up to 70[%]. Car pooling and greater reliance on mass transit would reduce smog in big cities. Furthermore, the use of alternative fuels such as natural gas and methanol would cut emissions... - 1995

Roadside radio beacons could be used to enforce pollution-free zones in city centres by automatically switching specially-designed cars to battery power, says a British engineer. Hybrid taxis could run on relatively pollution-free natural gas outside smog black spots, but use... 370kg of... batteries... [- enough to run the taxi] for as long as three hours... before needing a recharge... - ...in designated zero-emission zones...

Toyota will mass-produce the world's first production-line hybrid petrol and electric car within a year, the daily *Nihon Keizai Shimbun* newspaper reports. Toyota plan to turn out tens of thousands of the hybrid by the end of 1997, aiming at a price tag of around 2.5 million yen (\$31,950), said the daily. The hybrid is expected to boast a two-fold increase in petrol economy compared with the Toyota Corolla, according to company sources... Power generated by the petrol engine but not used for locomotion could be shunted to the car's battery, to be used later by the electric motor. The American market was being targeted first because of an growing shift in the U[S] towards low-pollution cars, the paper said.

...AUCKLANDERS can identify with Vancouver[']s inhabitants)... Both cities are proud of their natural environment, both are experiencing a growth spurt, and cars are the preferred means of transport. But Vancouverites have made some hard decisions... In consultations over four years, Vancouverites became convinced that continuing down their present track would mean they would end up with a seriously degraded way of life... So the 20 local governments of Greater Vancouver gave unanimous approval to a Livable Region Strategic Plan, a detailed transport blueprint and a Growth Strategies Act... which, by 2021, will reduce the traffic load on highways by 20[%], vehicle pollution by 37[%], capital outlays for roads and transport by 30[%], and the conversion of rural land to development by 33[%]... The plan has four strategies: (1) The establishment of a green zone to protect Greater Vancouver's natural assets, including parks, watersheds, ecologically important areas and farmland. The green zone sets a long-term boundary for urban growth. Municipalities nominate lands to be placed in the zone, which will end up comprising two-thirds of Greater Vancouver's total land base. (2) Building "complete communities" – transit-connected town centres and surrounding residential areas to replace sprawling, unfocused subdivisions. The result will be a better balance in the distribution of jobs and housing, a wider choice of affordable houses, better distribution of public services and more effective transport. (3) Concentrating a larger share of residential growth in certain city areas so that more people will live closer to their jobs, making better use of public transport and community services. (4) Developing an "automobile-restrained" transport system geared toward public transport. Its core will consist of light rail and bus connections. High-occupancy vehicles and goods transport will have priority on highways, and congestion will be allowed to discourage car use. Streets will be altered to favour public transport, cycles and pedestrians. The vision is of a more compact and efficient region with development focused on city areas and discouraged further out. Sound sensible?

...[the other day t]raffic officers in Rawalpindi, Pakistan... [used] a steam-roller[to] crush... 1500 pressure motor horns seized from vehicles during an anti-noise pollution campaign. The use of the horns is illegal in all but ambulances and police cars... [By the way, h]ow many cartons can fit on a single bicycle? Fifty-two, [some Hanoi merchants have learnt]. Widespread poverty has impeded the development of transport services in Vietnam and merchants must often resort to pedal-power or oxcarts to move their goods.

...Sleek, black and bug-like, the sun-powered cars that glided through the A[US]n outback on the World Solar Challenge will... never see the light of day on a city street... "No one goes to work in a F[1] racing car and these solar vehicles are race cars..."... said... the three-yearly international challenge[']s... founder... But... the technology is on track for wider commercial use in cars and homes... [A]n engineer with Ford A[US], said... a near certainly in the short-term is a hybrid using fuel, electric and solar power. "...These... solar... electric drives give regeneration, and when you hit the brakes they instantly change from motor into generator, so you could feasibly drive around town with no fuel consumed." ...The 3010-km race from Darwin to Adelaide saw average speeds rise from 66.9 km/h in the 1987 event to 89.76 km/h. The Japanese Honda Dream won with a top

speed of 140 km/h. Cars were allowed a maximum of 8 sq m of solar panels to gather the sun's energy, and to carry a small battery to store some energy for strategic use. The fastest cars used... 1.5kw of power – equivalent to the amount used to run a small hairdryer – and boasted major improvements in motor design, aerodynamics, battery, tyre and solar cell technology... Honda used laser-grooved solar cell technology from the University of NSW, paying \$NZ1.92 million for 4500 cells to power one car... The... [c]ells... were able to convert up to 24[%] of the light energy falling on to their surface directly into electrical energy, compared to vehicles from 10 years ago where a 14-15[%] efficiency would have been the best. A key had been to reduce the loss of light which falls on to the cells through anti-reflection technology, and in achieving maximum voltage.

...It may look like a bug whirring in the air, but it is the world's smallest helicopter, and mistaking it for an insect would set its German creators back by 100,000 marks... The tiny twirler, developed by the Institute of Microtechnology in Mainz, weighs 400mg, is 24mm long and 8mm tall. Propelled by a motor that drives two blades capable of rotating more than 100,000 times a minute, the helicopter flew about 13cm... on its maiden voyage yesterday before landing safely several seconds later... The motor was connected to an electricity supply by copper threads. When more power was applied, the machine went up; and when power was reduced, it landed. The... real challenge is to find practical applications for the micro-motor, which has a diameter of 1.9mm. Institute officials said the motors could be used in medicine, computers and, of course, toys. - 1996

...Chrysler is developing a vehicle that... might look like a toy but it's due to be a grown-up car very soon... Plastic has been the miracle material of the last half of the 20th century, used for everything from cutlery to credit cards... [However, although p]lastics might be used under the bonnet, under the fenders and inside the boot and cabin of every modern car... they have yet to become commonplace in vehicle super-structure or exterior cladding. This is surprising. After all, plastic is light, strong and easy to work with – a plastic body can withstand impacts – such as those from a bicycle or car door – without suffering a dent... [(k]ids' cars are made of plastic, and the best test of indestructibility has to be a stint in the hands of a toddler[)]... Plastic does not corrode and is unaffected by environmental contaminants such as acid rain. There have been plastic-bodied cars, of course, but most have been low-volume specials such as the Pontiac Fiero of a few years ago. [Unfortunately, the] mid-engined Fiero was a dismal flop, failing to meet the usual objectives of cost and quality... The one big-production plastics number is General Motor's Saturn, which is a reasonably successful car in the U[S]. The Saturn has a plastic skin on a steel skeleton... Now Chrysler is contemplating a plastic fantastic called the Composite Concept Vehicle. Unveiled last month, the CCV uses only five major components during production – four plastic body sections and a "drivable" steel chassis – reducing tooling and assembly costs by up to 75[%]... Other savings include tens of millions of dollars in regulatory costs alone in the U[S], normally needed to cut down paint shop emissions... and the huge cost of setting up the paint shop in the first place... Originally designed as a concept car for emerging markets such as China and India, the CCV may have broader appeal because of the low-cost methods of manufacture. The total number of pieces required to produce the CCV is about 1100 – down from 4000 parts in a traditional mini car... A traditional small American vehicle normally needs between 75 and 100 "stampings" (or massive industrial press actions which shape a car body from a flat piece of steel) in a plant of around 185,000 sq m of space... "For the CCV we can manufacture these vehicles in mass numbers in a 28,000 sq m plant... Virtually everything we do in engine, stamping and assembly plants could be done under one roof. It would require 6.5 hours to build each car compared to the 19 hours now needed to build small cars." ...The CCV is assembled using massive thermoplastic-based injection moulding machines which process... resins... [that] are almost 100[%] recyclable... (similar to plastic drink bottles) into large structural body parts. These body parts – virtually two interior and two exterior halves – are then glued together and bolted to the chassis using only four bolts. There are some hurdles before it gets into production. Chrysler... is developing technologies to meet crash test requirements without a steel substructure and methods to ensure repairs match the original moulded-in colour surface... Plastic (or sheet moulding composite, as it is known in the business) is dearer than steel, especially in bigger volumes. Steel is around \$1 a kilo and plastic between \$3 and \$5 a kilo... [- although 1kg of plastic should produce a larger area of body panelling than 1kg of steel! Remarkably, an]other major issue is recyclability. Plain plastics can be re-used easily, but... only about 50[%]... [by weight] of... cars... manufactured in sheet moulding composite... can be recycled... [compared with 84%] if the same vehicle was... steel... What is also obvious is that the steel industry has seen the threat posed by plastics. It has redoubled its efforts to remain the motor industry's main supplier. The industry is also happy to work with steel. Rust prevention measures have improved and pressing techniques are far better than even a decade ago. Weaning the car industry off steel will not be easy.

...MOTORISTS who know what they like in car design face an uncertain future, even some shocks. They have no control over the finished product. [It is the] environmentalists, safety legislators and accountants [who] are forcing big changes to the form and function of the average car. Forget fifties-style chromed bumpers, gigantic metal grilles and Darth Vader tail fins – they will never come back. Look instead, for little lumps of fibreglass and plastic, designed for function and not form... [-] the politically-correct dream of clean, green, mass mobility... It will not happen in 10 years, maybe not 20, but the world's streets are destined to be filled with plastic fantasies bearing all the appeal of an over-the-limit credit card. They will be powered by ultra-clean hybrid engines, with bodies so cleverly designed they will not damage people or other cars to anywhere near the degree they do now... Balancing the mix... [of] possible and planned international laws on vehicle safety, recycling, fuel efficiency and fuel type, car size and top speed... will be difficult for car companies, and their super computers will be processing data for years, with no guarantee of success. In the meantime, the less scientific equation – how the motorist will react to cars which may end up looking like badly-recycled yogurt bottles or mis-shapen bran muffins – has to be considered... That is why all the concept cars appear first as the show ponies.

...B[eautiful] girls, and some quite ugly cars. That is... the... story of the 32nd biennial Tokyo Motor Show, which opened officially... on Friday... With close to 1800 vehicles on display... fortunately, not all was... strained, dumpy and downright peculiar among, particularly, the smaller vehicles shown. One striking standout was a two-seater roadster from Honda, which displayed two themes common at the show, matching performance with environmental responsibility. The JV-X sports car featured a direct-injection petrol engine of just one litre, which integrates a slim electric motor. Apparently performance of this ultra-light vehicle does not suffer, because electricity generated by the electric motor under deceleration is available to enhance acceleration through the car's stepless automatic gearbox... [T]he car sips petrol at a rate of about a litre every 30km. Special features... include seat belts that double as air bags... known as the "air belt". It comprises an inflating seat belt shoulder, with an inflator and control unit. On impact, the control unit sends a signal to initiate inflation... The system partly doubles as a seat belt pretensioner by reducing seat belt slack on inflation. In addition, the air belt serves as a cushion, reducing head movement... reduces pressure on the thoracic cage on impact and absorbs kinetic energy as gases are evacuated through ventilation holes in the subsequent deflation process. Because the system is compact, it can also be installed in the back seats... The way ahead was also shown by the first appearance of Toyota's much-anticipated Prius hybrid fuel/electric car, along with the FCEV, a fuel cell car based on the body and mechanics of the RAV4... A variety of other low consumption, fuel efficient future cars were on display, some interestingly offering CNG as the fuel at the same time as N[Z] is backing away from this natural resource.

...N[Z] appeared to be encouraging the use of diesel fuel in spite of the risk to health and the environment, [says]... National Gas Corporation... "As a result, our CNG vehicle population is decreasing while other countries are doing exactly the opposite. We are out of step with... A[US and the] USA where the price of diesel is slightly higher than petrol... When natural gas is used to substitute diesel fuel particulate emissions can be cut by up to 98[%],"... At a natural gas conference in Sydney, N[Z] was used by several speakers as an example of how a successful CNG programme can fail if government and industry do not take a longer term view and critical support initiatives are removed prematurely. In the early 1980s... [NZ's] Government offered cheap loans to convert cars to CNG and provided incentives for service stations to install CNG equipment. The scheme ended in 1985, with CNG sales dropping... since then... 130,000 cars were running on CNG... ten years ago, but the total is now... 25,000...

[However,] the jury is still out on the effects of diesel... [(which utilises 'compression-ignition instead of spark-ignition – the advantage is that a high compression ratio can be employed, as there is no danger of the explosive combustion of a fuel/air mixture as with a petrol engine'). The] director of environmental programmes for Rover Britain, said both petrol and diesel were good fuels and... neither should be rejected on environmental grounds.

...[Britain's PM] runs a Ford Galaxy MPV powered by liquefied petroleum gas. So what? Well, [the PM] has also ordered that all 175 ministerial cars should be powered by natural gas by 2001... [A]gain, so what? The what is that [hi]s keenness on setting an example to Brits by publicly using environmentally friendly fuel, has a somewhat ironic relevance to N[Z]. Remember the mid-'70s when the Arab leaders of OPEC... forced the so-called fuel crisis by pushing crude oil prices... to a level rather more realistic for a fast-diminishing resource than had previously been charged. High-performance gas-guzzlers depreciated faster than a pierced balloon; carmakers suddenly found a new deity whose creed was "small and fuel-efficient is beautiful"; and N[Z], endowed with bags of natural gas and not a lot of oil from the huge new Maui field... was the first country in the world to set up a strong national infrastructure and installation programme for compressed natural gas. CNG was cheap and non-polluting. But the programme... was bedevilled by cowboy installers whose bodgy jobs led to starting problems and unacceptable power losses compared with petrol. The lack of range of CNG cars and the loss of boot space caused by their bulky cylinders added to the problems. When the Government pulled its installation subsidies, the industry withered and has almost died, in spite of... much good development work done on getting CNG to perform almost as well as petrol. Shamefully, and ironically as it has proved, N[Z] exported compressor stations, surplus CNG bottles and other equipment to countries which were, 20 years and more later, realising that natural gas has much to offer... Meanwhile, LPG... though never as high in profile as CNG, maintained a core of enthusiasts who appreciated its longer range. But only... 150 vehicles a year are converted to LPG. Only 50,000 gas-fuelled vehicles remain on N[Z] roads, a number declining by... 8000 a year, while less than half the 400 CNG stations of a few years back remain... A[US] has a fleet of 350,000 vehicles using LPG, Venezuela's domestic car industry is meeting a government requirement to build 60,000 gas-powered vehicles a year. Japan is targeting 200,000 gas vehicles within two years and Korea aims for 800,000 by 2005. A fresh drive to boost the LPG side of the industry here has now come from its biggest LPG wholesaler, Rockgas, a subsidiary of Caltex NZ and of Boral in A[US]. Rockgas believes putting... 100,000 gas vehicles on [NZ's] roads... could save \$50 million a year in displaced oil imports... The company has bought 13 factory-converted LPG Ford Falcons and is mounting a national drive with them to push the virtues of converting to LPG to high mileage users... It is offering Taxi Federation members an interest-free loan for the \$1200 a vehicle extra cost of having a factory-built Falcon, with 80-litre LPG tank specially designed to tuck away right at the rear of the boot, or in the case of wagons, in three scuba-like tanks neatly fitted... in the spare wheel bay... Cheaper fuel and better economy are said to give savings of around... \$1400 for a 60,000[km]-a-year car. I have been driving one of the Rockgas vehicles... Start-up is instant on petrol, and the almost immediate automatic switchover to 100% LPG can not be detected... [T]here seems no likelihood of any international let-up on development of gas-powered vehicles. On show at Tokyo recently was a current model Honda Civic with dedicated natural gas power... set for sale domestically in Japan and also in the U[S] next year... Honda has solved one big problem with CNG, its lack of range, which has specially affected small cars with boot space enough for only one gas cylinder. Honda has developed a gas cylinder capable of storing CNG at much greater pressure so its NGV Civic has a drive range of 400km... Honda claims its tailpipe emissions are 20[%] less than a petrol-powered car, and... by avoiding the need to have a dual fuel vehicle compromise, Honda has managed to get an excellent power output... taking full advantage of the fact that CNG has an effective octane rating of about 120 and a considerably higher calorific value than petrol.

...AT the Frankfurt Motor Show this month, the world's car companies have been pushing the environment... With global concerns for the environment growing year by year, and accusatory fingers pointing at the car as a big contributor to global warming, the car industry is in defence and attack mode at the same time. Environmentally friendly, eco-friendly and other public relations phrases are popping up in nearly all news releases about cars these days. It stretches belief to accept words such as these about any device which burns fossil fuels in order to operate, but all self-respecting car manufacturers now have intensive research and development programmes – looking for ways to reduce the impact their vehicles have on the environment. Volvo recently announced a technical development which it says is another step towards the goal of a zero-emissions car... The catalytic-conversion technology in present Volvo cars already eliminates up to 95[%] of the hazardous emissions... To meet increasingly stringent future demands, however, petrol engines and emission control technology must be further refined.

...British chemists have developed... [a] new converter... which... uses palladium rather than the platinum, rhodium and palladium used in the current generation of catalysts... The similarity of the new device's design to existing ones should make it easier for vehicle manufacturers to switch to producing the new catalyst in future... [The] professor of electronic and mechanical engineering at Dundee University in Scotland... believes his brainchild will be in volume production within two years, with its simplicity and cheaper cost likely to boost interest from car producers. The new catalyst still has to prove that it can go on working for 160,000km, the life span that is now required for catalytic converters.

...[if you ignore Nissan's] somewhat less than stylish Stylish 6 concept, a three-row six-seater with a multitude of futuristic gizmos... its parallel hybrid motive system and high-tech interior are symbols of well-developed engineering. It couples a direct injection 2.5-litre development of Nissan's V6 VQ engine with an electric traction motor which becomes a generator under braking. Nissan says the combination not only cuts exhaust emissions but reduces fuel use by half. It expects to make further gains by using a thermoelectric cell to recover as electric energy heat normally released into the atmosphere as exhaust gas[('thermoelectric cells can also be used to recover the heat created while braking')]... • Nissan says 90[%] of all passenger cars are driven less than 70km a day and 90[%] of cars on weekdays have only one or two occupants. This strengthens the case for small mini-size vehicles and for multiple vehicle ownership.

...The Maia, a multi-use city car[, is]... perhaps... one Mitsubishi concept vehicle that [won't] make it into production... if only because of its ultra-boxy looks. But the Maia does not lack for good ideas. These include sliding and reclining seats which can be rotated around a central pivot, and with a variety of passenger/luggage configurations, as is more likely to be seen in a much larger MPV.

...The world's largest airship is to be built to carry 100 revellers to the Chatham Islands for the year 2000 dawn celebrations. Tickets are expected to sell for up to \$60,000. The airship, twice as large as a Boeing 747, will be built in South Africa, a London-based consortium, FirstLight 2000, said yesterday. Channel 7 in A[US] has won the contract to beam live photographs from the airship to A[US]n and N[Z] television audiences.

...THE BIGGEST thing to come out of Africa since the pyramids will astonish the world next year. A huge airship is taking shape in a hanger on the fringes of Johannesburg International Airport. The makers of the largest flying machine to be built since the fiery demise of the Hindenburg in 1937, plan a celebrity-packed transatlantic voyage from South Africa to New York in August 1998. Some 60 passengers will have the run of three decks – enjoying liner-quality cabins, restaurants... a piano cocktail bar and an unsurpassed view. "It will be cheap to run and very safe," said... [the] managing director of the Hamilton Airship Company. The maximum speed is 100 knots – Johannesburg to JFK in three days. The 132m craft, powered by three fuel-injected V-8 Chevrolet car engines uses non-flammable helium.

...The sequel to one of the most famous aviation failures of the 20th Century has been unveiled in Germany. The ZEPPELIN N.T., a 25 metre long craft, can carry 12 passengers and two pilots... The \$12 million... helium gas... craft will be used to carry tourists around the German Alps.

...NOT SO long ago motor shows were full of weird and wonderful "show" and "concept" cars which had as little to do with car-makers' production plans as politicians' promises have with legislative reality. Most could not be driven, either because they were simply clay models or because their futuristic curves hid no power train. The Tokyo Motor Show demonstrated how much times have changed, with almost all the

vehicles on show... having been developed sufficiently to be already roadworthy. Even the big surprise – or should that be giant surprise? – from Mercedes-Benz, the Maybach super-luxury limo, is reported to be headed for limited edition production from around 2001. The Maybach, named for the [person] who designed the Zeppelin and also a variety of distinguished cars early in the century, is apparently to be hand-built to customer specifications at a rate of about 100 a year... Power is from a high torque V12 of just under six litres... Although the Maybach is a gargantuan 5.77 metres long, the use of synthetic fibres for its rigid upper body helped cut its weight by 10%... In spite of its size, the Maybach boasts only four seats. Beneath the glass-covered roof, which can be controlled to make the light intensity suit the occupants, the plutocratic pair at the rear can lounge back in electrically adjustable seats in a splendour as yet unavailable in any production car... Comfort is assured by the active hydraulic suspension which does away with shock absorbers while compensating for roll during cornering, as does Citroen's current Xantia Activa.

...Chevrolet is showing off an "active handling chassis" Corvette. The new system will be available on all new Corvettes from next year. The handling system features sensors that can read steering inputs, vehicle yaw rates and lateral G forces. In an emergency, the system selectively activates the brakes to stabilise the vehicle.

...Computer chip maker Intel is developing special PCs for cars – not just to navigate but to read e-mail to drivers, browse the Internet... and entertain passengers with computer games. A 15cm screen runs images when the car is stopped but the computer switches to voice-only in motion.

...Jaguar is developing a voice recognition system for its 1999 mid-sized model, the X200. The system allows the driver to dial the phone, tune the radio, set the air-conditioning and open the boot... merely by saying the word... • The technology seemed exotic at the time: Secret agent James Bond attaching a tracking device to a baddie's car in the 1960s blockbuster movie *Goldfinger*. Even more improbable was Bond... following the progress of the villain's vehicle via an electronic map on the dashboard of his Aston Martin DB5. But Bond's ploy to catch Aurial Goldfinger... off-guard ended up a blind alley when the evil genius had the car crushed in a compactor. Today's global technology would have made Bond's task easier. All [Bond] would have needed was a notebook computer and software from [US] electronic company Roadtrac. The Georgia-based company has a system that tracks a vehicle by beaming signals to satellites. It was designed to help guide police, ambulance or fire engine drivers to emergencies. But now Roadtrac has software which lets private car owners track and monitor their own vehicles on computer. It is something Goldfinger would have had difficulty resisting. Had [Goldfinger] been a family [guy, the evil genius] could have kept tabs on his teenagers out in dad's car on a date. Or made sure his wife wasn't cheating on him with his partners in crime. More legitimate business[people] like fleet operators might want to know where their vehicles are at all times. A company like Telecom would have no more use for private eyes – it could just use the system to make sure its vehicles go where they are supposed to.

...The Government should consider teleworking as an option when it thinks about changing management of the \$23 billion roading network into a user-pays, profit-making business, says a Wellington consultant... a[nd] member of a panel advising the Minister for Information Technology... who is also Minister of Transport. Teleworking allows office workers to work from home or in groups in "telecentres" located in suburbs or remote areas of the country... [The consultant] said putting teleworking on the agenda would highlight alternatives to building more or bigger roads and putting more people into cars or shifting them into cities. Overseas a steady and quiet teleworking revolution was taking place as governments tried to shift cars off the road to reduce pollution and the cost of roading... Sometimes tax incentives were used to encourage the development of teleworking. "Growth in teleworking has been very slow in N[Z] compared to A[US], Britain, Japan, Ireland and the U[S] – and one reason is that the benefits of teleworking have not been officially recognised in this country... But I think people are starting to get angry about road congestion."

...Hundreds of years ago most people travelled no more than a few kilometres from their homes. Their communication was limited to family members and people from their village. In the early days of N[Z], newspaper reporters would row out to meet arriving sailing ships to buy a three-month-old English newspaper for the latest overseas news. It was a long time before roads and rail made it possible to get from place to place.

...Japan's magnetically levitated (maglev) train has broken the world speed record for a [hu]manned train clocking 451km/h on an experimental track west of Tokyo... [In further news from] Japan... Toyota's production Prius Hybrid car... goes on sale... on December 10. Export plans are still unknown while Toyota plots the car's progress on the domestic market. Prius is a stand-alone car which at 4275mm is 180mm longer than a five-door Corolla hatchback and sits on a longer 2550mm wheelbase. At 1515 kg, the dual-power vehicle is substantially heavier than a 1050 kg Corolla five-door... An in-line four cylinder, fuel injected twin over camshaft 1.5 litre petrol engine producing 43 kW... operates in conjunction with a 30 kW electric motor which uses 40 nickel-metal hydride batteries.

...Environmental vehicles... starred at the recent Tokyo international motor show... They included an electric Toyota RAV4 which costs twice as much as a petrol version... Nissan's Hypermini concept car is only 2500mm long and definitely a two-seater. It uses light lithium-ion batteries for the electric power, has a range of 130 km and a top speed of 100 km/h. Battery charging is simply a matter of inserting into a charging port a plastic paddle with built-in coil that generates a high frequency magnetic field. Nissan has developed its own parallel hybrid system which is mated with a continuously variable transmission. [As with the Stylish 6, a] thermoelectric power system recovers the thermal energy... in the exhaust gas. Mazda showed an electric Demio equipped with a dual power source combining an ultra-capacitor and nickel-hydrogen cells. These cells have twice the output density of a normal lead battery. Daihatsu's EV Move station wagon incorporates a 570cm³ auxiliary engine which starts up and generates power when the batteries run low.

...A low emission Honda engine will be available in the Asian region by the end of next year while a petrol-powered engine with almost zero emissions is being developed, claimed to pump out cleaner emissions from the exhaust than the air which entered the engine. This ZLEV... technology virtually eliminates hydrocarbon emissions, offers improved combustion during cold starts and is better during warm-up and normal temperature operation... [But] Honda believes that, ultimately, powering vehicles with hydrogen from a fuel cell with reformer offers the prospect of simultaneously solving the three major environmental challenges currently posed by the motor vehicle: Air pollution from exhaust gases, global warming due to carbon dioxide and depletion of fossil fuels. Realistically, it says that such an all-encompassing solution is not likely until 2020.

...The Government eventually can be expected to increase road-user charges and/or impose a tax on water vapour if BMW achieves its long-term plans. The German car-maker aims to have hydrogen-fuelled cars in mass production soon after 2020. The company says the ultimate goal is cars running on the gas extracted from water. Sure to be tax revenue or compensation claims in there somewhere.

...[A fuel cell is a small device which converts chemical energy into a direct electric current. Car batteries might be classified as fuel cells, but these use expensive fuels, such as lead and zinc. A true fuel cell should use a basic, chemically reactive fuel, such as hydrogen, coal, oil, or natural gas. The fuel cell is 75% effective. In the case of the steam TURBINE, the most efficient method of producing electricity today, only 40% of the chemical energy of the coal is transformed into electrical energy. The rest of the heat is lost in the intermediate conversions. The fuel cell bypasses the intermediate stages and converts chemical energy directly to electrical energy. The fuel cell is not a new idea. As early as 1839, Sir William Grove of England invented a chemical BATTERY which combined hydrogen and oxygen to produce water and electrical energy. However, the DYNAMO, which was just becoming widely used in the late nineteenth century, provided the quicker means of getting electricity to industry and the public. As a result, the fuel cell – which generates electricity without using heat engines or great water sources to run huge *dynamos* – was ignored as a source of electricity until recently.]

...[A fuel cell is like a battery, but better. It requires no overnight charging. It reverses the familiar high-school science experiment in which electricity is put through water to produce hydrogen and oxygen. One key advance has been a cheaper membrane, the heart of the fuel cell. The first membranes turned brittle and failed after 300 to 500 hours, not good enough for a commercial vehicle. However, a "third generation" membrane – developed by Ballard Power Systems – kept running for 10,000 hours.]

...A BREAKTHROUGH in the real-life use of fuel cell technology will see Daimler-Benz and Ballard Power Systems of Canada put up about \$600 million to produce the world's first volume production vehicle with a fuel cell engine. This follows the success of Daimler-Benz scientists in fitting its new small A-Class car with a methanol-powered fuel cell which produces its own electricity. This eliminates the need to use storage batteries and gives the car an almost emission-free range of around 400km from its 40-litre fuel tank. It also allows 90% of the system's power to be available within two seconds of pressing the accelerator, endowing the vehicle with drive dynamics which the German scientists say is equivalent to conventional petrol or diesel-powered cars. The latest fuel cell car – dubbed NECAR 3 for New Electric Car – and shown for the first time at the recent Frankfurt Motor Show, marks huge progress in the three years since NECAR 1 rolled out of the... laboratory with the fuel cell system housed in the back of a small van. NECAR 3... fills up with liquid methanol, which... is more efficient for hydrogen generation than petrol or diesel... [and] can be handled by filling stations as safely as petrol or diesel. The methanol is converted into hydrogen by water-vapor reformation... The hydrogen gas then feeds into the fuel cells, reacting with oxygen in the air to produce electrical energy to power the vehicle... The system avoids the high energy losses involved in the intermediate stage of heat generation in internal combustion engines... But it seems likely that when a production car is introduced, especially in the early stages, a multi-fuel approach may permit the use of different types of fuel.

...U[S] car maker Ford [– which 'is working on a hydrogen-powered internal combustion engine that it plans to begin road testing later' next year –] has joined Germany's Daimler-Benz AG and Canada-based Ballard Power Systems in efforts to develop fuel-cell technology... The firms said Ford would buy a 15[%] stake in Ballard... Daimler will reduce its stake in Ballard to 20[% from 25%] and also scale back its 66.6[% holding in the] joint-venture to make room for Ford, while retaining a majority. The alliance reaffirmed it wants to have fuel cell power trains available to support commercial use of fuel cell vehicles by 2004.

...“I sell here, Sir, what all the world desires to have. Power.” Matthew Boulton, the manufacturer who made James Watt's steam engine into an industrial tool, grasped the realities of the new industrial revolution from the beginning. For 100 years, the source of that power was coal. For almost another 100 it has been oil. But, as the revolution that Boulton helped to start enters its third century, it may be about to embrace a third fuel: hydrogen. The idea of a “hydrogen economy,” in which that light, combustible gas would be the main source of energy, has been around for several decades. It was dreamed up by people who wondered what would happen when the oil ran out. In the way of predictions about the future, those people tended to extrapolate from the present. Hydrogen... would be used in much the same way that petrol and its cousins are: burned in engines. That, however, is not going to happen. Instead, not only will the fuel change, so will the engines that it powers. The hydrogen economy will be a consequence not of the running out of oil, but of the development of the fuel cell – just as the oil economy was not a consequence of coal running out, but of the fact that the internal-combustion engine was a better technology than the steam engine. The... fuel cells do not even burn [hydrogen]; the reaction in a fuel cell has no flame, so noxious byproducts such as nitrogen oxides are impossible. [F]uel-cell-powered vehicles would thus, in the jargon, be “zero-emission” vehicles. They would therefore qualify for sale in places – particularly California – that are tiring of traffic-generated pollution and have passed laws intended to do something about it. It is fear of California's zero-emissions law that provided the initial spur to take fuel cells seriously. But they have a second environmental bonus. Not only are their emissions not noxious, they do not include carbon dioxide... This pain-free way of reducing CO₂ emissions should prove particularly welcome in America, where rhetoric and action on global warming seem heavily at odds with one another. Those working on fuel cells reckon that the technology has developed to the point where mass production would make fuel-cell power generators or car engines economical to manufacture, compared with conventional generators and engines. Thereafter they could find their place in the market... This is where governments could step in. If they wanted to pursue the public good of having clean air and less global warming, they could skew taxation so that what is put into fuel cells is cheaper than what goes into internal-combustion engines and thermal power stations, just as some countries now favour diesel over petrol... Ever since the industrial revolution began... the sources of power have been getting dirtier – from water and wind to coal and oil, with the questionable exception of nuclear fission. Easier to live with than nuclear power, hydrogen could be the first durable steps towards reversing that trend.

...Two Norwegian designers believe they have the solution to traffic congestion and related pollution. Claimed to be the first combined solar and wind-powered vehicle, their three-wheeled, open, aluminium-framed car is based on a principle similar to a motorised rickshaw... Its roof has three solar panels extending from the windscreen to a black wire sphere containing the windmill at the back... [E]lectricity from the sun and wind... charge[s a]... battery at the rear of the car... Dubbed the Butterfly, because butterflies spread their wings to warm up their bodies with solar energy before they can fly, its top speed is just 50 kph. The Butterfly can seat the driver and... three passengers.

...Is it a bird? ...Is it a plane? ...No, it's... hypercar! It gobbles up motorways on a spoonful of gas... [and] puts dollars back in your pocket at the caryard. This is no science fiction. The hypercar is already on the way, heralded by the release in California and Arizona of General Motors' EV-1 sleek electric coupe... So what is the hypercar? It is the son of ZEV, the acronym for the now unlikely 1990 Californian target of having 10[%] of its passenger car and truck fleet as “zero pollution vehicles” by the year 2003. To date, only electric cars... [– which, by the way, Switzerland now] has more than 2000... [of on its roads –] meet the requirement... But, says... [the] manager of the Commonwealth Scientific and Industrial Research Organisation's environmental research unit, even EV is not really ZEV: “...A power station supplies the electricity to recharge the batteries and, while its emissions may not always contribute to urban air pollution, it is still a substantial greenhouse gas emitter.” So California now talks about equivalent zero emission vehicles, which pump no more pollutants into the air than a power station would emit in recharging a battery-powered car. As well as electric cars, these include compressed natural gas-powered vehicles, and some “super-efficient” petrol vehicles. Enter the next generation hypercar, embracing advanced technology to reduce weight and energy losses, and small batteries and very small internal combustion engines. [The manager] says bodyweight is cut by... [up to 70%] by the use of synthetic composite materials, aerodynamic drag is reduced by... 80[%] through sleeker streamlining and more compact packaging, and tyre and road energy loss are trimmed by up to 80[%] with better tyres and lighter weight... There is also less need for power steering, power brakes and engine cooling, producing performance likely to... [deliver] better than... 1.6 litres/100 km... Similar potential... exists for larger vehicles... A Florida firm has tested composite delivery vans that weigh less loaded than empty normal steel vans, and has designed a bus half the normal weight, while other companies are experimenting with streamlined composite designs for... 18-wheeler... trucks. All these achieve roughly twice normal efficiency with conventional drivelines, and could redouble that with hybrids.

...an American visionary... believes... that the hypercar owner... will be able to make money from its fuel-cell's electricity-making capabilities. “Consider your hypercar as a 20kW power plant on wheels. It is... typically... parked 96[%] of the time... So, you would drive to your office and park where the electric or gas company had installed hydrogen and electricity inlets. While you sit at your desk, your fuel cell will send back power to the grid, which they pay you for.” [The visionary] says that if all of today's cars were replaced with hypercars, they could generate five times the generating capacity of the [US] national grid, eliminating the need for coal-fired or nuclear power stations... [Such vehicles are also capable of moving] along in a cone of silence (well almost)...

ANTI-MATTER in space, antibiotics at the hospital[, anti-dirt glass] – ...Nissan has developed the world's first self-cleaning door mirror... which uses a chemical coating to ward off dirt and grime... [–] and soon, anti-noise for the family car. Anti-noise for motor vehicles has been seriously talked about for only a few years, but already many millions of dollars have been spent on its development. In principle, it is simple: noise plus anti-noise equals silence. Yet the average motorist has no better idea of what it means than differential calculus. Nevertheless, anti-noise has already gone well beyond the sci-fi magazine headlines. In fact it is based on a phenomenon known as “destructive interference,” patented as far back as

the 1930s... [I]ts latest form [is] often called active noise control... Three things cause car noise in the main: its slipstream, powertrain (engine and gearbox) and the contact point between the tyres and the road. Whistling, rushing or hissing noises are usually caused by the slipstream acting on the A-pillars either side of the windscreen, the door seals and the exterior mirrors. Roof racks and sun-roofs can set up a fearful racket too. Whining doesn't just come from the children in the back seat – it can be set up by the gearbox or the drivetrain, and vibrations can transmit themselves to a car's occupants through the seats, the gearshift, the steering wheel and the door frames... Science has found a tidy way of describing this tuneless babble in the form of decibel measurements (noise) and frequency measurement in hertz (vibrations)... For 60 years... scientists have... [been manually] eliminating noise and vibration by a counter-vibration of the exact opposite frequency and amplitude... [but now m]icrophones positioned in the headliner of the car's roof could measure the noise and transfer the data to a computer which would calculate the required anti-noise. Through a sine generator or synthesiser, the mirror-inverted wave pattern would be played through the speakers of the car's stereo – effectively extinguishing the annoying noise... [However,] German car builder Opel believes noiseless cars are no more desirable than noisy ones. If the car is completely silent, says Opel, the driver has none of the important feedback needed to judge speed, engine revs, acceleration and deceleration, and the countless other messages a car sends its driver during a trip.

...Some who contemplate a motoring future involving electric cars might be dubious about their load-carrying capacity, acceleration and range... Some might even worry about such a car killing them by electric shock. There has been little or no such concern in Europe where companies are streaming ahead with electric power and where Peugeot is already selling a 106 Electric model. But the safety issue has surfaced in the U[S, where t]here has been enough concern to spur the International Centre for Technology Assessment[(ICTA)] to assess the electric vehicle (EV) to see if one day it might fatally jolt someone... Part of that concern stemmed from numerous “anti-EV” advertisements and paid editorials sponsored by some sectors of the oil and car industry... [● T]he daughter of land speed record holder Malcolm Campbell is selling part of the family silver to help finance her son's attempt to set a new record for the family. Next spring... Campbell's grandson, hopes to go faster than 370 km/h in an electric-powered car named Bluebird Electric. His mother... is selling a solid silver trophy presented to Malcolm... after [it] set the record at 484.4 km/h...

WIDESPREAD use of electric-powered cars would prevent thousands of deaths and injuries, and hundreds of millions of dollars of property damage each year, according to a new study. The report, released last month by the I[CTA], outlines nine of 11 categories where electric cars are considered safer than petrol-powered cars. The risks of a collision or an electric shock were judged to be about the same in either type of vehicle. But petrol-powered cars were more prone to fires, steam burns, heat burns, chemical burns, refuelling mishaps, rollovers, toxic fumes, noise pollution and manufacturing defects. For example, the danger of fire in a collision is substantially reduced because electric cars do not have a petrol tank or a reservoir of engine lubricating oil. And... electric cars... have no radiator... The Consumer Federation of America welcomed the new report... – [which was commissioned] because of criticism from opponents of electric vehicles... – ...[because] it “should lay to rest the rumours and misleading charges made by those... oppo[nents.” However, a spokesperson]... for the American Petroleum Institute, a trade organisation representing major oil companies, says the report does not change that organisation's position on electric cars.

...There's a new motorcycle for California commuters who are born to be mild: the Lectra. What is touted as the world's first electric motorcycle [recently] went on display at the mobile Harley-Davidson Museum. With a small profile, a sound like a golf cart, a top speed of 72km/h and a range of 50km between power charges, the Lectra does not exactly thrill Harley lovers. “What the hell would you want with an electric bike?” asked... a tattooed, ponytailed... 45[-year-old]... mechanic. “You need something that makes noise and vibrates.”

...the casual observer of Beijing's bustling traffic could be forgiven for deciding the *last* thing anyone would want to do is get out there on a bike. But don't let first impressions deceive you. Biking in Beijing is simple... [– t]he city is... as flat as a punctured tyre... and most of the major sights are within comfortable riding distance of each other... [–] especially if you keep the following in mind. First, in China, vehicles drive on the right side of the road. This generally applies to bicycles, but sometimes necessity is the mother of creative interpretation. Second, major roads are edged with cycle lanes. In these sanctuaries from the internal combustion engine, the *zixingche* reigns supreme and you can cruise with calm confidence. In contrast, intersections are less straight-forward, even those controlled by traffic lights. Interpreting traffic lights is a more subtle process than in N[Z]... cyclists seemed to have the attitude that they were here long before traffic lights, so the lights didn't really apply to them. At uncontrolled intersections, the simultaneous criss-crossing of all road-users is an exciting spectacle. This might sound off-putting or downright life-threatening to the average tourist, but it works amazingly well... Finally, one *crucial* piece of advice. Never do anything suddenly. *Never*. Always glide along eyes firmly ahead (with your peripheral vision working overtime) and hold your line. People anticipate where you are going. A sudden turn or braking causes confusion and accidents. Make changes gradually, preferably with lots of bell-ringing... The bell... is extremely useful for warning those up ahead of your approach, or those nearby of an impending turn or stop. No one ever appears to respond to this information, but there is some comfort in having made the effort to let them know... The [primary] issue of concern to the potential cyclist is safety... The great bike safety feature of modern times is the bike helmet. Helmets? For bikes? Are you kidding? We never saw one during two weeks in Beijing. Wearing a helmet will probably be a major distraction to other road users and therefore a positive hazard. Forget it... ● *Some hotels rent bikes but we used the public bike rental by the Beijing Hotel... Bikes cost about \$1 an hour, with a refundable deposit of about \$40 for old bikes and \$150 for new.*

...[a lower North Island town has 'painted 100 old bikes green which will be free to all' who want to borrow them. In related news, g]etting westies out of their cars and on to bikes is the aim of a new cycleway. The cycleway, between Waitakere and the CBD, was officially opened on Tuesday when the northwestern leg of the route was completed. The route avoids busy arterial roads and links with the existing Henderson to Waterview cycleway. Cyclists no longer have to venture out on main roads and can get a clear run into the central [city]... The next stage of the cycleway will be creating a safe route between Newton Rd and Upper Queen St. The Auckland City Council intends to complete this section in the next financial year... A 1996 N[Z] Census showed only 1.8[%] of workers cycle to work in Auckland and the... Council wants to change this... “It's a moment many of us have been waiting for, for many, many years,”... [Auckland's] Mayor... says. “Not only will it be a safe route, but it will be a scenic one as well.” The route provides better access... to Motat, Auckland Zoo, Western Springs Park and Western Springs Stadium... for cyclists and pedestrians...

NEW school pedestrian crossings will be trialled... in an attempt to improve road safety for pupils. Kea crossings will be installed on roads surrounding 36... schools [throughout NZ] in the coming weeks, as alternatives to the more traditional zebra crossings... The kea... crossings... have... L-shaped markings... painted on the road to show cars where they should stop[to allow pedestrians to cross, or to give way to on-coming traffic as it travels through the stretch of road between the L-shaped markings that is normally narrowed to a single lane (roads won't be narrowed for the trial kea crossings because they might be turned back into zebra crossings afterwards)]... “...ultimately, it will be up to roading authorities and communities to decide what is the most appropriate form of crossing for them,”... [Kea crossings] will be used only at peak times, such as before and after school, and revert to normal sections of road for the rest of the time. Motorists will be warned of the kea crossings by bright orange signs on each side of the road, which will be taken down when the crossings are not in use. The... idea came from a group of Christchurch parents concerned about pedestrian crossing safety, and was developed by a working party made up of police... the Land Transport Safety Authority... education, health and roading experts... [T]he LTSA's general manager of safer vehicles, roads and rail, said that while controlled pedestrian crossings were traditionally safe, there was always the potential for accidents. In the last 13 years there was an average of two crashes a year involving children at controlled crossings, compared with an average of 37 crashes at non-controlled crossings. “So while more children are injured or killed crossing roads in an uncontrolled way, like running out from behind a school bus, we have to make sure our pedestrian crossings are as

safe as they can be. Drivers act in a certain way towards traditional pedestrian crossings. They don't take so much care because the crossings are always there – but they're not always being used and drivers become blasé about them. Also, for pedestrians, there is a false sense of safety when they use zebra crossings because they think motorists will always stop, but sometimes [motorists] don't. There are peak demands for school... crossings and no need for them at other times, so these temporary kea crossings are the ideal alternative. Because they will only be used at peak times, motorists seeing signs indicating a kea crossing know they will be being used." [A Plunket spokesperson says 'children aren't able to properly cross roads until they are 8 years old.']

...A NAPIER city councillor haunted by the death of Teresa Cormack says... the city['s]... 90 alleyways... should be sealed off as a crime prevention measure to safeguard young children and the elderly... [T]he six-year-old... was abducted on her way to school, sexually violated, suffocated and buried in a shallow grave on Napier's Whirinaki Beach on June 19, 1987... [Her killer has never been found and hair] samples taken from the prime suspect... do not match strands found near... the... schoolgirl's body... One of the last sightings of Teresa put her in a walkway near her home... "Her death was horrific. I guess you can heal but you never forget... Maybe that's made me over-cautious but there are not many days in the year when I don't think about her." [The councillor] described alleyways as "an accident waiting to happen", claiming criminals preyed on people using them. They were also used as a getaway to avoid police... "The reason for alleyways was admirable but society has changed. Now I'd never advise anyone to use them, especially young children and the elderly." However, [the councillor's] views are at odds with the city's district plan which promotes the building of more alleyways. "The idea is to create more walkways in the city – the council would not want to close them down," said the council's road assets manager... [- even though three] alleyways have been closed by the Napier City Council in the past 18 months. A committee meeting last week considered whether to close another in the... suburb... where Teresa was last seen. Alleyways were usually closed after requests from adjacent residents unhappy with graffiti, noise and anti-social behaviour. If an alleyway closed, residents were expected to pay the council because the land is added to their properties, making them more valuable. - 1997

It's hardly surprising that people are walking less and less when you consider the life-threatening risks we pedestrians expose ourselves to each time we step out on the Queen's pavements – 28[%] of people killed on urban roads are pedestrians... Traffic lights are... just one of the perils of pedestrianism... My favourite is the one by Victoria Park which signals pedestrians across busy Beaumont St and then turns red when they are halfway across, encouraging impatient drivers to believe they have every right to plough through them. Between this intersection and the bridge flyover is an even more novel obstacle – two old trees with head-high branches stretching across much of the pavement. Across the road, the route is even more dangerous. The mouth of Franklin Rd where it hits Victoria St is the most perilous crossing in Auckland. With no marked crossing or lights, and with everyone's sightlines blocked by two massive flyover uprights, this is one scary spot... At times it feels like it's the pavements that should come with a health warning. As [a] Road Safety Trust researcher... says, pedestrians are the forgotten road users in N[Z]. After all, when did you last hear of Transit N[Z] or a city council building a pedestrian-way? Motorways and busways and cycle paths are no problem. But a pedestrian way? It's as though... walkers are something of an after-thought. Pedestrianism is a particularly fraught activity in the central business district at present. Pavements are under threat from competing telecommunications providers, each intent on wiring the downtown with their own individual, high-speed cable network. Combine that with Metrowater's ongoing pipe renovations, and it pays to keep your eyes wide open each time you step out. The surface scars being left behind are as rough and prominent as the ones early open-heart surgery patients used to show off afterwards. Outside the *Herald* office in Albert St we have a particularly nasty example. Here the scar is accentuated by being in black, while the surrounding paving is red. Council officials assure me that if red seal is still available – apparently there's some debate about whether anyone still makes it – the contractors will have to replace the black scar with red. As for any unevenness between the old and new seal, the city's rules state that this cannot exceed 5mm either way. Of course, we all know that whatever the rules, once a trench or a patch appears in a pavement, it's only a matter of time before a puddle or a stumbling point develops. We walkers know these things. That's why the patchwork of... lines and arrows now appearing on pristine footpaths is so depressing. This graffiti identifies existing underground wires and pipes, no doubt in preparation for new diggings.

...If you have had a fall in a public place – Waitakere City Council would like to hear from you. The Safe Waitakere Working Group is using information on falls and near-misses to help identify hazards and prevent future mishaps – and is especially interested in hearing from the City's older residents. Over the past year, 20 people over the age of 60 have reported falls to the Council. All had fallen on cement, asphalt or paving stones. Only one described the conditions as wet, while all others said they had tripped on uneven or broken surfaces. In N[Z], one in every three people over 65 will fall each year, says Safe Waitakere['s] spokesperson... "Falls often have a huge impact on quality of life, resulting in loss of self-confidence, loss of independence, restriction of activity, injury, or even death... For older people, most falls occur... in public places... while carrying out essential daily tasks, such as shopping. But most are preventable." [A] Massey resident and Working Group member... found himself calling the service recently after tripping over a broken piece of footpath while out walking his dog in West Harbour... suffer[ing] a broken arm... "I was walking quite quickly so I hit the ground at a fair rate of knots,"... The council has since repaired the West Harbour Rd footpath.

...Waitakere City Council's Roading and Traffic service manager... says a total of \$426,000 was spent on footpath and vehicle crossing repair last year, with most of the damage caused by cars and trucks. A further \$165,000 was spent on the mowing and maintenance of grass verges, which are also often damaged by vehicles. "The council enforces its bylaw in relation to footpaths and grass verges rigorously – and a majority of the public complaints received by the Parking Enforcement Section relate to this type of offence... As a result of this illegal parking, the council spends a considerable sum of money repairing damaged footpaths and grass verges – and the pipes beneath. This damage is definitely not caused by lawnmowers or pedestrians. Footpaths are intended for foot traffic only and are constructed as such." A \$40 fine can be issued for parking on either a footpath or a grass verge outside a property line. A vehicle will also be towed away if it is causing an obstruction – leaving the owner liable for up to \$100 in towing charges as well... [□ A] Waitakere City Council project is using Formpave pavers which are so porous they can suck up 20 l of water in an amazing 17 seconds... and treat it... The small amount of water that comes out the bottom doesn't pose a threat to the environment. This is the first time the pavers have been used in N[Z], although it is becoming commonplace in Britain... While the pavers are a little more expensive than normal materials, they save the large cost of stormwater systems... "They can have ten acres of carparking. With normal pavers the stormwater problems would be massive," says the council's... project manager for the Parrs Park development.

...The resealing of the Te Atatu RSA car park has upset a neighbouring kindergarten which has asked for more than 10 years that its car park be upgraded. The community facilities and recreation committee has allocated \$30,000 to reseat the RSA car park before a visit from [the PM]... next month. But Te Atatu Peninsula Kindergarten['s] head teacher... says their car park is in a worse condition than the RSA's... Their metalled, pot-holed car park needs to be sealed, [the head teacher] says... "There's not a week that goes by that someone is not complaining about it." ...the kindergarten can't afford to repair it and one of the parents has even offered to do the work if the resources are provided... But [Waitakere City's] parks manager... says they are legally required to maintain the car parks to their existing standards. This means they have to reseat the... RSA car park and keep the kindergarten's car park metalled. [The manager] says the kindergarten car park won't become a priority for a few years.

...As soon as... [the] Sergeant... saw the blood-spattered concrete and the little pair of shoes, [it was sure another child] had been killed. "Looking at the scene, I just expected her to be dead," says the Auckland police officer, as [it] recalls arriving in the driveway where the toddler had been run over by a reversing car... [The two-year-old] cheated death and escaped almost unharmed after... [being] pinned under the car for several minutes, a

feat which amazed medical staff and her family... "It makes you believe in things like guardian angels....," says her mum... [The mum] had been at work on 29 April when her sister... who looked after [the toddler while its mum] worked, phoned to say her only child had been run over by an elderly [guy] visiting the sleep-out at the back of her Auckland house. "When [my sister told me my little girl] had been run over, I thought [the driver]'d just bumped into her and [my baby]'d taken a nasty knock... As I came around the corner and saw the police cars and ambulance, I freaked out." [The toddler] had been pushing her doll's pram down the drive on the way to the shops while [her aunt] locked up when the car hit her. Feeling the bump, the 70-year-old driver got out and discovered [a toddler] face down with the rear wheel on her body. After raising the alarm, [the driver] backed the car off her torso but had to move it again as her arm was still trapped. [Her mum] arrived as they put [the] bleeding and swollen body in the ambulance. "...The blood vessels in her face had burst... They couldn't tell me how bad [the situation] was but I found out later even the ambulance officer thought [my baby] wasn't going to make it. I thought [my baby] was going to be brain damaged... I began thinking the worst." Doctors at the Starship children's hospital were stunned to find [the toddler] had no broken bones. Fearing... internal injuries, they sent [her] for a CAT scan but miraculously, tests showed... only... a lacerated liver and bruising. They monitored her in hospital for a week and further checkups have been clear. Now, three months later, [the girl]'s a happy and healthy toddler and shows no sign of her ordeal. "[My baby] doesn't remember any of it but I don't think [my baby is] too keen on hospitals anymore,"... Although relieved her daughter was not killed or seriously hurt, [the mum]... still finds it hard to understand how [her daughter] was run over and hopes her close call will serve as an important warning to all drivers. "Before this happened, I'd never really thought about the dangers of driveways. Now, everyone who knows me... is a lot more aware when they're going into driveways. People need to be a lot more careful." ...[the two-year-old's] miracle survival came in a week where two other Auckland children were killed in their driveways. There have been several other driveway... deaths in the past few years: ...*I May*... • A five-year-old... died in hospital from multiple injuries after... [being] run over outside a house in Mt Roskill... [The child had] been sitting on a skateboard in the driveway when a visitor drove up and didn't see her. *27 April*... • An Auckland [mother] killed her 16-month-old baby daughter as [the mother] backed down her drive. The toddler had just learned to walk and may have followed her mother on to the drive. *December 1997* • A two-year-old Northland boy died after... [being] run over by a truck on his family's property... *August 1995* • A 20-month-old girl was run over by a trailer in the driveway of her Invercargill home. When her father moved the trailer after unloading it, [the dad] discovered his daughter dead under the trailer's wheel. *October 1993* • A 17-month-old Tauranga boy died after... [being] hit by his father's ute as it was backed down the driveway. *March 1993* • A 15-month-old... run over by a car backing out of his Wiri home died of head injuries... [T]he Injury Prevention Research Centre in Auckland [says]: • One in five Auckland children killed or injured by cars are hit in their own driveway. • Children are three times more likely to be backed over in their drive when the play area is not fenced off from the driveway. • The risk is higher for children in homes where the driveway is shared. • Most children involved in driveway accidents are toddlers, with the peak age being two... Auckland organisation SafeKids says fatal and injury accidents involving driveways are increasing and about 30 children are hospitalised at Starship alone every year. "We're not sure why they're increasing but it's very concerning,"... Some of the possible reasons include the increase in infill housing which has made driveways busier and there are now more cars on the road... "We need to rethink how we design houses and sections. Most N[Z] homes have long driveways with the garage at the back of the house. Driveways are very tempting places for little children, they're a nice place to ride a trike or play... People need to... understand that children move very fast and are usually below your line of vision. It can happen in seconds and it's usually family members who are involved, which is heartbreaking."

...N[Z] has the world's worst rate for running children over in driveways, prompting one council to encourage residents to fence driveways off. A... Starship study... [of] driveway injuries involving Auckland children... showed the majority of accidents happened in Housing N[Z] properties.

...Every week a child is hospitalised in Auckland after being run over by a family member. A new education programme to try to reduce these accidents will be launched during Kidsafe Week, from October 18 to 25. A Starship Children's Hospital doctor says N[Z] has a very high incidence of children being injured in driveway accidents, with one in five victims admitted to intensive care. [The doctor] has studied 77 driveway accidents over four years, involving children admitted to Starship. During her study, five children died. Many had their skulls, arms and chests crushed. [The] Dr... found that most accidents occurred in low socio-economic areas... Most accidents involved vans, followed by four-wheel-drive vehicles. They tended to occur at 10am, or 5pm, in summer... People should consider safety issues before putting in driveways, [the doctor] says.

...Road safety won't be an alien idea for St Leonards Rd Primary pupils after a visit from a spacey new roadshow. Auntie M from the Planet Z [wa]s part of the Intergalactic Roadshow, showing children the dangers of cars on the road and how to cross the road safely. [A] Safe Routes to School facilitator... says the show will go to each of Kelston's six schools and around Waitakere before going nationwide. New road safety mascot Foxy will tour with the roadshow, after making his debut at St Leonards Rd. And [a] westie comedian... will explore road safety issues with high school students. To make the streets safer near the Kelston schools, they are to get a roundabout at the junction of St Leonards Rd and Archibald Rd. Waitakere City's road safety co-ordinator... says they're also designing colourful gateways to the area. "As people drive into the area from three directions they will be able to see immediately they are in a safe zone,"... A voluntary 40 kilometre an hour speed restriction will also be on trial when the gates go up before the start of the next school year. "Outside schools in Canada there are 30kmh speed restrictions around school throughout the day... What we want to encourage is parents and other road users to voluntarily drive slower and support the schools." St Leonards Rd Primary's principal... says the package of voluntary speed restrictions and other safety measures should go down well with parents.

...Funding could be a stumbling block as road safety campaigners... [and p]rincipals... push for... 40kmh... speed zones... outside and around... Waitakere City schools... The idea is backed by Waitakere City councillors, who believe it should be paid for by central Government. Meanwhile, the L[TSA] says councils should pay. The call for reduced speed limits coincides with a new road safety campaign being launched in Glen Eden to raise public awareness of child pedestrians. The Glen Eden Gateways project will see signs designed by children... put up at key points to let motorists know they are entering school zones. It is being co-ordinated by the Waitakere City Council in conjunction with schools.

...[last week] Waitakere's 52 primary and intermediate schools were given 20,000 road safety posters for students to take home. Each had tips on how to get to school more safely and a quiz on road safety around schools. It even had tips about how... Waitakere schools could get their own "walking" school bus driven by parents... A walking school bus is where parents pick up children at certain points on a route to school... [T]he children are supervised to the school gates, which are less congested by cars, and it gets children doing some exercise.

...Working mum finds walking beats bus A[n A]uckland mother... has given up taking the bus because, like thousands of others, [it] has been let down too often by Stagecoach... The multinational bus giant has cancelled more than 800 trips since March because it does not have enough drivers to meet its timetable, leading to fears it will have a bad effect on the push to get more people to use public transport. [The mother], who lives in Three Kings, used to rely on being able to catch any one of four afternoon buses over a 45-minute period in Symonds St to get home in time to meet her three young sons after school. But... after being let down at least once a week [the mother] now walked the 6km home from work at the Auckland University Medical School. "I have given up taking the bus because it's so unreliable... I can walk from the hospital area to Three Kings in 45 minutes... I constantly read articles in the *Herald*, *City Scene* and *Region Wide* telling Aucklanders how we must start using public transport. But how do you expect to get that result when the buses are so unreliable?" Stagecoach, called before the Auckland Regional Council's transport committee on Thursday to explain its problems, is... almost 70 drivers short. Last month alone the company – paid \$23.5 million a year to run subsidised services – missed 441 trips, including 55 on one Monday. [The] Campaign for Public Transport spokes[person, who has been] let down

himself by no-show buses, said the number of missed trips was “calamitous. Public confidence in public transport is fragile... Cars are consistent, and if public transport is not aiming to perform at the same level we are missing the boat with all the bus lanes and other initiatives councils are putting in.” Stagecoach NZ’s executive chairperson... said the company had been working hard to get more drivers. It had tried to borrow drivers from other Auckland companies, but they were too stretched for numbers to help. It had taken some from its Hutt Valley operation and was set to advertise in other centres, including Invercargill... for more drivers for Auckland. [The executive chairperson] said the company had got the number of missed trips down to five a day, but it would still take a couple of months to get enough drivers. [The executive chairperson] blamed the shortage on the... driver licensing regime, which... was taking too long to pass new drivers, and on resignations, which ran up to nine a week in March and April as drivers looked for other jobs around Auckland and overseas. Stagecoach has started its own training school... where novice bus drivers would be paid by the company while they were getting their licences. Many had been giving up because of the wait... “For us it is a disaster and we do apologise. It had us flummoxed...” ...[the ARC’s t]ransport director... said Stagecoach would not be paid for the subsidised services it[']d missed.

...There’s nothing like a non-showing bus to jaundice one’s view of public transport. You while away the long minutes dredging up bad experiences, like the time a month or so back when the half-empty bus sailed past, ignoring your little band of regulars. Repressed memories of missing buses during the last wage-round disputes suddenly surface. Then you start having dark thoughts about local politicians who preach the glories of bus travel from the convenience of their air-conditioned cars. Finally, after much watch-checking and fruitless gazing down the street, you take the gamble that the 9 am from Herne Bay is missing without trace and strike out on foot. The Stagecoach “customer support” phone robot tells me that while this was going on, “all services should be operating to their normal timetable. Any delays experienced will be caused by traffic or weather conditions.” There’s no place for discussion. I redial and discover how to find lost property, to become a bus driver or to charter a bus, then finally, “If you would like to make a commendation, complaint or general inquiry, press six.” ...button six cannot help and puts me through to [someone else], who feels “it should be all right at that time of the morning.” [Mr Someone Else] takes my number and says [it] will get back. By 6 pm Friday I have not heard back from him, or from... Stagecoach’s operations manager. Perhaps the latter was out driving buses, because if what [the]Tramways Union spokes[person]... tells me is even half true, it is a case of every staffer to the steering wheel at Stagecoach. In March, [the spokesperson] told me that Stagecoach’s complement of around 750 drivers was 50 to 60 short. [The operations director] responded to that by reorganising the bus fleet and claiming as a result that few if any services were being missed. [The spokesperson] now reckons Stagecoach could be as many as 100 drivers short. Whatever the exact number, the resultant cuts in service have generated enough complaints to spur the A[RC] into beginning spot checks on whether the services it is paying for are actually running... [T]he ARC transport manager... has told Stagecoach that “the council is pretty unhappy with the situation” and “is very keen that they [b]e able to make some positive changes before too long.” [The transport manager] is worried that all the good work done by the ARC and the Auckland City Council in improving the major isthmus bus routes is in danger of being undone. “I’m a bus user on those routes as well and I’ve had a few full buses go past me and other people standing at the stop. You can see by the body language that they are not too impressed.” Now in other parts of the economy where there is a labour shortage, be it in the field of television newsreaders or of Y2K computer expertise, the answer has been to attract staff with better pay and conditions. Something to do with the free market and all that. Nothing like that has been forthcoming on the buses. If anything, the reverse has applied. According to [the spokesperson], for the past year the bus company has taken new drivers on only as part-timers, to gain more flexibility in their use. Even for fulltimers, the practice of broken shifts can make hours long. Under their contract, drivers can be brought in to work in the morning rush hour then stood down on no pay for some hours before being reactivated on pay for the afternoon or evening. Around 70[%] of drivers do these broken shifts, the reward for which is an extra \$3.50 a day. A driver’s hourly rate is \$12.44. These days there is plenty of overtime at time-and-a-half. But taken at the end of a split shift it makes for a very long day. For drivers, it is obviously less than attractive. [Their union asks: ‘Would you like your 8 hours to be spread over 14 hours with 3 or 4 unpaid breaks’ – especially if you are also required to ‘take your statutory breaks whenever possible, like while you are parked at the end of routes, where toilets and other facilities are often unavailable’?] If we want to attract passengers to public transport we are going to have to provide a reliable and regular service. For that, we will need enough safe and willing drivers. Why should anyone leave their cars at home for less?

...Waiting at the bus stop this morning to embark on a 15-minute journey to Auckland University, I became aware of exactly how inefficient our public bus service is. Arriving at the bus stop at 7.35, I left myself plenty of time to spare, knowing at least one of the morning buses would be too full to take on passengers. I was, however, unprepared to find myself trying in vain to flag down a total of five buses, all too full to pick up even one passenger. Finally a bus stopped at 7.50am but only I and one [other person] were lucky enough to squeeze on, leaving eight unhappy would-be passengers behind. As we pulled away another bus, this one stating “Limited Stop Only”, whisked past the bus stop and on its way (I would love to know which bus stops are included in this “limited stop” – it seems to vary). On the way to university, standing all the way (I have resigned myself that I may never sit on the bus again), I counted no fewer than 20 people waiting in vain at various bus stops for a bus with room to arrive.

...WHAT kind of snow job is [the]Stagecoach boss... attempting to perform on *Herald* readers? His letter to the editor... was full of numbers of new buses and percentages of passenger growth and [\$]s spent, which all adds up to absolutely nothing for the would-be passenger waiting on the footpath in the hope of being allowed to pay for the privilege of standing in the aisle of an overcrowded bus stuck in Auckland traffic. Two figures that did stand out in his letter were: 40,000 extra passengers being carried each day, and what has Stagecoach done about it? 4000 extra seats.

...Relief may be in sight for drivers making the twice daily crawl along the northwestern motorway. The Government has announced it could double funding for public transport. T[he T]ransport Minister... says Transfund’s \$46.2 million cap for public transport will be removed and up to \$51m additional funding will be available over the next three years... [The ARC] says the news is encouraging for west Auckland commuters.

...Waitakere commuters who rely on bus transport will have a better chance of getting to work on time from Monday morning. The A[RC] and Transfund are jointly funding an extra 98 bus trips per day between Waitakere City and Auckland City. An extra 66 trips are also running between Henderson and New Lynn on route 224. The route connects to Mt Albert and central Auckland and includes stops at New North Rd and Sandringham Rd. [The ARC’s] passenger transport committee chair[person]... says the changes make a bus available every five to 10 minutes during peak hour along New North Rd. “Weekend services have also been extended with an extra 43 trips on Saturday and 26 on Sunday... We know from the popular success of services along Dominion Rd and Mt Eden Rd that people will use buses when they are reliable, good quality and, most important, frequent. There is a 26[%] increase in patronage on these routes and I am confident the right package of services and infrastructure improvements will see similar patronage grow for Waitakere routes,”... The annual cost of the new services will be about \$990,000.

...If the buses through Avondale and Blockhouse Bay aren’t going your way, now’s the time to speak out... \$1.8 million is being made available through the annual plan to improve bus routes across the region... [An ARC] councillor... told the Avondale Community Board last Wednesday that the suburb is at the disadvantage of being between Waitakere and Auckland cities, with many bus services passing through... [but only going] down... Great North and New North Rds... [The board’s chairperson] says any improved services in Avondale would be put to good use, as it has one of the highest ratios of pensioner housing and bus users in the city. The board will look into paying for leaflet drops, posters in bus shelters and canvassing community groups to get people to come up with ideas.

...New bus shelters with integrated phone booths, rubbish bins and kiosks may soon be on the way to Waitakere City – and they won’t cost ratepayers or the council a thing! because [the] Waitakere City Council is looking at a... deal with advertising agency Adshel N[Z] Ltd to provide a variety of street furniture centred on bus shelters. It will also receive a share of the revenue Adshel makes from advertising. The contract will be

worth \$8.1 million to the council... Adshel already has deals with eight councils around the country and under the contract with Waitakere City will provide a minimum of 70 new shelters. There are about 1000 bus stops in Waitakere City and just under 300 have shelters. About 20 are [already] provided by Adshel, which... is responsible for installing, cleaning, maintaining and removing any graffiti. "The real savings to council are the cost of maintenance," says... [Waitakere's] roading and traffic manager... "People unfortunately kick them apart and graffiti gets all over them. We still have other shelters of our own that we need to maintain." The council can choose its own designs and accompanying furniture such as bicycle stands or water fountains... [The manager believes] the city needs bigger, more comfortable shelters that give protection from the weather.

...In South Auckland they don't want psychiatric halfway houses next door. In the Waikato they have an antipathy towards dumps for Auckland's rubbish. In upmarket Herne Bay, it's a bus stop. Apparently there is something about buses idling on the pavement outside that makes householders not just uneasy, but downright cantankerous. Since time immemorial, the bus to genteel Herne Bay has made its final outward stop on the south side of Jervois Rd, opposite the intersection with Herne Bay Rd. Then, after a suitable rest to meet timetabling requirements, it would swing around to pick up passengers waiting under the shop veranda on the other side of the street, before trundling back into town. This little ritual seems to have come to an end five years ago when, according to [a] local retiree and bus-user... some of the shopkeepers, sick of the fumes and noise swirling into their businesses, cried "enough." And who can really blame them? Public transport enthusiasts try to seduce us with visions of buses as curvaceous, sexy, noiseless transporters of delight, full of smiling, well-dressed, beautiful people. The reality is they're fume-belching, ear-battering machines carrying, in conditions of marginal comfort, people who on the whole would travel by car if they could. Anyway, back at the Herne Bay terminus, the shopkeepers, led by their landlord, managed to persuade the reluctant Auckland City Council to move the bus-stop a few metres along the footpath to outside a house. Disgruntled passengers were mollified by the offer of a shelter to replace the lost verandah. They are still waiting. A year or so back, change was again in the air. The shops were gutted and out of their shell emerged three small apartments. Enter the proud new residents. With their street walls hard up against the pavement, they were soon to discover the joys of living next to a bus-stop... Instead of coastal bird song, street noises echoed through their homes, accompanied by the scent of diesel exhaust fumes. Particularly put out was the person living nearest to the bus-stop, who persuaded the council to take the drastic action of abolishing it altogether – a bus-stop that the council's principal transport planner... conceded was well-used. [A] bring-back-the-bus-stop campaigner... says the first commuters knew of the change was when they arrived at the old stop to see a notice on the lamppost telling them that from September 28 [last year], it would be no more. Passengers would have to walk up the road half a kilometre to the bus-stop alongside the Bayfield School playgrounds... [The principal transport planner] did offer travellers the option of crossing the road and boarding the bus at the traditional off-loading point on the south side. The protesters concede such an offer was made but say that to force the elderly and the young, who make up a fair proportion of the passengers, to cross the busy and wide road would be to imperil their lives. And why should they have to anyway when the vast majority live on the northern side? Even if this was an acceptable alternative for the consumers, the householders on the south side let it be known that they were against the terminus shifting to their side of the road. The crisis has festered for... months. Petitions and circular letters have circulated. Councillors, the Stagecoach bus company and the regulators, the A[RC], have been lobbied. Tomorrow, finally, all the above parties will have an on-site meeting to try to resolve the problems. Meanwhile, a touch of sanity seems to have slipped into the proceedings. Yesterday morning on a quick tour of the battle scene, I spotted a bus at the non-bus-stop picking up a customer... [On a positive note, s]enior citizens can ride... Stagecoach buses for \$1... between 9am and 3pm... every Monday [throughout next month]. At present a senior citizen's one-way cash bus fare can cost as little as 30 cents (the lower fare will be charged if appropriate), rising to \$4.70 for the longest journey... A valid A[RC] senior citizens' ID card must be produced each time the fare is requested.

...Auckland City Council officials want to introduce a free shuttle bus service between downtown Auckland and Newmarket. They are also keen to extend the free-fares concept to the entire inner-city Link bus service in a bid to cut road congestion and pollution... The Link service... now carries more than 2 million passengers a year... [M]aking the... service free would probably double patronage... The council's principal transport planner... said the shuttle service would use distinctive electric-powered vehicles to act as a "flagship" for an imaginative and environmentally friendly regional public transport system... A Heart of the City spokes[person]... said the business group had looked at running a free bus service several years ago [to replace the former free Farmers' bus,] but it did not have the financial muscle. "We would like to work on this new proposal... [and] may even be in a position to tip a bit of money into it." ...But the region's public transport manager, the A[RC], and... Stagecoach, are wary of the proposal... Stagecoach Auckland's marketing executive... said... "You have to ask what it is you are trying to achieve... to move [more] people... or get people to experience more of the city?" ...Meanwhile... Stagecoach is reinforcing drivers' right to turn down passengers who look "dangerous", after... [four] violent robberies... on buses in south Auckland... in... recent [weeks]... One driver was hit on the head with a beer bottle, and a passenger who tried to help a [gal] driver during a robbery required stitches to his head... Stagecoach's Auckland manager of operations... says there are no written rules... [for] its policy of allowing... drivers... to "use their best judgment" to turn away passengers "who drivers feel would be a danger to them and other passengers"... but denies the atmosphere of fear created by the recent robberies will impair drivers' judgment. "Generally you see passengers and are able to access their attitude, demeanour and mannerisms." ...Stagecoach has also increased security on its south Auckland bus routes. The company will now complement its existing on-call security by placing uniformed and plain-clothes guards on some of its buses... However, [the manager] cannot confirm which routes these are and says they will change periodically, but did confirm that... there is a "whole raft" of criteria governing who drivers do not have to pick up. "If someone's in a dirty condition, carrying flammable goods or carrying animals other than a guide dog, we don't have to let them on,"... [A]ll the drivers involved in... [the] attacks are back at work...

An edgy bus driver's husband is riding shotgun on his wife's late night shifts to keep her safe. Drivers say drunk and abusive teenagers are making life a misery every time they stop at the New Lynn bus depot. [The wife]... says the situation has become increasingly dire because radios on many of the Stagecoach buses are either broken or faulty. Broken radios are becoming such a problem that Stagecoach fleet staff are suggesting they've been sabotaged. Radios inspected by maintenance workers at the Swanson depot have been found with their wires cut or missing altogether. [The wife] has been a Stagecoach driver for two-and-a-half-years... [The wife] starts in the afternoon and works through to 1... am. On nearly every shift [the driver] deals with drunken and abusive teens smuggling alcohol onto the bus or lighting up cigarettes during the ride. The situation has got so severe that [the wife] is trying to change her shifts. In the meantime her retired husband travels with her at night for added security... "If [my husband sees anything it] rings the bell and I stop the bus,"... Last month [the driver] watched a mentally disabled [person] being attacked and mugged by two youths at the New Lynn terminal. [The driver] tried to call her supervisor on the RT radio only to find it was broken. Two... bus inspectors instead chased the muggers on foot but failed to catch them. [The wife] has spoken to management at Stagecoach's Swanson depot about issuing drivers with cellphones. The suggestion was dismissed by management who say the practice was trialed in Wellington but canned because drivers made too many personal calls. But this is not good enough for [the wife] who has complained to her depot manager... "Why can't we sign for one and hand it back at the end of our shift? If I need help in a hurry and my RT's not working then I'm up the creek without a paddle,"... [The] manager of the Swanson depot, refused to comment... [but] directed *West Weekly* inquiries to Stagecoach's operations director... who says... it is the responsibility of drivers to check radios before they head out of the depot. On July 3, *West Weekly* reported that troublesome teens at New Lynn bus terminal were keeping local police and businesses busy. The spot had become a place for teens to meet – fights were a drawcard... Police said they were getting a handle on the situation... [■] West Auckland is now served by a Flexi Route... [a]t night... After the corner of Gt North Rd & View Rd on outward trips from Downtown, passengers are able to request the bus to go to any through road within 400

metres of the normal bus route. Please check with your Driver that the bus can go where you want to go. The bus [– which has the route number 140, and leaves downtown at 10.30 and 11.30 pm Monday-Saturday, 8.30 and 10.30 pm Sunday –]will always travel past the bus stop at Henderson Shops.

...‘Night Rider’ is now part of the Auckland scene. We’re not talking about “Kitt”, a sleek black car with artificial intelligence that starred in the 80s TV show Knight Rider. But public transport just got a lot smarter with the launch of bus services after midnight to most suburbs on Friday and Saturday nights. The bus will leave the Auckland CBD at 1am, 2am and 3am, at a cost of \$4 per stage. Taking the lead from its successful Wellington counterpart, the new Stagecoach service starts this Friday... The... ARC... is paying for the service on a trial basis for two years with financial assistance from Transfund’s ‘Kick-Start’ funding scheme... “Provision of the after-midnight services will provide a cost-effective alternative to taxis for many who might otherwise choose to take the risk of driving after drinking,” says [the]ARC transport committee...

Night run comes to end... Night rider bus services to West Auckland will be canned [next month] – because nobody is using them. The bus service was started... last month... to meet demand for late night transport. However, a review by the A[RC] and Stagecoach... found demand had slipped in all of the... five Auckland regions... Under [the]changes... West Auckland will lose two of their three bus routes... Stagecoach Auckland[’s spokesperson] says the service probably suffered because people didn’t want to change buses at the New Lynn depot late at night. “People don’t like to transfer on any service, it just adds uncertainty to their trip,”... [The ARC] public transport planning co-ordinator, says the service was costing the council too much money. Passengers paid \$6 for the ride, but with patronage so low the ARC was left with a \$25.80 per passenger shortfall.

...A revamp of routes and timetables for the... Night Rider buses takes effect this month, following concerns the service was going to be scrapped or cut-back... West Auckland... lost two night services... [– t]he remaining... services cover New Lynn and Henderson and leave Auckland City at 1.30am and 3am... [–] because the ARC was being left with a \$25.80... shortfall. However, the North Shore has seen a steady demand for the service.

...A safety device disconnected from Auckland’s Stagecoach buses might have saved a [North Shore]schoolboy who was dragged to his death on Wednesday... Browns Bay 12-year-old Matthew Scott Taylor’s bag caught in the rear bifolding door of a “bendy” bus as it moved away from a stop. [Matthew] was dragged under the wheels and police are investigating if a lack of a door sensor played a role in his death. [The Tramway Union’s] president... believes Matthew’s death was avoidable. “If there had been a sensor on the bus... then the door would have bounced back open and the boy would not have been caught in the doorway. Over and above the sensor, I believe there should be a warning device which tells the driver whether the doors are closed or not.” ...The Tramway Union... blames cost-cutting by former operator the Auckland Regional Authority. However, Stagecoach, the company that now runs 560 of Auckland’s buses, says operational problems were to blame... Stagecoach[’s] operations manager... said last night that the sensors were disconnected because they were “relatively crude” devices which often malfunctioned. Strong winds would sometimes cause the bus doors to open during a trip and, because they were linked to the accelerator, the bus would slow. “The reason wasn’t to save money... At the time there wasn’t any adequate solution.” ...[the operations manager also said] the union’s claim that a door sensor might have saved Matthew... [was] a little bit premature... [T]he company was carrying out a broad passenger safety investigation and... Stagecoach’s buses fell within passenger transport rules. Door sensors are optional under passenger vehicle construction regulations. The rules, written in 1978[– before the introduction of bendy buses to Auckland’s roads –] state that bus doors which jack-knife or glide open must have either a 10cm gap between the door and doorway filled by some sort of pliable material so that a limb can be pulled out, or a sensor fitted.

...A... bus driver asked... a supervisor if [it] could take the rest of the day off... after swiping a car at an intersection, but was apparently... ordered... by a more senior manager... to work on... [S]ix hours later, the driver was at the wheel of a “bendy” bus when... Matthew Scott Taylor’s bag caught in the rear door as the vehicle moved away from a bus stop, dragging the boy to his death. [But] the Stagecoach operations manager... says the driver did not ask his area manager for time off. Only the area manager can approve such requests. The company says it would not act in a way that put its passengers and drivers at risk. The 51-year-old driver is on special leave... No charges have been laid against the driver and police may yet refer the case to legal advisers... The driver is not a union member but the Auckland Tramways Union said it knew of several cases where staff had been pressed to keep working despite asking for time off... While [the] death is understood to be the first of its kind in N[Z], there have been numerous less serious accidents, including a 13-year-old... who fell and broke his arm while getting off a moving bus just two weeks earlier.

...Stagecoach tried to stop its drivers being told of a union safety scheme to prevent children leaving through the rear doors of buses. Depot managers were told by the bus giant’s Auckland head office to ask Tramways Union delegates not to display a notice requesting drivers to let children off only through the front doors on school runs. The union drive came after a spate of accidents, including the death of 12-year-old Matthew Taylor last month... [The union’s] president... said allowing schoolchildren only through the front door meant that drivers could make sure everybody had got off the bus before they drove off. The union attacked the company’s stance yesterday, but Stagecoach[’s spokesperson]n... said management only wanted the scheme delayed until a meeting between the sides next week... Stagecoach believed it would cause confusion because the message was addressed only to union members instead of all drivers and had not been endorsed by the management.

...A North Shore family’s grief turned to anger yesterday as the Stagecoach driver who fatally ran over their son was sentenced to four months’ periodic detention... “We just wanted him to hurt. We wanted him to suffer in some way because [the driver] just doesn’t appear to have done so,”... [The driver], aged 51, was last month found guilty in the Auckland District Court of careless driving causing death and failing to stop after an accident... [The driver] faced a maximum penalty of five years imprisonment for failing to stop, and three months for careless use. As well as the periodic detention, [the driver was] disqualified... from driving for 12 months, and ordered... to pay \$2476 towards Matthew’s headstone. [Matthew’s mother said it had wanted the driver] to go to prison. “I’m extremely disappointed because I don’t think the sentence will be a hardship for him at all.” A restorative justice conference had been proposed for the... families to reconcile, but after yesterday’s sentencing [Matthew’s mother said it] no longer wished to take part... The [mother] did not believe [the driver] was remorseful, but [the judge accepted the driver] had not apologised because of legal advice... The suitability of bendy buses for transporting schoolchildren was questioned by defence lawyer[s]... It was almost impossible for drivers to keep an eye on up to 80 children, and paid bus monitors could be an option, [the defence said. Stagecoach’s executive chairperso]n... said safety had been improved, and the company would reassess the suitability of bendy buses on school bus routes in light of the comments made. Although [the 51-year-old] had been on unpaid leave since the accident and had now lost his driver’s licence, [the executive chairperson] said Stagecoach – as a responsible employer – would look at what other jobs [the 51-year-old] could do with the company.

...School wants bus issue resolved Students are still waiting for a safer bus route in Kelston as Stagecoach has never fronted up to a meeting with school heads. Kelston Girls High School approached Stagecoach... earlier in the year about changing its school drop-off point from the heavily-congested Archibald Rd, to the school’s back entrance. The danger to students from the traffic “deathtrap” was outlined in the *Waitakere Week* on August 25. Stagecoach’s top brass from Wellington were due to... meet with the school and take a bus around the proposed route... This meeting was cancelled because of the Stagecoach bus drivers strike and the company has never rescheduled. “They said they’d get back to us but they never did,” says [the]principal... “We’re exactly where we were. We’re no further with getting the new entrance up and running.” The school has spent a \$10,000 Ministry of Education grant on upgrading the back entrance to accommodate buses. This development has now stood idle for half this year. While the Ministry, Waitakere City Council and other Kelston schools are in favour of the plan Stagecoach has yet to come to the party.

...We don’t want [AUS’s PM] to just hear about your problems, we want him to experience them, too. So, this week, [a]12-year-old... made [the PM an offer it] couldn’t refuse... *Dear [PM]... I go to North Sydney Girls’ High School. Every day, I have to travel by bus for an hour and a half to get to school, and the same distance back. Because there are no trains in this area, the buses are always overcrowded. I can never find a seat and have to*

stand all the way, laden down with heavy books. All the children are crammed in like battery hens, with barely enough space to breathe, let alone move, and by the time I get to school I'm exhausted. Politicians always encourage people to leave their cars at home and use public transport. But that's easy for them to say when they get chauffeured about in air-conditioned limos all day. Why don't you travel with me and my friends on the school bus and see what it's really like? ...[here's a selection of letters on the same issue: ♣ My daughter... is only 12. [Because it is tiny, it] gets really crushed on the school bus. Sometimes [it] comes home in tears. 'The bigger kids can push past, but I always get trampled and squashed,'... Does a child have to get injured or worse before people sit up and take notice? It's just an accident waiting to happen... [♣ My two kids, [aged] 16, and... 18, have been travelling on school buses for years, so they have literally grown used to the... shoving and overcrowding. I have tried for years to get something done to improve the bus services, because I don't see why children should have to put up with it. Adults certainly wouldn't... [♣ My son... contracted glandular fever when... [aged] 14, and travelling on the buses completely wiped him out. [My son] was recovering from his illness, yet... still couldn't find a seat... I complained numerous times to the bus company but nothing was done. It's been an exhausting situation for him – and me! ...[♣ My 14-year-old... has been travelling to and from school on the bus for four years now, and... always comes home exhausted. [My son] always moans about the overcrowding and, because all the kids are so packed in and hot, scuffles inevitably break out. One mum has given up mending her son's shirt, it gets ripped so often. I've written to the bus company and... government, but they just say there's no money for extra buses. I guess in the general pecking order, school kids come pretty low, but... I hate seeing my son dread his journey to school. I want to help him, but what can I do?

...Angry thousands stranded in winter blunderland... [A couple] left Cambridgeshire for an hour-long journey home to... a town in Leicestershire, last Thursday night. Seventeen hours later they were still in the car, and they hadn't even left the boundary of Cambridge... Similar tales of frustrations were shared all over southeast England over the weekend. Police compared the worst-affected stretch of motorway, 27km of the M11 between Cambridge and London, to a carpark, after 12 lorries jack-knifed on ice, trapping thousands of motorists at rush hour. Police, who said it was London's worst transport disruption in a decade, dispatched a helicopter to drop food parcels... The misery was duplicated nationwide... The transport paralysis intensified frustrations for commuters, especially in London, where one of the main Underground lines, which usually carries... 500,000 passengers a day, is closed indefinitely for repairs after a train derailed... at Chancery Lane... injuring 32 people. And intermittent firefighters' strikes are forcing the closure of dozens of stations with elevators for safety. The freeze came in a month when it was announced that a long-promised railways upgrade was to be scaled back because of spiralling costs. More than 100 daily train trips are to be cancelled... With the public transport system in chaos, London is weeks away from being the first city in the world to introduce an elaborate and controversial charge system for people driving in central London... The... £5... charge is being dubbed the biggest upheaval in civilian life since World War 2.

...Drive is on to make motoring impossible... Sweeping changes are about to be taken throughout Britain to make motoring increasingly untenable and force millions of people out of their cars and on to public transport. As more than 23 million took to their cars this weekend, transport chiefs unveiled the unprecedented crackdown on private vehicles in a series of schemes to drive people off the roads. In 50 towns and cities, from Edinburgh in Scotland to Exeter on the English south coast, bus drivers will be issued with remote controls to change traffic lights to green... and will be permitted to stop in the middle of the road, preventing motorists passing. Thousands of new bus lanes will be introduced... [T]he pro-car British Drivers Association, said that the increase in speed cameras, traffic "calming" bumps, bus priority measures and the move towards congestion-charging in London and other cities added up to a concerted war against the car. It was backed with Government support in the form of extra grants for councils tackling congestion by giving buses priority. The initiatives are a desperate measure to curb the increasing congestion that is throttling British cities. Until now the Government has tried to discourage car use by imposing higher duty on petrol, but that has done nothing to combat car use in cities. The cost of motoring is the same as 25 years ago while bus fares have increased by 80[%]. Car drivers in large urban areas spend a third of their time driving at below 5 mph... and journeys are getting slower. In the past five years, speed of peak rush-hour traffic has fallen by about 20[%]. The Confederation of British Industry reckons that traffic congestion costs the British economy \$56.8 billion a year. The Government estimates that traffic is set to rise by a fifth in the next 10 years, making it one of the fastest-growing sources of pollution. Curbing car use and increasing the use of public transport is a central plank in the Government's plans to meet its targets in reducing greenhouse gas emissions... [♣] Auckland's transport... planners... warn... a wholesale switch from cars to public transport is not only inevitable but imminent.

...A \$100-million public transport plan for tunnels under Albert Park and the Domain has been launched. The tunnels would be part of a rapid transit system linking the employment centres of Newmarket, Auckland Hospital and Auckland University with the central business district. The... "Proposed Central Area Rapid Transit System" would run from the yet-to-be-built downtown Britomart transport centre and up Queen St and Wellesley St before heading underneath Albert Park to an underground university station. After crossing Grafton Gully, it would go under the Domain before stopping at a hospital station. It would head across to Newmarket, linking with the existing rail line near Khyber Pass Rd. Although tunnels were built under Albert Park... [during WW2], the project would require a new underground route... The system's designers are not saying whether light rail or buses would use the tunnels... The central city system is an important part of a regional plan to build public transport "corridors" across Auckland. This masterplan, expected to cost hundreds of millions of dollars, will be publicly launched early next month.

...Auckland City councillors are under pressure to pour millions more ratepayer dollars into the \$220 million Britomart... project. Sources have told the [N/Z] Herald that councillors will have three options on the table when they discuss Britomart today – and they all involve spending more money. Two of the options involve cash payments to the developer[s]... It is understood the developers were upset after councillors voted 9-8 in May to turn down requests from the financier for a \$15 million top-up for long delays and cost increases, and are adamant the council must stump up with millions of dollars more in cash. Of late, the council has decided to spend another \$5 million on changes to Britomart and another \$6 million towards the rail tunnel leading into the underground transport centre... A spokes[person] for Rethink Britomart... said the council was being pushed into paying for unspecified expenses on a project that had not started and did not have final resource consents. The Property Council national director... was a[ls]o a[ll]armed... "Adding another \$15 million to the current level of ratepayers' exposure is unacceptable, particularly when we were told this is a fixed-price contract. The time has come for the council to stop pouring ratepayers' money into an ill-conceived project."

...Changes to the Britomart project will allow thousands of tonnes of polluted stormwater to be treated on land before being flushed into the Waitemata Harbour... [A] large settling tank... will [b]e... built underground to recover much of the central city's stormwater solids before the stormwater is discharged beside Captain Cook Wharf... Moving the bus terminal from the second underground floor has created space under the Quay St east underpass to build the settling tank[, which]... will be 110m long, 20m wide and 3m deep and provide capacity for 6600 cu m of water... The Auckland City Council has approved a \$7 million plan to divert stormwater around Britomart and through the settling tank. [One c]ouncillor said the tank was a big environmental plus, but... was unconvinced it was the best method of removing toxic sediments... [The councillor] would look at other methods which might improve on... the recover[y]... of stormwater solids before discharge into the harbour. "It sounds good but it still means 35[%] of solids are going into the harbour." ...After recovering 65[%] of stormwater solids on land by dredging or vacuuming the tanks, the council will dredge the seabed every 20 years to recover a further 20[%] of toxic sediments.

...Tape recordings tracing the history of Britomart since its inception may be destroyed to protect the privacy of Auckland City councillors. The council is seeking legal advice on whether the tapes can be kept or whether councillors can expunge the only indisputable record of their dealings with the controversial project. The... Auckland City historian... is furious at the prospect of the recordings being destroyed, saying it was arrogant

and showed a lack of interest in history... Full council meetings, including confidential sessions, have been recorded to help staff draft the minutes, even though there is no statutory obligation to do so. The tapes go back almost 15 years. Other councils in the Auckland region do not record meetings. The Auckland City Council will now record only open sessions and later destroy the tapes... A National Archives spokes[person] said its job was to preserve central government records. If the council decided to keep the tapes, it should place them in its own archival holdings. The council yesterday held a two-hour Britomart meeting behind closed doors. [The mayor] refused to say what was discussed or whether the council had reached a stalemate over the \$15 million developers are seeking towards costs over project delays.

...A legal oversight which left copyright for the Britomart project plans in the hands of a firm of Sydney architects could prove expensive for Auckland ratepayers. The Auckland City Council faces the prospect of paying a large sum – running into millions, according to one councillor – to the firm Hassells if it wants any other architects even to look at the project. [Auckland's] Mayor... said yesterday that [it] was very frustrated at the copyright problems, the result of council officials not realising the implications when contracts were signed several years ago... A[n architect]... for Rethink Britomart... believed the council had already paid \$2.5 million to Hassells. "It would be cheaper to start again," [the architect] said.

...Technical argument on dewatering the Britomart site once it is dug to five levels below ground kept [the] Principal Environment Court judge... and two commissioners occupied again this week. The long battle over consents for the downtown Auckland project began after the Auckland City Council signed a heads of agreement with NatWest Markets A[US]... in 1996 to start the redevelopment of the 3.2ha city bus terminal site. Commissioners appointed to consider the resource consent applications rejected dewatering... and th[is is] being appealed by the... council, which needs all consents in place before handing over the site for redevelopment... But the fate of the whole... project rests not just with the Environment Court but also with the new-look city council, whose councillors have had several briefings on it but have still to come out with any decisions.

...AUCKLAND City councillors have an easy exit from the Britomart development, which is not to extend the March 1999 time limit for remaining resource consents to be obtained. [The project's f]inancier... has already worked out that, with the potential for two levels of appeals, it is most unlikely that timeframe will be met, and has sought an extension to December 31, 1999. The council would be up for a \$375,000 payment to the financier, on top of the same amount already paid to cover its costs. An exit by that method would be possible despite the "absolute good faith" clause in the master development agreement signed in 1996 by the previous council and the previous financier, NatWest Markets A[US], which was taken over as part of the sale of County NatWest this year... There are other conditions which could also kill the project. A briefing document compiled by... [a] law firm... for councillors to consider this week says the financing and structuring arrangement for the project has not been satisfied. The development companies, Britomart Developments and Britomart Investments (which are subsidiaries of Pacific Capital Assets and now of Savoy Equities, all under the control of [one businessperso]n...) have to arrange a \$60 million finance tranche, which is made more difficult by Asia's economic troubles. Other important development aspects, seen as crucial by some opponents but as matters that can wait by the council, are documents relating to management of the underground centre and a contingency plan... Numerous changes in the Auckland property market since 1996 would support a change of heart by the council, apart from the change of councillors and of council control. But Auckland still needs something to happen at Britomart, 3.2ha of prime central business district land where existing buildings have been vacated and where the bus terminal has become distinctly unsafe territory at night, in contrast to the bubbling Queen St environment where the once-unsafe main street has regained its life and goodwill. That something is likely to be a revised development that still contains the transport centre but cans the property developer's dream of 11 highrise buildings and underground parking to support them.

...*Plug pulled on Britomart...* Auckland City has taken the bold step of tearing up the Britomart contract without knowing the financial implications of abandoning the [project]... After months of negotiations councillors yesterday voted 15-1 to... build a smaller, more user-friendly public transport centre in central Auckland. The council has already sunk at least \$23.5 million of ratepayers' money into Britomart. It has no idea if a planned new scheme will cost more or less than the \$140.5 million saved from ditching the much-despised five-level underground transport terminal and car park. Councillors must now wait to see how their former partners react to losing the hundreds of millions of dollars of work, development opportunities, fees and profits that would have come their way. A jubilant... Auckland mayor... who was elected... last October on a Rethink Britomart platform, said the time had come to move on. [The mayor] was confident the decision did not constitute a breach of contract, which lawyers had previously warned could see the council being sued for between \$100 million to \$300 million... The council terminated the contract on the grounds that the financier... and the developer, Britomart Investments, missed three deadlines over a two-and-a-half month period to agree to the terms of the resource consents... Britomart Investments, which had been having difficulty raising \$70 million to kick the project off, sought more time to find money. The council refused. Further, the council believed that correspondence from [the financier] showed it had terminated the contract. This is disputed. Last night... Britomart Investments and the A[US]n-based company with the contract to build the first stage of Britomart... said they did not believe the council had the right to terminate the contract. A spokes[person] for Britomart Investments... said they would almost certainly be looking to "enforce our rights," including the option of suing the council.

...*A \$16m case of tunnel vision?* ...[the] brave call by Auckland City to rip up the Britomart contract raises questions about a \$16 m... rail tunnel being built to bring trains into downtown... Work is proceeding on the 506m underground tunnel from near the existing Auckland Railway Station to the point of Britomart. The tunnel is due for completion by April, at which time it is likely to be sealed up awaiting whatever alternative scheme the council comes up with for Britomart. The deputy mayor... said the council would not end up with a tunnel to nowhere because the plan was still to bring trains underground to a point near the former Chief Post Office in Queen Elizabeth Square. If the plan succeeds, it will be the first time in 70 years that Aucklanders will be able to take a train into downtown Auckland... Work started on the tunnel in August before it was certain that the Britomart project would proceed. This enabled an open-cut tunnel to be dug before developers closed off that option by building offices over the route. Delaying the tunnel and then having to bore it while leaving the surface intact risked adding \$11 million to the... cost. The tunnel is being built by... the A[US]n-based company which, up until yesterday, had the contract to build the Britomart underground transport terminal...

A bus and rail centre on the Britomart site remains the dream of planners working to ease Auckland's traffic congestion... But... [over f]ive years after the city council unveiled it as the grand solution to many of Auckland's transport problems, few transport planners will shed a tear at the... project's demise. They have, however, been angered and frustrated by the way the debacle has delayed schemes to improve services, both bus and rail... [One guy who may shed a tear is] the sole... councillor... [who] stood up for the Britomart vision advanced by his old friend and former mayor... Even... [the] former deputy mayor[']s pro-Britomart Citizens and Ratepayers colleagues accepted the inevitable and voted with the anti-Britomart bloc in a 15-1 vote to move on... But [it still] insists Britomart as first envisaged would have benefited Auckland... "I hate to think of all the time I've spent on Britomart – all gone down the gurgler. [However, w]hat's done is done. We have to look forward to the future. But I will be interested to see how we are going to get a better deal for the city, better facilities opening up the harbour edge, restoring public buildings, all for less cost..."

...The first designs for the Britomart area... will emerge next Friday when a public competition closes. The 300 or so entrants have a wide brief but only an A1 sheet of paper to put a thumbnail sketch on what to build from the rubble of the original, aborted scheme. Proposals must take into account a railway station at the foot of Queen St, bus, ferry and rapid transport options, and sprucing up the dilapidated Britomart precinct with its collection of historic buildings. The new... project, which the Auckland City Council has renamed the Waitemata Waterfront Development for obvious reasons... [- since] dubbed the "son of Britomart[']" – ...is essentially smaller in scale and scope than the grandiose redevelopment envisaged by the previous council[, that]... showed an arrogant disregard for process and the concerns of Aucklanders, who vented their anger at the ballot

box... Having ditched the project, the [new] council was back to square one. Apart from a commitment to involve the public in a new scheme and to focus on a dedicated transport terminal, there was no alternative plan in the bottom drawer... The undergrounding of Quay St is no longer taking place and the environmental opportunity that created to build a holding tank for stormwater solids is gone. Instead, the water will be discharged beside Captain Cook Wharf. Buses will no longer be underground, to the relief of bus owners who had argued it would be impractical, uncomfortable and unattractive for commuters. There will be no retail development underground and... maybe not[even a railway station]. The reason Britomart was floated in the first place – to bring rail back into downtown Auckland... – has recently been challenged by a bizarre proposal to stop trains at the end of the existing Auckland Railway Station... From there a rapid transit system – such as light rail or guided buses – would go... [via a city circuit to link with] the western rail line near Khyber Pass. Handing over the underground tunnel to rapid rail... would wipe out the chance of heavy rail ever coming back to Queen St. Needless to say, Tranz Rail is not keen on the possibility of losing tunnel access to Queen St...

A \$1 billion spend-up on Auckland's rundown water services is threatening the region's ability to afford a decent public transport system... [One councillor], who chairs a regional water steering group, said public transport and water were both important but they would compete for funding... [Fortunately, the] Auckland City... council... [already] has \$129 million set aside for a replacement Britomart transport terminal.

...The Auckland City Council has won praise for the way it has consulted the public and managed the \$261 million "son of Britomart" project. Audit N[Z] has reviewed the management processes for the new downtown transport terminal and found that the council learned lessons from the unpopular Britomart project promoted by [the] former mayor... After dumping the... scheme... the [new] council developed a standalone transport terminal costing nearly \$100 million more than the old scheme, which was part of a bigger underground project. [The new] Auckland mayor... said the report was an endorsement for management of the new project... Audit NZ[']s director... said it was particularly impressed with the... openness of a public design competition – which selected [a] Californian architect... and local architectural firm Jasmax... It... could be a blueprint for other projects... The council was about to work on Britomart – a project that will bring trains back to Queen St for the first time in 70 years...

Cars and commercial vehicles will be banned from Grafton Bridge under plans to make way for a dedicated busway between the central city and Newmarket. Trucks are already banned from the historic 1910 concrete bridge, which needs strengthening before it can take heavy traffic. The Auckland City Council's transport committee yesterday voted to go ahead with a rapid city busway that passes Auckland University in Symonds St and Auckland Hospital in Park Rd on its route to Newmarket. This follows a decision by the... council to ditch work on a light rail route up Queen St and Wellesley St and across Grafton Gully to Newmarket in favour of a busway... The "Central Transit Corridor" busway is planned to run from Britomart... The committee also voted to continue investigations into a \$400 million rail tunnel through the central city, running from Britomart... ■ T[he]... final bill to Auckland City ratepayers for the axed Britomart project is \$24.15 million, of which \$22.15 million is being written off... [after] council officers decided that only \$2 million in engineering and design work could go towards a replacement transport centre.

...We now have what was nicknamed "Son of Britomart", with a double track to cater for five platforms[– at least three tracks were needed to cater for future plans to increase peak-hour services –] and no direct link to the western line or other points in the central city. A midtown railway station at the ASB Building in Wellesley St had been planned in 1969. Underground rail to Morningside was first talked about in 1923, then again in 1951, 1972... The \$1.23 million tube that frightened 1923 ratepayers had snowballed to \$400 million in [the latest talks]. Now the Auckland Regional Transport Authority has announced a \$1 billion central loop comprising 3.5km of tunnels between Britomart and Mt Eden, with underground stations at Wellesley St and K' Rd. If work starts now the loop is expected to be 15 years away. Much depends on funding and whether Westfield will agree to a rail tunnel beneath its new skyscraper on the corner of Customs St. Will it get off, or rather under, the ground? Watch this space.

...We've often heard the proposed Avondale-Southdown railway mentioned, but just when is this line actually going to be built? ...Who knows? ...a designation has been in place for many years, since 1947 in fact... Although it remains an important strategic link for Auckland's rail network... [-] the main functions of such a line would be to remove north-south freight trains from the section of Auckland's rail network that carries the most passenger traffic... [-] there are currently no plans or funding to build it.

...The total cost... of... [t]he Passenger Transport Action Plan, developed in consultation with Auckland's territorial councils... to... provid[e]... fast and frequent passenger transport systems... across the region... is estimated to be between \$715 million and \$1520 million. [However], Waitakere City's representative of the Regional Land Transport Committee... says this cost needs to be looked at in context. "Between now and 2004, the region is poised to spend \$1222 million on major roads, and a further \$1478 million between 2005 and 2021... By making it more convenient for people to use public transport, our roading network can work much more effectively."

...Auckland's car-loving motorists want a better public transport system – but they may not use it. They are happy for public transport to get more money, but... [a] survey... has confirmed the perennial bugbear for planners working on Auckland's \$1 billion passenger transport schemes, namely that commuters prefer the convenience of their cars... Nearly half of the drivers would still take their cars to work if the price of petrol rose \$1, [meaning]... they were paying \$2 a litre... while 40[%] would still drive if the trip took an extra hour... About 8[%] of travellers now use public transport... [but, while the chairperso]n of the regional land transport committee[believe]d the survey showed the mentality that public transport had to battle[, the]... northern regional manager... [for the Automobile Association believes] the... survey says... that potentially public transport could pick up 20[%] of the market overall and that during peak times on key routes into the central business district it could be 30 to 35[%]...

Plea to keep Oakley Creek A[n A]uckland City Councillor and Avondale Community Board member... says the [Avondale] area can't afford to lose the Oakley Creek Reserve, which includes [the city's most] picturesque waterfall... to the planned State Highway 20 extension. [The councillor] says if the extension goes through the Oakley Creek area it will have a big impact on the community. "The first stage [from Hillsborough to Richardson Rd] has been planned for many years, but the Avondale extension hasn't. The Avondale area has one of the lowest rates of open space anywhere in Auckland City. From my perspective we should be increasing the amount of space not reducing it." [The councillor] predicts public opposition if Transit N[Z] backs the Great North Rd route via Oakley Creek[, which backs on to the grounds of Unitec].

...While her Diamonds teammates slugged through a training camp mud run, [the imported] Jamaican goal shoot... had other things on her mind. Alligators, snakes and eels, in fact. "It was disgusting," [the netballer] says. "Back home you wouldn't go into mud like that because of all the germs and viruses and you definitely wouldn't venture into it in just your shorts and shoes." ...[the 23]-year-old... is studying at Unitec and says coming to N[Z] has meant a few changes to her lifestyle. "In Jamaica you can just walk outside your house and catch the bus but here you have to wait in certain bus stop areas which is quite funny. And the taxis here have meters whereas in Jamaica there is a set price and you don't have to pay extra when you get stuck in traffic."

...*Auckland, City of Snails*... From the wheel of his big V8 taxi [one driver] has seen Auckland roads change from "busy to madness" in the space of 30 years. Once [it] could predict the customer's waiting time – within a minute or two[, but] makes no promise now: "All I can say to them is... I'll be there depending on the traffic." The traffic is atrocious, [it says, and to]... make matters worse... motorists have turned ill-mannered and nasty... To think that, once, drivers coming from a blind corner would extend one or two fingers to approaching traffic to show how many vehicles were following. A times, [the taxi driver] retreats home early for the day, fed up with the battle to avoid collisions and to get people to the airport on time. [It] sees the wastefulness of Aucklanders travelling alone in their cars at peak times, when they could be public transport passengers... In 1902 when electric-traction trams began replacing horse-drawn trams, trains left a Queen St station to run out to Pukekohe, Helensville and Onehunga; Waitemata Harbour ferry services included an all-night service for Devonport. [The taxi driver] doesn't understand how a city needing to move the masses conveniently, cheaply and quickly, could rip out the 72km network of tram tracks in 1956. When since have the public been offered... very

low... fares... [for] a service as frequent as every... 7 1/2 minutes during the busy hours and 15 minutes at other times... and in a vehicle that has permanent right of way along its route? In the 5 o'clock rush the tram rocked and rolled from the city to Onehunga in 40 minutes, a time today's Stagecoach buses are pressed to achieve. Trams were chopped because they were overdue for updating and the replacement cost was daunting. Their successor, the trolley bus, went for the same reason in the 1980s when a suburban rail system running with 1920s carriages and an elderly harbour ferry fleet were also endangered. By comparison, the... car... ha[s] had red carpet treatment – by 1947 sufficiently important to warrant traffic lights on Customs St West, by 1953 the beginnings of a motorway network and by 1958 a municipal parking building. The 1976 shelving of a publicly funded, hugely expensive electrified rapid rail scheme, with an underground service for the CBD as championed by the [then] mayor... was denounced as a sellout to the motor car that would gobble more land and foul our air. Aucklanders took pride in the steel bridge built over the Waitemata Harbour in 1959 that shortened the drive to [Devonport by over] 40km, and spurred North Shore growth to the extent that bridge lanes had to be doubled to eight only a decade later... The authorities have thrown about 150km of motorway and 220km of rural state highways at the problem of congestion in the Auckland region. Each extension has bought a little more time for us to manifest our individual freedom by driving...

DISABLED drivers are using guerilla tactics to stop able-bodied vehicle owners nicking their parking spaces. The disabled... are fighting back because an estimated four out of five disabled parking spots are being used by non-permit holders. Some fed-up mobility car users are supergluing messages to offenders' car windcreens. Others are getting nasty notices photocopied to put on the cheats' cars, while many do them in to carpark owners and ask for the vehicles to be towed. One notice asks – "You've got my parking space. Would you like my disability?" ...ATMs and supermarket disabled spots were favourite targets for the cheats. "They see the spots empty and reckon they are only going to be a few minutes, but a disabled person could come along in those minutes,"... said... [a spokesperson for the Crippled Children's Society], which issues the mobility permits... "Many people do not realise disabled people have to pay for the cards, and therefore the parking spaces which are set aside for them." ...The cost of a short term mobility permit is \$20 a year, while a long term one is \$35 for five years. Applicants have to undergo a medical check.

...Auckland City parking officers have for the first time been given powers to issue fines to motorists committing moving traffic violations... Drivers found illegally travelling in bus lanes during peak traffic hours will be issued \$150 tickets. Auckland City's parking services manager... says 12 officers have undergone special instruction from a police trainer certified by the police commissioner... Roadside parking officers will watch for drivers travelling more than 50 metres in a bus lane. They are armed with video cameras to film proof of violations. The council says results from its own commissioned survey shows average car compliance with bus lane laws are as good as 95[%] in some locations. However, in other places the figure is as low as 55[%]. A nine-day survey was conducted... at 13 sites on seven main roads linking to Auckland's CBD... [The manager] says the council would be delighted if it does not have to issue any tickets... ■ From British newspaper the *Guardian* comes this: A London council has apologised and cancelled a \$100 fine issued by over-zealous parking wardens. Finding... [a] car parked illegally, they lifted the vehicle, painted double yellow lines underneath it and wrote out a ticket. The new double-yellow restrictions were to come into force the following week.

...a daily London bus traveller... [on the] Number 19... through Charles Dickens' haunts in Clerkenwell... is 75 and... tells anyone who sits beside... her that [it] will be voting for... "the LT card, dear." ...The LT card is the London Transport ticket allowing transfers between buses and tubes which was invented by the environmentally concerned... left-wing leader of the Greater London Council (GLC)[, who now is a candidate]... for Mayor of London... His transport policies so enraged [the Iron Maiden, that the then PM] dismissed the GLC, leaving London without a coordinated authority. [The GLC leader had] cut fares by 25[%], which brought a huge instant fall in car traffic, but [the Iron Maiden] forced them back up. [The current PM], as leader of the Opposition, disliked [the GLC leader] as much as [the Iron Maiden did. It was the GLC leader, the current PM] believes, who made Labour unelectable through[out the Iron Maiden's reign]... Since the GLC abolition, transport has deteriorated dramatically because of lack of investment. Official Labour renovation policies involve private investment in partnership with public, which means the system staying in public ownership but being effectively leased out to three private companies, which would rebuild and maintain it for a guaranteed fee. The public fear, intensified by the devastating train crash at Paddington Station... is that corners would be cut on safety costs... City analysts reckon renovation will cost £12.5 billion... of which £10 billion will come from fares and the rest from investment loans or bonds... [In spite of, or perhaps because] of... scare campaigns... [by other mayoralty candidates,] a series of polls show the Labour rebel as hot favourite. Importantly, soundings in the City of London financial community show significant support for [the former GLC leader]. With business, as with [75-year-old bus users], it is the promise of improvement to the transport infrastructure, offered by a [person] with a record of success, that is seductive... [The former GLC leader] has done public battle with central Government over London's infrastructure before and will have no hesitation in doing it again... But what real discretion the mayor is left with to alter policy[or] to decide on fare levels... remains to be seen... The mayor's room for manoeuvre has been curtailed already by the Greater London Assembly Act, which creates the role of mayor and the 25 member assembly, both to be elected... [in seven weeks time. In local news, relief] may be in sight for west Auckland's daily traffic gridlock if Infrastructure Auckland wins its bid for Tranz Rail's rights to the western rail corridor. Infrastructure Auckland[']s chief executive... says it plans to offer up to \$33 million to Tranz Rail by the end of the month. The offer's on behalf of the Auckland and Waitakere city councils... Infrastructure Auckland intends to lease back to Tranz Rail the right to run freight services at night. Tenders will be called for the passenger train services... Better use of the western rail corridor is identified as a key to developing rapid transit services, in the regional Passenger Transport Action Plan. [A p]assenger transport subcommittee member and Waitakere City councillor... says they'd like to see a service running every 5 to 10 minutes during peak hours. That involves double tracking the western line but there is still debate over who would pay for the estimated cost of \$240 million... [A Tranz Rail spokesperson] says the company has no comment... Tranz Rail was given an 80 year Crown lease over [Auckland's rail] corridors in 1993.

...[Auckland's mayor and a mayoral candidate hopeful] were in a National government that gave Tranzrail a monopoly lease on the railway tracks for just \$1 a year. Now Tranzrail wants \$112 million back for it... For the full sordid story... go to my website www.matt4mayor.org.nz...

The Auckland rail deal is sitting on a siding after being shunted off track by another missed deadline and no green flag from the Government. But central and Auckland local governments are agreed on one thing – they're not happy with the new \$112 million price tag. The... Waitakere City Mayor... says... \$65m is about what the Auckland rail corridors are worth... Waitakere, Manukau, Franklin and Papakura councils have all agreed to a revised rail deal – the "double assignment" option that would give them more control of the region's rail corridors. But each council also expressed concerns about the cost. Tranz Rail and the Auckland Regional Council, which is negotiating on behalf of the councils, have signed a revised heads of agreement based on the \$112m "double assignment" option. The ARC now hopes to get Government support in principle... The... Transport Minister... says... "The Government is not yet convinced the price is a good one." The Government is considering its rail policy following Tranz Rail's announcement... that it plans to stop passenger operations and close some freight lines... [● Yesterday's SIDESWIPE asked if it was] ironic... that Tranz Rail's head office is in Takapuna and none of its staff can get to work by train.

...The Auckland rail corridor is back in public ownership – clearing the path to a better public transport network. The Government's completion of an \$81 million deal with Tranz Rail to buy the corridor and assets was yesterday hailed by regional leaders as an historic move towards solving Auckland's transport woes... The new deal lets councils manage the railway and station development through their jointly owned company, Auckland Region Transport Network. The regional council would direct transport planning and integration, and contract an operator to run rail services. Previously, investment was on hold until the councils were certain of the rights to the network... The Mayor of Manukau City... said the Government had sold the rail rights for a pittance and... had paid a lot to regain them. But the acquisition was imperative to upgrading suburban

transport... [The ARC chairperson] said ownership meant that orders could be placed for new carriages to ensure the service continued beyond the “drop dead” dates for tired old rolling stock... [The ARC has already promised] west Auckland commuters extra 7.15pm and 8.15pm services out of the city from Monday to Friday... effective from... [the 9th of next month. Unfortunately, the council’s rail project leader... says Sunday services for west Auckland will not begin immediately. “Sunday services are not planned until next January... Additional qualified drivers are needed to run Sunday services and we are currently paying Tranz Rail to teach new drivers,”... Waitakere’s] Mayor... was convinced that... 40[%] of the city’s residents who now used cars could be persuaded to use rail. “There’s a big market in the next generation; they have had a gutsful of road rage.”

...A new generation of “smart trains” that can go on roads as well as rails – that’s the vision of [Waitakere’s] mayor... In a recent three-day visit to Melbourne and Sydney, the mayor was shown hybrid vehicles that can run on both road and rail tracks, and switch between diesel or electric propulsion as needed. These “smart trains” cost around \$5.8 million each and can be delivered within two years... [The mayor] has even suggested that “smart trains” could be allowed to move off the track at Avondale, go down Great North Rd... and rejoin just before Titirangi. This would avoid the \$20 million exercise of undergrounding the road at Totara Ave roundabout to allow double tracking. The council will also ask the ARC to double-track the western corridor as far as Swanson by 2007, and to make electrification of the line a future priority... The ARC has promised Aucklanders they will have a world-class rapid transit system with a 10 minute peak frequency for rail by 2006. [The ARC’s p]assenger transport chair[perso]n... says reliable rail services will provide the backbone to an efficient transport system, giving people freedom to move around... [Incidentally, a] 27-year-old Glen Eden lawyer was killed when hit by a train yesterday morning. The [lawyer] was hit at 6.40am, 300 metres south of Glen Eden station, by the first Waitakere-bound train of the day from central Auckland... [T]here were 18 passengers on the train. They stayed on board before being taken from the accident scene by police, and to waiting buses and taxis... Henderson police say... it appears the [lawyer] was walking on the tracks... on his way to work. The accident stopped trains on the western line, and Tranz Rail brought in buses to take stranded rail commuters to work. [A company spokesperso]n... says Tranz Rail has appropriate safety measures and they weren’t at issue in the accident.

...RAILWAY tracks must be made safer or more west Aucklanders will die, says [the] Waitakere City Council road safety co-ordinator... On Wednesday, 26-year-old Glen Eden lawyer Leon Graham Kay became the second pedestrian killed when hit by a train on the Glen Eden tracks since September 1998... [The co-ordinator] says safe walkways are needed alongside the rail lines because no amount of public education will stop people taking a shortcut over and along the tracks. “We don’t go the extra distance, we take the route which is quicker... The reality is people are walking down tracks so why don’t we make some safe walking spaces. How many more will have to be killed before we put some sort of walkways there?” ...[the councillor] says someone has to pay [for the walkways] because no price can be put on saving lives. “There reaches a point where you say enough’s enough and I think we’ve reached that point.” ...At an annual plan meeting last month, councillors voted against tagging \$1 million “in principle” for pedestrian and cycle routes along the rail corridor... Waitakere City’s]... Deputy Mayor... is unsure who should have responsibility for safety on tracks. “It’s something that concerns all of us and it’s probably a collective responsibility. People have to take responsibility for their actions,”... “It has to be said – don’t walk on the railway tracks, it’s very dangerous,”... [a] Henderson police sergeant... says.

...The Waitakere City Council road safety co-ordinator says that safe walkways are needed alongside the rail lines. What a load of tripe. People have been getting killed since the railways began in N[Z] and will continue as long as they remain. I have seen sections of track that have a walkway alongside ignored by pedestrians for a stroll between the tracks. How are you to stop idiots stepping off the platform and in front of or under trains? Must we fence everything off these days? Just because some people will not use common sense.

...Re human beings killing themselves on railway lines. As a child I was taught not to play on the railway line [from] London to Cambridge, [which had] twin tracks and at least four times more traffic than here. But we still put pennies on the line – school kids’ fun. Well I see that they are thinking of spending thousands of dollars to control us humans not to use rail tracks... I can understand keeping animals, horses, cows, etc, from straying but we are supposed to have a higher IQ than animals. What is the problem? Laziness? Ignorance? Or thinking they are too smart to get caught? By all means use gigantic signs that they can’t miss or instant fines for jaywalking. I feel sorry for the train drivers and those left behind.

...last week... a pregnant [perso]n... complained to the rail company Thameslink that [it] repeatedly had to stand on its commuter trains during the rush hour because no one would give up their seat for her. Instead of telling her [it] shouldn’t have got pregnant in the first place, Thameslink – known as “The sardine line” – said [it] should avoid travelling during the rush hour in the second place. This might be considered a somewhat callous reply to a [gal] forced to stand for 40 minutes on her way to and from Paddington Station, especially one in an interesting condition who also suffers from diabetes, low blood pressure and fainting fits. Apparently Thameslink, on reflection, thought so, too. “We are sorry that the tone of the letter was a little brusque,” said a spokes[perso]n for the line. Now the company is considering (a) more carriages to make its trains longer, and (b) increasing the size of the signs requesting other passengers to give up their seats to “mobility-impaired” passengers. Having travelled not so long ago on Thameslink, I doubt whether (b) will be of any use. Trying to prise Poms out of their seats and away from their crossword puzzles or page three girls during the rush hour would be a task beyond Solomon.

...FACES are pressed against carriage windows as the mass of bodies heave through the compartments every time the train slows on the approach to a station. Here and there there’s a quiet sigh as trapped passengers behind are pushed away by the pressure from further within. These are everyday scenes in Tokyo’s “tsukin jigoku” (commuter hell), as Japanese call the daily struggle of millions of commuters making their tortuous journey in overfilled trains to their workplace in the capital... On some routes in the Tokyo area in the rush hour, the compartments are filled to double their official capacities. At transfer stations such as Yoyogi and Uehara it is common in the morning and evening to see enthusiastic conductors in blue uniforms and white gloves running from compartment to compartment pulling arms, backs and bags from the door areas as quick as they can... “But it’s wrong to say we cram the people into the trains,” says one railway employee, “we are just helping them to get to work on time”. The railway companies are working on ways to relieve the problem for passengers, although this is easier said than done... In Tokyo, a city of 12 million, the trains [already] run every two minutes in the rush hour... The Government’s declared aim is to reduce compartment capacities to 150[%], the daily *Asahi Shimbun* reported. That would still mean passengers having to rub shoulders, but it may reduce the number of people who have to be treated for breathing problems... “I can smell the breath of old [guys] next to me,” complains a 32-year-old... An increase in indecent assaults prompted one train company in Tokyo to introduce [gals]-only carriages. That wasn’t only welcomed by [gals] since an increasing number of [guys] are accused unjustly of sexual harassment in the overfilled trains. Several [guys] are so nervous of making the wrong move and appearing suspicious that they stand with arms stretched above them the whole trip... [E]xperts are doubtful as to the extent of efforts to improve matters for travellers. They say that it is scarcely feasible to put more trains on the tracks. And the idea of attaching more carriages to trains is a non-starter because of the limited length of station platforms. One company... decided to introduce carriages 15cm wider than the previous model and with more space for passengers. But this solution is not possible everywhere because of space restrictions. A[ssumedly, the same issue prevents the railway companies from introducing double-decker carriages]... Most Japanese have no choice than to put up with the daily “commuter hell”. Horrendous property prices in Tokyo and in other population centres such as Osaka have forced many Japanese to move to the distant surroundings to achieve the dream of [owning] their own house. Unfortunately, the dream has huge drawbacks with four hours and more spent commuting every day.

...When I went to university in London in 1964 there were several direct trains each day, reliably taking four hours. That was before [the Iron Maiden] and the Conservatives began rail privatisation, a policy continued enthusiastically by the present P[M]... and his New Labour Government. My 22-year-old son lives in Manchester, a city important enough to deserve good communications with London. His train journey to

my home, which used to take under three hours, is regularly five, lengthened by rail “improvement” works since a train crash north of London a year ago... The term “unrealistic” was... used by the Transport Minister... about transport and pollution reduction targets set by the first Labour Transport Secretary... [The minister] said that the Government had spectacularly underestimated the growth in road traffic. In effect, [the minister] was saying that the policy of encouraging bus and train use and the reduction in cars and their pollution was being scrapped in favour of building more roads. New Labour has now caved in to the car lobby. [The minister] made his confession on the day that the Works and Pension Secretary... said that the Government is to scrap the compulsory retirement age of 65, allowing people to work in to their 70s, as a way around the admission that pension funds could not cope with the growing numbers of old people. It prompted some harsh headlines. As the *Guardian*, a left-of-centre broadsheet, put it: “Future Britain: save more, work longer – and stay off the roads.” ...Three times last week I walked the 3.2km from my home in Highbury, North London, to the Angel, Islington, overtaking buses as I went. It was the quickest way to get to the bank, the dentist and the bookshop. I considered hailing a taxi to drive around the traffic jams – but every side turn was blocked too, and the taxis were locked in as hard as everyone else. My husband each day drove 24km across London to work – a journey taking 1 1/4 hours. From all parts of London come similar complaints: all transport is locked solid daily and sections of the Underground are being regularly closed. I also drove a 580km round trip to Wales – taking five hours each way – to collect my parents for Christmas. I did it not because they are too old to travel alone but because the rail service across England’s heartland to London involves three companies and two train changes and is too unreliable for even fit 79-year-olds to contemplate.

...Britain’s Railtrack looks set to return to Government control amid reports that the ailing company is on the brink of bankruptcy. [The T]ransport secretary... was expected to comment on the firm’s future today after crisis talks with executives. Railtrack was seeking a rescue package to take it off the stock market in what many would consider renationalisation, the *Sunday Times* reported.

...Which track – public or private? ...The prospect that the [NZ] Government may renationalise the rail network is fast becoming a political football. Publicly listed Tranz Rail has been the owner since 1993, when the National Government sold NZ Rail to a consortium headed by merchant bankers... But Tranz Rail’s ownership has been marred by poor safety and claims that the major shareholders have underinvested in the network. The company has also been in conflict with some of [NZ]’s biggest exporters, who say they are unable to use the network in a cost-effective and efficient way. It is that point that has long exercised Labour Cabinet ministers... Many ministers believe that the national rail network is a vital strategic asset, particularly with the forestry “wall of wood” fast maturing in the North Island. Their ambition is to develop a transport strategy which ensures that all major pillars – road, rail, air and sea – perform to capacity. Reports have been prepared which point the way to a levelling of the field between road and rail. But ministers’ ability to deal simply with Tranz Rail has been hampered by National’s failure to ensure that the Crown retained a “Kiwi Share”. This would have enabled the Government to step in and ensure access to the network at a cost-effective price. It would also have ensured that appropriate maintenance was done. Neither [the P]M... nor... the... Finance Minister... wants to publicly disclose Labour’s position on the sensitive renationalisation issue, which is only one of the Crown’s options... The difficulty for [the PM and her Finance minister] is that the Government has set a precedent through its acquisition of the Auckland rail corridors.

...Planning to get back on the rails Tranz Rail’s moment of truth comes at 4pm on Tuesday[, when its m]anaging director... and chief financial officer... unveil to financial analysts at Auckland’s Stamford Plaza hotel a plan they hope will renew investor confidence in the rail operator. The move cannot come too soon for the big institutions and smaller shareholders who have lost a packet on their shares at today’s values. Tranz Rail’s share price has fluctuated wildly since the market got wind it would post a dismal result next month. The company also faces allegations of indulging in creative accounting to enhance its profitability and not properly telling investors of some liabilities it faces from its decision to sell and lease back assets such as Cook Strait ferries. Adding to the general angst is the grumbling from shareholders who believe they were sold a pup when they bought shares at levels much higher than yesterday’s closing price of \$2.25 a share, after Tranz Rail’s former controlling shareholders quit. [The m]erchant bankers... and Wisconsin Central, now under Canadian ownership, sold their stakes at \$3.60 and \$3.70 a share respectively in February... [The managing director] has made major changes to Tranz Rail under which a raft of under-performing assets have been sold and big parts of the business given to outside contractors. Tranz Rail does have a big point in its favour. It owns a strategic asset in the national rail network, which the Government wants better used for the country’s economic benefit. As one analyst notes: “These guys have problems but there is a good chance they will be bailed out by the Crown. The Crown’s already taken the first step by paying \$81 million for the Auckland network, and will probably do something for Wellington. If they put one or two people on the board who have got contacts with the Government and the ability to twist arms in Wellington, it could be very advantageous to them.” ...[● The] Greens co-leader... is to launch a campaign to save passenger rail services under threat of closure. [The Green]e wants a rescue plan ready to present to the new owners of Tranz Scenic rail services as soon as the sale is announced. One option would be to have the Government take back control of the tracks in exchange for giving Tranz Rail free use for a set time... It was reported at the weekend that the four Tranz Scenic services would be closed when Melbourne-based West Coast Railway was announced as the owner of the Tranz Rail-owned network... this week... The Southerner, between Christchurch and Invercargill, is the first service tipped to end. Others likely to go are the Wellington-Napier Bay Express, the Auckland-Tauranga Kaimai Express and the Auckland-Geyserland run to Rotorua. Services to continue would be the Tranz Coastal between Picton and Christchurch, the Tranz Alpine from Christchurch to the West Coast (seen as premium rides offering high-class touring trips) and the daily Northerner and Overlander services between Wellington and Auckland.

...The fight to save Hawkes Bay’s... rail passenger service is over... [T]he train will make its last trip between Napier and Wellington [next month]. The Bay Express was one of five services that Tranz Rail’s preferred bidder for its long passenger services... West Coast Railway, did not want to buy. The Kaimai Express, Geyserland Express and the Waikato Connection will also cease running. Discussions are continuing between the Government and Tranz Rail over an extension to the dead-line for the Southerner... to give local authorities... time to consider a rescue package.

...In a \$25 million deal... West Coast Railway has bought four profitable Tranz Rail lines, but if a buyer isn’t found for the others, they will close... As the rail conservation efforts continue, what exactly might we be losing? The... 56 seat... Geyserland... has a free run. It’s the only train that uses th[e track from]... Putaruru to Rotorua... built in 1894. “I hope they don’t rip [the track] up for scrap,” said [one]train driver... The Rotorua Express was once the pride of the New Zealand Railways, a star attraction for Aucklanders travelling to the “thermal wonderland.” The service reached its peak in the 1920s... but by the 1960s the run was no longer profitable and it closed in 1968. It was relaunched as a scenic route by Tranz Rail in 1991, but has not thrived. While it typically runs around one-third full, the train fills up during school holidays. [The]Green Party co-leader... one of the movers behind trying to save the threatened services, accuses Tranz Rail of not promoting them. [A]Rotorua taxi driver... agrees. “It’s one of [NZ]’s best-kept secrets... But I guess these days you have to be profitable. Still, it’s a shame.”

...[the] Finance Minister... has called a temporary halt to lobbying efforts by Tranz Rail’s major users over the long-term future of the national rail network. The move comes as the Treasury keeps a watching brief on Tranz Rail as the transport giant prepares to unveil a major financial loss tomorrow. The Rail Freight Action Group – which comprises some of [NZ]’s largest exporting companies – has been lobbying... to gain support for a Government buyback of the national rail network. The group... wants rail freight to be a robust and cost-effective part of the future transport mix... Tranz Rail is in virtual siege mode: it faces a potential credit rating downgrade, hefty increases in banking charges, investigations by the Securities Commission and the Stock Exchange’s market surveillance panel and a credibility issue with shareholders. Tranz Rail has indicated it will forecast earnings before interest and tax of \$26 million for the... year but this will move to a significant loss after interest costs, tax and asset

writedowns of... \$170 million are accounted for... Tranz Rail[’s CEO]... has defended his company’s decision to increase the prices it charges its big customers... say[ing the changes it] put in place, including the previous round of price rises, were necessary to avert a path towards bankruptcy.

...*Rail goes round in circles*... [Less than a decade] after it was privatised, [NZ]’s rail system still faces the same problems that afflicted it under Government ownership... The Government plans to buy 35[% of Tranz Rail] for \$76 million, or 67c a share. It will also buy back the tracks for \$1, and pay another \$50 m... for track-related assets[, and]... will spend \$100 m... over five years to improve the network. A new company will own and manage the tracks. Tranz Rail will get exclusive access, subject to a “use it or lose it” agreement. Tranz Rail will pay a track-access fee of up to \$70 m... a year. Shareholders must approve the deal – [also]... on the table is Toll Holdings’ full takeover offer, at 75c a share... A[US]’s Toll Holdings... plans to make the business part of an expanding empire that would offer service along the whole supply chain... [The Government announced its plan to] rescue... Tranz Rail a week before the company’s likely collapse because it wants rail to play a central role in its grand plan for land transport.

...TRANZ Rail’s relationship with some major customers has deteriorated to a level seldom seen in N[Z] business. In its attempt to transform itself into a freight-only company, Tranz Rail has succeeded in pushing five of its biggest customers – accounting for more than half its freight business – into forming a lobby group demanding that the rail company lose its monopoly track rights. Tranz Rail supporters have responded with counter-accusations of sabotage, claiming that the major customers are co-ordinating a behind-the-scenes campaign to gain a business advantage next time contracts come up for renewal. This has merely added to the company’s woes, making it harder to win back confidence and support in the N[Z] financial community. The programme of transformation, of turning Tranz Rail into a freight-only company, has been spearheaded by[its] chief executive... But there has been a reduction in freight revenue of \$25 million in the year to the end of March. In the forestry industry, where the number of logs being cut is rising dramatically every year, Tranz Rail is carrying fewer logs than before with revenue from forestry dropping by nearly \$15 million... in the past year... The Rail Freight Action Group sprang from the frustration and worry affecting five of the biggest exporters and rail users. Dairy giant Fonterra joined forestry companies C[HH] and... Challenge Forests, along with state-owned coal company Solid Energy and BHP N[Z] Steel... While Tranz Rail supporters... claim it is an attempt to kneecap the company while it is trying to get back on its feet, these big customers say they are genuinely concerned about Tranz Rail’s future. For some customers, the relationship with Tranz Rail has badly deteriorated in the past few years, starting when freight contracts came up for renewal and it started raising prices by up to 40[%]. In some cases Tranz Rail started asking customers to make a contribution for new wagons or track upgrades. In others, it simply told clients it no longer wanted to continue doing business with them – shifting their freight was not lucrative enough... Solid Energy’s chief executive... tells a story of a comprehensive breakdown in the relationship with Tranz Rail and a subsequent hardening of attitudes... [The chief executive] says his two-year battle with Tranz Rail over a simple contract extension was a frustrating and expensive exercise. The new contract would allow Solid Energy to increase the amount of coal it exports and Tranz Rail to win more business. A simple negotiation? Don’t count on it, says [the chief executive], who says Solid Energy ran straight into an intransigent Tranz Rail, which was trying a new approach to earning money from its tracks... across the Southern Alps that no other rail company is allowed to use. Solid Energy mines and transports two million tonnes of West Coast coal a year to Lyttelton, from where it is exported to the world’s steel mills and power plants. Its present contract with Tranz Rail is capped at 2.7 million tonnes a year, but Solid Energy wants to increase this to around 4 million. “It sounds like a pretty simple extension to the contract... Two years on from attempting to agree that extension, we have failed to agree to even get close to it with Tranz Rail.” The pricing component could have been sorted out within half an hour... but instead there has been no agreement, which means no expansion for Solid Energy. Despite paying for its own experts who found that the price paid to Tranz Rail should actually drop when the new business began, Tranz Rail insisted it be paid substantially more – suggesting price rises of 30 to 40[%]. It also told Solid Energy that coal was not “core business” for it. “We were flabbergasted,”... One of Tranz Rail’s major customers says it is not claiming any overcharging and is, in fact, quite happy with the service it receives. Regardless of this, there is a fundamental flaw in the way Tranz Rail is expected to operate. And it is this supposed flaw that gives the big customers a hook for their vision of a newly nationalised rail network. The argument runs like this: Tranz Rail claims repeatedly that it does not operate on a level playing field with its competitors – if a flood washes out a section of rail track and a road, what happens? The trucking firms sit back and wait for the taxpayers and ratepayers to fix the road, while Tranz Rail has to pay for repairs to tracks, bridges and tunnels out of its own pocket... Major users say that while Tranz Rail has the drain on its bank balance of maintaining the network, it will never be able to keep its shareholders or customers happy. It will never have the money to improve the network – improvements that happen every day of the week on the national road system... A simple solution is offered by the big users. Remove this millstone from Tranz Rail’s neck and hand over responsibility for maintaining and extending the tracks to a Government agency. But the removal of this obligation must be coupled with the loss of monopoly rights to run trains on the newly nationalised tracks, a privilege Tranz Rail now enjoys. Removal of monopoly privileges need not cripple Tranz Rail, say the customers. It would, for years, enjoy the benefits of incumbency – it would be the only company in N[Z] with rolling stock and locomotives. It has existing contracts, it knows the customers and can enjoy a few years basking behind some high barriers to entry before rivals make a serious dent in its business... [W]hile at first glance it might seem out of character for some of N[Z]’s biggest corporations to be arguing for Government intervention in the economy, the result they are looking for is more typical – freedom. Freedom from one rail company dictating terms, freedom from the fear of that operator going bust and leaving wagons and locomotives rusting on the sidings. And if that means the Government taking over again what it once owned, so be it.

...Tranz Rail must cut the average train speed to 40kmh and inspect tracks more frequently on hot days and in bad weather, because of rising concern over unsafe rail lines. [A] Land Transport Safety Authority spokes[person]n... says temporary safety measures are being imposed because of recent incidents involving heat-buckled lines. The latest occurred on the main trunk near Te Kuiti last week... The speed restriction will apply whenever the temperature between the train and tracks reaches 30 degrees Celsius, and when there are floods and slips. If N[Z] is hit by even a mild heat wave, the main trunk line could be affected. In that case, train travel between Wellington and Auckland could take 22 hours. “Our primary concern is for the safety of passengers and rail workers. We must do whatever is necessary to ensure that the rail network is safe,” [the LTSA spokesperson] says. The conditions will remain in place until an independent review of Tranz Rail’s infrastructure is completed by overseas rail safety experts. Track buckling due to extreme weather conditions is “fairly common” but needs to be discovered and fixed immediately... It’s uncertain whether the current spate of buckled tracks is the result of poor maintenance by Tranz Rail... Tranz Rail announced in December that it had signed a \$150 million, three-year contract with A[US]n-owned Transfield Services to maintain the track network. The new deal includes shedding 92 track and structure maintenance staff... Tranz Rail believes that contracting specialists to do the work will improve the company’s safety record considerably. But the authority has yet to approve the new maintenance arrangement... [A] Tranz Rail spokes[person]n... says the company has been working on the problem since 1995 and has achieved a reduction in the number of buckled-track incidents. The new conditions mean th[at trains must be]... fitted with heat-detecting devices that set off an alarm when the air temperature beneath the train reaches 30 degrees. When the alarm sounds, passenger trains... will be required to go slow for the entire leg of the trip... and a heat patrol is sent to inspect the track.

...Tranz Rail has asked the L[TSA] to allow train drivers to check for buckling tracks themselves. At present if track temperatures reach 40C the trains must stop at the next station until a ganger (inspector) arrives to get on the train to keep an eye out for buckling tracks. The train and all other trains on the region’s network must slow to 40km/h until the track is inspected. Tranz Rail asked for the change after heat alarms caused delays of up to an hour for commuters in Wellington and Auckland in the first few weeks of hot weather. The LTSA is considering the proposal but [its] director... said... “I consider driving to be a full-time occupation and expecting them to inspect the lines at the same time does not sound safe. I am aware of the delays to the public but we have serious safety concerns.” Last week, [the director said the authority] would not agree to any

changes because the company had not kept it informed about its schedule to fix the problem. On Wednesday, the Minister of Transport... stepped in and warned Tranz Rail to keep the LTSA informed or [it] would rush through the Rail Safety Bill to give the safety regulator more powers. The LTSA can only remove the operator's licence, stopping the entire network, and has no enforcement powers. Tranz Rail agreed to the speed restrictions this year after the LTSA became increasingly concerned about a spate of derailments and near derailments caused by buckling tracks. The buckling tracks were caused by poor installation and maintenance of continuous welded rail, which is used on half of the country's 4200km network[('NZ's railway system reached its greatest length – 5,656 km – in 1953; Dun Mountain Copper Mining Co had opened NZ's first railway, a 22.5km line to the port of Nelson, in 1862')]. Tranz Rail... said last week that it had inherited the problem from the Government, when the tracks were sold... in 1993... [T]he tracks were welded in continuous lengths from 1975 onwards, with 1350km welded before the sale. Since then, Tranz Rail had fixed 800km and a further 550km were to be fixed over the next five years. It had increased the anchoring of the track to sleepers and bought specialised equipment to de-stress areas prone to heat buckling by cutting out sections of track, stretching it and clamping it back down, enabling the track to expand when the temperature rose... NZ Railways['] former chief civil engineer... who was in charge of the first trials of continuous welded tracks in 1974, said the tracks were installed at a high standard but required strict maintenance. [The engineer] said de-stressing was not needed if the... tracks... were put in properly in the first place. When the rails are fastened to the sleepers they must be at 38C... The kilometres of welded rail replaced 42ft... sections of imported rail held together with bolts on the track... [M]aintaining bolts was expensive and the world switched to welded tracks. [The engineer] says the technique is safely used in countries with high-speed trains, some travelling at more than 250km/h... An independent report into the problem this year showed that Tranz Rail's installation and maintenance of the rail was "at the limit of acceptable practice".

...Twenty-eight heat-buckled lines have been reported by Tranz Rail in the past three months, the L[TSA] says... However, the accuracy of the reported figures was uncertain. An in[dependent in]quiry... found that Tranz Rail had grossly under-reported the frequency of heat-buckled lines and broken lines. The authority database showed 22 reported rail breaks in the 18 months to December... while Tranz Rail's records showed there had been an average of 150 breaks each year... A[n LTSA spokesperson]... said the sooner Tranz Rail brought the track up to standard the sooner speed restrictions could be lifted. Tranz Scenic owner West Coast Railway criticised the authority last week for the "too harsh" restrictions, saying trains in Victoria, A[US], were slowed to 90km/h in areas vulnerable to heat buckling. [The LTSA spokesperson] said 90km/h was too fast to hit a heat buckle. "If that is truly the Victorian practice, we view it as unsafe." Besides, Victoria had 1600mm gauge track compared with 1067mm in N[Z]. A Tranz Alpine locomotive engineer who found three heat-buckled rails on one Christchurch to Greymouth line crossing last year told the Transport Accident Investigation Commission the track was "like plasticine"... [In international news, a] Salzburg court has heard that a "mosaic of errors" led to a ski-train fire in an alpine tunnel that killed 155 people 19 months ago. In her opening statements, the public prosecutor... said the blaze on the funicular railway to the Kitzsteinhorn glacier at Kaprun could have been prevented... But lawyers for some of the 16 people charged with negligence over the blaze argued that it was wrong to compare the events of [19 months ago] with what was now known about the cause of the tragedy. Investigators said the blaze was caused by a faulty and non-regulation fan-heater in the rear driver's cabin. Their report stated that overheated filaments caused oil that had leaked from nearby hydraulic cables to catch fire as the train prepared to make its journey up the mountain... The findings tied in with witnesses who said they saw smoke at the rear of the train as it pulled away. The fire spread rapidly and, soon after entering the mountain tunnel, the train ground to an automatic halt. The doors stayed firmly shut but 12 people at the rear smashed in a window with ski-boots and sticks and fled back down the mountain to safety. By the time the doors opened it was too late for the remaining passengers to escape the toxic fumes and flames. Many collapsed and died as they attempted to run up the narrow stairway away from the fire. Two people in a second cable-car and three in the summit station also suffocated... Those now in the dock include employees of the Kaprun Glacier Lift Company, its suppliers and the Transport Ministry. They... face up to five years in prison if found guilty... But an end to the legal wrangling is not in sight. A[n A]merican lawyer... is seeking to hear compensation claims from victims' relatives. [Hi]s case for US jurisdiction rests on the fact that eight Americans died... Ninety-two... were Austrian but the victims came from eight countries, including Germany, Japan... and Britain.

...The escape of 32 tourists from a flaming coach in the Homer Tunnel... was a miracle, says the chief firefighter at the scene. The... bus was taking Singaporean tourists back to Queenstown from Milford Sound and was inside the tunnel about 2pm yesterday when the driver noticed flames coming from the motor at the back. [The driver] stopped about 150m from the eastern end of the tunnel and got the passengers out before the burning bus rolled back 50m, with acrid black smoke pouring out to the tunnel entrance. Firefighters, police and ambulances were called from throughout the region to the tunnel, which is 103km from the closest emergency services at Te Anau. Firefighters wearing breathing gear battled thick smoke to put the fire out... About 750 visitors were stranded in Milford Sound because of the wreck in the tunnel, which is the only road route out... The tunnel is due to reopen this morning once the bus has been pulled out... Three of the 32 passengers from the bus were flown to Southland Hospital in Invercargill to be treated for smoke inhalation. They were later discharged. The other passengers were checked at the Te Anau Medical Centre... A police spokes[perso]n at first said two people were missing, but they were later found at the other end of the tunnel.

...How Auckland missed the bus... Why is Auckland, a modern city of a mere 1.1 million people, hamstrung by problems normally associated with much bigger and older metropolises? The answer lies in four decades of neglect of public transport – a product of Government indifference, policy blunders and Auckland's tangled political and bureaucratic web. Since 1963, millions have been spent on transport studies which generally reached the same conclusion – an even-handed approach of motorways and mass transit was the ticket. The plans and reviews of plans now gathering dust and politicians now departed warned of future gridlock unless the two proceeded in tandem... T[oday]... the Comprehensive Transportation Study remains the blueprint for solving congestion. One half of the equation, a 175km network of ring motorways and arterial roads, is more than two-thirds complete (although more than 10 years late). The other half, a rapid-transit system based on the western and southern railway lines and supported by feeder buses, is still being talked about... Two Government decisions rankle most with long-suffering Auckland officials. The first was the Muldoon Government's shelving of rapid rail in 1976. The second came in 1993, when[the then] Finance Minister... handed Tranz Rail control of the rail corridor for a \$1-a-year peppercorn lease... [The later decision probably hurt Auckland the most, because s]ince the early 1970s, frustrated bureaucrats and civic leaders have... found money hard to come by, not just for major capital works but for small-scale boosts to services – such as new bus routes and increased frequencies... Yet money was [always] found for motorways and roads. [A r]etired Auckland Regional Authority transport planning manager... says that... roading... has been king since the 1950s, when the National Roads Board was formed with annual funding from road-user charges and petrol taxes... [S]uccessive Governments failed to correct the funding imbalance for public transport, which has had to argue a case for money from the roading kitty. Rules included a cost-benefit formula based on the immediate benefits to road users. It therefore penalised public transport schemes that offered a longer-term payback.

...The first official study for six years of potential [ferry] routes serving North Shore, Waitakere and Manukau cities starts next month. It will test the waters for the... Auckland Regional Council... which approves the total of \$1 million a year in subsidies supporting Fullers' commercial runs between downtown and Half Moon Bay, Birkenhead and Gulf Harbour... The \$1 million in ferry subsidies compares with \$27,774,000 for buses and \$6,795,000 for Tranz Rail. Now that more funds are available for public transport... the key issue is how they will be spent... The list of possible future water escape routes for car-bound commuters includes West Harbour, Beach Haven, Te Atatū and Greenhithe in Waitakere, Browns Bay on the North Shore and, in east Auckland, Beachlands and Panmure. There are, however, significant costs, drawbacks and obstacles to overcome... • Adequate wharves. • Buses bringing suburban residents to and from the wharf and linking with the ferry timetable. • Plenty of

parking at the wharf and an area where commuters can be dropped off. • Facilities for cyclists. A regular user of the Half Moon Bay service... introduced... [by] Fullers... last May... who... is the East Tamaki representative on the regional council... [and chairperson of] the regional land transport committee... says ferries are important to the transport strategy... [The chairperson] is concerned that... the North Shore ferry runs are threatened by Ports of Auckland wanting to sell the Devonport, Birkenhead and Northcote wharves. If one ferry company secures exclusive use rights from an owner, it could block competitors by asking unreasonable landing charges. [The chairperson says the ARC] will encourage the North Shore City Council to bid for the wharves so they are available to all. Funds to buy them could come from Infrastructure Auckland, which owns 80[%] of the port company. Competition could also spur the pioneering of new routes. Pacific Ferries, which runs a cut-price Waiheke [Island] service, is talking to the Waitakere City Council about starting a Te Atatu-downtown service using a 160-passenger catamaran.

...Pacific Ferries['] managing director... says [his company] wants to run a commercial service from Te Atatu but can't compete with Stagecoach and Fullers... [The problem is cheap integrated ticketing deals the other companies offer elsewhere in Auckland. Fullers Ferry company, which is 75[%] owned by Stagecoach, offers its Waiheke Island passengers free travel on Stagecoach buses within Auckland with a monthly ferry pass... [The managing director, who believes] Fullers is misusing a public operating subsidy by offering free travel on the buses... says if Fullers started a similar "bundled" service out west, Pacific Ferries couldn't compete because it doesn't have access to the buses once passengers reach the Auckland CBD. "If they saw we were making money and they wanted to get into the Te Atatu run it would be handed to them overnight... Until the bundling of services is looked at there can't be any competition on the harbour. There's not a level playing field." Stagecoach[']s managing director... says they're not thinking about setting up such a service because [the company] doesn't think it could run without a subsidy. "If we thought we could run a commercial service there, we'd do it." ...But [Stagecoach's managing director says the bus company] wouldn't be against some form of integrated ticketing with their buses if Pacific Ferries decided to set up in Te Atatu.

...An integrated ticketing system is part of the future for Auckland's public transport users. Members of the A[RC] passenger transport committee heard and accepted a proposal to introduce the system at a meeting held [a fortnight ago]. It will see public transport users buy one ticket, a smartcard. It will be accepted on all buses, ferries and trains around the city with a simple barcode swipe, making it easier for commuters to use and access public transport... "Each company has its own tickets, and you need to carry one for each form of transport you want to use," [the chairperson] of the... committee, says... The estimated cost of the system is \$30 million, and the committee has decided to seek some funding from Infrastructure Auckland... The smartcard ticket is designed to speed up boarding times... and keep electronic information on passenger trips for further research and development. To keep the ticket valid, commuters would simply top up the card. One of the biggest challenges the ARC faces is convincing the region's nine public transport operators that the electronic ticketing scheme is the way of the future. Introducing the system has been part of the ARC's land transport strategy since 1995... The system is already in place in Melbourne... and Hong Kong.

...Auckland commuters may need just one card to use all public transport in the region, but the system will not be available for three years. The A[RC]... is looking at an integrated ticketing system... [to] replace tickets, regardless of the type of transport and company operating it... [T]he council sees it as the first step towards the longer-goal of integrated transport fares... where the ticket price is combined for two or more connecting parts of a journey, or where two or more trips (not necessarily connecting) can be made with a single payment, such as a time-based reusable pass.

...Once purchased for a \$10 refundable deposit, the... credit card sized plastic card with a small memory chip... can be used to buy monthly passes, multi-journey tickets, day and family passes and to store value, on board [each Stagecoach] bus. Other operators have cardboard 10-ride tickets which can be bought on board the bus or train or at the ferry ticket office. Ten-ride tickets offer at least a 10% discount off cash fares. Tranz Metro trains and Fullers ferries also offer monthly passes, day passes and family passes... Children under five travel free, and those aged five to fifteen travel for a child's fare, a 40% discount off adult fares... Senior citizens with a Senior Citizens ID Card can travel for a child fare at all times except before 9am on weekdays... Full-time high school students can travel for a child fare but... must always show [thei]r school ID. Full-time tertiary students can buy Go-ride multi-way tickets at a 20% discount off cash fares from on-campus locations... Did you know there are over 300 bus routes, three rail lines and eight ferry services in Auckland. This network is there to help you to get the most out of Auckland's diverse destinations and attractions. The... A[RC] service... *Rideline* can answer all your bus, train and ferry questions as well as mail you out timetables.

...PUBLIC transport in Auckland has never seen anything like it. Buses, trains and ferries across the city have been flooded with over-65s taking advantage of free public transport after 9am... Pensioners are entitled to the free trips since October 1 last year as part of the government-funded SuperGold card... The scheme has a budget of \$72 million over the next four years... CBD and Waiheke Island businesses[are] feeling the benefits...

TELEWORKING – doing normal office work from a home or remote base – is being touted as a solution to regional transport problems, as well as a smarter way to work. The A[RC] has completed an investigation into telework promotion and it is now assessing how telework may fit into its overall traffic-demand management strategy. The Wellington Regional Council is considering a similar project. The ARC project made the finals of the transport category in the recent Energy-wise Awards... A telecentre on the Kapiti Coast, which allows 20 people to work away from their Wellington offices, also made the final three. It is smarter to eliminate a problem than cope with its effects, "so in the transport debate you eliminate the trip that creates the congestion," says... Telework N[Z]... a consultancy in teleworking. "Most existing strategies encourage people to switch... from the car... to the perceived inconvenience of public transport. [But a] lot of people would prefer to work from home two or three days a week. That would result in a significant reduction in traffic..." [Telework NZ] says the proposed North Shore busway will cost more than \$100 million to build, for a single-digit saving in traffic flows at peak time. A \$1 million campaign to promote teleworking could bring a 5[%] peak-hour traffic reduction, without the need for continued promotion. "Everywhere this happens – Los Angeles, Denver, Portland... – it grows on its own as employers realise there really are benefits in this approach." Its adoption is held back by lack of awareness, the fact most managers do not trust staff, and a lack of enthusiasm by Government and telephone companies... "[Yet, e]verywhere globally this has taken off, it was pushed by telecommunications companies." [Telework NZ] says the Government had the most to gain from more community servers, better use of national infrastructure and pollution control.

...A 5km oil slick suspected of coming from the wreck of the... Niagara was breaking up... in the outer Hauraki Gulf yesterday... between the Hen and Chicken and Mokohinau Islands off Bream Head. An A[RC] maritime officer... said the metre-wide slick was checked from the air yesterday morning about 500m north of Mokohinau and was no longer considered a serious threat to the environment... [The officer] did not know if the oil came from the Niagara... but said it was possible... The ship was the victim of a German mine... in June 1940... Environmentalists and [the fishing industry] are worried that oil on board the ship, lying 120m down, has been escaping for some time. They fear an ecological disaster if bunker oil surfaces. The Niagara could have been carrying thousands of tonnes of the heavy oil... [T]he oil in the latest slick was light and might have come from trucks reported to have been on board the Niagara. It had been bound for Suva with 349 passengers and crew, all of whom survived, and £2.5 million in gold bullion, nearly all of which was salvaged. 'The bullion was heading to Britain to help pay for the war effort, so the British Government was keen for its return. No one had ever dived to such depths before, so the salvage team – headed by AUSns – had to improvise with the limited equipment available to them. Eventually, all but about five bars of gold were recovered – each worth \$1m in today's money'.

...Sydney Harbour, A[US]'s world famous waterway, was covered in a 10km oil slick yesterday... About 80,000 litres of oil poured from open valves on the Italian tanker Laura D'Amato, while it was berthed at the Shell Oil Gore Cove Terminal, at Greenwich, on Sydney's north shore on Tuesday night. The incident sparked calls from Clean Up A[US], the tourism sector, and environmental and conservation groups for a full review to prevent its happening again. Thousands of Sydney residents were warned... to stay indoors as putrid oil fumes spread over a 20km area,

prompting 600 residents to call emergency services, fearing a major gas leak. The stench was so potent at the Sydney Opera House, it silenced A[US]'s premier operatic voices during the performance of *La Bohème* moments before the final dramatic act. Commuter ferries were yesterday ordered to slow down when travelling past slicks in a bid to reduce the spread of oil. The Waterways Authority[']s... chief executive... said Shell was not to blame for the spill, and... there was no evidence of any damage to the ship, which indicated the leak was either the result of sabotage or human error... [The authority] was investigating claims the spill may have been an act of sabotage by two sacked crew[members]... Those responsible for the spill on the... city's centrepiece face fines of up to \$A1 million... for a corporation and \$A250,000 for an individual, plus the cost of the cleanup... If reports of sabotage are proven, serious criminal charges could follow, the state's environmental watchdog warned... It will take days to clean up the oil, which is visible from the Gladesville Bridge in the west, under the Harbour Bridge, around the Opera House, to Rose Bay in the east, the N[SW] Fire Brigade said... The spill also claimed its first environmental victim yesterday, a... cormorant, which is being treated at Taronga Park Zoo for hypothermia and dehydration. The Nature Conservation Council of NSW claimed the oil was threatening important environmental assets, such as the endangered little penguin population at Manly Point. Emergency crews have vowed to work 24 hours a day to clean up the oil... "Work is progressing rapidly. About 40[%] of the oil has already evaporated... The skimming operation will continue throughout the night." Five skimming vessels, including two flown in from Brisbane yesterday, were being used...

The valve through which 80,000 litres of oil flowed into Sydney Harbour had to be opened manually, says the Waterways Authority chief executive... [T]he crew of the Italian tanker... were being interviewed to determine whether the valve was opened by accident or deliberately... [The Waterways Authority] would... also... look into whether tankers in the harbour should have booms around them... The spill is the third major incident involving the... Shell terminal at Gore Cove ...i[n recent years]. Six years ago, after a spill of 10,000 litres from onshore tanks, Shell was prosecuted, convicted and fined \$A42,000 with costs of \$A7682. Eight years ago a potentially much bigger disaster was averted after a heavily laden tanker was freed by tugs when it ran aground... [T]he latest pollution crisis reignited debate about the safety and management of the waterway. Should the Shell terminal stay as part of a "working harbour," or should it be shut down as a relic of the industrial past that has gone beyond its use-by date? ...Meanwhile, a rescue operation is under way to save an endangered colony of fairy penguins, some of which were found covered in oil... The widespread oil sheen will be left to natural process, broken up by the currents, winds and evaporation...

The owners and crew of a... tanker that leaked 300,000 litres of oil into Sydney Harbour face prosecution after authorities received the first official report... The tanker was allowed to leave Sydney last week after its owners... posted an \$A8 m... bond to cover the... clean-up and any fines.

...A CRACKED Ukrainian... tanker might be allowed to dump its fuel in Cyprus after roaming the Mediterranean for a month.

...A Russian-flagged tanker has split in two near Turkey's biggest city of Istanbul after running aground in heavy winds. Television pictures showed the front half of the Volganef 248 sinking into the sea, while the stern remained afloat... Crew members stood at the railings awaiting rescue. "As far as we know, the lives of the 17-person crew have been saved," an Istanbul maritime official said... [The official also] said there had been some spillage of fuel... Turkey's narrow Bosphorus and Dardanelles straits, linked by the Marmara Sea, are one of the world's busiest and most treacherous shipping lanes and the scene of frequent sinkings, collisions and ships running aground. Tankers use the straits to transport oil from Russia and the Caucasus to world markets. Turkey opposes the increased tanker traffic, citing the danger to the some 10 million inhabitants of Istanbul... But Turkey is unable to restrict the traffic since the straits are governed by the 1936 Montreux Convention... Ships are not obliged to take on a pilot. [However,] Turkish authorities halt traffic in the straits during harsh weather when a large tanker is passing through, forcing other ships to anchor off the coast. Two tankers and one container ship have already run aground off Istanbul this month... The worst accident in the Bosphorus in recent years was in 1994 when a Cyprus-flagged tanker collided with a freighter, killing 29 [sailors] and causing large oil spills.

...Russian motorists face growing fuel shortages as privatised oil companies take advantage of rising world fuel prices to divert more of the countries vast petroleum output on to the global market. "I don't understand how we can be one of the world's biggest producers of oil and have no gas for our own cars," says... a 42-year-old truck driver... Although large cities such as Moscow are still relatively unaffected by the gas shortages, a major crisis appears to be developing in central and southern Russia... The fuel shortages have been described by the Government as a "time bomb" that could rupture public confidence and wreck this year's grain harvest. Farmers are complaining they have no gas for tractors and combines, and the harvest season in Russia's northern regions has already begun. Along with a few other staple products, such as bread and vodka, the Russian Government imposes price controls on gasoline to prevent eruptions of public discontent. Until recently, supplies were plentiful and priced very low.

...FUEL prices are rising and so are thefts at the pump... Even... stations... insisting on prepay have run into problems because thieves find ways around the system... [A] Waitakere police analyst... says the situation has got worse since petrol jumped to \$1.27 a litre. It is now more than \$2.

...Oil prices jumped... US\$25 a barrel yesterday – their biggest one-day jump – ...to US\$130 a barrel on the New York Mercantile Exchange... Crude is within striking distance of its record of US\$147.27, reached... [two months ago. By the way,] there is talk of a road tunnel linking Alaska to Russia. This would allow motorists to drive from... America to Britain. New York to London overland has a certain appeal, don't ya reckon?

...Residents of Avondale anxiously await a final decision on the Waterview connection to complete the State Highway 20 ring route. The government is currently considering surface alternatives after estimates for a tunnel increased from \$1.89 billion to \$2.77b... *Sequels:* Remember the toll foul-ups which began... on the new north-bound tunnel and motorway? Well, it's [4 months later] – and they haven't stopped. The evidence: Refunds to umpteen drivers because automatic top-ups became too automatic and doubled up on withdrawals from cards and bank accounts. One report talked of \$200,000 handed back in one week, \$45,000 in another. All because of a "data corruption error" – whatever that means.

...The \$365 million Northern Gateway toll road may have eliminated congestion through Oweria but motorists heading north... still found themselves in hour-long queues near Warkworth last night... – prompting concern the... Gateway simply pushed the bottleneck further north.

...Work[ers] last night began demolishing the old Onewa Rd onramp bridge after it was damaged by a truck carrying a digger. The incident yesterday morning caused a giant snarl-up on the Northern Motorway and... left chunks of concrete and reinforcing rods on the roadway.

...THE TEENAGER who killed a motorist by dropping a concrete slab from an Auckland motorway overbridge has been freed on parole... At his parole hearing earlier this month, the grieving mother of... 20[-year-old]... Chris Currie, killed by the [the]n-14-year-old... made a passionate plea for him to always think about her son... [The teen] was charged with murder but a jury found him guilty of... [humanslaughter. In related news, a]s motorway planners set the ball rolling today for a \$430 million tunnel beneath Auckland's Victoria Park... [-t]he consents... cover the... transfer on skids to a site about 30m up Franklin Rd... [of] the Birdcage Tavern, [built in]... 1886... – ...they are being urged not to cut corners above ground.

...road workers in Romania were caught placing kilometre markers every 900 metres to make it look like they had built more road than they had.

...major changes [have been] proposed for the Road Code. The Land Transport Safety Authority yesterday circulated a six-point plan to councils and interest groups, arguing that the changes would cut road accidents. The most contentious is likely to be the change to give-way rules. The present rule – give way to all traffic crossing or coming from the right – would no longer apply in two situations at intersections. The first case would let a car turning left into a sidestreet go first, rather than having to give way to a car turning right into the sidestreet. [The] LTSA... said this would stop traffic banking up behind the left-turning vehicle. In the second case, a car turning right from a main road into a sidestreet could go first, rather than giving way to a car turning right out of the sidestreet. The LTSA... estimates that the changes would cut the number of intersection mistakes by 1 to 3[%], equal to 30 to 90 crashes a year. But an Automobile Association survey suggests the proposal will meet stiff opposition from motorists. The survey... found that only 25[%] want the change. A r[esearch] policy analyst... said the change would bring N[Z] in line

with A[US] and most other countries. But [it] had gained the impression that motorists saw few problems with the law and did not want the hassle of changing... [The] NZ Drivers Club... said the change was long overdue, but there would be “chaos” while motorists learned the new law.

...Of all the dull, witless things this Government is doing, the restoration of a dedicated traffic patrol is the most trivial. And therefore the most infuriating. It will be warmly welcomed by the grey cardigan brigade who drive by the rules, blithely unconcerned that they are breaking the traffic flow and causing a flurry of lane-changing in their wake. They have never come to terms with the disappearance of traffic officers and write the most tedious, anal-retentive letters that newspapers receive. There is a regulatory need still beating deep in the N[Z] psyche. Few other countries feel the urge to put a special police force on the roads, probably for the very good reason that the job can only attract the sort of people who wear security passes with pride and never really let their dogs off the leash. In Britain they become rugby referees. In this country, since traffic control was entrusted to the real police, they have gravitated to the driver licensing business... Driver licence testing has become the last refuge of the regulatory itch in this country. Young people... are failed repeatedly for omissions a reasonable person would keep in perspective. They can be failed for behaviour that is standard on the roads. Like signalling to leave a roundabout which drivers rarely do, and no doubt should. But it is not as though licensing is going to change behaviour. There is a good business in driving tuition today that consists largely of training people to pass the test, not to drive normally... Young drivers are being knocked back three or four times, at \$42 a throw. It has been this way for 10 or 15 years now. When it is reported that there are an estimated 200,000 unlicensed drivers on the road these days, I believe it.

...[a Ranui resident] knows what it is like to live in fear of being caught driving illegally. The 33-year-old drove for at least 15 years without a licence – and without getting caught... “If I saw a cop I’d pull into the nearest garage and turn around...” ...But [the 33-year-old] recently attended the ongoing Workers Education Association... programme and got her learner’s licence. [The 33-year-old] says her step-father used to do most of the family driving, but after [her step-father] died earlier this year [the daughter] was the only person available to take her mother to hospital for leukemia treatments... Her dad had taught her to drive, and then [the daughter] went to a learner’s licence course. However, [the daughter] failed the test: “My problem was that I used to get a bit uppity with the cops,”... The... six week[long]... WEA driver licence programme has been running since 1980, and over the last six months the number of people attending has doubled. This is partly due to publicity, says [the]programme facilitator... “Most of the people... who do the course... don’t have confidence in their ability to pass.” However, the course boasts a 97[%] pass rate... A... Senior Sergeant... [who is o]ne of the organisers... catches at least 12 unlicensed drivers weekly. The programme offers participants the opportunity to have outstanding fines waived when they pass. The next WEA learner licence course is scheduled for the third week in July.

...I feel disgusted that [a newspaper’s] front-page item and photo should give such emphasis and apparent glory to a 15-year law-breaker who placed the rest of the population at risk by driving for such a length of time without bothering to study road safety and the rules and regulations required to allow us to drive in safety on our roads. Why should a 33-year-old be given a pat on the back for doing what the law requires of all of us? If the police were really doing their job they would ticket this person even now for her blatant admittance to deliberately flouting the law for so long. As far as outstanding fines being waived for law breakers who finally condescend to obtain a licence, this is ridiculous. Why not waive the fines of all licence holders throughout the entire country as a reward for doing the correct thing, ie. obtaining a licence before ever venturing on the road in a motor vehicle? A fine is punishment for breaking the law and it is unfair to the rest of the population that a privileged group of blatant law-breakers should have their outstanding fines waived. As far as any fair-minded person could see, the young boy... who handed in a wallet [it] found on a bus containing \$1000 should have had its picture on the front page... in recognition of his honesty, instead of... [being] relegated to page 10. Everybody I have spoken to about this wholeheartedly agrees that, although well-intended, [the] newspaper got its priorities wrong.

...Chinese drivers are cheating the Kiwi road system by using fake driver’s licences bought through newspaper classified advertisements... Police have arrested and charged a number of people behind ads which have been running in Auckland’s 15 or so Chinese newspapers for at least a year... [(China’s capital has added nearly 1500 new cars to its notoriously congested roads every day so far this year... Xinhua news agency... said] yesterday)... Sharp-eyed Asian police spotted the ‘Need a licence?’ classified ads, which had gone undetected because only a few officers can read Chinese... [A detective from] the Asian Crime Unit... warns the scam is putting lives in danger and the erratic driving of inexperienced Chinese motorists is adding fuel to the already contentious “Asian driver” stereotype... “They end up driving vehicles which they have no skill in driving and could end up killing someone or losing their own life...” ...[the detective] says anyone involved in buying or producing a fake licence could face jail or deportation, and... admits police don’t know how many of the bogus licences are currently circulating... The phoney licences sell for between \$150 and \$500 and police say they are practically impossible to spot compared to the real thing. “They obtain a false [licence] and take it to the LTSA and just exchange it [for a genuine N[Z] one]. There might be a short theory test and a driving test, but you circumvent the whole aspect of going through a two and a half year graduated licence, getting your learners and then restricted licence,” says [the d]etective...

A JUDGE has granted two sisters an exemption to their restricted licenses so they can travel in the same car. The 16-year-old Wairoa twins applied for the exemption because it was too costly driving two vehicles into town. Their application was rejected by the LTSA but that was overturned by the judge. Restricted drivers are normally only allowed to carry spouses, dependents, or a fully-licensed driver.

...Budding motorists may have to take approved driving lessons to get their licences if a proposal by [the]Transport Minister... goes ahead. At present, those wanting to drive can learn from anyone who has had a full licence for more than two years. They can cut six months off the length of time they hold a restricted licence if they sit an approved driving course. [The minister] said yesterday that [it] wanted to save lives by having young motorists take driver courses, and hoped to test the idea next year. The suggestion comes as Parliament considers whether motorists should pay an extra \$10... every 10 years to renew their licences... Each licence cost \$43 to process, but a taxpayer subsidy meant each driver was charged \$29.50.

...New licence rules apply to all drivers from Monday... All drivers must upgrade to a new photo licence within 60 days of their birthday... The new licence will last until the person’s next 25th, 35th, 45th, 55th, 65th or 75th birthday... After that when a driver renews his or her licence, it will be valid for 10 years[– as opposed to the old licence, which was meant to last for a *lifetime* (someone ‘tried to have a court rule that her old licence was still valid and would remain so indefinitely’)] ...Eyes will be tested and a photograph and signature taken and stored digitally when licences are upgraded... Upgrade information will be sent to everyone’s home... Drivers must carry their licences – be it the old, paper licence or the new, credit-card style photographic licence... Getting a full licence will now cost \$246, previously \$146... Learner-drivers will have to show “L” plates on the front and rear of their vehicles... All new drivers will need to get learner and restricted licences... Fines can now be imposed for breaching restricted licence rules... Anyone breaking the speed limit by more than 50km/h or driving at twice the legal alcohol limit can have his or her licence suspended for 28 days... [although s]uspension will not apply to speed-camera offences... Police will have the power to stop motorists at the roadside for 15 minutes while checking their identity... Police can seize a vehicle for 12 hours if they have “reasonable grounds” to think it necessary to protect the public... Vehicles driven by disqualified and unlicensed drivers can be seized by police and kept for 28 days.

...If you drive to work this morning without your driver’s licence, you will be breaking the law. Sweeping changes to driving laws come into force today and include the requirement to carry a licence at all times while driving. Government research last year found that 80[% of NZ]ers carry their licence when driving... While anyone caught driving without a licence may be fined \$55, police have said they will use discretion... From today, police [also]have the power to detain a motorist at the roadside for 15 minutes to check his or her identity.

...Wrong photo, yes, big problem, no. After the N[Z] *Herald* yesterday showed... [a Pakuranga resident]’s new driver licence, complete with a photo of a different [person], transport officials have said such an error is extremely rare. In the 10 weeks since the licences were introduced, the “identity error rate” was less than 0.01[%]. The... director of the L[TSA], said 446,000 photo driver licences had been issued... so far... there had... been 45

“identity-type errors,”... This included people receiving a licence with the wrong... signature or personal details printed on it. Operator error had been blamed. “Certainly the system itself is quite robust – it is a question of how the button is pressed at the front counter.” The front counter system was complicated, but had been designed to be idiot-proof. [In another development, the ‘LTSA says it won’t refund the cost of retesting eyes if the first test proves to be wrong’. After being refused a new licence because they failed their LTSA eye test – at the front counter – clients are required to pay for a professional eye test, which some have passed!]

...My father’s 78 and we think his eyesight is too poor for him to drive any more. [Father] doesn’t agree, despite already having had a series of small accidents. What can we do? ...Older drivers are the fastest-growing group of drivers on the road today, and deteriorating sight and hearing, muscle stiffness and weakness, mental confusion and medication can all reduce driver safety. Try talking to your father’s doctor... If the doctor thinks your father is impaired, [it]... can insist on appropriate restrictions on his licence, like no night driving. At 80, all drivers must have an annual medical examination to retain their licence, and from 85 there is an annual driving test as well.

...Elderly people can be devastated emotionally by the cancellation of their driver’s licence for medical reasons. Studies at the University of South A[US] show significant numbers exhibit grief, anger and depression... A... coordinator of the Driver Assessment Rehabilitation Service, said the licence was a symbol of health for many elderly people. “They think: ‘As long as I’m still holding this bit of plastic, I’m ageing well.’...” ...[the occupational therapist... said there was a need for greater preparation before cancellation to lessen the impact on mobility and independence. The issue was vital, with estimates that at least 40,000 people driving on A[US]n roads had dementia, and that crash rates could be up to four times higher for them than for others of the same age.

...TRANSPORT officials are worried that diabetes-related motorist crashes are not being picked up... The issue is of concern because health authorities believe the disease is about to reach epidemic proportions in N[Z]. Since 1998... five people [have] died and nine [been] seriously injured in crashes thought to have been caused by diabetic drivers. LTSA figures show 53 people suffered minor injuries in 47 such accidents. Figures may also be inaccurate because officials do not document diabetes-related problems, such as poor vision, and because of undiagnosed diabetes.

...European roading authorities are pushing for new laws... requir[ing] drivers to have a driving check plus health and eye tests when they reach 50. Support for stricter tests was boosted by a survey which found... [3] million middle-aged British motorists have such poor eyesight... they would fail a basic licence test... □ Learner drivers in France are being posted the results of their tests after... attacks on examiners by failed candidates.

...New Government safety rules could add \$1000 to the cost of a used car but make it more likely that its occupants would survive a crash. The average used car would be newer, safer and costlier under the proposals, which would effectively ban the importing of Japanese cars built before 1994. The changes are among 11 proposals to improve vehicle safety which the Government unveiled yesterday as part of a strategy to halve the road toll by 2010. They include tougher border controls, compulsory replacement of used airbags, better seatbelts and banning flood-damaged vehicles. But the widest-reaching proposal is for a Frontal Impact rule to set a tough new standard for crash safety in older imported vehicles. L[TSA] figures show that 50,000 of the 120,000 used cars imported last year would have been barred under the proposal... The 820,000 vehicles on our roads manufactured before 1996 will not be affected by the front-impact proposal because they are already here. The... editor of the *Dog and Lemon guide* used car manual... supported the law change. “The Government has effectively joined the rest of the world in insisting that our cars are safe as well as cheap...” But the chief executive officer of the Independent Motor Vehicle Dealers’ Association... [said] the proposal... meant poorer people would be forced to buy newer cars... □ [The]... 16.5km stretch of State Highway One between Waipu and Oakleigh... has taken a horrific toll... [on] a community scarred by the ripple effects of the carnage... [caused by] a failing road safety message... In all there have been 17 fatalities between Waipu and Oakleigh... over the past five years, bringing the statistics for this stretch of road almost level with the notorious blackspot through Meremere on the road to Hamilton. Why so many? Insists [an i]nspector... of Operations and Strategic Traffic: “It’s not the road. The road’s fine. It’s a combination of things – in the main driver frustration, limited opportunities to pass... if you need to take evasive action there’s nowhere to go.” Mostly though, locals put the carnage down to a peculiarly North of Auckland phenomenon. When drivers hit the summit of the Brynderwyn ranges and the Ruakaka flats roll out before them like a lumpy, ocean-fringed bowling green with Whangarei city a speck on the horizon, they think they’re home. This is Nga Puhi country – a wide sweep of land where the living is more laidback than in Auckland, where many of them learned to skid their old bombs on the back country metal roads, where Marsden Pt, that great monument to petrol consumption, flames day and night – and where a [guy or gal] feels free. What they tend to forget is that the 40km of road to Whangarei has no passing lanes for 30km at a stretch; that it is bordered by deep, treacherous ditches on both sides; the trucks come thick and fast; it is almost impossible to judge how far away a car coming out of summer shimmer really is; little bumps mean oncoming cars can be half concealed. And people kill themselves and each other in such great numbers that his stretch of uneventful road is locally known as the killing fields... Locals have come to dread the sound of a siren... Every accident is tragic in its own way... Clarke[Hemara]’s crash was caused when David Chan, of Waipapa, pulled out in front of the Hyundai coming towards him. Both drivers were killed... [Clarke’s wife] attended his tangi – “the biggest-ever” at Pehiaweri marae on the Tutukaka Rd – in a wheelchair... [Clarke’s wife] doesn’t remember being hauled from the burning wreck by two nurses... and dragged clear. Instead [the 33-year-old] woke up in the helicopter, asking them to ring her husband and tell him [his wife] was okay. It wasn’t until much later, after the trauma team at Whangarei [Hospital] had treated her for shock, concussion and burns to her hand and back and [her husband] still hadn’t arrived in the acute ward that [the 33-year-old] finally “clicked”: Clarke, aged 34, her husband of just two years, wasn’t coming back.

...For most N[Z]ers, Marc Hill, Richard Kelly and Carl Wilson were the Southland teenagers who went out for takeaways and never came home. But those who lay them to rest today will remember them as three best mates – Monty, Sticks and Grimmace. Just a week ago the 18-year-olds were settling in for a night of car-chase videos and test-match rugby when they decided to go for a drive in Richard’s new Mazda 323. Taking a new CD to listen to as they left... [Marc’s] family home at Otatara near Invercargill, Marc, an architecture student, called, “See ya Dad, we are going into town. We will be back soon.” That throwaway comment at 7 pm last Saturday was the last thing [Marc’s dad] ever heard his son say. For the following four days three families were left wondering how the strapping young [guys] could simply disappear. But a chance sighting of two wheels protruding above the Oreti River, 30km from where they vanished, confirmed everyone’s worst fears. Inside the crumpled wreck the... three frozen teenagers – so inseparable in life – were huddled together in the backseat. Police said they apparently drove down Wilson’s Crossing road and turned down a dirt access road to McCallum Beach... About 1km along, a section of the private access road had been washed away over the previous fortnight. The teenagers plunged 2m into the icy, fast-flowing river. Now, as police investigate the murky legislation surrounding roads and rivers on private land, three families are left wondering why their children travelled in fog and darkness to get to the river... [Marc’s dad] does not blame the landowner... for not closing the wiped-out road, but hopes landowners will take action in future if there is a slip. “We cannot apportion blame; it is not going to bring our boy back.” [The person] who has coached the trio at the Collegiate Rugby Football Club for two seasons, says the close-knit team were devastated and baffled. “No one seems to know why they ventured to the river. It was totally out of character. Maybe they just decided to go for a drive.” ...the team would form a guard of honour at today’s funeral service in the hall at Southland Boys’ High School. “You could not get a nicer bunch of guys – I would be proud to have them in my family.” ...Police are waiting for toxicology results, but the boys did not appear to have been drinking... [An] Invercargill Detective Sergeant... told the *Weekend Herald* that part of the police inquiry would focus on legislation surrounding ownership of the road. It was too early to tell if charges would be laid. Occupational Safety and Health said yesterday that it would not investigate because farmers are not responsible for the safety of those who go on to their property without permission. Environment Southland... said the river and road were privately owned but the public had been granted limited access to the road

through Southland Fish and Game. [The landowner says it] agreed to put a sign up on his land saying anglers were welcome. In summer, up to 40 people gather on the river to fish or picnic – and [the landowner] is happy about it. But in winter, [the landowner] says, people came for one of three reasons: “To nick something, to dump something or do something they shouldn’t. The deaths of these boys is a tragedy and I really feel sorry for the families. But they were trespassing. If they had come and asked me if they could drive down to the river I would have told them ‘No.’”

...Police want drivers to take extreme care when faced with sun strike. The warning follows the death of 38-year-old Jie Wang following an accident at... Te Kanawa Cres, Henderson... Mrs Wang, a mother of two, clipped a parked truck after being blinded by the sun... at 7.15am... The collision caused minor damage to her vehicle and [Mrs Wang] stopped to talk with the truck’s owner. [Mrs Wang] moved to the back of the truck and was struck by a second car driven by a 19-year-old on his way to work. Mrs Wang was trapped between both vehicles for about 10 minutes before being freed by firefighters. [Mrs Wang] died in an ambulance on the way to Auckland Hospital... [Incidentally, h]ow’s this for an early – and stressful – start to the day: rescheduling truck deliveries before dawn to cover for a driver who has called in sick at four in the morning. It always requires some fancy footwork, but by bringing old guys out of the woodwork or filling in himself, [the]... managing director of [one] Auckland transport company... has never let a client down. But the firm is one of countless transport companies throughout the country facing a driver shortage, especially over the past three years. For the first time since [the managing director]’s father and grandfather set up the business back in the 1940s, [it] has had to start advertising for staff. “Up until the early 1990s finding staff was all word-of-mouth,” says [the managing director], whose 50-strong fleet of 44-tonne trucks mostly haul tankers. “Up until then we had a dozen drivers ready to drive at any time. These days there’s nobody queued up, and my oldest driver is now 70 years old.” People still want to be drivers and there is no shortage of big rigs. The trouble is, says [the]... chief executive of industry body the Road Transport Forum, there are just not enough people. And the country needs them, especially when the so-called “wall of wood” soon starts being harvested from our forests... A report commissioned by the forum, the Log Transport Safety Council and forest owners suggests N[Z] now has about 21,000 truck drivers – 1250 fewer than needed. [The chief executive], a former Transport Minister, expects the shortage to compound. Given the rate at which drivers are leaving, [the forum] expects the present shortage to increase by 1000 drivers a year. So what’s deterring drivers? Three key factors, [the chief executive] says: ■ Low pay... – typically from \$13.50 to \$18 an hour – ...and less-than-attractive conditions, such as no health benefits and long hours away from home... Also... laws limit truck drivers to a maximum working week of 70 hours... ■ The cost of getting the special driver’s licence required... Big-rig drivers must be 18 years or older with a class 5 licence, which allows someone to drive a truck and trailer weighing more than 25,000kg. Five tiers of classes separated by obligatory stand-down periods means it can take more than two years to gain a licence. That, plus the \$2000 cost, can be a deterrent... ■ Labour market changes that have created a greater variety of jobs to choose from. There is no easy solution, and bringing in overseas drivers is not the answer[– the truck driver shortage is a world-wide phenomenon, and NZ transport companies can’t compete with the level of pay that is attracting experienced drivers to the US!]

...No charges will be laid over the death of a young father who was decapitated when a truck’s driveshaft... disintegrated, sending the knuckle of its front universal joint flying through the windscreen of his 1990 Mazda utility on Auckland’s southern motorway last November 20. Police consulted engineers and experts in a bid to find out what caused the driveshaft failure... They had also sought information on other driveshaft failures and found at least four which were non-injury... ■... For nine years an Auckland motor mechanic... sabotag[ed vehicles so it] could then fix them... siphon[ing] thousands of dollars from the wallets of unsuspecting clients... [(i)n one case ripping off a customer for more than \$7500]. Yesterday, the]... 44-year-old... who formerly owned two... workshops... was sentenced to jail for two years... after being found guilty of fraud...

Armed gangs of kidnappers are increasing their attacks on hauliers in Britain, and truck drivers are routinely being abducted at gunpoint for their cargo, a leaked police intelligence report reveals. Truck hijackings by “modern highway[persons] rose by 50[%] last year, with an estimated £250 million... of goods stolen... An average of £130,000 of goods are stolen in each raid... A £50,000 reward has been offered for information about a gang who hijacked a truck in Cheshire at knife-point and stole cigarettes worth £1 m... Police said the Lancashire driver remains “distracted”.

...[A t]ruckie... has turned detective in a bid to find the two young hoons who totalled her prize Mk 5 Cortina. [The truckie], 38, was the victim of a hit-and-run recently as [it] was turning into a driveway on Larnoch Rd, Lincoln, to be faced by two boy racers attempting to outpace each other. “They were side-by-side...,” [the truckie] says. As the pair hurtled past one of the cars clipped the mint Cortina – leaving the car a write-off. [The truckie] was left shaken by her ordeal and sought medical aid at the hospital A&E the next morning. The Hibiscus Coast resident reported the accident to the Henderson Police. But [the truckie]’s also doing her own bit of detective work – calling about 50 panel beaters and car wrecker yards looking for the culprits. And [the truckie]’s determined not to give up looking. “I think [the culprit] is probably hiding [his car] at a mate’s.” The car... was... believed to be... a canary yellow... Toyota Levin. [A s]ergeant... of the traffic investigation unit at Henderson says about 60 to 65[%] of the traffic accidents they investigate are hit-and-runs. “People just don’t give a dam[n] about others, they are either drunk or disqualified and they know it’s going to cost them money,”... If you have any information regarding the crash please call [the sergeant] on 839-0600.

...Two cars racing each other through Dunedin... were clocked at 155km/h – about 95km/h above the speed limit. Police said the cars, driven by young Dunedin [hoons], were stopped on a south-bound section of the one-way system about 2am... The drivers immediately lost their licences for 28 days – under a new law – and will appear in court charged with driving at a dangerous speed.

...Less than a week after new “boy racer” laws came into force Waitakere police are poised to make their first arrest. The Street and Unauthorised Drag Racing Act was introduced last Tuesday and aims to curtail illegal drag racing and noisy cars... The Shore wing of the North Shore/Waitakere and Rodney police district... Road Policing Division says a driver was picked up on the weekend and faces a variety of charges relating to reckless driving... [T]he driver had been involved in a crash and was “behaving like an idiot.” ...The penalties for breaking the law include... three months in prison, fines up to \$4500... los[s] of licence for six months... and vehicle impoundment for up to 28 days.

...half the 1000 cars seized each month under new driving laws have not been claimed by their owners. Many cost more to store than they are worth, the transport ministry says... [In related news, h]undreds of car wrecks will be hauled out of Northland’s paddocks, gullies and ditches this month by Royal N[Z] Air Force staff as part of a goodwill exercise to clean up the environment... 30 Air Force personnel would collect cars throughout the area... The cars will be taken to central points to be compacted and removed by Gamma Compaction for melting and recycling. The project[has been] organised by the Department of Conservation, [Whangarei District C]ouncil and the Northland Regional Council... [N]ot only did the cars pose an environmental risk due to the oils and other chemicals they contained, but they were eyesores... When the project ran around Whangarei nearly four years ago, about 400 cars were removed. The Far North District Council ran a similar project this year as part of the clean-up for the arrival of Bishop Jean-Baptiste Pompallier’s remains at Motuti. About 200 cars were collected and the project was so popular that many wrecks were left sitting on the roadside and had to be collected in the following months. At Pawarenga, locals blockaded a Gamma vehicle because they were so upset that only half the wrecks were collected... Gamma[’s] manager... said the company provided a national crushing service. Large numbers of car wrecks were an increasing problem in poor and remote areas. Last year Gamma collected up to 40,000 wrecks throughout the North Island... [I]t was illegal to dump vehicles, but the rule was not enforced. Some cars were undoubtedly stolen, burned and abandoned.

...To most people, they look no different from other Jeep models on the road but there’s something very special about a small fleet of Wranglers buzzing around Detroit. They are part of an experiment that is set to revolutionise the way all vehicles – not just Jeep – are built in the future. The secret is in the hardtops that sit on the steel bodies of these Wranglers. Regular Wranglers have a hardtop made from a costly Composite material, which is then painted, but these new hardtops are... made from an entirely new thermoplastic process that can mass-produce high quality panels, with the colour impregnated into the material, thus eliminating a separate paint process... Chrysler has been experimenting with thermoplastic

bodies for several years and showed off a utilitarian concept car made completely from it in 1997, but it was just a one-off. The fleet of 40 Wranglers and their experimental hardtops have now advanced the technology closer to full production. In 2002, Jeep hopes to begin selling Wranglers to the public featuring these new thermoplastic, injection-moulded hardtops for the first time. Being lighter, they will be easier to lift off the vehicle and if they get scratched, the damage will hardly be noticed because the entire material is made of the same colour.

...Its makers hailed it as “the most magnificent car ever produced” but the Queen’s new Bentley is just as vulnerable as any other vehicle... [T]he limousine, estimated to have cost ...\$[NZ]14.95 million... in research and development, has a dent in the bonnet. One onlooker who saw the Queen and the Duke of Edinburgh arrive at Epsom racecourse to watch the Derby said: “It looks like they’ve slammed the bonnet too hard.” ...[In further news from Britain, t]housands took to the streets of Birmingham... yesterday to protest against German carmaker BMW’s sale of Rover... Up to 50,000 jobs... could be lost... A florist handed out thousands of carnations to the crowd, which included union leaders, city officials, church leaders and a minister of the Government’s Department of Trade and Industry... Employees from other Rover factories, including the Cowley plant close to Oxford and the Swindon plant, joined the demonstrations, as did British Ford workers... BMW revealed a fortnight ago that it was selling Rover to Alchemy Partners, a London firm of venture capitalists. The British Government said it had been betrayed by BMW after having negotiated a subsidy for the German firm conditional on it keeping Rover... Meanwhile, the launch of the Rover 75 in A[US] has been cancelled. The A[US]ns haven’t had Rover cars for years and they don’t want them now that Rover looks like being consigned to history.

...The British Mini Club kicked off the car’s 40th birthday last August with a huge car rally. Other clubs from London to Auckland followed up with their own. There was much joy in the world of Mini clubs. Not any more. The same British club, miffed that BMW has sold off Rover, has warned prospective buyers of the BMW-owned new Mini: “We have told people if the car bears the BMW logo, it will not be seen as a Mini and will not be recognised by the club.”...

The Mini, along with cars like the Model T Ford, Citroen 2CV and the Volkswagen Beetle, was a true advance in motoring... [Ironically, the Mini evolved during] the 50s and 60s [when designers] were heavily influenced by American styling[– examples of which]... will be on show at LynnMall from tomorrow... ■ More than 40[% of guys] in America rate their cars as the most important thing in their lives, says a survey.

...The pride and joy of members of the west Auckland-based American Muscle Car Club... [can be seen at LynnMall] over the next week... Restoring each car has been a labour of love after they were saved from rusty graves... It’s taken [up to] three years of hard work replacing and revamping everything in and on the cars, right down to the finest detail including engine labels... [If engine labels don’t interest you, that doesn’t matter because the club’s] president... says there’s something to marvel at for everyone. “They were legends in their day,”... says[the president, who] owns a 1970 Chevelle IS6 with 450 horsepower, the most ever put into a car... [It was the end] product... of the race to produce the highest horsepower engine in the late 1960s early 1970s. “It was a time before the petrol price wars when gas guzzlers reigned,” [another club member] says. His 1968 Plymouth Hemi Roadrunner is just one of 450 built and is classified as “very rare”. “It’s not like a car today that if something happens to it you can get another one exactly the same within the hour... These have atmosphere... You have to drive the car they don’t drive you.”

...what i[s it] going to be like in the super-sophisticated car of the future when you just say the word and the car does the rest[?] RENAULT’S vision of what the future holds for cars is more a celebration of how far the motoring industry has come in 100 years or so. The flying family bubble appeared in a special magazine the French carmaker published to celebrate its centenary in 1998. It is there to ask: Will such a vehicle ever appear? Who knows? Carmakers are working on all sorts of weird and wonderful designs, but for the moment they are pouring millions of dollars into making the car a mobile communications centre. Take the system BMW expects to have in its cars soon... BMW magazine[contains an article] about a communications pilot project which falls into the category of telematics, or the wired world of the car... Before setting out on a journey, [the article] says, motorists will simply inform the telematics service of their destination. The service will work out the ideal route and transmit it to the car’s on-board computer, taking into account traffic flow and roadworks. If you are going on holiday and you want to visit everything of interest along the way, telematics will do that too. It will also provide you with a choice of accommodation. All you have to do is speak up. You won’t even have to take your car for a maintenance check. By then every new BMW will have its own internet address, allowing all functions to be remotely tested. Your car will be able to “talk” to your house, too – switch on the kettle, check the roast in the oven, turn the temperature down in the fridge for a few minutes to put a chill on the beer, or tune into the surveillance cameras to make sure everything is hunky-dory... [L]ooking further ahead, cars will even be able to swap information with each other. When two cars meet they will be able to warn each other of possible hazards such as black ice, traffic congestion or other obstacles. Okay, but how will telematics help motorists to solve one of the great frustrations of driving – finding a parking space? Easy, says... BMW... “Parking guidance systems in the cities will ensure that motorists are informed of vacant parking spaces well in advance... We are also testing concepts which would allow you to make a firm reservation for a parking space...” ...■ [In the US an]... anonymous telephone bidder offered US\$1.1 million... for a car that cannot go... [C]ompany officials had expected... [the] Ford Ghia Focus roadster... would fetch no more than about US\$120,000... [The] 10-year-old Ford, deemed unfit for driving on public roads, has sold... in a deal even the pushiest used-car sales[person] might call too good to be true. It happened when Ford Motors put 51 “concept” or prototype vehicles up for auction as part of a charity fund-raiser... None of the... vehicles has any practical use and some are simply bodies on frames without engines.

...BMW’s latest technology promises an enhanced driving experience if you are willing to put your faith in a computer. Drive-by-wire technology will remove the physical link between the steering wheel and the front wheels and replace it with electronic signals... [BMW] is moving towards this goal, not just because it believes it will bring big qualitative advances in its car’s handling, but to ward off competitive pressures. Drive-by-wire is being developed by all the big car manufacturers, which see it as making cars easier to drive. They also think their image will be harmed if they are regarded as lagging behind the latest technological developments. But they have to persuade consumers that an electric link is safe. Motorists know that when they turn the steering wheel, even with power steering, that they are in direct contact with this most crucial of controls. It will take a leap of faith for the computer wary to believe that a virtual link will work. Computers have been successfully working controls for years in the aviation world, where the technology is called “fly-by-wire”. But fly-by-wire recalls the 1988 crash of an Airbus A320 airliner at a French air show in which three people died. The... pilot claimed that because the computer sensed the drastic evasive action [the pilot] was demanding might damage the plane, it refused to react. An inquiry pinned the blame on the pilot and exonerated the computer, but potential drivers of a “drive-by-wire” car may feel uneasy about handing control of their cars to electronics. BMW has no such qualms about drive-by-wire safety. At a technology briefing for journalists, the firm set out its new technology aims which were headed by “mechanical steering”, as drive-by-wire is also known.

...BMW calls it iDrive. It doesn’t say what “i” stands for, just that iDrive is a new definition of active motoring, offering new freedom and motoring pleasure and giving rein to BMW engineers to integrate future technologies. It could be intelligent drive, or information drive. Perhaps injection drive. It could even be a tribute to the German... family – there but for the grace of God go i – the major shareholder who continued to bankroll the carmaker even when the cost of BMW’s six-year affair with Rover became apparent and Ford and Volkswagen were lining up to buy it. Whatever i stands for, it and the car it comes in represent BMW’s design philosophy of the future. The car is the Z9 gran turismo, a convertible variant of the coupe unveiled to much fanfare at last year’s Frankfurt motor show... The controller in the Z9 concept car sits at the front of the centre armrest and allows the same intuitive control as a normal gearshift. All the driver has to do to enter his commands is to press the controller: forward and backward through the gears, to the left and right for other functions and in four diagonal directions for others. To select and operate the menu functions, you turn and press down on the controller. A variation of the controller is expected to be the operating system in the next-

generation BMW 7-Series, due next year. The controller allows the driver to choose eight functions in much the same way as if they were shifting gears. Available at the flick of the hand are communication mode, climate control, entertainment and the drive selection and satellite navigation, road and weather information, vehicle functions and a help desk. All eight functions are displayed in the centre instrument panel within view of driver and passenger. Of course, the driver can instead use the steering wheel-mounted buttons, with control functions like indicators, wipers, cruise control and the manual/automatic Steptronic transmission.

...*Look mum, no hands* An Argentinian engineer who built and drove a car without a steering wheel says a Japanese carmaker has offered him nearly \$60 million for the concept. [The engineer], aged 34, says the carmaker is one of seven bidding for his design. The car is controlled by a digital panel that responds to touch. [The engineer says it] got the idea while watching a video on disabled war veterans.

...*Technology turns the driver into a passenger* Surrender the steering wheel: electronics are set to turn fallible human drivers into safe, sensible dummies... That is the prophecy of... the worldwide electronics company, Delphi Automotive Systems[, which] says we are just starting to use electronics to make motoring life safer and more efficient... Delphi has developed the Wolf (Wide Open List of Functions) system to get a car's suspension, brakes and engine working together, potentially to save you from a range of nasty experiences stretching from momentary embarrassment to shortened life... "By 2005 we could have steer-by-wire with no direct link between the steering wheel and the wheels. So with a link through a satellite navigation set-up that covers every bend in the road, the system will allow electronic systems to help to steer drivers out of trouble." ...At its Aubevoye research centre near Paris, Renault is developing a system in which cameras monitor the white lines at the centre and edge of the road. If a car starts to wander, the driver will feel a faint vibration through the steering wheel. If the electronics sense that the driver is losing control, the system will take over the steering. For overtaking, the system can be over-ridden by the driver operating the turn indicator. But will overtaking be allowed, or will we just move in ordered convoys at set speed? A danger then would be inattention from boredom, but that could be solved by a collision-avoidance system. The radar-controlled "intelligent cruise control" system is already available on the Mercedes-Benz S-Class, slowing the car as danger is detected ahead. Such systems may be developed to give all-round protection... Nissan is developing a "back-seat driver" that monitors the driver's behaviour in order to predict when they are about to make a dangerous manoeuvre... It then overrides their control... Yet if, despite... the power of electronic wizardry to keep you on the straight and narrow, you manage to defy the system and slide rebelliously into a ditch, [the]... car's central computer will know what you have done and, probably with a deep sigh of irritation, flash a mayday signal to the emergency services... 21st century... skies... could be full of super-safe smart planes that can diagnose and repair their own problems, landing almost soundlessly with the help from virtual control towers... For the electronics engineer who makes such things possible, it all seems like common sense – and so it is, up to a point. But there is a downside... [-] could this be the reality of George Orwell's Big Brother watching us all? Rapid advances in electronics are turning the hardly credible into the highly likely... Even in the short time that speed cameras have been keeping an eye on us, things have moved along with extreme rapidity. A speed camera might flash, but there is a strong chance that the film has run out or that it never had any. However, Big Brother is going digital. Digital cameras can just snap away happily, with the results rapidly downloaded at the local police station. A summons will be in the post within hours or even minutes – eventually it will be e-mailed to your home, your company – or your car. Speed could indeed be electronically limited for all cars (legislation will be needed, of course) and roadside transmitters placed at strategic points may act as electronic "gates" into different speed bands, the car being made to slow without any input from the driver. So those speed cameras will become museum pieces. We simply won't be allowed to be naughty, silly, irresponsible or even a shade inattentive.

...British roads have become more dangerous because there are so many speed cameras on them, says *Autocar*... magazine... "Speed cameras are a £150 million... failure. They do not deter drivers from speeding, are remarkably unsuccessful at saving lives and may well cause accidents of their own. Their presence has meant the removal of police from our roads, so thousands of serious driving offences now go undetected."

...T[he T]ransport Minister... may consider scrapping hidden speed cameras following a review. The cameras have been tested in the Waikato for the past two years, but... the results of the trial were inconclusive. In their first year of operation, the road toll in the Waikato dropped to a 17-year low. However, road deaths and accidents rose steeply in the second year. The decision to use hidden cameras was a controversial one... "Public animosity means people are willing to break the law. People are against covert speed cameras and we have to respect that," [the minister] said. An AA spokes[perso]n... said its members were delighted with [the minister]'s indication that the cameras would be scrapped altogether when the trial finished... The... Government had planned to introduce hidden cameras to the rest of the country... Law enforcement visibility was the most important factor in decreasing speed on the roads, [the spokesperson] said. "It's a case of out-of-sight, out-of-mind. It is the cold, hard shock of seeing a police car that actually makes you slow down. If you put something behind a bush, you don't know about it until three weeks later. By that time you might have crashed and killed someone." [The spokesperson pointed out] that as soon as the publicity surrounding the cameras subsided speeds in the areas began to increase... [Incidentally, m]illions of brakes used in cars and trucks contain asbestos that puts thousands of mechanics at risk of disease, the *Seattle Post-Intelligencer* says. Contrary to widespread belief, the use of asbestos in brakes is not banned, the newspaper said. Although brakes on almost all new cars contained no asbestos, older brakes and replacement parts frequently contained the substance. Dust collected in 31 brake garages turned up asbestos in 21 of them, in amounts ranging from 2.26 per cent to 63.8 per cent.

...Diesel users are being warned of a problem with the locally refined product which could block the fuel filters of their engines. The NZ Refining Company said petrol was unaffected, and the problem with its diesel raised "no immediate issue of safety." But users were advised to see a mechanic if their engines were running rougher, losing power or cutting out. The refinery said the problem had arisen since winter-grade diesel had gone on the market... and was possibly linked to an additive with anti-freeze properties. It had stopped using the additive and was working to make replacement... stocks available quickly. In the meantime, users, particularly marine and essential services, were... to take "particular care."

...The mystery chemical additive behind the dirty diesel scandal is promoted worldwide as a way for oil refineries to cut costs. A *Weekend Herald* investigation has revealed that a fuel additive named Dodiflow was put into N[Z]'s winter diesel supplies for the first time this year. The N[Z] Refining Company, part-owned by the four big oil companies, has consistently refused to name the new chemical it added to its winter diesel.[The] Energy Minister... has demanded a full report into the diesel problems, as truck, car and bus owners across the country are forced to replace filters blocked by the new fuel mix... Oil companies have told more than 400,000 diesel truck and car owners that they must continue paying the same price to use the dirty fuel for at least a month, until clean fuel can be transported to tanks around N[Z]. Marine diesel tanks are the only ones that have been pumped out and refilled with clean fuel, while the Gull and Challenge chains remain the only companies selling clean diesel to motorists. The refining company yesterday rejected any suggestion that cost-cutting was to blame for the fuel crisis... Last night, it promised a full, independent inquiry into the problem. A report would be sent to the Government as soon as possible. Yesterday, the company said it had called in lawyers to investigate whether Clariant... [-] the European chemicals giant... th[at manufactures the additive -] ...could be sued... Importers of an additive called Paraflow, which was previously used by the refining company to make winter diesel, have been asked to rush in emergency supplies.

...The row over lower-sulphur diesel for Auckland intensified yesterday after [the ARC chairperso]n... called for a boycott of Shell and Mobil, which... refused to support the fuel's early introduction. But Shell said traffic congestion was the main source of the city's air pollution problems.

...FRENCH carmaker Peugeot has abandoned plans to import its latest diesel model because it won't run on N[Z] fuel. The Peugeot 607 uses the industry's latest clean-air device, an award-winning exhaust filter which traps and burns diesel particulates, a mix of combustion residue which includes the pollutant sulphur, a natural ingredient of crude oil. But the high sulphur content in diesel from the Marsden Pt refinery clogs the silicon filter and prevents burn-off, Peugeot says. Diesel in N[Z] is restricted to a maximum of 3000 parts a million of sulphur. On average it

contains about 2000-2400 ppm. But the 607 will only run on diesel with a sulphur content of 350 ppm, the European limit... Until the mid-90s the limit in Britain and Europe was... the same as N[Z and AUS]. But the powerful green lobby helped to force it down... to 500 ppm. This year it has been lowered even further... By 2005 it will be cut to 50 ppm, 60 times lower than [in N]Z... Sulphur by itself isn't recognised by the oil industry as a lubricant, but it is when combined with other properties in fuel. So the... Marsden Pt... refinery will have to install costly technology to ensure the new largely sulphur-less fuel maintains its lubricity. The... refinery... has commissioned a study into the cost of making cleaner fuels and is talking with the Ministry of Economic Development about meeting new international standards. The first stage of the report is expected later this year.

...direct-injection, common rail diesel engines have a bright future for cars, light trucks and vans. Within four years this technology will be incorporated in half of all diesel engines produced world-wide, according to [the person] who heads up Peugeot's technical communications... The HDi engine, which will be first seen in the Peugeot 406 on N[Z] roads later this year, is... no more expensive to produce than the... 2.1 litre turbo diesel four cylinder engine currently used in the Peugeot 406 but is... a three billion franc... investment by the French carmaker... Not only does the HDi engine produce low levels of carbon dioxide emissions, its model lifespan is expected to be between 15 and 20 years...

Deep in the Pacific Ocean, the bottle tops, plastic bags... and myriad other objects that make up what has been dubbed the "plastic vortex" cover an area twice the size of Texas... conservationists believe that it is now too large to ever be removed. Yet an audacious scheme could clear up the six millions tonnes of plastic estimated to have collected in the swirling currents. It would utilise a floating "processing plant", a ship anchored next to the vortex, that could convert some of the plastic into diesel... A car can be run for an hour from a lump of plastic the size of an ice-cream carton.

...Scientists in the... town of Bolton have developed a new fuel from coconuts. It is as potent as diesel, so they say, but has no particulates (black soot). It can be mixed with diesel and used in diesel-powered vehicles. The boffins reckon it could be commercially available within two years.

...[it's of no use to 'people in Britain - who aren't allowed to use cooking oil to fuel their cars (because that would mean they aren't paying petrol taxes') - but a] Louisiana company says it has developed a cleaner alternative to diesel from fat used in McDonald's and Burger King deep-fryers.

...[a NZer] can't help but dream of eating fried fish and a scoop of chips every time [the guy] starts his diesel van. It's not that [the guy] is a huge take-aways fan - it's just that the smell of the fuel in his tank drives his tastebuds mad... [His] van runs on the oil from fish and chip shops, which... is cleaner burning and gentler on the olfactory senses... [The guy] first heard of the fish and chip car concept while in Tauranga about 20 years ago. [The guy] bought a diesel van with the idea of trying to run it on vegetable oil, and discovered that the cleanest way of powering his vehicle was to filter the oil first and add 10% ethanol. But the guy believed the filtering and ethanol addition would be too much work for him to keep his van running constantly on fish and chip oil. So [the guy] talked a company into doing it for him. The company already collects the vegetable oil in large quantities and exports it to Asia. [The guy] has been running his vegetable oil-fired van for three months without problems. "I've ended up being the guinea pig," says the test pilot of the more environmentally friendly vehicle. The vegetable oil will still work if mixed with diesel, or will run without ethanol altogether. "You don't have to do anything to your engine. In fact, it will improve your engine,"... An Auckland courier van company is conducting tests to see if its fleet of diesel vehicles could be run off fish and chip oil... Auckland University is also carrying out environmental tests on the oil... [D]iesel engines can be run off oils from a range of plants, including corn, palm, olive trees, hemp and sunflowers.

...THEY'RE delicious mashed, fried or cooked up in a curry. But if [an] Auckland Institute of Technology... [lecturer] has her way, potatoes will soon have another purpose - fuelling your car... [The] senior lecturer in Applied Science, was [temporarily] recruited by the Technical University in Vienna after the Austrian government pulled the plug on funding for a local ethanol plant. Part of her job was to turn that plant into one that could transform potatoes into butanol... "My... goal was to identify strains of clostridia bacteria in potatoes that could produce high concentrations of butanol at a fast rate,"... [H]er team... also made an important discovery: starch doesn't need to be hydrolysed (converted to simpler sugars by using an enzyme pre-treatment) in order to ferment. Which means to make the fuel, any old potato will do. In fact, any organism containing sugars has the potential to be converted. And the more sugar per organism, the higher the yield of butanol. Potatoes have been used in the non-culinary arena dating back to [WW2]. In recent years, the rising price of petrol has prompted scientists to [resume research on] alternative sources of fuel. True, it sounds like a dream - turning the household vegetable scraps into fuel - but... butanol still can't compete with petrol because the cost of fermentation is high. "There is still work to be done to reduce the cost, but turning solid waste into fuel would be a big step environmentally."

...One [perso]n's waste is another's... treasure in a process developed in N[Z] that could revolutionise the fuel industry. A South Island company has developed a means of turning algae that grow in sewage ponds into crude oil, which can then be turned into fuels... Another [NZ] company... is also working on the... algae, after initially focusing on making biofuels... Unlike biofuels that rely on planted crops, the algae form naturally.

...A Palmerston North radio DJ couldn't quite get a grip on the concept of bio-diesel cars the other morning. "Can they burn rubber," [the DJ asked the] Energywise Rally organiser... during the Auckland/Wellington/Auckland event this week... The bio-diesel car in the rally was a Volkswagen Passat running on a mixture of vegetable and diesel... The Peugeot 406 HDi diesel... was leading the field going into the final leg with 4.20 litres/100km (67.3mpg). The thriftiest vehicle was the hybrid Honda Insight with 3.54 litres/100km (79.8mpg). But it is not on sale in N[Z].

...An amazingly economical Honda mini car which uses both petrol and electric power is likely to go on sale in N[Z] early next year... Insiders at Honda say the thrifty model will use less than one third the fuel of a typical family car... while producing extremely low levels of CO2 emissions. The hybrid car... uses Honda's new Integrated Motor Assist system... [Unlike GMs'] EV1... the first electric car of the modern age[- which]... had dismal sales... because of its very limited range... [-] the Honda Insight two-seater... [is] able to go more than 1300km on a tank of fuel... Toyota has already had success with its hybrid Prius four-door sedan which also uses combined petrol engine and electric motor power.

...Toyota is planning to cut the cost of building its eco-friendly Prius hybrid by... 30[%], before beginning exports... Production in Japan has been almost tripled to meet the domestic demand for the car since it was launched... The A[US]n Government is testing the Prius as a possible fleet vehicle, and the Government in Britain is also looking at it.

...They're all the rage in Hollywood - ...[enviro-cars provide] that environmentally friendly air every Hollywood star needs... [The star of *Titanic*]'s latest enviro-model is the newest generation of these type of cars. [The star] owns a hydrogen-battery-powered vehicle that is a step up from [Toyota's] Prius... which uses a combination of electricity and petrol to get the motor running. Enviro-cars are hard to come by in N[Z]. It's thought only about six Kiwis have them. Toyota... [isn't] marketing... the Prius... here. There is a demonstration vehicle, but Kiwis must import their own environmental runabout. The trouble is, spare parts may have to be imported if there are any break-downs. The Prius cars cost between \$40,000 and \$60,000 but they do have a downside. Industry insiders say the development of electric cars has a long way to go because they lack power. The Subaru WRX is considered the most sought-after car in N[Z] because of its grunty motor, so it stands to reason Kiwis are not as interested in weak-motored cars. Other car manufacturers, including BMW, Ford, and Honda are involved in manufacturing environmentally-friendly cars.

...Chrysler is on track to develop a car within the next three years that not only breaks the 2.8 litre/100km barrier (100 mpg) but will also be affordable. With fuel prices at record levels, Chrysler says it would have a hit on its hands if it could put such a vehicle on the road today... Chrysler showed just how close it got to... [its] target fuel consumption figure... with the recent unveiling of the Dodge ESX3 hybrid concept car - better known as "mybrid" for its mild hybrid use of a diesel engine and electric motor. Most fuel-efficient cars have largely failed to fire the imagination of the public, but the four-seat ESX3, with its advanced styling and innovative features, has received glowing praise. It's the third in a line of hybrid experimental vehicles from the Chrysler Group that stretches back to the ESX1 of 1996 and ESX2 of 1998. Those early efforts did well in making a litre of fuel go a long way, but even with improved manufacturing techniques, the ESX2 would have cost \$37,500 more than a

comparable petrol-engined car. The EXS1 would have cost \$150,000 more. With the EXS3 Chrysler has moved closer to its goal, by lowering the price difference to \$18,700 and improving its fuel efficiency... to an average of 3.9 litres/100km... Its target is an average of 3.5 litres/100km...

Holden Limited in A[US] has unveiled a leading edge concept vehicle that uses 50[%] less fuel than a conventional family car and dramatically reduces exhaust emissions. The advanced hybrid-electric powered Ecommodore has been developed jointly by Holden and the Commonwealth Scientific and Industrial Research Organisation... and is designed with the emphasis on practicality and achievable technology. It is the first hybrid-electric vehicle to be produced by an A[US]n automotive manufacturer and is the only one of its type in the world. Like N[Z]'s best selling and most popular car overall – the Holden Commodore – it is based on, the ECommodore is a full-sized family car. Its unique hybrid-electric powertrain [–] which combines an electric motor powered by supercapacitors and advanced lead-acid batteries with a four-cylinder aluminium alloy petrol engine – delivers the same level of performance as a standard 3.8 litre V6. The ECommodore's technologies are specifically targeted at improving overall vehicle efficiency. These include significant mass reduction through the use of advanced, lightweight materials, clever aerodynamics, reduced rolling resistance and regenerative braking. Holden A[US]'s Chairperso[n] and Managing Director... says the ECommodore illustrates the high level of technological innovation that is achievable in A[US].

...The Aussies are telling world carmakers that whatever they can do Holden can do better – and greener – with their environment-conscious hybrid Ecommodore... It's a front-drive petrol-electric prototype built to showcase A[US]n technology to a world tuning into the Sydney Olympic Games... There are two types of electric hybrid vehicles. A parallel hybrid uses a conventional engine and an electric motor to simultaneously power the vehicle. A series hybrid is an electric car which has a small conventional engine driving a generator to charge the batteries, and a separate electric motor to drive the car. The Ecommodore is a parallel hybrid built in 18 months at a cost of \$10.5 million. Holden says a production version could be ready within eight years, although it acknowledges that its success depends on how green A[US]ns ultimately want to become... Holden says a production Ecommodore would cost about \$3000-\$4000 more than the current model... The CSIRO, which claimed 11 patents in developing lead-acid batteries, says the battery pack and supercapacitor cost about \$2500. It is already working on a smaller, lighter battery pack. Other hybrids like the Toyota Prius and Honda Insight use nickel-hydrate batteries, the same technology as mobile phones.

...WE'VE all done it, misplaced something that all along was right in front of us. The A[US]ns have a response to such mental lapses. "If it was a black snake it'd bite you," they say, meaning that what you were looking for was under your nose all the time. That A[US] should use its mineral riches to help develop fuel alternatives has been staring leaders in the face too, since [an AUSn] wrote *The Lucky Country* in 1964, telling his country[people] that to abuse the nation's enormous natural wealth was to risk being bitten. Part of that wealth has helped developments in motoring, including a petrol/electric hybrid Holden Commodore which the company believes could be on the road inside three years. Meantime, Holden and its parent, General Motors, are [planning to] show... off another future fuel alternative during the Sydney Olympics, or "Green Games." It is a hydrogen vehicle developed in Germany and the U[S] by GM subsidiary Opel – and the only thing that comes out of its exhaust is water vapour. Hydrogen1, as it is called, will lead... [the] marathon-runners around Sydney... "We think it is appropriate that a vehicle that is leading the way in future fuel technology will also lead the world's best long-distance runners in the Olympics," said Holden['s chairperso]n... "It is a demonstration of GM's commitment to technological and environmental leadership, and more specifically to producing vehicles which offer economical use of resources." Based on Opel's Zafira van and people-mover, Hydrogen1... "...represent[s] another step on the way to a volume-production, fuel-cell vehicle." GM researchers and engineers view fuel-cell propulsion as an ideal platform for vehicles ranging from private cars to buses and trains, and they believe high-volume production will be in place before 2010. Indeed, the A[US]n Government is gearing up to have the first hydrogen filling station operating by 2007. Apart from Opel, Mercedes-Benz, BMW and Volkswagen-Audi are already running hydrogen-powered vehicles in Germany. DaimlerChrysler and Ford have them in use around their home base of Detroit. Hydrogen1 is a concept car that... is powered by a three-phase electric motor. It has a top speed of 140 km/h and a range of about 400km. Electricity is generated by a fuel cell stack that consumes pure hydrogen. The stack consists of 200 individual cells measuring a fuel source 59cm long, 27cm wide and 50cm high, about as compact as a conventional four-cylinder petrol or diesel engine. Its continuous power output is 80kW and its peak output is 120kW. The liquefied hydrogen is contained in a 75-litre tank at minus 253 deg C. Priorities for... Hydrogen1 include developing a lighter and more compact cell stack...

The quest for the car industry's "holy grail" – a true zero-emission car that looks and feels pretty much like today's petrol-powered model – appears tantalisingly close to being realised. But forget slow, range-limited battery cars or cumbersome hybrid models. The only way, according to the world's biggest carmakers, that cars will be removed from the environment debate – the U[N] has predicted that by 2030, the 800 million or so vehicles populating the world will have doubled – is to use fuel-cell technology. Fuel cell sounds new and exotic but as with many "breakthroughs", the idea has been around for more than 160 years... The fuel-cell HydroGen 1 Zafira, which will act as the 'pace car' for the... marathons at the Sydney Olympics... looks the same as the standard car... offers just about as much interior space and... is only fractionally slower than the diesel-power Zafira that is sold in Europe, accelerating from rest to 100 km/h in 16 seconds... Jump behind the wheel and the only significant difference is there is no gear lever, just a few buttons on the centre console. Select the one pointing forwards, hit the accelerator and while it is a little sluggish off the line – to prevent some of the prototype components over-heating, the engineers backed off the motor's torque peak – you are soon on your way... Its torque peak, which is delivered from a standing start, is an impressive 251Nm, or as much as a 3.0-litre V6... Once on the move, the power is readily available and since there are no gears, the 55kW electric motor that is fed by the fuel cell stack goes smoothly and enthusiastically about its business. The driving experience should be a silent one but with an industrial compressor pumping air into the stack, this prototype does sound a bit like a vacuum cleaner that needs its dust bag emptied... Obviously, cooling the hydrogen to minus 253C is not an ideal solution, but it does allow more fuel to be squeezed into the tank. Store it as a gas, as you would with natural gas, and the tank has to be super strong, which means it would be heavy and take up a lot of space. Longer term, hydrogen is expected to be stored more economically between the atom spaces in metal hybrids... [(t)hese so-called nano spaces are about a millionth of a millimetre[])... or in the surfaces or spaces between small carbon structures.

...The Government is investing up to \$6 million in the development of N[Z]'s own hydrogen-powered fuel cell technology, extracting the hydrogen from coal. Researchers expect to have the technology up and running in a laboratory in three years, and a prototype in the field within six years... Initially it would be used to produce energy at small sites, and for transport. A fuel-cell car could be plugged into the electricity grid overnight to generate hydrogen to power it the next day. In the longer term the hydrogen should be pure enough to run high-efficiency fuel cells, micro-turbines and the fuel cells of transport fleets. In N[Z], CRL Energy Ltd, the former research arm of state coal company Solid Energy, is to be funded to find ways to produce hydrogen from coal. At the same time, the Government's science funding agency, the Foundation for Research, Science and Technology, is investing in a project by crown science company Industrial Research Ltd (IRL) to use hydrogen in fuel cells... Commercialisation of fuel-cell technology had begun and IRL had already demonstrated a 5kW fuel cell... Solid Energy['s] chief executive... said the coal industry was pleased to be involved... because... "N[Z] has enough coal to provide energy for thousands of years if we make it environmentally viable."

...N[Z] is ideally placed to be one of the first countries to power its cars on hydrogen-powered fuel cells, says [an]American energy guru... Making his 15th visit to N[Z] in 31 years, the co-author of *Natural Capitalism and Small is Profitable* said N[Z] had the huge benefits of hydro energy – and no old-style car makers. "Not having an iron-age car industry is actually an advantage... You can actually produce a 'hypercar' in N[Z] using your boatbuilding and composite material skills and software." [The guru] heads Colorado's Rocky Mountain Institute, which has designed a "hypercar" made of light but strong new materials. The vehicle needs only a third as much energy as a conventional car. [The guru]

advocates powering the car with a “fuel cell”... The combination of a fuel cell and light materials would make the car at least six times as efficient as a conventional car – and “ultimately efficient enough to cross the US on one tank of fuel”. There’s another benefit, too. When it is not on the road, the car could be kept running while parked at work or at home, feeding its energy into the office or household electricity system to reduce power charges... “Iceland is going to an all-hydrogen economy based on hydro and geothermal energy, starting with buses, then cars and fishing vessels. They intend to not use a drop of oil. Shell Hydrogen is very active in helping with that. There has been interest in doing the same thing in Tasmania. There is one [project] going on in Vanuatu, and there are a couple of islands off the west coast of North America where this is now a very active option... But... hydrogen-powered vehicles... will still be less sound in congestion. When we have these wonderfully clean, efficient, safe cars that use no oil and produce no carbon dioxide and no smog, we will still have too many people driving too many times in too many cars, and therefore still have congestion and a lot of other land-use problems. So instead of running out of air and oil and climate, we’ll run out of land and time and patience. Therefore we have to pay attention to how we can encourage people to drive less by having fairer and more economic access to public transport for all, including for the one-third of the population who are too young, old, poor or infirm to drive.” ■... Earlier this year, DaimlerChrysler subsidiary EvoBus signed a contract in Amsterdam with nine major European cities for the delivery of 30 Mercedes-Benz Citaro fuel-cell buses. The cities are Porto, Hamburg, London, Luxembourg, Amsterdam, Barcelona, Stockholm, Stuttgart and Reykjavik. The buses will be delivered in 2003. The success of the buses, and the fuel cell unit that powers them, will hinge largely on the methods used for producing the hydrogen on which they will run. In Amsterdam, for example, the production of hydrogen will depend mainly on electrolysis. The Dutch intend to burn organic waste to generate the required electricity. They are also conducting experiments using bacteria to extract hydrogen from glucose obtained from biomass. Elsewhere in the world, in Iceland and Brazil for example, they intend to use hydroelectric power to produce hydrogen... Sceptics who still have doubts about the bright future in store for the fuel cell are now few and far between in public transport companies. The Chicago Transit Authority, for example, has set itself the goal of replacing its entire diesel-powered fleet with fuel-cell buses within 25 years. This follows the conclusion... of an extensive two-year trial of Canadian-made city buses powered by Ballard fuel cells and an Xcellis drive system. These buses travelled more than 50,000km in 5000 hours, carrying over 100,000 passengers... [(the buses have) a range of 300km, a top speed of 80 km/h and can carry up to 70 passengers[]]... A similar trial is now underway at Palm Beach... Funded by the California Fuel Cell Partnership, an organisation put in place by the state government and business interests, it has set itself the goal of testing 25 fuel-cell buses and 30 fuel-cell cars under normal road conditions...

Hybrid cars, which combine electric motors with small petrol engines, will outpace the environmental benefits of hydrogen fuel-cell cars until at least 2020, says a university study. Hydrogen fuel-cell vehicles have low emissions and energy use on the road. But the study says that converting a hydrocarbon fuel such as natural gas or petrol into hydrogen to fuel such vehicles uses substantial energy and emits greenhouse gases. The Massachusetts Institute of Technology research was published after the [Republican] Administration announced an initiative to develop hydrogen fuel cells. Combined with last year’s “Freedom Car” programme to build vehicles fuelled by hydrogen, the initiative will be powered by US\$1.2 billion... in Government funds. [The]US Energy Secretary... said... hydrogen-fuel cars... could reduce US demand for foreign oil by 11 million barrels a day by 2040... After 2020, hydrogen cars will win out, predicted the researchers, who do not recommend stopping work on the hydrogen fuel cell... In the future, analysts say, large amounts of hydrogen will be separated from water, where it bonds with oxygen, through the use of alternative energies such as wind and solar power. But the study says that for now, the green method of making hydrogen is too expensive.

...FORD N[Z] and... the country’s largest supplier of liquid petroleum gas, are about to promote LPG as an alternative to increasingly expensive petrol. Not since the ...70s and ...80s – when N[Z]ers were using about 90,000 tonnes of LPG a year... – has the gas been given such support. Rockgas is using public relations company the Sigma Group to get the message across. The LPG campaign comes as the price of a litre of petrol... could go over \$2 a litre again... [I]n downtown Auckland yesterday... a litre of LPG cost 64c. Rockgas is getting in behind Ford and its new LPG model Falcons, one an LPG-only unit and the other dual-fuel. The[y respectively]... cost... \$42,000 and... \$43,500... There has been renewed interest in alternative fuels since the price of petrol began going up a few months ago, particularly in A[US] where Ford services thousands of LPG-powered taxis. Investment there is such that a 60,000-tonne LPG storage tank opened last week near Sydney airport. Ford N[Z] is getting in behind its dedicated, factory-built LPG Falcon Forte, despite there being fewer LPG outlets than petrol pumps. Ford says the LPG Falcon is more environmentally friendly... than a petrol car... – emitting about 30[%] fewer pollutants...

THE DAYS of relying on fossil fuels for... transport are surely numbered, now their role in global warming is so well recognised. But when will the “green” car finally have its day? Does it actually exist? Not totally. Toyota has its Prius... Honda... [ha]s the similarly powered... Insight[, and] in Britain is selling a hybrid Civic. Ford N[Z] is pushing sales of its LPG-only Falcons, greener and cleaner than the petrol Falcons. But none of these cars are totally green – that is, producing nothing but water vapour from their exhausts. Five years ago alternative-fuel issues were hardly on the industrial radar screen. Now, all the world’s major motor manufacturers have huge green programmes and boast senior executives with titles such as “vice-president, environment.” The prize for the company that first cracks the formula for the green car of the future will be measured in trillions of dollars. The prize for the human race will be cleaner air. The bad news is that those same companies have found that solving the technology problem of alternative fuels is taking more time and money than they expected. But while the most obvious alternatives to the car are still public transport, two-wheels or working from home, alternative-fuel vehicles are moving up the agenda. Leading carmakers... are busy researching what they see as the most likely future alternatives to petrol and diesel – and some are greener than others.

...Three oil companies are working to develop biodegradable lubricating oil. Shell and Castrol have teamed with Japanese heavy-equipment company Komatsu to work on the project. Komatsu has already developed a biodegradable oil formula for its machinery.

...Engineers from the University of Tokyo are showing off an eight-seater/eight-wheeler limousine powered by an electric motor at each wheel. (Ferdinand Porsche did something similar 100 years ago).

...An international rally of steam cars will be held near Melbourne next year. The get-together brings to mind the Stanley Motor Carriage Company, formed in 1896 by the two... brothers who built the Stanley Steamer, the most famous steam car[(t)he... brothers also invented and sold to Kodak the dry photographic process[]]... One of the brothers was killed in a Stanley in 1916... The last true Stanley steam car was built in 1924... In 1906, a Stanley steam car broke the land/speed time of 204 km/h, a record it held for many years... The first American police car was a Stanley.

...British police are testing their latest weapon in the fight against crime – an electric-powered three-wheeled car with a top speed of 40 km/h[and a ‘50km range for around a cent a km’. The one-occupant], German-made scooter, nicknamed the “flying banana” comes in a shocking yellow plastic and is more likely to make criminals burst out laughing than quake in fear. But the police driver who is testing the scooter as an environmentally friendly alternative to 160km[h] “flying squad” police cars said its electric motor made it perfect for creeping up on unsuspecting wrongdoers.

...Spurred by a leak on media website Inside.com in January, technophiles have theorised about a hydrogen-powered hovercraft, a toilet that produced no waste, or, more accurately, “George Jetson’s car in a briefcase”... The ultra-secret “It” invention that has kept the high-tech world abuzz for nearly a year is a self-balancing, motorised scooter that costs less than US\$5c... a day to run, says *Time* magazine. I[ts i]nventor... believes the machine, codenamed It but officially the Segway, will replace cars in downtown areas by enabling users to zip around at little cost and no harm to the environment. The two-wheeler uses a complex array of gyroscopes and computers to mimic the human body’s sense of balance... Users lean forward to move forward, lean back to reverse and turn by twisting a handle. Falling over is impossible, the article says, and the Segway can handle ice, snow and stairs with ease. “The big idea is to put a human being into a system where the machine acts as an extension of your body,”

said [the inventor]. The 50-year-old inventor holds about 100 US patents... including the first portable insulin pump, a briefcase-sized dialysis machine and a wheelchair that can climb stairs. The scooter's range of about 28km and a top speed of 27 km/h mean it will not replace the car on long trips. But [the inventor] and officials at private firm Segway Co see the machine as a handy way to get around congested cities, or as a people-mover in developing nations such as China. Company officials have met city planners and federal safety regulators to ensure that the scooters will be allowed to share footpaths with pedestrians... The US Postal Service, General Electric and National Parks Service will be the first customers, buying 36kg heavy-duty models at \$US8000... apiece. Segway expects to market a consumer model for \$US3000 within a year.

...With half the world seemingly ready to bomb the other half into oblivion, a global recession looming and climate change ready to flood out your long-term plans, what would you say the world really needs now? [A 50-year-old inventor] thinks the answer is simple: his scooter. Except you must never, ever, call it a scooter. It is "the first self-balancing, electric-powered transportation machine", and it will "empower pedestrians" and let them reclaim cities from the deadly embrace of the cars that have overrun them. "Cities need cars like fish need bicycles," [the inventor] told *Time* this week... The Segway looks like nothing more than an overlarge scooter with the back end lopped off, but what it does is more subtle. By all accounts, it is a marvellous piece of technology. It is two-wheeled, concealing in its base a complex array of gyroscopes, computer chips and tilt sensors that check the centre of gravity of the person standing on its platform 100 times a second. Those who have used it say starting, stopping and turning quickly become intuitive... Is the Segway the product the world has been waiting for? News of the invention, then known only by its codename, "Ginger", leaked in January, followed by months of silence from [the inventor]... Word of Ginger trickled out when... a journalist, won a six-figure book advance from the Harvard Business Press to tell the inside story of its development. ([The inventor] is no longer cooperating with him.) At that time, it had been shown to few people... The rumours took off. It was a *Star Trek*-style transporter. It was a hydrogen-powered car that would end our reliance on fossil fuels. It was... an antigravity device. But no, it's a scooter. Sorry, self-balancing electric-powered transportation machine. For some, the revelation has been a disappointment, to which [the inventor] responds: "...I would stake my reputation, my money and my time on the fact that 10 years from now, this will be the way many people in many places get around... If all we end up with are a few billion-dollar niche markets, that would be a disappointment. It's not like our goal is just to put the golf-cart industry out of business."

...[a] General Motors executive... isn't counting on keeping the \$2.3 million cash prize for his hole-in-one at a charity golf tournament in America. GM has a policy prohibiting personal windfalls for staff acting on its behalf... [By the way, Volkswagen's] chief... has apparently given himself a retirement present – a 30m luxury yacht. [The chief] is to call it quits next year and is expected to cruise the Mediterranean in the \$35 million vessel[, but] will remain on the VW board. While we are on VW, its N[Z] operation has] had its biggest month... selling 195 cars. VW is already way ahead on last year's sales. Stablemate Audi is setting records, too. It sold 18 all-road models in August, each one costing more than \$100,000.

...A Norwegian ship with a cargo of almost 3000 new cars sank in shallow waters in the English Channel yesterday after colliding in thick fog with a Bahamas-registered container vessel. There were no casualties. The Tricolor keeled over 35km north of the French port of Dunkirk. It was yesterday resting on its port side in 30m of water, brushing the surface. The Tricolor had been bound for the south England port of Southampton with 2862 new BMW, Volvo and Saab cars worth between \$50 million and \$63 million. They had been loaded at the Belgian port of Zeebrugge.

...A ship carrying 70,000 tonnes of kerosene struck the wreckage of a sunken car transporter in the English Channel yesterday but was freed after more than two hours... Three tug boats and a warship from the French Navy led the operation to aid the 243m tanker, which the British coastguard described as an "elderly" single-hulled vessel, built in 1981... The Turkish-registered Vicky struck the top of the submerged Tricolor about 7.30pm... and floated off the wreck shortly before high tide at 10.07pm local time, the Dover coastguard reported. The ship anchored 1.6km north of the wreck, where a damage inspection was being carried out. A... maritime spokes[person] in the French port city of Cherbourg, said the captain of the Vicky believed the vessel sustained only minor damage and there was no risk of its fuel seeping into the water or air. However, authorities were unsure whether the Tricolor, which was carrying 2000 tonnes of fuel oil when it sank, had been damaged further. The Tricolor, laden with BMWs, Volvos and Saabs, sank [a fortnight ago] after colliding in thick fog with a container ship. Salvage efforts continue. Another cargo ship, the German-owned Nicola, struck the sunken Tricolor [the day after it sank] but was pulled clear. Maritime authorities in Cherbourg said the Vicky was issued a warning about its proximity to the wreck but for "a reason still unknown" was not able to avoid hitting the Tricolor. The wreck is in a lane used by up to 500 ships a day, and is marked by five illuminated buoys. Hourly warnings are issued to ship crews.

...*Insurers warn of risk from lost containers* Up to 10,000 containers a year are lost from ships worldwide and the Insurance Council says they are "floating disasters waiting to happen"... The council today launches a campaign in Wellington to try to get support from maritime groups, the Government and public to put preventive measures in place and ensure lost containers are recovered... both in N[Z] and overseas... The International Marine Organisation requires the master of a ship to report a lost container if it carries noxious substances. But the only regulation for an empty container, or one holding non-poisonous substances, is that the master reports to the nearest coastal state if [the master] comes across it... [The] Maritime Safety Authority deputy director... estimated that only about one container a year was lost in N[Z] waters. But... it was such a problem worldwide that the Dutch Coastguard had two vessels on permanent lookout.

...Big is best when it comes to shipping freight. Size is so important that Auckland's Waitemata Harbour must be deepened to accommodate the new generation of container ships plying N[Z] ports. The master of a new, regular visitor to Auckland, the P&O Nedlloyd Encounter, was keen to show off the huge vessel as it was loaded with containers... by... two 28-storey cranes... on a \$100 million extension of the Axis Fergusson container wharf... for its maiden voyage from N[Z] to the east coast of the U[S] and Northern Europe... [The master] says the Encounter is so massive that it will struggle to fit through Panama Canal locks as it journeys from the Pacific to the Atlantic Ocean. The German national says entering the lock will be a tight squeeze as the vessel's 32.2-metre beam, or width, leaves only 30cm clearance on either side of the lock. P&O Nedlloyd commissioned seven new Albatross-class vessels, and partner operator CP Ships has ordered three, to ply the Eastabout trade route. The ships have been built specifically to cater for N[Z] exports, particularly refrigerated meat, fish and dairy products, for the next 20 to 25 years... Ports of Auckland... gain[ed] resource consents to deepen the commercial shipping lane through the Rangitoto Channel to accommodate the vessels' deeper draught. Ports of Auckland negotiated the dredging proposal with Friends of the Earth and iwi groups. Blasting may be used, if necessary. The dredging will allow round-the-clock access, which is now limited by tidal conditions as bigger ships can't negotiate the Rangitoto Channel three hours either side of low tide. P & O's regional manager... says... the new ships... carry twice as much cargo, at higher speeds than older ships. The Encounter is the second vessel of her type to visit N[Z] shores, its sister ship the Remuera visited Auckland for her naming ceremony... [three months ago. The Encounter is crew]ed by nine German officers and engineers and... 15... Filipino[s]... Routinely dwarfing wharves, the ship is as long as three rugby fields and can hold a total of 4112 containers... [- including] up to 1300 temperature-controlled containers... [-] with a computerised stacking system used to stack containers up to eight high into hatches... Newer, more technically-advanced containers, which can be monitored by remote, are being phased in. The changeover should be complete in a year... ■ PO[RT GISBORNE]... is being sued over the grounding of the Jody F Millennium last year. Japanese company Twin Bright Shipping, owners of the log carrier, and its parent company Soki Kissen Co, are suing the port and the Gisborne District Council for about \$23 million. The Jody was stranded for 18 days after running aground while leaving Gisborne harbour in a severe storm... [The port company] would not discuss the details of the lawsuit yesterday. The company planned to defend the suit... While aground on the sandbank the Jody developed several cracks in its hull before being towed off by three tugs. Tonnes of fuel oil leaked into the surrounding sea and was washed up on the beach before what remained in the ship's lower tanks was pumped into barges or into higher ballast tanks above the waterline. The Maritime Safety Authority then claimed the costs of the rescue operation and cleanup from the Jody's owners. The[

district council's] chief executive... said the council, a secondary defendant in the lawsuit, was already preparing its defence. "They are claiming the port wasn't effectively operated and there wasn't sufficient regard to the conditions at the port... When the Jody left, it effectively bottomed out because the channel wasn't, in their view, deep enough..." One of the issues will be deciding who is responsible for choosing to leave port in a storm.

...The M[SA] will today release its long-awaited report on the grounding of the Jodi F Millennium... last year. The investigation, which has taken 14 months to complete, is one of the most comprehensive the authority has carried out. It will reveal what went wrong... when the ship ran aground off Waikanae Beach in Gisborne while trying to leave port during a southerly storm... The ship's owners are suing the former port company and the Gisborne District Council over the Jodi's grounding. Twin Bright Shipping and its parent company, Soki Kissen, say Port Gisborne negligently and improperly ordered the ship to sea in unsafe conditions and otherwise failed to provide a safe port. "They should probably never have allowed the ship into the port because they didn't have the systems and the management to cope with it," said [a] maritime law specialist... who is acting for the Jodi's owners. "When it was in port, they dropped the ball... [Afraid that 'if the ship rocked it might damage their wharf',] they sent it out of the port... with 20,000 tonnes of pine logs... in circumstances where it was almost doomed to hit the brakes." ...Tomorrow's authority report is expected to express concern about the role played by the port company, the council and the ship's Korean master during the grounding.

...Kawau Island jetty owners are angry at a Court of Appeal ruling that permits the public to use private jetties to get to beaches. The decision arose from an access dispute on the island, which has about 60 private jetties. Some residents have spent up to \$100,000 building a jetty. Vivian Bay owners... pursued the appeal after feeling aggrieved by rulings of the High Court and Environment Court. Their appeal was opposed by the Auckland Regional Council but supported by the Department of Conservation and the Rodney District Council. [The] ARC environment committee chair[perso]n... said the decision vindicated the ARC stance in defence of the fundamental public right to access the coast... The regional council said allowing public access minimised the structure's intrusion into public land... But the [jetty owner's] lawyer... said... the... [appeal court judge]'s ruling limited "to a certain extent" the amount of use the public could make of jetties. The public could use the [Vivian Bay] jetty providing they did not unreasonably impede the couple's access to and use of it. For example, no one else could indefinitely tie his or her boat to the jetty because that would prevent the [owner's] using... it. The decision meant the [owner's] could still take out an enforcement order against anyone who was using the jetty for purposes other than to gain access to the coastal marine area. [Their lawyer] said there was much interest in the case by the boating community, port companies and marine operators over concerns of free use of moorings and marinas. "Anyone who thinks they can now tie up their boat to a marina would be sadly mistaken,"... [In international news, m]ore than 430 asylum seekers rescued from a sinking boat were last night stranded on a Norwegian freighter in the Indian Ocean... The refugees, from Afghanistan, Pakistan and Sri Lanka, have high-lighted the increasing pressure on A[US]'s borders with thousands of illegal immigrants arriving every year from Southeast Asia and the Middle East. The A[US]n Government yesterday refused entry to the refugees, who had threatened the captain of the freighter Tampa when [it] tried to return them to Java under international law governing rescue at sea. Last night the Indonesian Government also refused to take them... In Canberra, [AUS's P]M... said A[US] would not be forced to accept the 438 refugees on the Tampa, anchored 12 nautical miles off the A[US]n Indian Ocean territory of Christmas Island... In the past two weeks more than 900 other boat people have landed on the Island, forcing the erection of a tent city and a shuttle service of Air Force transports flying illegal migrants to centres on the mainland. More than 2800 refugees have already reached A[US] this year. "We simply cannot allow a situation to develop where A[US] is seen around the world as a country of easy destination," said [the PM]. "...While this is a humanitarian, decent country, we are not a soft touch and we are not a nation whose sovereign rights in relation to who comes here are going to be trampled." ...The drama began when the Tampa plucked the asylum-seekers from a sinking Indonesian ferry, spotted by an A[US]n patrol aircraft after the passengers spelled out SOS on the deck. The asylum-seekers – including 26 [gals], two pregnant, and 43 children – were taken in a heavy swell from the 20m KM Palapa... [T]he Palapa was falling apart as [the Tampa] took the refugees on board... The owners of the Tampa, the Wilhelmsen line, said... [the asylum-seekers] had been at sea for eight to 10 days and there were health problems that needed urgent attention. The ability of the roll-on, roll-off ship's crew of 27 to care for the refugees was limited, and the ship could not land helicopters... The standoff has added further fuel to a row over A[US]'s treatment of illegal migrants which is due to reach another head in Parliament tomorrow when Labor and the Democrats will block a Government bid to restrict refugees' rights to appeal against deportation orders. With existing detention camps almost full, the Government last week announced a \$A22 million programme to almost double their capacity to 7000.

...HUNDREDS of A[US]ns attended a candlelight vigil [last night] for those on the Tampa. Around 300 people gathered in a park calling for the government to accept the refugees and to respect human rights... The asylum-seekers... have been on the Tampa in terrible conditions since they were rescued from their sinking boat on Monday... [B]olstered by wide public support[. AUS's PM] refused to let the asylum-seekers land.

A court ruling today on the Tampa asylum seekers may not resolve the matter. Ultimately, an appeal to the High Court is expected to decide their fate. The... Federal Court will decide on an appeal by the Federal Government against... [a] ruling that... resulted from court action by the Victorian Council for Civil Liberties... [that over 430 people] rescued from a sinking boat by the Norwegian freighter should be returned to A[US].

...The fate of... 460 asylum-seekers on board the Tampa has been decided. N[Z] came to the rescue yesterday, agreeing to take 150... and the rest... would go to... Nauru. "Those who are genuine refugees in N[Z] will remain there," [AUS's PM] said. Genuine refugees in Nauru could apply to enter A[US] or other countries. The U[N] was pressing A[US] to let the[m]... land on Christmas Island while their claims for refugee status were processed. But [the PM] stood by an earlier decision that this latest boatload of illegal immigrants would[n't] be allowed into A[US]. NZ's PM defended him, saying... Indonesia turning a blind-eye to the refugee problem placed A[US] under enormous pressure. [The PM said NZ] was only meeting a short-term crisis and the world had to act... [(s)]weeping changes to immigration rules will shut the door to... thousands of people already in the queue to come to N[Z]; t]he overhaul of immigration policy announced yesterday is also expected to mean some people already living here, but still seeking residency, will be forced to leave[.]. ● AUS has]... boarded a boat carrying 200... illegal immigrants. They have been put on the Manoora with the Tampa refugees.

...N[Z] will not take any of the extra 200-odd asylum-seekers now on board the A[US]n troopship Manoora. The Manoora, carrying 434 asylum-seekers taken off the container ship Tampa, to Port Moresby in Papua New Guinea, took charge of the additional group on Friday night after the A[US]n Navy intercepted another boatload of illegal immigrants heading for A[US]. The NZ P]M... said yesterday that the offer to take up to 150 of the Tampa asylum-seekers stood. That offer related to the particular humanitarian crisis surrounding the Tampa. "What this latest incident shows is that this flood of asylum-seekers is far bigger than N[Z] and AUS]... That's why I'm calling for an international response to the whole situation..." The international community eventually responded to the crisis of the Vietnamese boat people and the same response was needed now, [the PM] said... The Tampa asylum-seekers are expected in Port Moresby by tonight or tomorrow but may have been delayed by the latest incident and bad weather. The 150 destined for N[Z] will be flown straight from Port Moresby to Auckland. ■ [AUS's PM] wants tough new asylum law[s. The PM]... said the legislation, to be introduced in Parliament this month, would remove Christmas Island and the Ashmore reef islands from A[US]'s migration zone, the area within territorial waters from where applications for asylum can be lodged... "We have to be decisive and forceful in trying to break this ugly people trafficking racket." ...The main Opposition Labor Party has yet to indicate its position. [A c]onstitutional lawyer... from Sydney University, said there was no constitutional impediment to the Government's proposed law. But [the constitutional lawyer] said it was unheard of for a country to cut off part of its sovereign territory to suit its purposes.

...A[US's] Government said yesterday that its policy of refusing entry to asylum seekers was deterring hundreds of boatpeople from attempting the voyage... from Indonesia... reject[ing] claims... that the arrival on Saturday of... 200 boat people... showed the headline policy was not effective.

...Another boatload of... asylum seekers, most of whom say they are from Afghanistan... was moored off... A[US]'s remote Christmas Island... yesterday, arriving less than 12 hours after [the P]M... trumpeted a victory in his fight against boatpeople by forcing a group back to Indonesia.

...Asylum seekers rescued by the A[US]n Navy after their boat sank... would not be allowed on the A[US]n mainland, A[US's] Foreign Minister... said yesterday. The 187 asylum seekers were last night in limbo on HMAS Adelaide, which rescued them when their boat began sinking on Monday night. [The minister] said the asylum seekers had earlier acted abominably by throwing children overboard when their boat was turned back by the Navy. The Government has said it may unload them at nearby Christmas Island, which has been excluded from A[US]'s migration zone. "...I don't think any A[US]n wants people who would behave in such a way as to throw their children overboard to come to... our country." [The minister] said there were some indications that the asylum seekers had sabotaged their boat. Meanwhile, [the]... Government has pledged a worldwide hunt for the people smuggler blamed for hundreds of deaths after an unseaworthy ship sank last year. A[n]... Egyptian national, is accused of orchestrating the... SIEV-X voyage, which cost 353 lives when it sank off Indonesia... the *Sydney Morning Herald* reports. [The Egyptian] is due to walk free from a Jakarta jail tomorrow after four attempts to bring him to A[US] to face charges... A[US] was unable to extradite [the Egyptian] on murder charges because it could not say whether SIEV-X sank in Indonesian or international waters. The... A[US]n federal police had also sought to extradite him on people-smuggling charges but this too had failed because there was no law against this in Indonesia... [The] Federal Justice Minister... said that A[US] was helpless to prevent the release but would not relent in its pursuit of him... The impending release sparked criticism that the Government failed to press Indonesia to hand over [the Egyptian] because of what [the Egyptian] might reveal about A[US]'s alleged role in the SIEV-X tragedy...

Late last year, with an election just weeks away and an apparently unending armada of refugee boats sailing from Indonesia, did A[US]n officials condemn 353 people to death? The implication, raised with evidence that the Navy knew a dangerously overloaded, decrepit boat was heading to almost certain doom but did nothing to prevent the subsequent tragedy, has intensified A[US]'s agony over the interception and detention of illegal asylum seekers. While it seems inconceivable that naval officers on land would order one of their ships to stand by while people drowned – or that a captain and crew at sea would obey and remain silent – the suggestion made by a former diplomat has gained surface credibility through official minutes and the evidence of one of the Navy's most senior officers. The Navy contents that while it knew in advance that the boat was heading into likely danger, its available aircraft and ships were occupied intercepting other boats elsewhere, and there was nothing it could have done. But that explanation contradicted earlier evidence and added to a disturbing tale of deception and manipulation emerging from a twice-extended Senate inquiry into the quaintly named "certain maritime incident" that... fuelled... [the PM's] refugee and terrorist-supercharged run for a third term in power. The saga has overlapped domestic and international outrage at A[US]'s policy of mandatory detention of asylum seekers for months on end in... Outback camps, sparking riots, self-mutilation, hunger strikes and mass breakouts from a system condemned by, among others, the U[N].

...A series of fires were left to burn early yesterday at Woomera camp in South A[US] after staff fled attacks by detainees armed with metal bars and stones, immigration officials said. The blazes, which continued an outbreak of trouble sweeping A[US]'s... detention centres for illegal arrivals, destroyed or damaged 43 buildings before they were finally brought under control. It was the latest in a string of incidents at Woomera... Charges were expected to be laid against some of the 121 detainees. The fires at Woomera followed similar blazes at two other centres in recent days, blamed on detainees awaiting deportation after their applications for asylum failed. Extra guards have been put on duty to prevent more trouble. The latest violence again shone a spotlight on A[US]'s hardline stance on detaining all illegal arrivals, including [mothers] and children, in guarded camps. Asylum cases can take years to process, triggering protests and escapes... "What have people fleeing persecution and the risk of injury, torture or death done to deserve this unconscionable treatment?"... [a] Supreme Court judge... h[as] asked. "If there are some cheats amongst the people seeking asylum in A[US], what crime have the rest committed to warrant the A[US]n Parliament and its members from the two major political groupings taking leave of their senses? What are the crimes of the children and the elderly? (And) what would be happening if the boat people were white farmers from Zimbabwe or Afrikaners from South Africa?" The worst of these answers don't bear thinking about... ■ Detainees armed with pipes yesterday set fire to a dining room and took over a compound at the Christmas Island detention centre. The Immigration Department said the disturbance was still in progress last night. It was not known what caused the incident or if there were injuries.

...Hunger strikes by protesting asylum seekers spread yesterday to a fourth A[US]n detention centre while refugee activists took to the streets of the country's two largest cities to call for greater compassion. An Immigration Department spokes[person] said 17 people at the Port Hedland refugee camp in Western A[US] began to refuse food and water in a copycat protest to mirror 12 days of turmoil at another camp in the baking heat of the interior... Police said 300 people tried to break a perimeter fence at the Maribyrnonga detention centre in... Melbourne... where dozens of asylum seekers and visa overstayers have staged a sympathy hunger strike... "This just shows the level of desperation, these people just got nothing to lose, they are throwing themselves on razor wire," said [a spokesperson for] the Refugee Action Collective...

The A[US]n Government drew fresh fire yesterday for a false claim that asylum seekers threw children overboard in an effort to stay, with the Opposition putting out Navy photographs of refugees fleeing a sinking ship... The Opposition Labor Party leader... said the Government made public only close-up photographs of people in the water, but did not show the sinking boat. "Of course people are going to be in the water if the boat is sinking, including children." ...Government reports last week said the Navy told... [the Immigration D]epartment the claim was false the day [t]he... Immigration Minister... made it, but [the PM]'s department was only told several days later... [The P]M... has said [it] was never told the incident was false and has denied lying to the A[US]n people. Analysts do not expect his head to roll but believe the furor could eventually lead to a leadership change. Newspapers – and 51[%] of respondents to an opinion poll – criticised the Government. "Was [the PM] the emperor with no clothes, whose courtiers were too frightened to tell him the truth?" the *Sun-Herald* newspaper asked in an editorial. "[The PM] and his ministers have been shown to be inept or downright dishonest." ...[the minister] regretted "any action that misleads people as to what actually happened".

...Nauru's President, who is crucial to A[US]'s "Pacific Solution" for handling Middle Eastern asylum seekers, now calls the policy a "Pacific nightmare". [The President] told ABC radio yesterday that [it] was frustrated that the A[US]n Government had failed to keep him informed about the fate of more than 1000 asylum seekers who remain detained on the island. Nauru agreed to house and feed more than 1000 mainly Afghan and Iraqi asylum seekers as part of A[US]'s so-called Pacific solution. But the detainees were to have left the Pacific nation by [the end of last month]. That deadline has passed and the refugee applications of 700 asylum seekers are yet to be processed. [The President] wants answers. "I've got Parliament due on Thursday and it would be nice if I could tell them something... [Plus] I have an election coming up in 10 months and I'm not riding too well." [The President] also claimed A[US] had not kept its promise to give Nauru A\$30 million... in goods and services as part of the deal.

...*Bridge deaths* [Yesterday a] group of barges smashed a 72m section out of the only bridge leading to popular South Padre Island, Texas, and at least four people died after their vehicles plunged into the water below. An unknown number of people were missing. Thirteen were rescued...

At least 13 people were killed and 32 injured yesterday when a gangway connecting the dockside at the French port of Saint-Nazaire and the newly built liner the Queen Mary 2 collapsed. Hundreds of visitors, many of them families of workers involved in the ship's construction, were enjoying an open day... before... QM2... bade [the port] farewell... The disaster cast a pall over the launch of the Cunard liner, the biggest and most expensive ship of its kind in history... At 345m-long, the... NZ\$1.29 billion... 150,000 [tonne]... vessel can carry 2620 passengers... [and] 1253 crew...

Hundreds of workers will scour a cruise ship longer than two football fields, wiping down Bibles, washing linen, steam-cleaning cushions and disinfecting light switches, doorknobs and handrails. The Holland America cruise line hopes to kill a virus that has been sickening cruise ship passengers by the hundreds. More than 500 people aboard the Amsterdam have contracted a contagious stomach virus on four successive voyages over the past month, despite repeated efforts to disinfect the ship. At least two other U[S]-based cruise ships... have reported similar outbreaks... – ...at least 175 passengers and 12 crew members on a Disney cruise ship had become infected with a contagious stomach virus... The Magic departed from Port Canaveral with 3200 people on board and returns in a week. Disney officials have ordered the ship cleaned and disinfected at sea... Such cases are rare in an industry that will[annually] serve an estimated 7.4 million passengers worldwide... The Amsterdam is only the second US-based cruise ship to be pulled from service this year, and only two others have been taken out in the past four years, according to the Centres for Disease Control and Prevention. The Norwalk-like virus can cause diarrhoea, stomach pain and vomiting for up to two days.

...Hong Kong doctors and paramedics boarded a chemical tanker yesterday after it made a distress stop in the territory when 10 of its 24 member-crew showed Sars-like symptoms. Covered from head to toe in white protective gear, the medical staff got on to the Bunga Melawis Satu shortly after the Malaysian-flagged vessel dropped anchor... The... vessel... was originally bound for the southern Chinese port of Guangzhou... It is not known how or where the sick crew members, all of Indian origin, contracted their illnesses... [● 90 AUS]n tourists have been quarantined in India because of fears over a Sars outbreak... [after a 19-year-old] from the group... was admitted to hospital with Sars-like symptoms.

...The doctor credited with being the first to spot the mysterious and deadly pneumonia now spreading in Asia has died from the disease. Dr Carlo Urbani, 46, of the World Health Organisation, an Italian expert in communicable diseases, died on Saturday in Thailand where [it] had been receiving treatment after becoming infected while working in Vietnam. Dr Urbani, who was married with three children, was the first to identify the disease in an American business[person] who later died in a hospital in Hanoi. The physician's death comes as Hong Kong recorded its biggest one-day increase (58 more victims) since the WHO's global alert this month. The N[Z] Government is considering tighter controls for any outbreak here. Hundreds of N[Z]ers were in Hong Kong for the international rugby sevens series at the weekend. The WHO says the disease is being spread by international travellers, and nations across Asia are fighting to contain it... 1500 cases and 56 deaths have been reported globally. The Ministry of Health is unaware of any suspected cases in N[Z]. The]Health Minister... said last night that [it] would take a paper to today's Cabinet meeting recommending that [Sars]... be made a notifiable disease. This would give medical officers of health the power to quarantine people suspected of being infected. A N[Z]er at the Prince of Wales hospital in Hong Kong... has been sending daily emails to 1500 intensive care doctors around the world. In one of them [the NZe]r... wrote: "Events are starting to overtake us in terms of case load." All staff members who had had direct contact with Ward 8A, where the hospital's first case surfaced, had developed the illness. Hong Kong and Singapore have quarantined thousands of people and closed schools. Some Hong Kong businesses, including bank branches, have closed temporarily to be sterilised after workers became sick.

...The mysterious respiratory virus Sars has claimed its eighth victim in the Canadian province of Ontario and a ninth death is under investigation. The pneumonia-like disease is believed to have originated in China's... Guangdong province and has spread through travellers to infect 2500 people worldwide. More than 90 have died. Health officials in Ontario, where thousands of people have been quarantined to prevent the spread of Sars... have warned that more infections are possible... There are now 163 probable... cases of Sars in the province, which has a large Chinese immigrant population. Canada has the highest number of Sars sufferers after China and Hong Kong, and most are in Toronto. In Hong Kong... [t]here have been reports of hotels in the city refusing to check in locals or guests from mainland China. Some doctors will not treat patients with high fever unless they are certified free of Sars. A funeral parlour has refused to hold the funeral of a Sars victim... Meanwhile China, which has suffered more than half of all deaths and infections from the disease, fears the effects of Sars on tourism and the flow of foreign direct investment... "All of China's tourist attractions are guaranteed to be safe and healthy," a headline in the *People's Daily* said. The public are not so sure... The W[HO]'s infectious diseases chief says the mystery respiratory virus... should be identified within weeks, but... fears the virus may be carried by people without symptoms... "If there are people who have the virus and don't show symptoms... that would mean it had spread throughout the world, as it is easily contracted... That was how Aids was transmitted before it was discovered. We don't know if this is the case. That's why we need a test."

...The civet cat may be a weaselly looking thing, but southern Chinese have eaten them for centuries and that famous fondness for the exotic may have inadvertently set off... [Sars]. University of Hong Kong scientists... found coronaviruses – believed to cause Sars – in four civet cats they tested... The [civets face a similar fate to 'China's stray dogs – who are being beaten to death by police officers after some people said they were a source of Sars']...

As the Sars crisis intensified with record deaths in Hong Kong, a suspected N[Z] case remained in isolation in Dunedin Hospital last night. [The 63-year-old] is in a stable condition... The newspaper production editor became unwell while returning on Wednesday from a five-week holiday to London... [It] had spent three days in Bali on the way to London and had stopped over in Singapore, Bali and Brisbane on the way home... [When the patient] was admitted to hospital on Friday with most of the symptoms of Sars, staff leap[t] into action with full infectious disease protocol... [His wife] believed her husband's condition was improving. Elsewhere, Hong Kong reported 12 deaths from Sars on Saturday, its highest one-day jump, and another seven yesterday. The disease is fatal in about 4[%] of cases and has no known cure. The W[HO] says 3547 cases with 182 deaths have been reported from 25 countries. Chinese authorities raised significantly their number of cases after criticism the true figure had been concealed. The bulk of the new cases were in Beijing, where the number of infections was estimated at an alarming 339 and 402 more suspected cases.

...Beijing has closed theatres, cinemas, internet cafes and other public entertainment venues in an attempt to stop the spread of... [Sars], as the number of cases in the Chinese capital surged over 1000... The closures came amid increasingly drastic official steps, including the quarantine of thousands of people this week in Beijing and the sealing-off of at least three hospitals. Builders were working around the clock on a new 1000-bed isolation camp for Sars victims in the rural district of Xiaotangshan, on Beijing's northern outskirts... City officials raised the maximum fine for spitting in public – thought to be a means of Sars transmission – by 100[%] to 50 yuan (about \$10)... The decision was made to "stop possible spread of the Sars virus and ensure public health,"... It was announced just days after the city shut schools, sending home 1.7 million students.

...Auckland... principals are asking students and parents not to panic amid fears of a ...Sars... outbreak here. Misinformation and rumours about the virus had resulted in some "pretty unpleasant prejudices" being aired... A parent... had complained that... Rangitoto College... was not doing enough about students returning from high-risk countries after the school holidays... There have been no confirmed cases of Sars in N[Z]...

RUTHERFORD High School['s] principal... fears multi-million dollar benefits to west Auckland's economy could be jeopardised by needless scare-mongering surrounding the ...SARS... virus... [The principal] is calling for calm among parents worried their children may catch the virus from Asian students newly arrived from their home countries. Rutherford has two students whose temperatures are being taken twice a day since their arrival from China for the start of term two on Monday. Their presence has prompted at least one parent to remove her two sons from class until the 10-day quarantine period being enforced by other Auckland schools has lapsed. T[h]e Atatu resident... is angry the school did not contact parents a[nd]... says the school, which has 1000 pupils, is playing Russian roulette... So far N[Z] has had only one case of the SARS virus.

...Doctors and nurses don head-to-toe disposable clothing when they enter the isolation room in Hastings that is home to the [patient] suspected of having Sars. After every visit to the room, the paper suits, gowns, gloves, shoes, hats and masks are all burned. The patient lies in one of the hospital's four negative-pressure isolation rooms. When the door opens, outside air is sucked in; none escapes. The air inside the room is changed

10 to 12 times an hour, filtered and vented outdoors. The [patient] was admitted last Tuesday... three days after returning from a tour of China. Six days later, health authorities have still not been able to confirm whether [the patient] has the deadly virus... A range of tests had included screening for legionnaires disease, which exhibited similar symptoms but took at least two weeks to confirm. The [patient] and her family had asked for anonymity... Once discharged, the [patient] was likely to face 10 days' isolation at home and her family would be advised [of] the precautions they should take. Thousands of kilometres from Hastings, a former Tauranga [resident]... who has been confirmed with Sars, remains in isolation in hospital in Xi'an, China. The... day before the 39-year-old was due to leave China for the Caribbean, [it] was stopped from boarding a flight to Beijing and quarantined at Jaido Hospital... After a week in isolation, watching... Chinese-language TV, [the Tauranga resident] was last night itching to return home... The... horticulturist, who left N[Z] 15 years ago, is feeling much better and hopes his enforced isolation will end this week.

...The Sars threat has seen the trip of a lifetime canned for a disappointed group of Waitakere College students. The 10 year 12 and 13 students were to attend a youth leadership conference near the Sars infected city of Toronto [next month]... But... the trip had to be called off because of the lingering threat of Sars that caused a delay booking the cheapest and best airline deals, which cost the school money... The school and parents had been fundraising for the month-long trip, that included four days in New York, since August last year... [● Canadian s]cientists... yesterday broke the genetic code of the virus suspected of causing ...Sars[-] the first step to developing a test for doctors to diagnose victims and find a possible vaccine... Because of the lack of a definitive test, the Sars diagnosis is labelled by doctors as "probable" or "suspect"... The genetic sequence was posted on the internet (www.bcgsc.bc.ca) for use by other scientists immediately after it was broken... [The] director of the Michael Smith Genome Sciences Centre... said the new information "will tell us if Sars resembles other viral genomes, and gives us hints about the biology of the virus".

...An Aids expert is collaborating with a team of scientists in Hong Kong to design a drug that they hope will control the Sars virus, which has killed more than 500 people worldwide. Experts are racing against time to find a treatment... Existing drugs used in Hong Kong are ineffective for a fifth of victims there... [By the way, l]ife has imitated health planning for N[Z] hospitals dealing with the Sars epidemic. Just over a year ago the health system went through a month-long exercise with uncanny similarities to Sars... The scenario for the Ministry of Health's Operation Virex involved an outbreak of an influenza-like illness in a remote part of China and its spread to Hong Kong and other Asian countries, and on to A[US and N]Z... Public health officials and hospital managers say it provided an invaluable stocktake on N[Z]'s ability to cope with a large-scale infections disease. It tested the chain of response, from the ministry to regional co-operation to individual hospitals... The bad news: A full-scale outbreak would probably overwhelm any health system, including N[Z]'s. The exercise... showed up weaknesses in a health system already running at near capacity after years of economically driven change... N[Z] hospitals aim to run at 85[%] capacity, but all three Auckland boards acknowledge that they often run... over 90[%], and in the winter peak sometimes exceed capacity, meaning some patients are treated in corridors. Auckland is actually reducing the number of beds when the merged city hospital opens in October... Britain's *Daily Telegraph*... says the UK is ill-placed to deal with a Sars outbreak because its hospitals perpetually run at, or even above, the limit of their capacity. "Most British hospitals are already working as if there were a permanent epidemic of unprecedented proportions, though in fact they are merely dealing with normal day-to-day demand... We operate our hospitals on the Japanese principle of car manufacture: the just-in-time system of supplying parts. No doubt this is economically sound, in the sense of being cheap, but the idea that present demand for hospital beds is stable, that there should be no slack in the system, that slack in the system means slack staff is to invite nemesis. If Sars doesn't get the National Health Service, something else will."

...In light of the Sars... epidemic it would be appropriate to repeat the BBC's 70s drama series... about a pandemic illness originating in Asia that decimates the world's population. It described how unprepared survivors were to cope with[out] what is taken for granted in the modern world.

...N[Z] will become the first country outside Hong Kong and Singapore to use an infra-red camera to check air travellers for Sars. The Ministry of Health will borrow the \$150,000 camera from car light manufacturer Hella to screen all international travellers arriving at Auckland Airport for a trial period between 10am and 2pm on Wednesday, Thursday and Friday. The camera will be in an "unintrusive" position, probably high up where it can monitor faces as people walk from their planes towards the duty-free store. Anyone with a temperature above 38C will be identified by the colour on the monitor screen and taken aside for assessment by a nurse. The director of public health... said the three-day trial would determine whether it was worth using the camera for as long as the Sars epidemic lasts... [The director] said the 10am-2pm period of the trial each day had been fixed to cover the arrival of most flights from Asia. However, if the ministry decides to keep using the camera after the trial, it may extend it to run around the clock to include flights from A[US. "90%]... of the Asian traffic to N[Z or AUS] do the two countries at the same time,"...

Qantas officials have tracked down almost all 359 people who flew to A[US] with a flight attendant thought to have Sars. The airline would not say whether any flew on to N[Z], but the Ministry of Health is confident it would have been notified. The hostess mingled with 341 passengers and 18 crew for more than seven hours on Flight QF32 from Singapore to Sydney eight days ago. Medical experts say the Sars virus can live for up to three hours outside the body. It can be transmitted by objects passed between people, such as food containers. Qantas['] chief executive... said the flight attendant, aged 25, was in Sydney's St Vincent's hospital after becoming sick on Thursday. [The chief] stressed that the [attendant] showed no symptoms during the flight, and therefore was unlikely to have been infectious... The news came after N[Z] officials told people returning from Sars hotspots to delay surgery and avoid hospitals for two weeks... The W[HO] lists 6054 people around the world as having Sars... Sars has dominated news so heavily in Western countries that it has buried reports of potentially the biggest outbreak of the deadly ebola virus. The W[HO] believes the outbreak in the Democratic Republic of Congo has almost been contained after killing more than 123 people.

...[when t]he aircraft's massive cargo-bay door opened 10,000m in the air, a... Congo police Lieutenant... latched on to a truck in the hold. Dozens of others found nothing to grasp and tumbled out to their deaths. Survivors and airport officials said more than 100 passengers on the Ilyushin 76 carrying police, soldiers and their families were presumed dead, although the figure was in dispute and the company that owned the plane denied anyone was hurt. [The lieutenant], speaking at a military hospital in the Congolese capital of Kinshasa, described a scene of mass panic in the hold of the plane, crammed with people and cargo, when the huge bay door in the rear suddenly opened. "When the back door opened, I fell down and lots of boxes covered me... Lots of my colleagues were sucked out by the wind. I don't know how many, because I fainted." The flight crew returned the plane to Kinshasa 45 minutes after the flight took off for the southeastern city of Lubumbashi. Only about 100 people aboard returned safely, [the lieutenant] estimated... 350 people were aboard the plane when it took off, including... children – meaning as many as 250 people had died... Congolese military helicopters were deployed to search for bodies near the city of Mbuji-Mayi... It was not known... whether the[passengers] had seats or seatbelts. It also was not immediately known why the door came open... Ukraine's Defence Ministry, which owns the plane and leases it for use in the Congo, denied anyone died in the accident and disputed significant details of the survivors' accounts. [A]Defence Ministry spokes[person]... cited officials of the state-owned company that operates the aircraft, Ukrainian Cargo Airways. "Neither the people, nor the cargo, nor the plane itself were hurt or damaged,"... The Ilyushin 76 is a medium to long-range transport jet that was first flown in 1971. It has a capacity of 40,000kg and there are 900 in service... The plane has a chequered safety record, including 47 accidents that resulted in 668 deaths...

All 19 U[S] Marines on board a new-technology military aeroplane were killed yesterday when it crashed during a training exercise... using night-vision goggles... The MV 22 Osprey crashed... about 30km northwest of Tucson... Arizona... [Local] residents told television news crews that the plane burst into a ball of flames before hitting the ground... [but m]ilitary officials could not confirm whether the plane had become an airborne fireball before it crashed... [However, they] said there was no live ordnance on board... The Osprey, under development for more than a decade, can take off and land like a helicopter using rotors before converting to fixed-wing operation that enables it to fly like a plane... It was not known

whether the crash occurred while the plane was in transition from rotor-powered to fixed-wing flight... The hybrid Osprey is due to be placed on full operational status in 18 to 24 months. It is designed to replace the helicopter as a means of getting US troops in to and out of hot spots quickly, and in conducting civilian rescue operations. In a White House statement, [the]President... underscored the dangers those in the military faced even during peacetime. "This terrible loss of life is a reminder of how so many... [people] in the nation's military put their lives at risk, each and every day, so that we might be a free people, and the cause of peace can be advanced throughout the world." A second Osprey on the training mission was not involved in the accident, [the President] said... No one on the ground was injured when the plane went down in fair weather.

...A team of military investigators yesterday began sifting for clues amid the burned wreckage of... the \$US44 million... MV-22 Osprey aircraft that crashed... Inside the downed aircraft were four crew members and 15 other Marines, including four members of a Marine helicopter unit that provides... [the US President]'s helicopter service... [A] Marine Corps spokes[person], said the Marines were carrying out final evaluations of the hybrid Osprey in a test programme... It was the third crash of an Osprey... [the spokesperson] said. There were no fatalities in a 1991 incident but seven people were killed in July 1992 when an Osprey crashed at the Marine Corps base in Quantico, Virginia.

...Since the U[S] is not at war at the moment, the families of the 19 Marines who died this month when their V-22 Osprey heli-plane crashed... will not receive any of the special medals reserved for those who perish on the field of combat. But perhaps they should, because a very definite state of war has existed inside the Pentagon for more than 50 years. As the military's rival branches battle for turf, and the lion's share of the defence budget, [armed services personnel] keep dying and vast sums – untold billions of dollars – are poured into projects destined to finish their days as gold-plated curios. You can find whole gaggles of ruptured ducks at places like the US Air Force Museum. There is Tacit Blue, for example, a streamlined shoebox with a tail like a devil's horns that was conceived as a high-altitude radar surveillance platform. It cost well over \$2 billion to develop. Now it makes an expensively photogenic backdrop for the snapshots of awestruck tourists, who do not realise its real purpose was to make sure that money which might have gone to the CIA's surveillance satellites stayed in the Air Force budget. Then there is the mock-up for the Orient Express, the space plane powered by a hydrogen-burning "scram" jet which [the 40th US President] promised would be ferrying business[people] from New York to Tokyo in less than two hours by 2001. At the Pentagon, which invested another \$4 billion into the fantasy, the concept was seen as a means of rapidly deploying the squadrons of "Star Wars" satellites that were supposed to shoot down incoming ballistic missiles. And don't forget the nuclear-powered bomber, which was to be powered by twin reactors as it roamed over the Soviet Union irradiating the countryside with its lethal exhaust. That cost \$6 billion and didn't get airborne either. The generals' chief allies are [members of C]ongress... – who don't seem to care if the latest gee-whiz hardware actually works as long as it is assembled in their electorates – and the defence contractors, who relish the rewards for letting their techies' imaginations run riot. Meanwhile, taxpayers pick up the tab and military undertakers collect the remains... The institutionalised rivalry inside the Pentagon is the sole reason an aircraft like the Osprey – a weird, ungainly creature with windmill-sized propellers on stubby wings – took to the air in the first place. Apart from the engineers at Boeing and Bell who put the beast together, it is almost impossible to find an independent aeronautical expert who does not regard the Osprey as a \$40 million death trap... Even inside the Marine Corps, those senior officers more concerned with winning wars than spending money don't like it one bit. While the Osprey sounds great in theory, the sceptics argue that the practical realities of such a complex machine doom it to constant and tragic failure, particularly under battlefield conditions. Of the six prototypes built so far, three have crashed... Yet despite the... US Government Accounting Office[']s... urging that the Osprey be scrapped, it continues to fly – at least when it is not colliding nose-first with Arizona. Its supporters on Capitol Hill... trace the Osprey's birth to the Marine Corps' decision in the early 1980s to replace its heavy-lift Chinook helicopters, which have been used since Korea to ferry [personnel] and equipment from ships to beach[es]. The Marines wanted something with a greater range that would permit ships to stay further out to sea, where there is less chance of falling victim to a surface-to-surface missile. But the Osprey's genesis actually goes back to 1948, when what was then the US Army Air Corps won a bitter bureaucratic battle to become an entirely independent branch of the armed forces. The newly re-christened Air Force was riding high at the time. After its planes ended... [WW2] by delivering the nuclear bombs that decimated Hiroshima and Nagasaki, the war-gamers and strategists of the day concluded that the Navy and Army would play only minor roles in future conflicts... In the Navy, the loss of prestige caused such anguish that Navy Secretary James V. Forrestal suffered a nervous breakdown and flung himself from the 10th-floor window of his hospital room. The Army, which had just lost all its fixed-wing aircraft, tried to circumvent the rules by turning helicopters into the ground-attack weapons it needed to support troops in the mud below. This is a job the Air Force should have performed but was loathe to do since it saw ground-support missions as a drain on what the generals regarded as their purpose: trucking nukes to Moscow in flashy and expensive supersonic bombers. Fifty years later, the consequences of this rift became apparent in Kosovo, where the Army's \$30 million Apache helicopters were prohibited from venturing more than 500m into enemy territory. For more than a decade, the Army had been assuring congressional committees that the Apache's death-dealing potency matched its staggering expense. But when faced with the acid test of actual combat, the generals bowed to reality and withdrew the Apaches from the field of fire... Will [the Osprey] survive another burst of flak from critics, particularly those in the Army and Air Force who would love to see the money for 350 additional Ospreys re-assigned to their own pet projects? Logic says no. Political precedent indicates otherwise. With parts of the Osprey being built in a full 40 of America's 50 states, few [members of C]ongress... will be brave enough to vote down a programme that keeps many of their constituents employed.

... "We're the company that is developing a new means of transportation... for the 21st century... a vehicle that combines the best features of the helicopter with the aeroplane. In other words, something that can take off vertically, which is absolutely essential if you're going to use it whenever or wherever you want... then converts to a aeroplane... in forward flight... Our intention is to get the skycar [– 'cost today, \$1m' –]down to the point where in volume production, it can be at about as expensive as a luxury automobile, so that you'll see masses of them... [O]f course, it won't happen until we have a system that can operate many, many skycars safely. NASA has already started... what they call 'highways in the sky'. They've appointed a committee of 7 representatives of... [the] aviation industry to study this concept and make recommendations as to how we ought to go in building the... sky... highways... It will be based, principally, on the global positioning system satellite network. The issue is how do you integrate [skycar traffic into an] airway network so that you don't get run into by someone else... Because, of course, flying at nearly 400 miles an hour in a vehicle this small you clearly need to be automated – you can't have somebody up there that has his hands upon the controls. So you're going to be a passenger... This vehicle could be flown by people who are blind; ...by people without hearing; the handicapped would have the flexibility to go wherever they want when they want. There's a... [lot] of opportunities here that just don't exist today. I always joke about the fact that... a drunk could get into this thing and the worst... that could happen... is [the drunk] could end up in Alaska instead of LA, but [the drunk would] certainly end up safe and sound there at the end of his flight... Until people understand our aircraft they're going to say, 'Oh, now we're polluting the skies... [and] if we look up in the air we're going to see all these vehicles, we won't be able to see the sky any more.' What people don't realise is that today we're trying to solve a two-dimensional-plus problem... with a one-dimensional solution. If you have a three-dimensional solution, I think the thing that's most significant is that if every automobile that's in every garage in the world... was in the air at the same time they would still be more than a mile apart. So we don't have any image really of what a great natural resource [this] is. Even if we use it to its maximum capability we're still going to have an enormous amount of free space up there. And yet, at the same time, we'll have efficient ground transport concurrent with that..."

...ON THE foreshore at the bottom of Earnoch Ave, Takapuna, is a... 1960s 200 sq m... two-level... house... with an office... two bedrooms, a shower and bathroom, and a... two-car 75 sq m garage[, which also]has a shower and toilet... It has a two-year-old government valuation of \$1.28

million and will be auctioned... by Bayleys in Takapuna... It is one of the few private properties certified by the North Shore City Council for helicopter landings. The council has designated a commercial helicopter pad near the sewage ponds on Rosedale Rd. Otherwise, with permission and \$300, helicopters can land on clear spaces such as parks in the city. The private pad is the lawn of the 1012 sq m property, which includes a sandy strip about 1.5m below and access around the rocks to Milford Beach. It has been owned by a property trust for about 10 years and the occupant flew in and out regularly in the late 1980s, but recent lack of use has caused the number of permissible landings to be limited.

...A ROW has flared between Piha residents and the Waitakere City Council over attempts to upgrade the... grassy helipad site... which has fallen into disrepair... to improve access for the rescue helicopter. The council is... [also installing] more warning signs... after three drownings at the beach over Labour weekend. Residents intervened last week as council workers began trimming trees around the helipad. And an upset delegation turned up at Tuesday night's Waitakere Community Board meeting, complaining they hadn't been consulted... [T]hey're worried the helipad will ruin the look of the beach and that it will become a permanent fixture... [One resident said,] "If they trim the trees we are going to see more of that ugly toilet block." ...the council has a resource consent for the existing site and isn't obliged to consult the public about pruning the trees. Another Piha resident, [who is a] former Split Enz and Crowded House member... says residents recognise the need for a helipad... "No one is denigrating the job the lifesavers are doing. But the foreshore of Piha is what people come to experience,"... After hearing the delegation, the... board called on the council to resume the helipad repairs... "If anything went wrong tomorrow, I think we'd all feel... we hadn't done our duty," [a councillor said]... The board says the upgrade is a stop gap until a permanent site is chosen, and residents will be consulted before any development takes place.[The] Surf Life Saving Northern Region director... says the upgraded helipad will only be used by emergency helicopters, not commercial ones. "The reason behind it is purely safety. We can't always rely on being able to land on the beach... It's not safe for the public or helicopter crews, and it's unfair to compromise their safety." [The director] says having easier access for a rescue helicopter is also a benefit to the Piha community.

...BOTH sides in the Avondale heliport battle are weighing up appeals against the strict consents granted by the Auckland City Council. The application by Oceania Helicopters Ltd to build a service and maintenance heliport on the Avondale peninsula was approved by planning commissioners last Friday. Oceania[']s lawyer... says the company will decide by tomorrow whether to appeal... [while the resident] who formed the North Western Community Association to oppose the heliport, says the Environment Court is the next step. [His group] says their legal advice is that Avondale residents have a strong case for an appeal... [T]he group has enough funds to launch an appeal, which could take a year to reach the Environment Court... Heliport opponents believe residents and the Pollen Island marine reserve have got the "thin end of the wedge" with the consent, despite the conditions imposed. The consent requires a two-year wildlife research programme before any helicopters can use the facility or the flight paths. It also reduces the number of flights to and from the helipad to eight a day instead of the proposed 16, and shortens the operating hours. But [the group] says the clause of most concern is that the company can reapply to change these restrictions at any time.

...THE Auckland Regional Council and the Department of Conservation have lodged appeals against the heliport in Avondale. Both say the heliport will endanger birdlife and that the consent from the Auckland City Council goes against regional policy regarding designated wildlife zones... [According to] the ARC and DOC... the N[Z] Coastal Policy Statement, the Auckland Regional Policy Statement and the Auckland Regional Coastal Plan have been ignored in the council's decision... [T]hree threatened birds, the N[Z] dotterel, North Island fernbird and banded rail, are found on neighbouring Pollen and Traherne Islands. The area is also a stop off for migrating wading birds... The ARC says the two year baseline monitoring that Oceania is required to do... is unacceptable because it does not involve an independent body or peer review and is not subject to "rigorous public process". Both agencies say any long term effects might not be apparent until it is too late and the consent didn't include how or what Oceania should do to repair any damage if it was found... They bring to four the number of appeals lodged against the consent.

...[the] North Western Community Association chair[person is]... delighted... Oceania Aviation has sold the Rosebank Rd site it was hoping to use for 30 flights a day... The land is now owned by Kensington Properties[, which]... has permission to build an office and warehouse on part of the site... No one at Oceania was available for comment... [but p]lans for a heliport in Avondale look permanently grounded.

...Planes were grounded, air crew locked out and passengers turned away when the country's second biggest airline went into receivership[, throwing]... the travel plans of thousands... into chaos... Yesterday's drama began when Wellington airport threatened to ban Qantas NZ planes because of unpaid landing charges of \$700,000. The eight-month-old airline had been losing \$400,000 a week. [The r]eceiver... said: "There must be hope someone will fly again but it won't be this animal." ■... AIRPORTS around the country have been thrown into chaos by the collapse of Qantas N[Z]. Hordes of people spilled out of destination lounges as 12,000 stranded passengers scrambled to transfer their tickets to other airlines. The 1100 dumped Qantas NZ staff – including 140 pilots and 180 cabin crew – held emergency meetings at major centres. Workers had turned up at airports yesterday morning to be met by security guards, told to hand in their keys and security cards and go home. The airline – which had flown as Ansett NZ since 1986 – was placed in receivership at 3.25am. It had been rebranded as Qantas NZ eight months ago but... [a] lengthy dispute with pilots... saw passengers shifting to Air NZ. Analysts say it never recovered... Tasman Pacific Airlines – the owner of Qantas NZ – blamed Wellington Airport for forcing the receivership... But Wellington Airport[']s general manager... rejected the claim, saying it was o[nly o]ne of many creditors... The Qantas NZ collapse caused three national league soccer games to be postponed. The league is sponsored by the airline.

...A ray of hope exists for 1100 airline staff with signs that Qantas Airways will take over its N[Z] franchise. But it[']... is unlikely to re-employ all the... staff laid off, or fly all the routes of the old airline. The N[Z] manager of Qantas Airways... will meet [the] Transport Minister... today to discuss the A[US]n airline's plans to fly domestic routes in N[Z]. The meeting, scheduled some time ago, follows a tumultuous week in the skies on both sides of the Tasman... Tasman Pacific... collapsed with debts believed to be about \$20 million... [The minister], who last week granted Qantas Airways approval under an open skies agreement with A[US] to fly domestically, said the Government would do all it could to help Qantas. "I think we will see something emerge from the gap that's there, but we won't know what it is for a while." Qantas Airways... said that after failing to negotiate a deal with Tasman Pacific in several weeks of talks, the company had several options. But it was too early to be more specific. A[ir NZ said it]... would be surprised not to see Qantas Airways run some domestic services in N[Z] in the "very near future." ...Air N[Z] shifted thousands of extra passengers at the weekend... and is putting on 50 extra flights today to move the Monday business crowds... Qantas Airways was already helping Air N[Z] by carrying passengers affected by the grounding of Ansett A[US] jets. Qantas Airways hoped some of its aircraft would be in N[Z] by tomorrow to help move passengers... "If the Ansett thing hadn't happened, the planes could have been here much earlier, but it's... all happened at once."

...Tasman Pacific, a consortium of N[Z and AUSn businesspeople], paid... News Corp \$36 million for Ansett N[Z] in March last year, then rebranded the airline as Qantas NZ in September... Qantas [Airways] contributed towards a \$6 million rebranding exercise, and Qantas NZ agreed to pay what is believed to be several millions of dollars for the franchise rights, the first Qantas [Airways] had negotiated anywhere. But the bright hopes... were never met... *How could some of N[Z]'s most successful investors buy a turkey?* Good question. It seemed a good idea at the time, even if predecessor Ansett N[Z] had lost a variety of owners more than \$230 million... since [it had] arrived in July 1987... Although the outcome has been otherwise, industry analysts predicted the franchise might finally be able to mount a real challenge to Air N[Z]'s market dominance. Qantas [Airways] would help with economic advice and management systems, provide access to the oneworld global airline alliance, offer smoother international connections for Qantas NZ passengers, and greater buying clout for essentials ranging from fuel to uniforms and cutlery.

...Having allowed its N[Z] franchise to collapse, Qantas Airways is considering entering the domestic market in its own right, and at a bargain basement cost. Tasman Pacific... went into receivership on Saturday morning at the prompting of its major debenture holder, the Bank of N[Z]. The receiver... would not reveal the size of the debenture held by the BNZ, but said it was more than the \$4 million reported at the weekend. [The receiver] was still working out how much debt the airline had, but said it had few assets to sell. Twenty of Qantas NZ's 21 planes were leased from Air N[Z], and had already gone back... [T]wo parties, which [the receiver] would not name, had shown interest in the assets... Damage to the Qantas brand was inevitable, said... [the] director of the Centre for Asia-Pacific Aviation in Sydney... But by allowing its franchise to fall over, Qantas can fly into N[Z] with new aircraft, free of the hangovers from Ansett ownership. Qantas NZ flew eight 90-seater Bae146 whisper jets on expensive leasing deals. Qantas could use Boeing 737s which are cheaper to maintain... [In related news, NZ Soccer's] chief... faces a frantic damage control session this morning as [it] tries to salvage the national league. Stunned by Saturday morning's announcement that the league's sponsor... had tumbled into receivership, [the chief] was yesterday putting on a brave face and made it clear they would do everything to save the league... With [Qantas NZ's collapse] went a sponsorship deal which had been set to cover at least the first three years of the new-look competition... The three-year deal with Qantas NZ was understood to be worth about \$1 million. The budget for travel and accommodation for this season was \$600,000...

Shuttle keeps national league aloft It sounds like something from a space odyssey. But it is simply N[ZS] Flight 101. Determined to have the national league go on with minimal disruption, the [soccer] association has taken to the air. Tomorrow, at 7.45 am, the Central United players will fly to Palmerston North for their 2 pm game with Manawatu. The aircraft will then go on to Wellington, collect the Miramar team and fly them to Auckland to play Waitakere City. After cooling their heels at Auckland Airport, the crew will fly Miramar back to Wellington, drop into Palmerston North to pick up... Central... and return to Auckland... • Tasman Pacific owes... creditors... \$100 m... and most have little chance of getting their money back... A handful of secured creditors – the B[NZ], Inland Revenue... Customs... Ansett A[US] and 1100 former staff – will be paid \$23.9 m... [S]taff will receive up to \$6000 each in wages. But hundreds of unsecured creditors, including businesses which supplied services and staff owed redundancy payments, will be left looking at a black hole. The receivers' report into Tasman Pacific, which flew as Qantas NZ, said the... airline had... \$3 m... with which to pay debts to unsecured creditors of... \$80 m... The largest unsecured creditor is Mobil, owed... \$8.6 m... It... was still exploring its options... Yesterday, businesses and former staff reacted with a mixture of shock... and resignation... at the scale of the debt... The receivers' report comes six weeks before a liquidator, appointed by the Zazu consortium of wealthy business[people] who were Tasman Pacific's sole shareholders, is to meet creditors... Then the directors are expected to explain how the company traded its way into such a mess.

...The proposed buying in to Air N[Z] by Qantas Airways... [is] likely to dominate local sharemarket news this week. The market is closed today... but... [t]he Air NZ ownership debate is expected to continue to generate plenty of news... JP Morgan's [broker]... thinks Qantas will continue to push hard to get the Government to agree to its proposal. "I think the resolution will be that Air N[Z] sells Ansett A[US] to [Singapore Airlines] and that will be positive for Air N[Z]'s share price." But JB Were's [broker]... disagrees, believing that the deal will face serious difficulties. "There are just too many hurdles: you've got regulatory hurdles, you've got ownership hurdles, you've got competition hurdles."

...Qantas plans an aggressive push on N[Z] domestic and trans-tasman routes "to put Air N[Z] out of business", say reports of an internal speech by the airline's chief executive. [The chief executive] was reported in the *Sydney Morning Herald* as telling 70 managers: "Qantas believes that the airline [Air NZ] will not survive." [The chief executive] was quoted as saying the N[Z] Government eventually wanted Qantas to buy in to the national airline. "Qantas, however, intends to aggressively compete in the N[Z] market by beginning a major domestic operation." ...The report has clearly clouded relations between Qantas and the [N]Z... Government... NZ's Finance Minister... said the tenor of the report was not in tune with his meetings with [the Qantas chief executive. The minister also]... said it was not true that the Government wanted Qantas to eventually buy in to Air NZ... [The minister] said that in their meetings [the Qantas chief executive] had given the impression there were advantages in some sort of strategic alliance "which would include the potential for expansion for Air NZ." Air NZ has been hit by the [performance] of its Ansett subsidiary in A[US].

...Air NZ directors early today remained locked in a marathon meeting to develop a rescue plan to stop the national flag carrier's financial collapse. Directors from the company's two major shareholders, Singapore Airlines and B[IL], were taking part by video-conferencing, and [the NZ Government's] negotiator... and teams of lawyers were on standby. Late last night... [NZ's PM said it] thought Air N[Z] would survive. Asked about its A[US]n subsidiary, Ansett, which is losing \$1.5 million a day, [the PM] said: "I am not going down that road – no further comment." [The PM] is expected to brief the cabinet today on the developing measures to salvage Air N[Z], but no firm proposal will go before ministers... The P[M] also talked to A[US]'s Acting P[M]... during the evening. One of the issues complicating the boardroom talks was a "letter of comfort" Air N[Z] gave to loss-making Ansett which makes it difficult to put the A[US]n airline into receivership without also threatening its parent. Air N[Z] executives could not say yesterday whether the letter guaranteed all Ansett's loans, or was simply a stop-gap measure to keep Ansett afloat while Air N[Z] put together a recapitalisation plan. If Air N[Z] writes off its investment in Ansett and reports, as expected, an operating loss of up to \$300 million on Thursday, it would have shareholders' cash of \$350 million against consolidated debt of \$3.1 billion. If Ansett's debts are also guaranteed by Air N[Z] in the letter of comfort, its plight will be far worse... The depth of Air N[Z]'s plight was shown when it pulled Ansett's advertising in A[US] at the weekend. So desperate is Air N[Z] that its board last week asked Qantas to buy Ansett. But Qantas' chief executive... rejected the proposal.

...Three months ago, four airlines were warring for a piece of the A[US]n skies, and passengers could pay \$33 for a one-way ticket from Sydney to Brisbane. Today, there is a risk that only Qantas will survive. Impulse has been swallowed by Qantas. Virgin Blue has only nine planes. And Ansett, once a true competitor to the Flying Kangaroo, is on its knees. In the space of six years, it has gone from being the nation's leading domestic carrier to fighting for its corporate life. How did it come to this? The company has been in trouble for years, but the realisation that its condition could be terminal has come remarkably swiftly. Until this week, the accepted wisdom was that Ansett could be rejuvenated under a proposal unveiled... by its parent company, Air N[Z]. What it needed was an injection of cash to modernise its fleet and bolster its day-to-day working capital. Not more debt; it already had enough of that. It needed more money from shareholders. It was generally agreed that \$NZ1 billion would do the trick. The... plan was that Air N[Z] would issue new shares to Singapore Airlines in return for cash, which could be applied to solving Ansett's problems. Air N[Z] was keen; Singapore Airlines was keen. All that was needed was to persuade the N[Z] Government to change the laws restricting foreign ownership of the national airline. The new shares issued would take Singapore's stake in Air N[Z] from 25... to 49[%]. As late as last Monday the... plan appeared to be on track. That day, [NZ's P]M... said her Government hoped to make a decision on foreign ownership by mid-week. Tuesday brought an unexpected development – [the British entrepreneur] who runs Virgin Blue, made great play of rejecting a takeover offer from Ansett. It soon became obvious that the failed takeover had been a crucial – if undisclosed – part of the... plan. If Virgin and Ansett were merged, A[US]n aviation could go back to the cosy days when two carriers could both make profits... What no one knew at the beginning of the week was how badly Ansett was suffering from the Virgin competition... Six years ago Ansett ruled supreme, with a 56[%] market share over Qantas, then a Government-owned entity... [Indeed, from 1994-96 Ansett was] named best airline by travel agents... But Ansett's distracted owners, News Ltd and TNT, did not realise the power that a private Flying Kangaroo – merging with A[US]n Airlines and listing on the sharemarket – would have on its dominance... [(although, in 1996 TNT sold its 50% holding in Ansett... for \$A475 million... to... Air N[Z] – which eventually agreed)... to purchase News Ltd's holding for \$A580 million]. The... loss of market share accelerated after the entry of Impulse and Virgin, and some analysts now believe it is as low as 39[%]. Ansett's rickety fleet is now the second-oldest of the top 50 airlines in the world. The most stunning

evidence of the neglect by successive owners came... when the Civil Aviation Safety Authority grounded the airline's entire fleet of Boeing 767s. Even if governments on both sides of the Tasman agree to a bailout, it will be only a reprieve. Until Ansett can finally find itself a committed owner with deep pockets, its position will continue to deteriorate. And if Ansett cannot find such an owner its days are numbered.

...[NZ's]Government has put up \$550 m... towards an emergency bailout of Air N[Z] after it posted the biggest loss in N[Z]'s corporate history – \$1.4 b... Major shareholders B[IL] and Singapore Airlines have also pledged \$150 m... each to keep the national flag carrier operating after it was engulfed by huge losses... on its... investment in... Ansett A[US]. Air NZ has been pushed into a loss by its attempt to break into the tough A[US]n aviation market. The... rescue deal is subject to a due diligence exercise by the Government and its two major shareholders, and the agreement of the airline's bankers... Ansett was put into voluntary administration... after a dramatic race against time failed to secure any realistic new ownership proposals. Air N[Z] directors on the Ansett board... might yet face strong scrutiny from A[US]'s securities watchdog after allegations... Ansett may have traded while insolvent. The allegations were strongly denied by [Air NZ's acting chairperson. NZ's]... Finance Minister... declined to criticise the performance of Air N[Z]'s present board. But the board will be reduced from 13 to [9] members and the Government will have a controlling say on the appointment of a new chair[person. The acting chairperson] was grim-faced when [it] unveiled the airline's \$1.4 b... loss at a transtasman video conference at 1.15 pm yesterday. The conference was to have started at 12 noon, but was delayed while airline chiefs haggled with the N[Z] Stock Exchange over their decision to post an unaudited result. Air N[Z]'s chief executive... – who was headhunted from Qantas Airways less than a year ago – said [it] was “shattered” by having to disclose such an awful outcome. Protracted negotiations with Governments on both sides of the Tasman to try to recapitalise Air N[Z] and its A[US]n offshoot had failed. The Government will lift the ownership cap on Air N[Z] so Singapore Airlines can raise its stake... to 35[%]. The distinction between shares that can be bought by foreigners and those available only to N[Z]ers will be abolished. [The minister] said the huge Ansett writedown meant it would not have been possible to reconstruct the airline without Government support. [But maintaining NZ]'s only international carrier and its main domestic carrier was “not an issue we could stand back from.”

...[NZ's P]M... landed in Auckland late last night on an Air Force plane after furious Ansett airline workers blockaded her commercial flight from Melbourne. Transtasman travel for thousands of passengers was thrown into turmoil after protests by workers forced Air N[Z] to suspend flights and Qantas to delay services. Up to 16,000 Ansett workers might lose their jobs after the Air N[Z] subsidiary was placed in voluntary administration, grounding all Ansett flights early yesterday... [The PM] last night described her ordeal as “the journey from hell”. After flying to Rome and back since Tuesday – “we haven't been in a bed since” – the P[M]'s party flew into the Ansett collapse and the resulting anti-N[Z] sentiment. They arrived at Melbourne at 6.45 pm - ...four hours after Ansett had been grounded. When the P[M]'s party discovered airport staff had blockaded the Air N[Z] plane they transferred their belongings and baggage to Qantas. Word quickly went around the terminal that the N[Z] P[M] was to be on the Qantas flight and it, too, was blockaded. Police advised her to stay in the lounge, where they remained for four hours until taken by police helicopter to Sale Air Force Base, where [the PM] boarded an Air Force Orion... Ansett passengers who arrived early at airports around A[US] yesterday morning learned that the country's second-largest airline... w[as] on the ground for good... Most Ansett staff woke to learn they had lost their jobs over radio or television, or by notices stuck to the locked doors of the airline's terminals. As the realisation sank in that the unthinkable had happened, shock turned to anger that erupted in the blockading of Air N[Z] aircraft, stopwork meetings, mass rallies and calls for the heads of the board of the Kiwi flag carrier and the N[Z] and AUS]n Governments. With trucks jammed against more of their aircraft at Melbourne's Tullamarine airport and fury spreading into the broader union movement, Air N[Z] suspended transtasman flights out of N[Z]. Terminals were choked by 45,000 stranded passengers, waiting for news or for one of the free seats offered by Qantas and Virgin Blue, or simply giving up and accepting they had lost their holidays, business trips and – for many – any chance of a refund. A[US]'s corporate watchdog, the A[US]n Securities and Investment Commission, launched an investigation into Ansett's collapse and the A[US]n Government vowed to pursue Air N[Z] for \$A400 million... in workers' entitlements that [i]t... is refusing to accept responsibility for. The Opposition warned that a Labor government could shut Air NZ out of A[US] if it did not meet its obligations to Ansett staff... [AUS's PM,] who stepped off a plane at Sydney after his harrowing time in Washington to be greeted by a domestic crisis that has the potential to wreck his chances of another term in office, spoke briefly with a delegation of Ansett workers before heading for an emergency cabinet meeting... N[Z]'s Finance Minister... issued his own statement to the A[US]n media to quell anti-N[Z] sentiment, absolving Wellington from responsibility and passing the buck to problems inherited from Ansett's previous owners... News Ltd hit back with claims it had left Ansett as a business in good shape run by a first-class management team. And as the political war raged, the effects of Ansett's collapse rolled out like a succession of tidal waves. National A[US] Bank reeled with massive losses from its exposure to Ansett and Air NZ, Ansett travel subsidiary Traveland and airline caterer Gate Gourmet also moved into administration, the viability of Canberra and other smaller airports was cast into doubt, and rental car and taxi companies prepared for setbacks. At Tullamarine... an Ansett worker for 27 years whose father had worked for the airline for more than 40 years, harangued passengers lining up for transtasman Air NZ flights. “They should hunt down Air NZ[s] chief executive... as a traitor. [The chief executive] is an A[US]n and it's too gutless to come back...”

Air N[Z] is in danger of being put into receivership and its rescue plan is on shaky ground because of mounting pressure on it to cover Ansett employees' entitlements... Air NZ's cornerstone shareholders and the [NZ] Government have come up with a rescue plan for the national carrier, but that was based on Ansett being divorced from Air NZ, and a share price of 67c a share. All that has changed since Friday, when the share price plunged to 50c and there were calls from A[US] to make Air NZ liable for some of Ansett's debts, especially staff entitlements. This has placed a lot of uncertainty on Air NZ's future... As a result, shareholders Singapore Airlines and B[IL], along with the NZ Government, were revisiting their options... The parties have four to six weeks to complete due diligence before committing themselves to the deal. Placing Air NZ in receivership would be the most effective means of safeguarding the carrier, ringfencing it from Ansett A[US]. Ansett's staff would become unsecured creditors, rather than enjoying the preferential position in the queue they could hold now. Sources said receivership would allow the carrier to continue flying while the receiver traded the company out of trouble or found a buyer in an orderly fashion. Angry A[US]n unionists are threatening a boycott that could force Air NZ out of their country amid growing fallout from the Ansett A[US] collapse. But amid the Kiwi-bashing, there was a glimmer of hope yesterday that A[US]'s second-largest airline may not yet be gone for good. As the A[US]n Council of Trade Unions warned that up to 100,000 jobs would be lost if Ansett died, the airline's administrator... hinted of signs that Ansett planes could be flying some routes again by tomorrow... and asked all Ansett staff to stand by for more news... The grounding of Ansett has become the biggest industrial disaster in A[US]n history in terms of job losses – and Air NZ is getting most of the blame. Late yesterday the airline... said... all its flights to the US and A[US] had resumed.

...ANSETT returned to A[US]n skies yesterday with banners, balloons, a brass band and lots of cheering. Emotions were running high as Ansett workers and supporters turned out to celebrate the first flights of the resurrected airline, which took off simultaneously from Melbourne and Sydney airports at 11am... As hundreds of employees gathered in the Ansett terminals in both cities there were tears, lots of hugging and kissing, and renditions of “Ansett, Ansett, Ansett, Oi, Oi, Oi”. Passengers on the first flight from Melbourne Airport were all issued a T-shirt saying: “I helped get Ansett A[US] back in the skies.” They were then cheered through the concourse by hundreds of supporters. At Sydney's Kingsford Smith Airport, staff made a guard of honour and carried passengers' bags through the terminal doors. Passengers on the flights, who were served bottled water under the airline's new no frills service, were pleased the airline was back in the skies. The... [a]dministrator... said selling the airline

remained a possibility, and they were in talks to relaunch flights to Brisbane and Perth as early as next week... [The] ACTU president... said the send-off showed the tremendous spirit of Ansett employees. "It is a huge team, all these people care about each other." But [the president] criticised the federal government for refusing to inject \$A200 million to help get the airline fully back in the air... ■ [Air NZ's]... major shareholders will be asked today to affirm their commitment to the national carrier's \$850 million rescue package... Air NZ directors meet at 1 pm and if... Singapore Airlines... and BIL refuse to commit to the bailout the airline could risk being put into statutory management. S[ingapore Airlines] yesterday dropped its objection to the Government's taking a stake in the national carrier, opening the possibility of the airline ultimately being nationalised if the rescue package falls over. But [the] Finance Minister... said the Government remained wary of exposing taxpayers to the airline's liabilities.

...Air NZ[, which] lost a record \$1.3 billion... [– not including] the \$184 million settlement reached with the Ansett administrators which... ended Air NZ's liabilities... [for Ansett's total] liabilities around the \$1 billion mark[–]...and had to be bailed out by the taxpayer[s of NZ, is]... looking to cut the equivalent of 800 jobs, half in management. With weak international traffic, Air NZ is deriving much of its returns from domestic travel ...Qantas has reiterated to the N[Z] Government... that it is still interested in a proposal to buy in to the airline... In the past few months Qantas has boosted services in N[Z], with 10 return flights between Auckland and Wellington and eight between Christchurch and Auckland. It is also adding flights to several provincial cities, helped by provincial airline Origin Pacific. Significantly, Qantas last month announced the appointment of [the person]... who previously managed all Air NZ's domestic services... to a senior post to help supervise the expansion. The managing director of the Centre for Asia Pacific Aviation... said Qantas' extra presence definitely threatened Air NZ and could result in its demise. "They are extremely fragile right now and everyone knows it." But Qantas is battling worsening industrial strife, with 300 workers banning overtime – something [NZ's Finance Minister] was quick to point out. "Like all major airlines they are having trouble on the international side of their business..."

...Two Air N[Z] flights were aborted in the weekend after a... Boeing 747... and a Boeing 767... had... problems. Air N[Z] visually inspected the rest of its fleet this weekend, but said there were no other problems and the two incidents were not related. The first problem happened on Friday night one hour into a six-hour flight to Auckland. The 767 pilot was forced to turn back to Perth airport after the computer detected a problem with... a banking control on the wing used to turn the aircraft. The plane's 217 passengers were delayed for 18 hours while engineers replaced the aileron with a new one ordered from Sydney. Air N[Z] said the passengers were not in danger as the pilot did not lose steering control but turned back as a precaution. One passenger, [a] children's book publisher... said many on board the flight vowed to never fly Air N[Z] again. "I've been flying... around the world... for 25 years and I've never experienced anything like it. They wouldn't turn back unless it was serious and they wouldn't order a new part if it wasn't broken." When the plane finally arrived in Auckland on Sunday morning, the passengers clapped, [the publisher] said. On Saturday morning an... Air N[Z]... 747-400, was forced to turn back to Auckland Airport shortly after take-off to Japan when a panel detached from the right wing above the engine. The crew were unaware the panel had fallen off until the police contacted the airline when two members of the public saw it fall. The 10kg panel fell into a carpark... 800m away from the Wiri police station. The 1.3m by 80cm panel was non-structural, and did not affect the plane's performance. The 350 passengers faced a five-hour delay while Air N[Z] found a replacement 747, which took off again at 1.30pm... The Civil Aviation Authority will investigate both incidents... Air N[Z] was cleared of blame for a similar incident in May when a 5kg piece of metal broke off a wing of a 767 and smashed through a Manukau warehouse roof.

...Investigators are believed to be trying to find how an Air N[Z] Boeing 747 was allowed to fly with just four screws in a wing panel that needed about 120. The screws failed soon after the huge jet took off for Japan... and the 10kg "non-structural" part plummeted into a Manukau carpark. Air N[Z] will not discuss an investigation it is conducting under C[AA] supervision, but... it... is understood from several sources that the four screws were inserted purely as a temporary measure, pending more work on the part. But a communication mix-up meant the plane was cleared for takeoff, possibly after the intended work was done – but on the wrong piece... The aircraft concerned had been out of service at Air N[Z]'s world-class Auckland maintenance base for several weeks, possibly even months, because of the downturn in air travel. Work was done on it sporadically by many different people, who wheeled it in and out of hangers to fit it around more pressing maintenance on other aircraft. Air N[Z]'s spokesperson... said it was too early to speculate on the causes of a mishap that might take several more weeks of investigations. Neither would the C[AA] discuss the investigation. But its director... said on Monday that [it] was confident of Air N[Z]'s safety performance and of the systems in place at the airline, which is renowned for its engineering excellence. [The director] was commenting then after the loss of another part from an Air N[Z] 747 on Friday night, when a 2m piece of wing flap fell into the Manukau Harbour. The Transport Accident Investigation Commission has only just started its inquiry into that event but it might have been a manufacturing fault because... Seattle-based... Boeing says several 747s have lost similar parts... Air N[Z] also confirmed yesterday that a Boeing 767 flight was delayed from leaving Auckland for Rarotonga [last month]... while a cockpit light was replaced, but only for 144 minutes, not the three hours complained of by a *Herald* reader. [Air NZ's spokesperson] denied this and an incident reported in the paper yesterday, in which a faulty hydraulic pump delayed a 767 from leaving Rarotonga for Auckland [three weeks ago] for 24 hours, indicated any worrying trend. [The spokesperson] said delaying flights to replace such parts demonstrated the airline's commitment to high safety standards.

...Air N[Z]... admitted yesterday that a wing panel that fell off in flight had been marked for repair and the jet should not have been cleared to fly... The panel fell from the Boeing 747... and crashed into a Manukau carpark. Last Friday a second panel fell from... another Air N[Z] Boeing 747... into the Manukau Harbour... After a 2m section of panel fell from the wing flap... an inspection found a broken bracket fastening... Air N[Z] said inspections of all its Boeings... revealed signs of corrosive staining on the same type of fastening on yet another plane... Air N[Z]'s acting chief executive... confirmed... the aircraft which lost the panel over the harbour showed signs of corrosive staining on the broken part... The Transport Accident Investigation Commission... was still waiting for the broken bracket from the aircraft in Los Angeles to be returned for inspection.

...[one passenger]... heard a snap then a bang just moments after Air N[Z] flight NZ2 took off from Auckland for Los Angeles. His first reaction was "Oops, there goes something". It was too dark to see what happened, but [the passenger] said it was clear something had fallen from the plane. [The passenger] and his sister... told flight staff, who said the pilot was aware of the situation... The aircraft had lost a 2m section of a wing flap, the second time in a week an Air N[Z] aircraft has lost a part of a wing soon after takeoff. The latest incident forced the pilots of the Boeing 747 to perform an emergency landing at Los Angeles. The Government is demanding urgent answers on the cause of the two incidents to ease public fears... Another passenger... knew nothing of the incident until... [the] Auckland schoolteacher... reached Scotland. The 53-year-old flew on to London to attend an aunt's funeral in Scotland and heard what happened only when [it] phoned her Oratia home from Edinburgh yesterday. [The schoolteacher], who was in an aisle seat, said there was just one mention of "technical problems" when they circled above Los Angeles about to attempt the landing. [The schoolteacher] thought her husband... was joking when [it] asked her about the missing flap... "I thank the pilot for not reporting it because we would have been sitting there feeling alarmed." [Her husband] had seen news reports about the flap and immediately phoned Air N[Z] to make sure his wife was safe. [The husband] paraphrased Oscar Wilde's *The Importance of Being Earnest* in questioning how Air N[Z] could have lost large pieces of wings: "To lose one wing is unfortunate but to lose both wings is careless. The attitude of Air N[Z] seems to be that these pieces of plane are just not important." An inspection of the aircraft indicated the broken flap may have damaged the plane's tail when it fell off... The part torn off... was the top section of the starboard wing's inboard flap. Each wing has two such flaps, inboard and outboard, which are divided into three segments. The flaps are used during takeoff and landing to control the aircraft while it is flying at low speed... The safety scares follow turbulent times for the airline... Has the price of financial results put the safety of Air NZ's passengers at risk?

...A piece of plane found washed up on a beach in the Manukau Heads yesterday may be a missing part of the section of wing that broke off an Air N[Z] jet... Air N[Z] last night said it was too early to know if it was part of the 2m section that broke off and plunged into the Manukau Harbour after causing minor damage to the plane's fuselage and tail... It will be checked by engineers today... The... airline... attempted to search for the piece but had problems with the tide... ■ *Have you been on a flight that had mechanical problems? Let us know at newsdesk@herald.co.nz...*

[A Herald reader] of Mt Eden writes: "Is this a sign? My son received an Air N[Z] plane for a... gift purchased on a flight recently by a kind relative. The plane has a pullback action with a real sounding take-off noise. [My son] opened the box and proceeded to play with it, and lo and behold, within a few moments we heard the words, 'Broken mummy'." An engine had fallen off.

...Passengers on board an Air N[Z] jet from Brisbane screamed as the pilot warned they were making an emergency landing after parts of an engine broke off soon after take-off. Minutes into the flight, when the plane was at about 3000m, passengers heard a loud bang in the left engine. The 767-200 was forced to return, dropping parts off the engine cover and leading edge flap on the runway. The incident, which is being investigated by N[Z and AUS]n safety authorities, is a major embarrassment for Air N[Z] as it lodges applications with regulatory bodies today for its \$550 million deal with A[US]n airline Qantas... It is the third time in four months that Air N[Z] has lost parts from an aircraft in mid-air... Qantas, which has agreed to buy 22.5[%] of Air NZ if regulators in A[US and NZ] clear the deal, would make no comment on the incident last night. Air N[Z] assured travellers that its aircraft were safe, and said passengers' lives were never in danger during yesterday's incident. The Boeing 767 is designed to be able to operate on one engine. An airline spokes[person]n said the aircraft, in service since 1986, underwent heavy maintenance a month ago. Separate maintenance on the General Electric engine last took place in March. The engine was due for its next check next month. The engine had done 14,000 flying hours, which was well within recommended guidelines. The aircraft had not been involved in any accidents... of note.

...A fatigue crack caused the engine failure that forced an Air N[Z] jet to make an emergency landing in Brisbane last month. Air NZ now faces a \$3 million bill to inspect four of its eight General Electric engines not due for routine inspections, and airlines worldwide face similar bills to fix what may be a design fault. The A[US]n Transport Safety Bureau... revealed that a 40mm fatigue crack on a turbine disc caused it to break free, punch a hole in the engine casing and cut into the wing as the jet with 190 passengers left for Auckland. The bureau is still investigating why it happened, and the report did not clear Air NZ's maintenance, as a statement by the airline implies... ['A flap fell off a 747 because of eroded lugs – Air NZ had been warned about the problem but hadn't checked the lugs.'] The airline is [still] investigating why an insecure 10kg panel that fell into a Manukau carpark... was fixed by four screws instead of the required 125. ■ One of the Air Force's increasingly unreliable VIP Boeing 727 aircraft was delayed five times by technical faults on a recent mission and faced air space restrictions over Europe because of its obsolete navigation and communications systems, *Air Force News* has reported. Problems included a major fuel leak, engine problems and a navigation system failure.

...At Terminal 1, the new facility used by Air France and a handful of other international airlines at New York's JFK Airport, all indication of the doomed incoming Concorde flight had been erased yesterday. There was no mention of Flight AF4590 from Paris on the high-tech indicator boards. The main Air France desk at the upper departures level had a sign up – "Closed – ferme." It was deserted. Evidence that something was terribly wrong was limited to the large number of police and emergency vehicles, parked where limousines would normally be. The Concorde, one of five operated by Air France, had been due to arrive in New York at 2.21 pm. But minutes after takeoff from Charles de Gaulle Airport the supersonic airliner crashed in a ball of fire. All 100 passengers and nine crew died when the jet slammed into a hotel in the town of Gonesse, about 6km southwest of the airport. A British tourist and three workers at the Hotelissimo were also killed... Airport officials said the pilot informed air traffic control seconds before the crash that [it] intended to try an emergency landing on the nearby motorway, the N-17 dual carriageway between the airport and Le Bourget Airport. It appears that while [the pilot] was trying this manoeuvre, the plane lost power and plummeted. Witnesses described seeing the plane take off with flames up to 4m long already roaring from its two port engines. One witness... said [it] saw the Concorde coming down in flames "as if it was a bomb of napalm." A N[Z] family living in Paris, who were returning from a trip to Euro Disney, wept as flaming debris from the aircraft fell around their car on the motorway. [The wife] told the *Herald* that her husband... who works at the airport, first noticed the Concorde on fire about 200m away. "We looked up and there was a huge tail of flames running behind it just as it was taking off and gaining altitude... At that stage it looked pretty much under control. It didn't seem to be a big panic or anything." There were several nose-to-tail accidents as motorists stopped. The family then watched in horror as the Concorde crashed. "As it got a bit higher it turned slightly and then basically just stopped, turned on its side and dropped to the ground. As we saw they were going to crash I was yelling, 'Those poor people, those poor people' – you could see there were going to be no survivors. Then there was a huge explosion, like a bomb going off... There was smoke everywhere. It was pretty scary." ...her two youngest children did not see the crash but her 5-year-old son... saw it all and was in shock. The dead passengers... [included] three children... The flight was a charter by a German deluxe tour company that had organised a dream holiday in New York... for which ticket prices ranged from \$US5000 to \$US12,000... each and included the exclusive champagne flight, two nights in Manhattan and a Caribbean cruise aboard the MS Deutschland. It was the first Concorde to crash since the supersonic planes began flying about 30 years ago.

...Concorde – slender, swift and graceful, carrying only jetsetters and royalty... The world's first supersonic passenger jet and maybe the last for decades... And one of the most under-used commercial aircraft in the world. The 100 passengers on yesterday's tragic flight were unusual in that they were tourists. Concorde usually carries the rich and famous. Air France styles it as the pride of its fleet, extolling the pleasures of enjoying champagne and caviar at twice the speed of sound, and enabling business[people] – for \$15,000 – to go to New York for a day of meetings and fly home again that night to London or Paris... It cuts the Atlantic crossing time from 7 1/2 hours to 3 hrs 40 minutes... The snobbishness even covers Concorde's seating arrangements. Insiders at Air France say passengers fight to sit at the front of the aircraft, within nodding distance of seats 1A and 1B, where the airline puts travelling heads of state and government, film stars and rock stars... who enter the somewhat cramped narrow tube to be hurtled at the speed of a bullet on the edge of space. Princess Diana used it... For some the seats are a little narrow. [One d]isgraced tycoon... is said to have bought two tickets to accommodate his ample frame. The first Concorde took off 33 years ago. When Britain and France conceived the idea of a joint venture, they saw a market for dozens, perhaps hundreds, of Concordes among airlines hungry to attract big-spending passengers. It was a plane for the future, and its creation employed the best of British and French brains and designers. For Britain it was a successor to the Comet, which pioneered jet air travel but flew into oblivion after a series of fatigue-related accidents. The trouble for the supersonic Concorde was that although it first flew just before the prototype Boeing 747, the jumbo – carrying a far greater payload – went quickly into production. It was another nine years before the Concorde entered service. And when the British and French Governments threw in the towel and wrote off the cost of the development, only 14 had been delivered for service. Each cost the British taxpayers what is reckoned at today's prices to have been the equivalent of £1 billion... Britain and France started working separately on building supersonic aircraft in 1956. Their ideas were so similar that they joined forces in 1962. Concorde prototype 001 was jointly built. A second prototype, the British-built 002, made its maiden flight from Filton aerodrome, Bristol, on April 9, 1969. Two months earlier, the Soviet Union rushed into production with an aircraft which seemed to be a triumph of industrial espionage. But the TU-144, nicknamed "Concordski," crashed at the 1976 Paris Airshow. The Americans also tried to produce such an airliner but cancelled the project because of technological difficulties. A small number of TU-144s did fly on the internal Moscow-Tashkent route, but soon disappeared from public view. Rumours of crashes were never confirmed. Until yesterday, the Concorde had a very good safety record – one blown tyre in 1979. A safety scare this week relating to wing cracks was the latest in a series of minor incidents involving Concorde over the past 12 years. Most related to small-scale fissures in wing, window or roof components, none of which

was thought to endanger the aircraft. A more persistent problem emerged with the aircraft's rudder, which disintegrated at 18,000m on a British Airways flight from London to New York in 1991, after two similar incidents over the previous two years. A fourth rudder failure occurred in 1998, although detailed investigations uncovered no inherent fault. Previous instances of failure in the four engines have been extremely rare, although one occurred six months ago in a London-bound service. Pilots generally regard mid-flight engine failures as controllable, and the aircraft landed normally. Another BA Concorde turned back to Heathrow the next day after a fire alarm went off. One of the reasons airlines have been talking of keeping the Concorde flying until at least 2015 is that their flying hours are very low for their age. They have carried 2.5 million passengers since 1976. But BA's... Concorde is airborne, on average, for just over two hours each day. On a typical day, more than 1200 Boeing 747s will be flying in some part of the world. The number of Concorde aloft may be no more than three. Its difficulties started early. The U[S] at first refused to allow the noisy aircraft to land. So the commercial services that began on January 21, 1976 were on BOAC (now B[A]) from Heathrow to Bahrain and Air France from Paris to Rio de Janeiro. A year later, Washington relented and allowed flights. But it was several more years before New York would let the Concorde in. Bahrain, Dakar, Dallas, Miami and Singapore each enjoyed a brief supersonic affair before the truths of aviation economics asserted themselves. Now the only scheduled services link Paris and London with... New York. To help pay the enormous costs of maintaining the Concorde, the aircraft are also used for joy flights like the one which ended in tragedy yesterday. Concorde is what aviation engineers call a "hanger queen." It spends inordinate hours out of service being cosseted, checked and maintained by a small army of specially trained technicians. The 185-tonne Concorde can cross the Atlantic at an average speed of more than 2000 km/h... At full speed, its 60m length stretches another 15 to 20cm as its airframe heats up. But it is allowed to go supersonic only over water because of the sonic boom. Sporadic, half-hearted attempts were made during the [past decade] to develop a successor to Concorde. But aerospace engineers can see no way to reconcile supersonic speed with moderate noise and acceptable running costs. Little research is being done now, and engineers say a new supersonic airliner will not appear until well into the century. The big problem is that such aircraft... have to be long and skinny to minimise drag, so not many seats will fit in, resulting in a lot of expensive machinery for a few passengers. And that noise! Concorde, with afterburners, has a deafening roar. A few years ago, engineers thought it might be possible to get it down to the level of today's sub-sonic engines. Then regulators reduced the noise from these engines, and no one could see how to get supersonic engine noise down that far. These days, the world has many more rich people than when Concorde was conceived. Yet Air France and B[A] still cannot justify more than three trans-atlantic flights a day. As the Airbus A3XX100, the new super carrier being planned by the four-nation Airbus Industrie, has shown, the future of aviation lies with accountants, not dreamers. ●... *How many Concorde are there?* After debate this year with expert readers and the director of the Imperial War Museum at Duxford in Cambridge, the *Herald's* Q and A column said that, counting prototypes and pre-production models, 20 Concorde were made. One is at Duxford and one at the Fleet Air Arm Museum at Yeovilton in Somerset. France also has various models on display or in storage. Ten Concorde were built at Toulouse in France and 10 at Filton... A total of 16 production aircraft were built. Two are stored, B[A] has seven, all still in use. Air France also had seven but one was used for spare parts and finally broken up in 1995.

...French investigators have retrieved the black box flight recorders that they hope will reveal why the supersonic airliner bound for New York crashed soon after takeoff from Paris, killing all 109 on board and four people on the ground... The pilot of the doomed Concorde airliner reported that one of his engines had failed just before the supersonic airliner crashed out side Paris... a French judicial official said last night. Air France said separately that a part of the same engine, the number two motor, had been replaced shortly before the plane took off... [The] deputy public prosecutor... who leads a judicial investigation into the disaster, said... initial examination had shown that there was a "malfunction in engine number two during the take-off phase" and no indication of sabotage. Meanwhile, French fire[officers] worked around the barely recognisable crumpled fuselage of the aircraft that had once been the pride of Air France yesterday, marking out the bodies of the victims with traffic cones. Two vast ruts gouged out of the neighbouring cornfield led to the wreckage, a mass of ashes and blackened metal and small pieces of fuselage. Acrid smoke continued to drift across the cornfields towards Gonesse from the site of what only hours earlier had been the 45-room Hotelissimo hotel... Aviation experts suspect that a catastrophic blowout ignited the fuel tanks. A... British business[person]... who was in a plane waiting to take off behind the Concorde, said [it]... saw a piece of engine fall off before the jet disappeared in a huge pail of smoke... [A witness], who works for Jet Service, a courier firm operating nearby, said: "There was panic in our building, which was only a few hundred metres away, because people were afraid the plane was going to crash into us." But instead it stalled and bounced on its tailfin on top of the Hotelissimo... The body of the jet ended up... just 100m from apartment blocks. Thirty-three passengers who would have been on the flight had been switched to a sister aircraft after the trip was overbooked. Others who escaped the tragedy were a party of 50 British students from the Suffolk youth orchestra, wind band and choir who were due to book into the Hotelissimo yesterday. The students, aged between 14 and 22, arrived at the scene 40 minutes after the crash.

...Moments after a Concorde jet slammed into the Hotelissimo hotel, a young British [tourist] jumped to safety from her first-floor window, escaping with minor burns. A busload of 44 teenagers from southeastern England were mercifully overdue arriving at the hotel. Polish tourists returned to the charred remains of the building in shock. They had been out touring when the jet crashed, destroying all their belongings. These are among those who escaped death in Wednesday's crash of the Air France Concorde... Air France and British Airways suspended Concorde flights following the crash... A last-minute engine repair before take-off has emerged as the likely cause of the Concorde crash... Air France has revealed that the captain of the doomed Flight FA 4590, Christian Marty, a 54-year-old father of two, had insisted on the replacement of a faulty part in the reverse thruster of his number-two engine as the aircraft waited on the tarmac at Charles de Gaulle Airport. The plane could have taken off with this non-vital fault untouched but the captain – one of the most experienced [pilots] on the elite Concorde roster – refused to fly until the repair had been made. His scrupulous attention to safety and detail may have led, paradoxically, to the disaster. A criminal investigation for [hu]manslaughter, formally launched in France, will focus on the possibility that the repair by two engineers may have introduced another fault into the aircraft's left-side inner engine. Since no spare part was available, a piece was stripped from another Concorde, which was out of use, and fitted to the New York-bound Concorde. The switch took 30 minutes. The crash was far from being the costliest in aviation history in terms of lives lost but has generated extra-ordinary attention and emotion, partly because of the Concorde's special status as the world's only supersonic airliner; partly because of its hitherto perfect safety record; and partly because of the aircraft's sheer beauty and elegance... Aviation experts said that it should have been possible for an experienced Concorde pilot to land safely on three engines. But the aircraft dropped gently from the sky – one witness said yesterday that it "fell like a leaf in autumn, tail and wing pointing downwards" – as it attempted to turn towards its emergency landing site... at the smaller Le Bourget Airport, 10km away... Investigators believe that the blaze in the number-two engine must have spread to the number-one engine, alongside, unbalancing the delta-winged aircraft. A former Concorde pilot told the newspaper *Le Monde* that the positioning of the... airliner's engines in two groups of two, close beside each other, had always been seen as "Concorde's Achilles heel." ...All the data from the plane's two black boxes had been extracted last night but French air experts would not say how soon any conclusion could be drawn.

...A catastrophic series of failures, starting with a fire in one engine and a loss of power in a second, brought down Concorde Flight AF4590 near Paris on Wednesday, according to the black box flight recorders. The crew also reported to the control tower that the landing gear had failed to retract on takeoff. It remains unclear whether these were separate faults or – more likely – that the original explosion and fire in the first engine damaged the second and jammed the landing gear. Debris from the doomed aircraft has been found all along its brief flight path, starting with fragments of tyres on the runway. This has raised speculation that a piece of tyre may have been sucked into an engine and triggered a fire.

...SAFETY inspectors had warned French airline bosses that the tyres on Concorde flights were “potentially catastrophic”. American air safety experts wrote a memo to Air France chiefs 19 years ago about the dangers of blowouts on takeoff. The disaster – which killed 114 people – appears to have been caused by a burst tyre which damaged a fuel tank... America’s National Transportation Safety Board said there had been four cases where Concorde tyres had burst on takeoff at New York and Washington airports. They passed a memo to the French... saying: “The repetitive nature of these incidents and in particular crew response in the more recent incidents is of serious concern.” Yesterday about 8000 Air France staff attended a 60-minute memorial service at the company’s headquarters at Paris Charles de Gaulle airport. The airline’s president and its mechanics protested at press speculation that the crash was caused by negligent repair work before the aircraft took off... At nearby Gonesse, where the plane went down, about 1250 people marched from the town hall to the crash site, which remained cordoned off by police. Many participants carried flowers which they left at the roadside. Among the marchers was... the manager of the Hotelissimo hotel, who escaped death when the supersonic jet ploughed into the hotel shortly after takeoff... THE [perso]n who filmed the last moments of the doomed... flight said [it] did not realise the plane was crashing. “I wasn’t aware of what I was filming... When I put the camera down, I thought, ‘Oh my god, it’s crashing’.”

...the provisional finding [is] that Wednesday’s Concorde disaster was caused by a structural failure in the aircraft – the bursting of two tyres on take-off, causing rubber and metal fragments to sever fuel lines in the wings – rather than by an individual, human error... [S]tate-owned... Air France... had hoped to resume its supersonic flights at the weekend but the French Government has ordered the five surviving Air France Concordes to remain on the ground until the precise chain of events which led to the crash is known... British Airways was under pressure to [ground the] Concorde last night... It was also announced that a[nother] victim of the crash had been found in the burned-out wreckage of the hotel...

A B[A] Concorde flying from London to New York with 57 passengers and nine crew members had to make an emergency stop in eastern Canada after a crew member smelled gasoline in the cabin, the airline says. Emergency vehicles were on alert yesterday as the Concorde descended into the Gander, Newfoundland, Airport but the landing went ahead without incident... It was the second problem with one of B[A]s’ supersonic jets yesterday... [– e]arlier in the day, a New York bound Concorde was unable to take off from Heathrow because of a refuelling problem, delaying the flight for more than an hour... [–] and the third in two days... On Sunday, fire trucks and ambulances were put on standby at Heathrow after a Concorde flight from New York to London experienced a mixture of fuel and air in the engine. A loud bang was heard inside the jet, which was “something like an engine backfiring,” a B[A] spokesperso]n said... An Air France Concorde crashed last week outside Paris... Air France grounded its fleet of five remaining Concordes after last week’s crash. B[A]... resumed flights on most of its seven supersonic jets the day after the crash. Despite the three recent incidents, B[A] expected to continue its regular service out of London and New York today...

A week after a French Concorde crashed after takeoff... doubts are being voiced about the plane’s design... and... the transparency of the two airlines which use it... Air France and B[A] have been forced to admit that their Concordes have a record of tyre bursts – now the suspected chief cause in last Wednesday’s disaster – and to discuss measures to beef up safety on a plane that they contend is already safe... If investigators indeed show that there was a persistent hazard with the tyres or undercarriage, the questions will be: what and when did the two airlines know about the problem, what did they do to fix it – and were the public advised of any danger? The two airlines have a proud record of safety but have run into a credibility problem since the crash... B[A] has] defiantly kept its seven Concordes in operation, insisting they were in no danger... Meanwhile, the French press has started to raise doubts about the disaster inquiry, fearing the potential for a coverup if the accident is found to have been caused by negligence. The head of the probe commission... is a controversial figure to France’s powerful airline pilots union. [The figure] headed an inquiry into the crash in 1992 of an Air Inter Airbus in Alsace in which 87 people died. In 1993, his report blamed pilot error and absolved Airbus of any blame. [Last] year... evidence came to light that some of the cockpit instruments, later fixed by Airbus, had been at fault.

...The investigation into the... crash of an Air France Concorde has shed light on another suspected design flaw in an aircraft previously hailed as an engineering masterpiece. The new culprit is a small fibreglass shield, attached just in front of the tyres on the plane’s undercarriage, which deflects spray from the engines when the jet takes off and lands on wet runways... [T]he head of the Accident Inquiries Board which is conducting a technical inquiry into the crash, acknowledged yesterday that pieces of the deflector had been found on the runway after the Concorde took off from Roissy/Charles de Gaulle Airport in flames. A similar incident happened on a B[A] Concorde in 1993, although there was no fire... Two years later, BA modified the deflector so that it would not disintegrate, although Air France says it did not follow suit as it was not a measure required by the national civil aviation safety authorities... Meanwhile, the crash has helped to revive controversial plans to build a third airport for Paris to help ease air traffic congestion. Only two years ago, [France’s] Transport Minister... put the plans on ice and instead plumped for building two additional runways at Roissy. Now the scheme is back on the agenda. A decision on whether to push ahead with the airport will... probably be announced next month. [The minister denies that the] accident has had any bearing on the decision, but this response is widely dismissed as bogus, given the enormous shock of the crash and the clamour for safety that it sparked among local residents. The stricken jet crashed near Gonesse, a straggly suburban town in farmland a few kilometres from Roissy... [The death] toll would have been much higher if the plane had ploughed into the busy A1 motorway linking Paris with northern France and Brussels, or if it had veered towards the large town of Villepinte, to the southeast.

...A 40cm metal strip that did not come from the crashed Air France Concorde has been found among runway debris, adding a new twist to the disaster... An aeronautics expert said: “...the strip of... titanium... could have gashed the tyre, which could have broken things in the landing gear and this debris pierced the fuel tank, causing the fire.” ...[In local news, an Auckland] faces a jail term for allegedly pointing a high-powered laser at the police helicopter. The [Auckland] was hunted down and caught by the same helicopter. Police want N[Z] to follow what is happening in A[US] by banning possession of high-powered lasers and introducing a specific charge of laser-pointing. [The Police] Eagle pilot... said a crash would happen unless something was done... Planes flying into Wellington have also had laser beams aimed at them.

...Israel may boast the world’s tightest security at Ben Gurion International Airport, but passengers in planes taking off and landing have no idea of the danger posed to them... Pirate radio stations, many of them run by ultra-Orthodox sects and Jewish settlers, have become so ubiquitous that they fight one another for airspace. At Ben Gurion in Tel Aviv the congestion is becoming dangerous, says... the air-traffic control services manager... [I]n several cases planes have flown too close to one another, with the control tower powerless to warn them because its frequencies have been jammed by the Holy Channels, as the illegal broadcasters call their stations... Last month, an air-traffic controller saw on his radar that a Spanish Iberia airliner was heading in the wrong direction after takeoff, directly towards an incoming jet. The controller tried to contact the Iberia pilot but the frequency was blocked. At the last moment the second plane was contacted and told to take evasive action, narrowly averting disaster... Since the revelations, police have declared war on pirate stations, including the threat of heavy fines and prison sentences for those involved in the broadcasts. That was enough to knock the Holy Channels off the airwaves for a week, but they quickly became emboldened to resume... Yizar Be’re of Keshev, which is a non-profit Centre for the Protection of Democracy in Israel, estimates there are 150 pirate stations. About two-thirds are commercial and the remainder ideological...

[S]cores of people [were] killed when a Russian airliner exploded over the Black Sea on a flight from Israel... Cause of crash [is] still a mystery...

The... jets that collided over Germany yesterday morning, killing 71 people, were both diving to avoid a crash when they flew into each other, say Swiss air traffic controllers. The pilot of the Russian passenger jet began a steep dive only after the controllers’ third instruction to do so, said... an official at Skyguide... The Boeing 757 cargo plane started to dive when its on-board warning system instructed the pilot to lose altitude to avoid a crash... Had the Boeing kept its course, “there... would not have been a crash,”... The crash turned the chocolate box landscape around Lake

Constance, a holiday resort on the Swiss border, into a hellish scene of burning wreckage and corpses... [T]here were 12 crew and 57 passengers on board the Tupolev, all Russians... Most of the victims were children... heading for a Unesco festival in Barcelona... Mid-air collisions are relatively rare. The worst such accident took place in 1996 when a Saudi Arabian Boeing 747 and a Kazakhstan Ilyushin 11-76 cargo plane collided over India, killing 349 people. Tupolev 154s have crashed several times in the past year. An Iran Air Tours TU-154 crashed... in Iran, killing all 119 aboard... 136 passengers and [9] crew were killed when a Russian TU-154 plane crashed near the Siberian city of Irkutsk... [● In Europe t]here are 65 radar centres with 31 different systems using 22 different computer networks made by 18 rival firms that talk 33 different computer languages.

...Officials traded recriminations over who was to blame for the midair collision at Lake Constance after it was revealed the pilot of a Russian airliner was given less than a minute's warning... Swiss air traffic controllers insisted yesterday that the 50-second warning they gave the Russian pilot was enough time for him to drop the Bashkirian airlines plane out of the way of the Boeing 757 cargo plane. But German officials said that was far less than usual... Last night Swiss air traffic controllers said an automatic warning system alerting them that two planes were on a collision course was switched off when the aircraft crashed into each other... Skyguide... said the system... had been shut down for routine maintenance.

...Swiss air traffic control faced further questions yesterday after it was revealed that its radar did not meet European standards a week before a midair collision killed 71 people. The head of the Swiss Federal Bureau for Aircraft Accident Investigations... said a report a week ago into the radar's shortcomings was severe enough for improvements to be ordered... It has also emerged that a collision warning system at Zurich was switched off and a controller was taking a break when the Russian charter plane carrying dozens of children collided with a DHL cargo jet...

A new ground radar system was not working because of red tape when 118 people were killed in what is believed to be Italy's worst air disaster. A Scandinavian jet collided with a light plane... and crashed into a hanger at Milan's Linate airport. All 110 people on the... MD-87, all four people on the Cessna Citation II and four baggage handlers in the hanger were killed. Terrorism was ruled out, officials saying that the small plane was almost certainly at fault in an accident aggravated by heavy fog at Milan's second-largest airport... [The] president of... the company that runs Milan's airports, said the small plane had turned right from the terminal and crossed the runway as the S[candinavian] plane was taking off... But in a twist that was expected to be the main focus of a probe by Milan magistrates, officials said a new ground radar system had not been turned on for bureaucratic reasons... At the time of the crash, visibility was only 100m because of the fog... "If there had been a working ground radar system at Linate, this accident would not have taken place," said [a member] of the Italian pilots' union... The largest previous number killed in a civilian plane crash in Italy was 115 people, in Sicily in 1972... [In related news, Concorde could shortly resume] flying again... B[A] and Air France... say they plan to start flights on the luxury planes as soon as possible. BA has kept its Concorde crew on full pay since the... crash... The airline has invested millions of dollars in safety improvements since the tragedy and says it will get the planes back in the sky.

...B[A] is adding bulletproof lining to the wings of its seven Concorde[s], a safety measure it hopes will have the supersonic airline flying again... BA's technical manager, said the modifications would prevent a repeat of the catastrophic fire... that caused an Air France Concorde to crash... The £17 million... programme will require engineers to crawl into the tiny spaces between the top and bottom of the wings, where the fuel is stored, and fit hundreds of tray-like protectors incorporating Kevlar to the bottom of the fuel tanks. Kevlar is used in bullet-proof vests... Kevlar lining is [also] used in military helicopters and vehicles and Formula One cars to prevent disastrous fuel leaks... [The technical manager] said that if the lining had been fitted [to the doomed Air France Concorde], even with the same puncture the fuel leak would have been cut to less than one litre a second – too little to catch fire – and the Concorde would have been able to land safely... The modifications, which also means adding armour plating to the wing recesses for the landing gear, are being done in close consultation with Air France... and with the jet's manufacturers, Aerospatiale and BAe Systems... As a first step towards getting Concorde in the air again, Air France will fly one of its fleet to a military base at Istres tomorrow for two weeks of high-speed ground tests. It will be the first takeoff of a Concorde from Charles de Gaulle [Airport] since the crash.

...An Air France Concorde landed in Paris after successfully undergoing ground and flight tests on new... "Michelin Near Zero Growth" ['shred-proof'] tyres... The tests are aimed at restoring the supersonic jet, which was grounded... after a fatal crash, to commercial service.

...British Airways has test flown a second Concorde in preparation for a re-launch of its supersonic service [next month]. It took off from Heathrow Airport and reached supersonic speeds as it flew halfway across the Atlantic, said a BA official.

...The supersonic Concorde got its wings back yesterday... with French and British officials clearing the fleet of 12 aircraft for flight once safety modifications are made... Air France said it would resume commercial service between Paris and New York... but did not give an exact date. B[A]... said it intended to resume London-New York supersonic service soon, but also did not set a date... One Air France Concorde should have its certificate within days, with two more planes ready within weeks. B[A] has said one of its modified Concorde was to be certified to fly yesterday.

...[a British actor] glided into the Concorde cockpit clutching a flute of the finest Dom Perignon. [The p]ilot... turned to greet the raffish actor and together they watched the fiery orb of the sun sink below the horizon as they cruised at twice the speed of sound. Such encounters were all in a day's work for... [the pilot. A former world heavyweight boxing champion turned Muslim (r:p1561, ln26) – who] would write poems and call them the fastest poetry [it] had ever written[; a former Beatle (r:p1754, ln66) – who formed a band named Wings; and the *Lassie Come Home* actress (r:p1729, ln11)]... – who, befitting a friend of... [Wacko,] was obsessed with the aircraft's ability to change the shape of its nose – all regularly wandered down to his flightdeck. [The Prince of Wales] also sat next to the 57-year-old pilot, joking that the crotch strap on the plane's emergency jumpseat held the potential to "ruin a dynasty"... [The Beatle] would be transfixed by the experience. On one journey they left London in the evening, proceeding to outpace the spinning of the Earth to the extent that... [the pilot] and the former Beatle caught up with the setting sun for the second time that day... [T]he pilot, who flew Concorde between 1976 and 1986... had been witness to an era of opulence now confined to history, never likely to be repeated. Decadence is dead. At least for a travel industry founded on elitist values and a shameless willingness to offer the most extravagant services to the most well-paid. In more austere days such excesses seem faintly vulgar. The end of Concorde, and its iconic image of luxurious travel, means no-holds-barred finery has been replaced by no-frills. Last week's announcement that Concorde – the most exclusive, ambitious aircraft ever built – is to be retired is the latest development in a trend that is rapidly redefining the way people travel. It also reflects a shifting cultural attitude to decadence. Even the QE2, once the world's most luxurious, languid mode of transport, has fallen victim following Cunard's decision to retire the vessel from the Atlantic. Elsewhere, airlines are beginning to reject the very concept of first-class and sales of luxury car brands in Britain, at least, are struggling according to some dealers. On Britain's congested rail network, first-class compartments stand empty alongside overcrowded "cattle trucks". Behaviourists blame the democratisation of travel for the phasing out of opulence. Every weekend the Gucci-shaded glitterati rub shoulders with business[people] and students on Britain's booming budget carriers... Even "luxury" has lost its cachet, becoming so overused it is now meaningless[– f]or the savvy consumer... it can simply mean overpriced and overhyped... Even those at the forefront in the conception of Concorde appear to have adjusted to these more pragmatic times... – weeks before Concorde makes its final voyage... British Airways will scrap its first-class quota on six as yet unnamed routes... [A] travel sector analyst for PricewaterhouseCoopers, has detected a seismic "downsizing" among travellers. "Those who might once have flown Concorde will probably now fly conventional first-class, and those who flew first-class might move down to business and so on." Inevitably, this has destroyed the market for which Concorde, QE2 and first-class rail journeys were created. "There used to be no one who did it like Concorde," said... [the person] who personified "pile it high, sell it cheap" holidays until his International Leisure Group collapsed after the 1991 Gulf War. "Concorde was a romantic dream... It signalled a bygone age of elegant travel... It was an occasion, smoked salmon canapes at the gate. And when you flew you would get little things that were all part of the

exclusivity. That doesn't seem to happen any more." Others are less sentimental. [The person who founded the failed cheap-seat airline] Laker was on an advisory panel that helped persuade a wavering British Government to invest in Concorde in the 1960s. Speaking from the Bahamas, where [it] still runs an airline flying to the US, [the] 80-year-old... said bluntly: "If they cannot make money on it they ought to put it in a museum." [The octogenarian] believes technology always goes forwards and we will see supersonic passenger travel again, "but not in my lifetime or yours".

...A prototype of the latest experiment in supersonic travel, known as NEXST, will be tested over the A[US]n desert next month. A 10[%] scale model of the Japanese designed and built plane... [that] looks like a winged javelin... will ride piggyback on a rocket and then be hurtled forward at a speed of 2500km/h for a 14-minute test flight. The NEXST prototype – short for National Experimental Supersonic Transport – is designed to have twice the range of Concorde, seat three times the passengers and cut emissions by 75[%]. Its supersonic boom will be reduced to the tolerable rumble of a Boeing 747. The programme has its sceptics, who point out that Japan has developed almost nothing of interest in aviation since W[W]II. But companies such as Boeing, which is developing its own supersonic aircraft called the Sonic Cruiser, are taking the test seriously.

...Space may be the final frontier but the A[US]n Outback is playing a crucial supporting role in the attempt to boldly go where no one has gone before. The enduring fascination with Mars has prompted a bunch of enthusiastic earthlings to head for the... Red Centre[, parts of which] look uncannily like the surface of the Red Planet, our closest planetary neighbour. So where better to practise landings, test space suits and try out remote-controlled rover vehicles in preparation for a [pilot]ed mission to Mars as early as 2020? This week, a research team, including two Nasa scientists, scoured the vast, dusty landscape trying to find terrain that most closely resembles the surface of Mars. They are not the only ones to have honed in on the Outback. A[n AUS]n-born astronaut... wants the former rocket testing range at Woomera to be home to an emergency facility that would service the new international space station. The federal Government is considering the proposal, which [the astronaut] believes would also give A[US] a stake in that all-important first [pilot]ed mission to Mars. And on Tuesday, Woomera was alive with expectation for the launch of a revolutionary jet engine that could eventually not only make space launches cheaper but also revolutionise commercial air travel. The scramjet technology, dreamed up in the 1950s, burns only oxygen from the air and hydrogen carried on board. It will take some time to analyse the results, but a successful flight would in aviation terms be comparable to the first flight to break the sound barrier. Capable of flying at more than seven times the speed of sound, at 2.6km a second, a scramjet engine would slash the flight time from Auckland to London to just over two hours.

...The first prototype of an aircraft intended to revolutionise travel and shatter speed records was destroyed during its maiden flight yesterday after a booster rocket carrying it aloft tumbled from the sky. U[S] space scientists were forced to destroy the un[pilot]ed X-43A prototype in mid-air minutes before the plane was due to fire the oxygen-scooping "scramjet" engine designed to drive it at seven times the speed of sound. Cameras aboard two chase planes showed the Pegasus rocket careering off course and falling out of control before controllers triggered on-board explosives to destroy it over the Pacific Ocean. Pieces of the booster rocket and the small, black X-43A, part of Nasa's "Hyper-X" programme, fell into the sea. Dejected Nasa... scientists – who have called the programme an aviation breakthrough as historic as the Wright brothers' first flight – ...will form a "mishap investigation team" to determine what went wrong, and vow the \$US185 million... programme they have billed as the future of aviation will go ahead... The X43-A was making the first of three scheduled test flights in the Hyper-X programme, which Nasa has said will ultimately make space travel routine and pave the way for cross-country commercial flights in 30 minutes... The X43-A and its Pegasus booster were carried to 8000m by a B-52 bomber from Edwards Air Force Base in the California desert...

An unpiloted, high-altitude aircraft that scientists believe could one day replace some satellites has been successfully tested over Hawaii. Nasa and the company AeroVironment, which helped build the plane, launched the solar-powered aircraft named Helios from Pacific Missile Range Facility in Kauai on Sunday. It climbed over 22,800m in the Hawaii sun after three previously aborted attempts, and landed on the same landing strip. The standing altitude record of more than 24,500, was set in Kauai in 1998 by Pathfinder Plus, a smaller version. The flying wing features 14 propellers powered by motors that consume about as much energy as a standard hair dryer. With a wingspan of some 75m, Helios (the Greek sun) is wider than a Boeing 747 but not nearly as fast: It takes off at the speed of a bicycle and travels at a cruising speed of 30 km/h to 50 km/h. According to Nasa, the aircraft could eventually be used as a relatively inexpensive telecommunications satellite or a scientific observation satellite[as it can "reflect signals like current satellites and should be able to fly at 20km indefinitely"]. Researchers hope that Helios will one day reach heights of 30,000m, setting a new record for this type of aircraft... The Helios generates about 10kW of power in the early morning sun, giving it a rise of 33m per minute. By noon the solar panels produced about 40kW, and the climb rate increased. With evening coming on, the plane was switched to back-up battery power. It took the Helios 10 hours and 17 minutes to reach peak altitude. It is scheduled to fly again in about three weeks.

...[Waitakere's] Mayor... has a vision for the future – electric cars plugged in outside the Waitakere City Council chambers. On his recent trip to the U[S, the mayor] attended the unveiling of an electric car called the Crayon, built by Toyota... [The mayor] thinks the cars would be ideal for the Eco City. "If we were to fall asleep like Rip van Winkle then wake up in 50 years, the world would be a series of electric plugs." ...At the moment [the cars] are only good for short trips and are expensive. [However,]Toyota proposes shared ownership of the... compact two seater... cars in urban areas to ease parking problems and traffic congestion. One person would drive a car to work or the shops, leave it at a re-charging station where it could be picked up by someone else. "I think it's absolutely ideal to look at role modelling it in... [NZ,]" says the mayor who] believes private car ownership is on the way out as hired electric cars take over...

A shiny white-pod that began road tests this month is being tipped as the taxi of the future. The pod, known as ULTra – Urban Light Transport – could make driver-free transport a reality and not just the stuff of futuristic fantasy. "It will be the first in the world," said... [the] director of business development at ULTra's makers, Advanced Transport Systems. The... 800kg... pod – which seats up to four passengers – is the brainchild of Bristol University... The first stage of the ULTra project will have 30 pods circling the Cardiff Bay area in Wales by 2004. The pods system would then move to the city centre. The battery-powered pods, able to reach up to 40 km/h, will operate on a single, 1.5m track and recharge at every stop. The vehicles are designed to stop automatically if they sense an object in the way. ULTra pods could work as an automated personal taxi system. Passengers will "hail" the pod from a designated stop, and choose a destination along a set route. When the pod pulls up, the passengers swipe a smart card that provides the travel details and ULTra carries them directly to their chosen stop. Rubber wheels ensure a quiet journey and security cameras at every stop increase passenger safety. Passengers would find on-call pods at designated stops at least 80[%] of the time. This efficiency would come from a large number of pods in circulation and the shortened journey times... *Pods circle in one direction... Stations are off the main line to allow other pods to pass... Some routes may need raised tracks, creating a futuristic look...* Advanced Transport Systems estimate that building an ULTra network would cost about one-third of the amount needed for a light railway. Connecting Cardiff's city centre to its waterside region is expected to cost £45 million... The pods will be accessible to the disabled, as well as passengers with bicycles or prams. Designers hope pod travel will cost about as much as ordinary bus journeys, or less if passengers share their pods.

In a moneyless society, either everyone or nobody would have to be provided with private transport. If everyone had private transport there would be no need for public transport; if public transport was properly utilised there would be no need for private transport. Because private transport is one of the most wasteful uses of energy and other resources, the sensible solution to transport problems is to create a high-capacity public transport system.

Initially, where public transport is already available, it can all come under the management of one ministry and be provided free (where it isn't already available, steps should be taken to build the necessary infrastructure). Unfortunately, the worst aspect of modern public transport systems is that they cover such a small amount of a city's territory. Auckland, for example, only has two rail lines (although one line has two branches) and, while there are hundreds

of bus routes, most of them follow the same major roads until they reach their destination suburb – and even then they only go along a limited number of streets. Consequently, catching a train isn't a viable option for the majority of Aucklanders, and most Aucklanders have to walk hundreds of metres to reach the nearest bus stop (not a problem for most people when the weather favours walking and they don't have much to carry, but a huge problem for people who have poor personal mobility). This means that, at present, only a limited number of Aucklanders would benefit from a free public transport system. On top of that, with the exception of the Link route and some 'cross-town' routes (e.g., #007 – which services bus stops every 15 minutes during peak hours; Auckland's limited range of cross-town routes link distant suburbs without passing through the centre of the city), the bus services are infrequent – commonly once every half hour (including the 007 route during off-peak times); once an hour on some routes, especially during evenings, weekends and public holidays – and don't operate for much more than 18 out of every 24 hours (less on Sundays and public holidays – when the last bus on major routes leaves before 10.30pm, while on some lesser routes the last bus leaves at 4pm).

The solution to urban transport woes is, however, relatively simple. Each city should have three types of bus route: suburban; inter-suburban; primary. A suburban bus would start out from a central point of its suburb and either travel around all of that suburb before returning to the central point, or complete a circuit of part of the suburb (e.g., each suburb could be divided into four routes – such as north, east, south and west), after which time the bus would immediately head off around the circuit again – and keep doing so. Suburban bus routes would go along as many roads as possible in one direction – they should avoid dead-end streets if there isn't enough room for them to turn around (in some cases it might be easy to create room for a bus to turn; in other cases, mini-buses can be used on a route instead of larger vehicles) but they ought to be able to cover close to 100% of the through roads, even if that means coming back down the other side of some streets which the bus has already travelled along – picking up or off-loading passengers at any point along the route (e.g., outside their house or destination; or the closest point to their house or destination). At the central point of a suburb, passengers can catch a bus to another part of the suburb – if it is divided into more than one route – or a bus that travels along an inter-suburban route or a primary route. On primary routes, a bus would either: (a) leave a central point of the city and head out in a straight, or nearly-straight, line to the edge of the city – stopping at the central point of any suburb it passes through (they could also stop at designated points between suburbs, rather than wherever passengers request them to stop) – before returning along the same route to the city, then heading back out again; (b) travel around a circular or nearly-circular route – there could be one route that goes around the circumference of the city (linking all of the end-points of the routes that head in and out of the city) and one or more inner circular routes. A diagram of the primary bus routes will have a web-like appearance – with each suburb being accessed by at least one primary route, and some by both a straight route and a circular one (note that it may be possible to use remote-controlled – i.e., *driverless* – vehicles on primary routes). Inter-suburban bus routes would travel back and forth between the central points of adjacent suburbs that aren't already linked directly by a primary route (be it straight or circular) – preferably stopping only at the central point of each suburb and, perhaps, the midpoint of the route. Incidentally, it should be possible for every bus to carry at least one wheelchair-bound passenger (although it would be preferable if they had space for two wheelchairs – which, along with other mobility aids, should be supplied via the Health Ministry – created by folding up standard seats; note that there would be no reason why wheelchairs couldn't enter buses via mid-section or rear doors – as opposed to the front doors – if passengers don't have to pay fares) but, if not, a taxi-like service using specially adapted vehicles would need to be maintained for transporting people with various permanent or temporary physical disabilities.

A public transport system like the one described above would enable a passenger to travel to any part of the city by bus, with little or no walking involved (although, obviously, people who aren't in a hurry could walk instead of catching a bus whenever the weather is suitable and they only need to travel a short distance – e.g., they can walk to or from a primary route bus stop instead of catching a suburban bus). Although a passenger might have to change buses more than once to reach a destination – riding a maximum of five vehicles in some instances (e.g., starting out on a suburban bus, transferring to a straight primary route bus, then a circular one, another straight route, finishing with another suburban bus) – this shouldn't pose much of an inconvenience (in cities like London, passengers are already used to using more than one tube line per trip; and, in Auckland, it would create a more direct service than currently exists – in order to get by bus from two relatively close suburbs, many passengers currently have to catch one bus all the way into the city then another bus out again!), especially if every route has a frequent service (frequent enough to prevent a bus from becoming so full that the driver has to refuse to take on any more passengers). Apart from minimising waiting times, if a service is frequent enough (e.g., less than 15 minutes between buses) it will eliminate the need to provide timetables. Furthermore, if the service on all primary routes is closer to more than one bus every minute, and one every five minutes on suburban routes, most workers who have to travel from one location to another as part of their job, but don't have to carry much equipment (especially heavy or bulky equipment), can also use the public transport system. Therefore, the number of passengers using buses during normal daylight hours would be constant enough to warrant maintaining throughout those hours what might be thought of as a *peak times* capacity service, only reducing the capacity after the evening rush and at weekends – although, if everyone is using buses to get around during their own spare time, the volume of passengers using them could be similar every day of the week (primary route buses can be double-decker to help move larger numbers of passengers; and, if an increased capacity has to be created during weekday mornings or late afternoons, trailer carriages could be hooked up to the buses – thereby eliminating the need to increase the number of bus drivers, assuming the vehicles aren't driverless). During the hours when passenger numbers are minimal (e.g., midnight to early morning), the entire bus system – or at least suburban and inter-suburban routes – could operate like a taxi service (i.e., people who have to travel during those hours would phone for – or pre-book – a bus/mini-bus to come and pick them up then take them directly to their destination; or at least take them to or from the central points of suburbs and their homes). Each suburb could have a taxi station, or a number of adjacent suburbs could share a taxi station.

In Auckland it isn't possible to have primary bus routes that are completely circular because there are two harbours in the way. However, it would be possible to construct tunnels under the harbours – although a much easier solution is to use ferries to link the end points of semi-circular bus routes; and another solution is to have one circular route system for the North Shore, one for west Auckland and another for south and east Auckland (with each circuit sharing one or more bus stops with its neighbouring circuit). Furthermore, primary routes don't have to utilise buses – trams and rail (be it above or underground – though underground transport tunnels are only advantageous when space above is limited or where above-ground routes can be hampered by heavy snowfalls) is an alternative where they already exist ('New York's underground system costs \$2 and runs all night'). Where inner-city tram or rail lines don't exist, that should remain the case (and old inner-city tramway and railway lines shouldn't be replaced by new ones when their useful life is over) because *efficient, flexible and low risk* buses are more mobile (e.g., a train can only move backwards and forwards in the same direction as the rails, whereas an independently powered bus – as opposed to one that is powered via electric cables in the road or overhead – can easily make detours around unexpected obstructions, be used to carry people on unorthodox routes, etc.); tend to be quieter (unless the trains ride a *cushion of magnetic fields* rather than rails); and, although roads may require more effort to maintain than railway lines, they can easily be used by the vehicles of other ministries (which normally need to follow unorthodox routes). In addition, maintaining just one type of land transport network ought to be more efficient long-term than two or more!

It should only take a few days for the Transport Ministry to work out new bus routes for Auckland, but there might not initially be enough buses to provide an adequate service at all times. However, until enough buses are available, mini-buses and large cars (e.g., 7-seaters or MVPs) can be used around suburban routes – perhaps operating more like an inner-suburban taxi service than following set routes. Indeed, there should be no need to provide more buses to the Auckland region until all of the available mini-buses and cars have outlived their usefulness! Ideally, every vehicle (including motorcycles) within the Auckland region ought to immediately become the property of the Transport Ministry – excluding vehicles required by other ministries – with excess vehicles being sent to needy districts or put into storage until required (e.g., if a vehicle in circulation becomes worn out or damaged beyond repair, it can simply be replaced by a stored vehicle). Certainly there should be no justification to allow people to still buy vehicles for private use – which means

any vehicles sitting in new and used car sales yards can become the property of the Transport Ministry (thereby freeing up car salespeople, car-groomers, etc., for more important work – plus large areas of land), as can vehicles currently owned by hire companies. Unfortunately, convincing every HB to give up its right to continue having a private vehicle might prove to be a difficult task – but the Transport Ministry could monopolise fuel supplies so that they are only used for public transport and industrial purposes (ministries which require fuel for their own vehicles and equipment can arrange for that fuel to be provided by the Transport Ministry – rather than having their own fuel supply and storage systems); at the very least, fuel supplies for private use should be expensive and limited – with vouchers or subsidies being provided to people who car-pool their vehicle and rural residents who can't be moved to an urban location (people who can be moved from a rural home to an urban one but refuse to do so shouldn't receive any kind of special consideration when it comes to private transport – especially since an infrequent rural public transport service can be established, with rural residents arranging their movements to tie in with the service's timetable; alternatively, rural residents who don't already have a bicycle can be given one).

If members of the public are still able to use private vehicles (they may need them to carry groceries, for example, until weekly supplies are delivered directly to households by the Food Ministry – r:p2089, lns5-6 – although free taxis could wait outside supermarkets to carry people and their groceries home) it ought to be harder for them to get their vehicles repaired if a part breaks down or the vehicle is involved in a crash; and such repairs should only commence after the customer has fronted up with the money to pay for labour and parts. Mechanics and panelbeaters, their equipment and spare parts could be combined into larger working units to increase the efficiency of repair services; a minority of mechanics at each garage could work solely on private vehicle repairs – with each new repair job going to the bottom of the waiting list (thereby giving customers a chance to save up the cost of the repairs out of their weekly allowance money – but, hopefully, most will decide that they can't afford to allocate any of their allowance to vehicle repairs, and simply forfeit their vehicle to the Transport Ministry so it can at least be used for spare parts) – while the majority of mechanics work on industrial vehicles, only assisting with private repairs whenever they have a shortage of industrial jobs. The owners of private vehicles could buy replacement parts and do the repairs themselves (or get mechanically-minded friends to do the repairs in their spare time), but garages should be required to inspect such repairs before allowing privately repaired cars to be driven on public roads (i.e., a warrant-of-fitness system would need to be maintained and enforced).

Eventually, the only vehicles on the road will be public transport and those required by other ministries. This would remove the need for residential properties to have garages and driveways, and for city or suburban centres to have multi-storey carparks and metered parking spaces; eliminate traffic jams (plus the need to have traffic-spotters flying over motorways – which should no longer need to have more than two lanes each side, if they are still needed at all – as well as traffic law enforcement officers, parking officials, etc.) while simultaneously reducing vehicle travelling times – and may even make traffic-lights redundant; severely reduce the amount of accidents, as well as the number of mechanics, panelbeaters, etc., who need to be employed by the Transport Ministry; increase the life expectancy of roads. Incidentally, the maintenance and construction of roads would be another responsibility of the Transport Ministry, with each district using whatever materials are easiest for it to produce, while creating a long-lasting surface that is safe in all or most weather conditions (e.g., tar shouldn't be used where it will melt during the middle of summer – unless the tar can be treated to prevent melting) – although, if it eventually becomes practical to only or mostly use vehicles that can be levitated above the road surface when moving (e.g., hovercraft; electromagnetic vehicles) wear and tear on road surfaces would be minimal.

Factories that manufacture vehicles which still use standard internal combustion engines ought to be shut down immediately, meaning that only hybrid or other types of efficient, low-polluting or non-polluting vehicles are manufactured in future. It would be ideal if motors that are powered by hydrogen fuel cells or run on water become commonplace – in the latter case, buses and other vehicles would only need to have access to taps in order to refuel; or, alternatively, if all vehicles are eventually able to utilise the turning of their wheels to generate enough energy to make the wheels continue turning (if it isn't possible to use the four – or more – main wheels to recycle a vehicle's momentum, perhaps an extra axle and wheels can be fitted to re-generate energy), thereby eliminating the need to refuel vehicles – unless a battery or electric plug is required to provide the energy that starts turning each vehicle's main wheels. However, if other types of fuel have to continue being used into the future, they ought to be produced from plants or other renewable raw materials – or at least be sourced from natural gas as opposed to using petrol. The same can be said for engine or transmission oils (consider '*Mobil 1* – the synthetic oil that is better for your engine') – although oils can be recycled. By the way, because aesthetic appearance would no longer be a consideration, new vehicles could all be given a wrap-a-round – i.e., bumper-car-like – protective guard to prevent damage being caused to panels and lights in minor accidents (ensuring that only properly-trained people with a defensive-driving attitude work as drivers should also help to reduce the chances of vehicles being damaged unnecessarily; as will producing vehicles that are incapable of exceeding maximum speed limits); alternatively, every vehicle could have a *collision-avoidance system*.

The Transport Ministry wouldn't have to manufacture vehicles but, because it is responsible for the maintenance and repair of vehicles (unless it is more practical for the Manufacturing Ministry to handle vehicle maintenance and repairs) plus roads, other ministries should have to give their orders for new vehicles to the Transport Ministry – which would then arrange for the Manufacturing Ministry to produce them (and, for easy identification, each ministry's vehicles could be the same unique colour – e.g., every Food Ministry vehicle could be green; every Health Ministry vehicle could be white). Ministries will have to be accountable for the efficient management of their vehicle fleets, having just enough vehicles – be they of a standard or specialised design – to avoid delays caused by vehicle shortages, while also taking into account the need to schedule routine maintenance checks for vehicles (and perhaps have a few spare per district to be used when workloads surge unexpectedly, or to replace vehicles that have broken down). However, rather than trying to schedule routine maintenance checks during daylight hours (i.e., while the majority of a ministry's vehicles are being utilised), such checks could be performed during low or zero-use hours (e.g., during weekends; at night – scheduling routine maintenance checks for evenings would be especially advantageous for the Transport Ministry because that will maximise the number of buses available to be used during daylight hours).

The Transport Ministry of each district will need to have enough buses to cater for peak times, but if it has slightly more buses per district than needed during such times, other ministries should be able to borrow buses whenever circumstances conspire to leave them short of vehicles. In some instances, however, there would be justification for other ministries to have their own supply of buses. For example, the Education Ministry needs buses – and drivers – to take classes on field trips (if field trips were arranged so that approximately the same number of classes are being transported each school day, the number of buses required by the Education Ministry could be fairly constant; if the drivers were qualified to also act as guides or tutors, they won't have to be idle between the time their bus arrives at its destination and the time to leave) – but there shouldn't be any justification for supplying buses to take pupils to and from school (if the majority of adults are commencing or finishing work either an hour before or after school begins/ends, there might be enough of a lull in passenger numbers on suburban routes to allow high school pupils to catch a normal bus to and from school if the walking distance between it and their home is excessive; but primary school pupils ought to all live close enough to their schools to always walk – assuming they can walk – and have adequate clothing to protect them whenever the weather is very wet or cold). The Food Ministry would also need to have a personal supply of buses to transport its workers from the city to surrounding fields, and from one field – or glasshouse – to another during the day (although, if the Food Ministry mostly only requires mini-buses for this purpose, those mini-buses may be used as taxis by the Transport Ministry at night). These vehicles could leave from the centre of the city – meaning that the Food Ministry's workers have to travel into the city to catch them, or at least be waiting somewhere along their route out of the city – or, preferably, leave from a selection of outlying suburban centres (teams of workers can then predominantly consist of people who live in neighbouring suburbs).

The Food Ministry would need its own supply of delivery vehicles, as would the Manufacturing Ministry. Initially, the Housing Ministry could also have its own vehicles to help shift tenants and their personal belongings from one house to another. However, because household furnishings and equipment

should belong to houses not the tenants (r:p2204, ln56), the amount of personal possessions tenants have to move will eventually mean that they ought to be able to pack all of their personal belongings – including, if they are air-filled, mattresses (but excluding *oversized* bed-bases – r:p2204, ln58) – into one or two suitcases (supplied by either the Housing or Manufacturing Ministry) and catch a bus to the new residence! Incidentally, if – when a thorough public transport system has been adopted and the overall volume of vehicles using roads minimised – a person has to travel by bus for more than 30 minutes when journeying to or from the person's workplace, or the place where the person is collected by a ministerial vehicle (e.g. Food Ministry workers), and it isn't possible or practical to move the person into a house which is nearer to that workplace (like if the person has a partner who would then be living more than 30 minutes travelling time away from its work), or to transfer the person to a workplace which is nearer to the person's home, any travel time in excess of 30 minutes (or maybe in excess of 60 minutes) ought to be included as part of its normal working hours.

The Transport Ministry can be responsible for inter-district or inter-state travel. However, there should be only three reasons for moving a person (and, if relevant, its partner and children) from one district or state to another. The first is if that person is required to perform a particular work task which can't be performed by someone already living in the destination district (or can't be performed via video-conferencing – e.g., via the Internet – or other means of communicating over long distances), or there is a shortage of qualified workers in the destination district but an oversupply in the person's home district; such transfers should be viewed as temporary (i.e., just until the destination district can provide a local resident to perform the visitor's task) – the Housing Ministry would have to provide visitors with accommodation – although transferred workers could have the option of remaining in their newly adopted district. The second reason is if a natural disaster renders an entire district uninhabitable – temporarily or permanently. The third reason is if someone is being moved from an overpopulated district to an underpopulated one (r:p2024, ln41). People wouldn't need to be charged money to move under any of the above circumstances (but if, when a new system is instigated, some people have their plans to migrate cancelled – because the Transport Ministry, and any other relevant ministries, consider their migration to be unnecessary – any money those people have already paid out shouldn't be refunded).

Volunteers should be sought to leave overpopulated districts, but preference of destination ought to be shown for people who had previously migrated from an underpopulated district, or have some kind of connection to it (e.g., some of their relatives live there; they have skills that are required by the underpopulated district). However, because it is senseless to allow people to move from underpopulated districts to overpopulated ones, people would have to be aware that once they have migrated to an underpopulated district they can't go back! Furthermore, when every underpopulated district has reached an optimum population, and each district is able to fulfil all of its employment needs from its own population, migration can be stopped completely (excluding the *second reason* – but, if cities aren't built in hazardous locations, such as next to volcanoes or above earthquake fault-lines, natural disasters might have a minimal effect on future societies). Therefore, it would normally only be necessary to move raw materials or manufactured products between districts/states.

Adjacent districts that share the same land mass can be linked by a railway line for transporting the majority of raw materials and manufactured goods. It shouldn't be necessary to construct underground railways for this purpose (except where it is more practical to go through mountains than around or over them), because they require much more effort to produce – especially where above-ground railway lines already exist – and maintain long-term (e.g., it is easier to realign earthquake-damaged railway lines that are on the ground rather than under it). Above-ground railways can be protected by a semi-circular wire or plastic cage – to prevent animals, broken trees or falling rocks obstructing the rails (if the cage is made of a plastic able to reflect heat, buckled rails may no longer be a problem – though rails can be made from heat-resistant alloys) – thereby enabling trains to safely travel at high speeds (although it might not be possible to achieve the same speeds as can be obtained from an underground railway). Speeds would be aided by the fact that – when everyone in each district lives in the same urban area (i.e., when railway lines no longer pass through small towns) – trains can travel non-stop between cities. Not having to stop between cities means trains could be automatic (i.e., driverless) and, if their travel times are fast enough, it might only be necessary to have a single railway track with one train continuously going backwards and forwards along it (or at least going backwards and forwards during normal working hours).

If underground railways or railway bridges are constructed at the shortest points between land masses separated by sea, it would be possible to establish a worldwide railway system (although each train should just go between adjacent districts instead of being able to travel right around the world – goods travelling further than adjacent districts would, therefore, have to be transferred from one train to another; each city could have a central railway station to make it relatively easy to do so). However, goods should mostly only travel between adjacent districts by rail, with goods that have to be transported over longer distances being carried by ships or planes – with the latter being the preferred carrier because they can cover territory so much faster than the former and are generally safer (although it may be possible to design ships that remain stable regardless of how treacherous the sea becomes – and whose noise doesn't affect sea mammal social interaction). The Transport Ministry would, obviously, be responsible for managing and maintaining railway networks, airports (which would require less land if all aircraft can be designed to take-off and land vertically, or only require short runways) and docks. By the way, as with cars, there would be more than enough planes and ships in existence to cope with initial workloads – which will only decrease with time – meaning that excess ships (there are '90,000 commercial vessels') and planes can be put into storage until required to replace those kept in circulation, while production of new ships and planes can be stopped (unless they are of an advanced design – e.g., made out of long-lasting materials and powered by electric motors, seawater, hydrogen, or other environmentally sound fuels and energy sources; in the early 1990s a 'Japanese company used superconductors to develop an electronic ship engine which was minute in comparison to standard ship engines – which can be three floors high – had fewer parts, could be placed on the outside of the hull thereby further increasing internal cargo space, would propel the ship through the water faster, and ran continuously after being started'). When transferring goods between districts, thorough measures should always be practiced to ensure they arrive in a sound condition (where relevant, popcorn can be used as a packing material instead of polystyrene chips or other sophisticated products) and the spread of pests (be they plants, animals or viral diseases – or other forms of contagious illness) is eliminated – unless the sending and receiving districts already share all of the same pests.

Controlling the movement of people between districts should also help to eliminate another kind of pest – criminals (including the ones who illegally smuggle immigrants – plus those illegal immigrants, and also refugees) or other undesirables who, instead of taking responsibility for their actions, simply escape to somewhere where they are unknown (often repeating their unsociable or destructive behaviour, before moving again, then again, and again)! Incidentally, the type of society proposed by this thesis should eventually eliminate the existence of vagrants and other homeless, jobless people.

Some HBs will claim that if people are no longer able to freely move about the world, it would stifle the development of individuals and communities. "Travel broadens the mind", they'll say, and might even suggest that the reason Jesus of Nazareth stood out from the crowd was because his parents travelled to different countries during his childhood, and Jesus also moved about a lot in his later years. However, although their reasoning would be valid, the examples of people like Socrates and Immanuel Kant prove that a person can live in one place all of their life and still develop a strong mind and personality (while modern communications technology makes it easy for people separated by distance to influence each other)! Furthermore, people tend to care more about their community – its people, facilities and environment – if they have a long-term commitment to it (note that making people catch public buses – instead of travelling around in private vehicles, usually alone – should help to bring the members of communities closer together).

Unfortunately, people who have previously moved away from their families and friends, but are prevented from moving back (because the district they left is overpopulated), would never be able to see each other in person again – unless they are responsible for operating a train (if trains have drivers), plane or ship between the relevant districts – but this needn't be an issue (because – except for instances when people were forced apart by authorities or events beyond their control – if they really cared about their family or friends, they would never have moved in the first place; and, anyway, modern communications technology means that people who are kept apart physically can easily keep in touch electronically).

TALK

Television-telephones may reduce the need for... face-to-face business conferences and... result... in... saving[s] in business travel... - 1983

The Internet pastime of 'chatting' is also called 'conferencing', though that makes it sound a bit business-ish. Chatting by computer is one of those leisure things you can now do with one or more individuals, anywhere on the planet. Here's an awesome thought. There are now some 50 million people who use the Internet. The number grows around 8000 a day. And you could talk to *all* of them... by equipping your computer with a modem, joining up with an Internet Service Provider, and going online. When you chat by computer you go to a suitable online site and announce to the world that you're there. Soon a message jumps onto your screen. It's someone in Kathmandu who asks you what's happening at your part of the planet. You reply – and soon develop this fascinating conversation. It all takes place in what computer users like to call “real time”. They mean that you're actually exchanging written conversation live – in the same way that you exchange spoken conversation on a phone call... Let me make clear that chatting is not what is usually meant by the term “email”... Sending email is one of the best things about the Internet. It's very cheap – maybe only five or six cents a time. And it's very simple – your online software will flash a message form on the screen for you to fill in. Addressing it and sending it off can be done in a few taps of your keyboard or mouse. (You could send off a hundred email messages in the time it takes to get out an envelop, address it, put your letter inside, seal it and take it to a postbox.) Email is a private and direct link to one person. But there's another, public method of sending electronic messages... [which, along with email, is] less immediate, but may be more efficient [than chatting]... This you do by going to the site of a particular interest group on the Internet... You might choose one dedicated to Drag Racing, for example, or Astrology or Stamp Collecting or Genealogy or Left-handed Film Stars Born in Hawaii During the Second World War. (Whatever you're interested in, *somebody* on the Internet shares your enthusiasm! ...You can find out about *anything* on the Internet... though there's no guaranteeing that it'll be true!...)... These sites are called Newsgroups... [By the way, m]ore Americans, confronted by a deluge of new information programming and expanded coverage, are turning off the traditional nightly news broadcasts[. A] study shows... that nightly newscasts – offered by ABC, CBS and NBC – are fast fading as an institution. “The pace of life is so hectic that people don't have the time to make an appointment to sit down every night at 6.30 to find out a lot of things they already know... Fewer than half the public [42[%]] now says it regularly watches one of the three nightly broadcasts, down from 48[%] in 1995 and 60[%] in 1993,” said the Pew Research Centre for People and the Press... The Pew study found that local news shows, with their menu of neighbourhood crime, local government and community events, have been far more successful in holding on to their audiences at 6 pm... Many local stations now offer as much as two hours of news leading up to 6.30 pm... [65%] of survey respondents said they watched local news regularly, down from a high of 77[%] in May 1993... [The] director of the Pew centre, said the most surprising finding was that “it is now television's turn to experience what newspapers have struggled with for the past decade and a half – the decline in audience.” The second surprise... “is just how quickly our lives are being changed by computers. A big decline in viewership is associated with computer use.”

...Computer software already controls much of our lives. And the more it does... the greater the odds of a disaster caused by a system crash. ALL the planes over a huge area of... Seattle... fall out of radio contact. Hospital patients die after being exposed to too much radiation during radiotherapy. London ambulances fail to arrive at accident scenes after being given wrong addresses... [O]n the world's largest roller-coaster... at Blackpool's Pleasure Beach in Britain, two cars ram... each other at high speed, causing whiplash injuries... [-] brakes that should have triggered automatically when the cars were travelling too close... had failed to activate... None of these incidents should have happened, but they did. And in each case computer software was to blame... Air traffic control, traffic light grids, train signalling, hospital drug administration and patient monitoring systems, the brakes of luxury and not-so-luxury cars, weather forecasting, the stock exchange... all these rely to an ever-growing degree on bespoke sets of computer code that cannot be fully tested before they go into commission. But surely, you may think, software is still more reliable than humans? Perhaps so – but even people in the profession confess that software engineering is far from infallible. [A p]rofessor... of the University of Washington, the acknowledged world authority on the subject, recently wrote to *Risks Forum*, an Internet publication on computer safety: “Software engineers are causing the same accidents other engineers learned to avoid years ago. I feel that unless [they] learn those basic safety concepts that have been accumulated over years by engineers, we are going to repeat the accidents of the past and kill thousands of people unnecessarily.” ...“Outages” – computer breakdowns which temporarily kill radio communications – have become common across most of [US] airspace. The software in the Seattle incident was part of a state-of-the-art system, just two months old, which cost more than \$NZ2 billion. But it was not immune to the “bugs” most programmers agree are inevitable in any software development – bugs which often go unnoticed and unfixed until a particular confluence of events causes them to strike. IN most cases (defence systems are the main exception) there are no regulations on how computer software systems should be specified, built or controlled – even though lives and economies increasingly depend on them. “Anyone can develop one, regardless of experience, competence or resources,” says... [the chairperson] of the A[USn] Computer Society's committee on safety-critical systems. Other engineers – mechanical, electrical, civil – operate under much more onerous regulatory constraints. But the problem is not just one of professional inequity. Software developers' creations frequently shoot past the red and off the scale in terms of complexity and ambition, experts say. If such complexity were transferred to other design and engineering disciplines, it might be the equivalent of building a bridge across the Pacific. However, because software takes the form of binary digits stashed invisibly within a computer, self-indulgent design folly is rarely exposed. “If you're building an aeroplane, you're constrained by the properties and the cost of cutting metal to keep things fairly simple,” says [the p]rofessor... who heads the Software Verification Centre at the University of Queensland. “...The discipline of keeping things within the bounds of what is verifiable with mathematics is what most branches of engineering do as a matter of course.” Not so software, [the professor] says, much of which is written in such a way that it cannot be independently combed for errors or fully tested. The complexity of much software concerns experts. Two who commented for this report said there were certain planes in which they personally chose not to be passengers. “There are 10 million lines of code [in two of the planes],” said one. “That's a lot of software and a top-quality organisation will produce software with one error per thousand lines of code. You can't get rid of those. I prefer them to fly without me.” ...[the] programme leader for software and systems engineering at A[US]'s Commonwealth Scientific and Industrial Research Organisation... gets nervous... [upon learning] that someone has invented a new medical device. “I think, ‘Oh my God, there's software in this sucker’.” ...an American safety engineering specialist, [the programme leader] is heading a CSIRO push to offer consulting on software safety to industry, buyers and regulators... [R]esponse has been patchy. [The programme leader] believes that in 20 years we will look back in horror at the computer projects we accepted in the 1990s, and cites a historical parallel, the development of the steam engine in the 19th century: “At the beginning, anyone who could weld metal was putting steam engines together and they

were exploding and killing people all over the place. There was no science of metallurgy. Software is in that phase now. We're part-way towards making it an engineering science but we're still not sufficiently beyond the craft stage." ...[the] director of industrial training at the University of Technology, Sydney, says a strong professional association could help to bring software practitioners into line. [The director] believes that just as doctors can be struck off, lawyers disbarred and priests defrocked, so software engineers ought to write computer code in the knowledge that their careers can be terminated if they do so negligently. Back-up systems – software designed to swing into action if the primary software fails – underpin the computers that control many plane and rail systems. [The University of Washington professor], however, rejects the semantic justification... used as an excuse for poor-quality software projects... that if the computer system has back-up software, then the primary software is not definitively responsible for protecting human life... "I think that argument has been pushed to its limit in commercial avionics software... As a person who flies a lot, I'm not thrilled by it." ...The main reason many people are worried is that computers lack intuitive logic – while the machines can deal expertly with predicted events, if something out of the ordinary occurs they lack what we would call common sense in deciding how to respond. The French Airbus company has gone further than any other commercial aircraft manufacturer in giving computer circuitry the upper hand. The results have been far from perfect. A Virgin Atlantic Airbus A340 was on approach to London's Heathrow Airport when a number of its computer systems failed and the crew decided to revert to manual flying. The renegade computer thought otherwise and turned the plane to the right, ignoring a manual instruction to turn left. The crew did regain control but the incident sparked an inquiry because the rogue instruction should not have happened. The inquiry found that inter-relatedness was at the heart of the problem. A tiny error in one program had affected the calculations of others, compounding into a potential catastrophe what in isolation might have been a negligible bug. Software is not only vulnerable to its own internal inadequacies. It can be interfered with from outside sources[(computer 'circuits work at very low voltages and a lightning strike could disrupt them, and erase their programs and memory in a flash, so to say, but a Faraday cage is a sovereign remedy against extraneous electric fields – all the really important computers are so protected; also, if one is concerned about earthquakes, a hydraulic platform gives reassurance')]. During the filming of *Babe*, the animatronic pig which was being operated by radio in the middle of a field suddenly began behaving strangely, its legs kicking and jerking... [T]he pig's maker, says: "Next day the local police arrived. Every time we operated the pig, no police could talk on their radios for 120 kilometres." The logic of the pig's circuitry was not sufficiently robust to withstand interference from police radio traffic. AT Melbourne's Tullamarine Airport police thought a professional hacker must be blocking pilots' communication channels. When they identified the source of the interference it turned out to be an ordinary VCR in a home beneath the flight path. Mobile phones have affected computer-controlled systems in cars, such as those designed to maintain even speeds or accelerate and decelerate smoothly, causing potentially lethal jerkiness or failure to start altogether... "It becomes an argument whether it's the purveyor of the phones or of the vehicle systems that carries the duty of care. But the system manufacturers should look at shielding them in some way... Typically, it takes a major accident before the public tells the government that it has to regulate," says [the programme leader]. "I hope those of us in the community that do know can raise the issue before that happens."

...[To make this more explicit, let me mention that modern compact, low-voltage computer memories are, like living cells, vulnerable to the cosmic rays that pervade space and rain on the Earth. The radiation particles, especially muons, create bursts of electric charges which do not damage the hardware but alter the stored information. Recent studies by IBM suggest that a large computer, using a thousand chips and operating at sea level, will suffer an error due to cosmic rays once every day or two. Error correcting codes, analogous to the gene repair systems of living cells, are standard circuits in large computers and can cope with most but, probably, not quite all of such errors. At high altitudes a significantly higher mutation rate must be expected, especially in outer space where satellites operate. Incidentally, 'the trail of ions that a meteor briefly leaves reflect very high frequency (VHF) radio waves. Since at any given moment there are enormous numbers of meteor trails in the atmosphere – most too faint to be seen with the naked eye – the meteor trails collectively provide a kind of reflecting surface surrounding the Earth, by which radio waves of the proper frequencies can be relayed. Since the average duration of an individual ion trail is less than a second, the message must be sent very fast. This has led to an entire field of technology called Meteor Burst Communications (MBC). But why would anyone go to such lengths, when there are perfectly adequate means of communication at hand? Because communications satellites would be among the early casualties in a nuclear war. MBC has been developed so that a nuclear war can be fought.']

...*Bit by byte towards peace...* Hatred is threatening Bosnian peace once again. But the fabric of order that has lasted nearly a year remains well in place, and it owes much of its existence to something rather unexpected: software. Last November, around a table in a foreign land, enemies-turned-uneasy-partners sat staring at each other, desperate to end a war that had splintered their nation. But how to reach a common ground – and make it stick – when so much blood had been shed? So, surrounded by squabbling Serb, Croat and Muslim leaders, mediators trying to end the war in the Balkan nation enlisted a computer program – the software that the Taco Bell chain uses to scope out locations for new restaurants... [- and] 45 software operators... A combination of three computer programs enabled mediators at the talks in Dayton, Ohio, to redraw bargained ethnic boundaries within hours, sometimes even minutes, after they were agreed to in principle. Negotiators, in turn, could visualise how their version of Bosnia would look. It worked – or at least made the peace process far faster, which may have meant the same thing... "If someone asked, 'If we moved this boundary, what would the effects be?', the software answered that. It would say, 'Well, you lost 10 schools here and got three hospitals here, and this is what it will do to the ethnic mix,'" says... [the] vice-president of marketing and sales at ESRI, the California company that produce[d the]... main programme, ARC/INFO... "Had they been made to wait any more, things could have been substantially delayed," says... a geographer from the U[S] Army Corps of engineers who set up the operation. Computers have been used for years to recreate war, whether by video game or military simulation. But this was the first time computer software was used to fashion peace – to end, in this case, a conflict that left more than 200,000 people dead or missing since 1992... ARC/INFO is used widely by municipal governments... public utilities and companies to keep databases of stores... The Defence Department enlisted an earlier version to track troop movement in Operation Desert Storm... Countries use it to feed phone numbers of emergency calls into a database and pinpoint a call's origin.

...A[US]ns could have trouble making phone calls in the future unless rapid steps were taken to encourage Internet users off the telephone system, Telstra Multimedia told an Information Explosion conference. The Telstra Multimedia chief operating officer... said a significant proportion of local calls had "call all time" of more than 24 hours, meaning they lasted 24 hours or longer. "These 24-hour users are using them for an Internet connection... over a telecommunications network that was designed for three-minute calls... This is placing incredible demand on the telecommunications network." [The officer] said that in the Silicon Valley in the U[S], people trying to make phone calls at night could pick up their phone and not even get a dial tone. "There is no dial tone because there are so many people there using the Internet... Unless something is done about this very rapidly we could all be in the [same] predicament..." Telstra has forecast that the capacity necessary to transmit internet traffic will exceed all other telephone traffic in A[US] by the last quarter of 1998... [P]art of Telstra's answer to the problem would be to launch a cable modem using cables currently being laid by Telstra and Optus to carry pay TV. The cables were designed for interactive communications, giving A[US] an edge over other countries, particularly the U[S] which faced high costs in upgrading its cable system. The cable modems could be more than 100 times faster than the telephone modem and [Telstra] expected people to rapidly move off the telephone network to cable.

...Some A[US]n states moved to daylight saving at the weekend. New South Wales, A[US]n Capital Territory, Victoria and South A[US] have put their clocks forward an hour... But Queensland, Western A[US] and the Northern Territory do not observe daylight saving. This means there are five time zones across the nation during summer.

...The times, they are a'changing – and France wants to ditch the switch. Most of Europe comes off summer's daylight savings time today and sets its clocks back one hour... from being two hours ahead of Greenwich Mean Time... to one hour ahead... All for nothing, the French

Government contends. Breaking ranks with the rest of the E[U], France says the twice-yearly chore should be scrapped “in the name of good sense and general interest.” “The worst would be if we take different paths on the time question after having decided together to unite under the metric system and even merge our money,” said... a politician who is studying the issue for the [French Premier. The] Premier... told French television the nation would be making the traditional switch today “for the last time or the next to last time.” But even [the politician] concedes it won’t be easy. For nearly 20 years, most of Western Europe has set its clocks ahead an hour in spring and back an hour in autumn... Even if France and its neighbours stopped changing their clocks, they’d have to agree on whether to stick with “winter time”... or “summer time”... There’s no consensus on that. - 1996

AT THIS time of year, if [a couple of Northlanders] want to catch their favourite television programme they have to sit down an hour early. For the past 13 years, [the couple]... who are now semi-retired, have refused to follow daylight saving. The couple are the only bandits left in the... town of Ararua wh[ere, in]... 1984 the residents, mostly dairy farmers, argued moving their clocks forward an hour meant getting up in the dark when the cows were “loathe to get up” for milking. They gathered a petition with 13,000 signatures and took it to Parliament, but the opposition was too great and gradually all the residents, except the [semi-retired couple], agreed to conform to N[Z] time... Plunket’s Auckland regional nursing specialist... said daylight saving brought many complaints from parents but the key was weathering it out. “We advise parents to stick to their normal routine and then to darken the room. Some parents let their children stay up later, but that means they sleep in longer in the morning, and parents need time to themselves too.” ...A spokes[person] for the Department of Internal Affairs said it had received no formal complaints about daylight saving which this year began last Sunday. [The spokesperson] said it was up to the... public, rather than Internal Affairs, to decide when it wanted daylight saving. The public can make submissions to Parliament asking for it to be changed. In 1985 a survey by the department showed the public wanted more [days of the year to have] daylight saving hours. ■ ‘Today approximately 70 countries utilise Daylight Saving Time in at least a portion of the country. The only major industrialised country not to have introduced DST is Japan. Of interest, equatorial and tropical countries (lower latitudes) do not observe DST since daylight hours are similar during every season, so there is no advantage of moving clocks forward during the summer.’

...‘Daily life in the early days of the colony of NZ did not require high accuracy of timekeeping, and it appears that each district kept its own approximately local mean solar time. Development of coastal shipping, trans-Tasman steam services, railways, and the electric telegraph soon showed the necessity of some kind of uniform time system for the country, if confusion was to be avoided. The House of Representatives resolved that the mean time for the colony should be 11 1/2 hours in advance of Greenwich mean time as from 2 November 1868. It is interesting to note that not long afterwards discussions arose as to whether or not it would be better to make this time difference exactly 12 hours. After the vicissitudes of “summer time” experiments, the standard time at present is in fact 12 hours ahead of GMT, as defined by the Standard Time Act of 1945. Time and longitude are two completely interwoven quantities both for the navigator and for the surveyor; and it was soon appreciated that not only was it necessary to have a uniform time system for the young colony but also that the longitude must be known as accurately as possible. While fixing the location of the country accurately on charts, longitude relates its time to that of the prime meridian of Greenwich.’

...‘The Greenwich Meridian, which was defined to pass through the Airy Transit Circle at Greenwich, was adopted internationally as the zero of longitude at a conference in Washington in 1884. Its acceptance was facilitated by the overwhelming use of the Greenwich Meridian in navigation and the adoption, in the USA and Canada, of time zones based on Greenwich. Originally, different towns in Great Britain kept their own local time, varying according to longitude. In the mid-19th c. Greenwich time was adopted by railways throughout Britain for the sake of uniformity. However, it was only in 1880 that Greenwich Mean Time, mean solar time on the Greenwich Meridian, became the legal time throughout Great Britain. The international reference time-scale for civil use is now based on atomic clocks but is subject to step adjustments (leap seconds) to keep it close to mean solar time on the Greenwich Meridian. The formal name of this time scale is UTC (a language-independent abbreviation of co-ordinated universal time) but it is still widely known as GMT. Some early non-mechanical ways of measuring time were: the sand-glass (this principle was in use from an early date); the Egyptian shadow-clock, c. 900 BC (a bar was placed in an east-west position, with a cross-piece at the east end in the morning, and reversed at noon – the shadow cast on the bar indicated the time by its position in relation to the markings); the Greek water-clock, 5th c. BC (the time taken – about six minutes – to empty a 7 litre vessel was used to measure speeches at council meetings); and the sundial (since a sundial measures time by the position of the sun, it becomes slightly fast or slow by clock time at different periods of the year’).

...‘Time was measured by ancient people by the passage of days, by phases of the moon, by seasons, and by the apparent passage of sun and stars overhead. Shorter periods were measured by the sundial in Egypt as early as 1500 B.C., and later by the water clock. The modern clock came into use in Europe in the 13th cent., the watch in the 15th cent. Measurement of time takes into account changes in the earth’s position with respect to the sun throughout the year. Mean solar time, or civil time, which is the time used in ordinary civil affairs, represents a compromise, the *mean* solar day of 24 hours being the *average* length of the solar day throughout the year. On any given date the *apparent* solar day, which is the day as measured by the sun’s positions as actually observed on that day, may be as much as 30 sec. shorter or longer than the mean solar day, which has the same length throughout the year. For astronomical purposes the *sidereal* day is used; this begins when the vernal equinox is at the meridian and lasts until (the earth having rotated once) it is again at the meridian. Since the earth rotates through about 360° in each 24 hours, each degree of longitude represents 4 min. of time. To avoid the inconvenience of changing time whenever one travels a short distance east or west, the earth has been divided into 24 longitudinal time belts. Within each belt, time is the same everywhere, so that one’s watch needs to be reset only when one moves to the next time zone, which is exactly 1 hour later or earlier. The calendar, which makes possible measurement of time from year to year, has been improved periodically since its beginnings in ancient Babylonia.’]

...North Korea marked the 49th anniversary yesterday of the founding of the Stalinist state by adopting a new dynastic calendar based on the birth year of its founder... “From today, the DPRK... uses the Juche era,” said the official Korean Central News Agency. Juche, or self-reliance, is North Korea’s state ideology and the new calendar, in the style of ancient Korean kingdoms, counts the first year of the Juche era as 1912... The Communist Party organ, *Rodong Sinmun*, carried an article entitled “Kim Il-Sung’s Korea will be everlasting with Juche era.” It was illustrated by a picture of the late President and his son... taken in... Juche 76 (1987)... [By the way, p]opular culture faces an identity crisis as the new millennium dawns. Not only will computers be short-circuiting, but the supposed trendsetters are blowing their creative fuses as they struggle to come up with a pat phrase for the next decade. Short-forms that have stood us in good stead for the past eight decades – the 20s, 30s, 40s, 50s, 60s, 70s, 80s, and 90s – are no good for the next. With the end of this decade fast approaching, several titles for the first 10 years... have already been tossed into the ring – the zeros, zilches, the oh-ohs, the noughties and the pre-teens are among them. Some clues may be gleaned from the phrases used 100 years ago... According to a historian at Auckland University, the first decade of the present century was known as simply *the new decade* or *the nineteen hundreds*, although the latter caused some confusion when the phrase was adopted to describe the whole of the 20th century. Whether any of the old or new phrases enter standard vocabulary will be up to the masses, according to linguistic scholars. An expert of the use of the English language[at] Auckland University... said... “The scholars define these things but they don’t start these things,”... An English language expert at Victoria University suggested that the decades would be named retrospectively, just as the first couple of decades of the 20th century had become known. For example, the early 1900s were known as the Edwardian era... while... from 1910 to 1919 have become the... W[W1] years.

...A little over a century ago the founder of Kodak, George Eastman, gave the world popular photography. For the first time anyone could create a picture and suddenly everyone was a photographer. “You press the button, we do the rest,” proclaimed Eastman’s slogan. The rest is history. A

century later Eastman's technological heirs and others are bringing similar point'n'shoot simplicity and mass availability to photography's space age descendant, digital cameras. One of the most exciting advances of 1997 has been the dramatic leap in image quality now coming from digital cameras under \$2000. The whole price performance equation has changed radically... These cameras offer a quality near to that previously only found in 'professional' digital cameras, costing upwards of \$10,000... Basically the quality of digital cameras is largely determined by the number of pixels on the camera's imaging chip (the device that replaces the film)... "You click the mouse, the software does the rest" could well be the catchphrase for the new millennium... By the year 2000 it is expected that worldwide digital camera sales will be about \$14 Million a year and could translate into sales of over 100,000 units in NZ (last year NZers spent over \$26 million buying compact cameras – that's over 125,000 cameras')... opening up all sorts of new business applications. The... implications for 'who uses digital photography and where' are far reaching.

...[When a Herald columnist wrote of wedding photographers' "tyranny," reactions came in a flash. Last week, a wedding celebrant and parish priest accused photographers of dominating weddings, taking control of the couple, shooting too many pictures and keeping the guests waiting. "How many photographs are needed?" asked the Father. Not fair! cry the photographers, with the NZ Institute of Professional Photography's president taking great umbrage at the comments. Local wedding photographers were recognised internationally for their innovation and creativity, the president said. A basic package includes photographs of the arrival at the ceremony, the ceremony itself, various family and friends, and a location shoot of the bridal party. A couple could expect to pay \$600 to \$2500 for this. They would get a professionally organised 20-page album of their favourite photos, but could choose more at extra cost. Couples are given a list of reasonably priced, discreet and well-dressed photographers from most wedding planners and celebrants'...

"I've been threatened about three times now, but I've got a lot of good photos by not asking people if it was OK beforehand, because they tend to stiffen up. Maybe if I published them I'd get in a bit of trouble," says a Massey photographer, who loves the danger and excitement wrapped up with documentary-style images, and is one of nearly 40 graduate students putting on their first big exhibition this week since completing a year-long photography course at Edu-Col School of Arts and Media. Things have certainly changed since F-stops and shutter speeds became part of his everyday vocabulary: "You have to be a nosy bugger and extremely confident, because it's quite hard to get in someone's face when they're angry at you." • 'Celebrities are delighted with a new law effective next January, banning photographers from intruding on their private lives. The paparazzi say freedom of the press is being curtailed.'

...The Press Council has condemned as a "dangerous practice in a free society" an attempt by the Privacy Commissioner to find out a journalist's confidential sources... But the commissioner... said last night that the council had given a "very misleading impression" of his request and of his position on journalists seeking to withhold their sources from him. "In my opinion it is quite intemperate to attack me for having the temerity to ask a journalist to assist me in an investigation and to call on me never to ask the sort of questions I have outlined." ...his office had asked for, not "required," information from the journalist that [the journalist] considered might be helpful to the inquiry. [The commissioner] was perturbed the Press Council had adopted such a "partisan stance on what it believed to be an inroad into press freedom," particularly as it was the body that dealt with individuals' complaints against newspapers.

...News-hungry NZers are keeping their country honest, according to a new report from an international corruption watchdog... [Other honest countries are] the Nordic nations and Canada. These [countries and NZ] are... where the most daily newspaper copies are published – between 30 and 61 per 100 people[(note that, in '1990, there were 1,611 newspapers in the US – the number has gradually decreased from 2,042 in 1920 – with a total circulation of 62.3 million; peak circulations of 63.1 million were reached in 1973 and 1984; 1920 = 27.8 million')]. The study showed the two countries best known for controlling corruption in the developing world in the course of the past generation, Hong Kong and Singapore, also had high newspaper circulations. The three European countries with the highest perceived degree of corruption – Italy, Spain and Greece – were among countries... with the lowest number of newspapers published... Far down on the list were Colombia, the Philippines, Indonesia... India... Kenya... Pakistan... and Nigeria... where between two and six daily papers per 100 people were printed... [A] former director of the World Bank, [who] set up Transparency International in 1993 to fight corruption in international business... said corruption thrived in a climate of secrecy... [when presenting] the report on Wednesday to an annual forum organised by the International Institute for Democracy and Electoral Assistance... "...the best conditions for bribery and extortion are those in which the media fails or is unable to perform as a watchdog for the public interest."

...Payments by news organisations for interviews or stories may compromise credibility because the subjects may demand to approve the contents. That is the issue of chequebook journalism raised by... a former news editor of the [NZ Gals' Weekly, which]... operated in a market where [the editor] had to authorise payments for stories and pictures to sporting and other celebrities. Now, as chief news editor of the [NZ Herald, his opinion] is blunt: "A commitment that the story be acceptable to the subject is a compromise of journalism. If you're paying you're not going to be allowed to ask the awkward questions which might be in the public interest." None the less, says... [the] head of news and current affairs for Television NZ, there are four big players in NZ paying for stories... they are [Gals'] Day magazine published by A[US]n Consolidated Press, [NZ Gals'] Weekly, published by Wilson and Horton which also publishes the Herald, TV3 owned by Canwest, and, "with some reluctance on very rare occasions, TVNZ... but I think the artifice should be put to one side because... TV3 keep saying – we... have never paid directly... On the four occasions that I can recall in the past eight years where we have agreed to make some sort of financial accommodation, and I choose my words carefully here, we could equally stand up and say we didn't pay them directly." The four agreements... were with the Wellington Hurricanes player accused of rape... [while staying in a South African hotel.] the... twins accused of jumping ship to illegally enter A[US], the wedding of the All Black [No 11, and with the NZer]... who photographed the Princess of Wales working out in his gymnasium... [The amount of the [rape accused's] agreement was "below the \$20,000 quoted... closer to the \$10,000 offered by TV3. TV3 offered money not in terms of cash but in terms of air fares and accommodation. Our discussions with [the NZ Gals'] Weekly – and it is well known that this is an arrangement done with [the] Weekly – is that we would only be party to any arrangement if [the player] was either found innocent or the charges were withdrawn. That's a question I'd like to ask [TV3], how they thought they were protecting that ethical position by paying someone's airfares and accommodation to assist them in a defence... We didn't pay [the All Black No 11] himself but we did make a contribution to... the cost of staging [his wedding in South Africa]... in return for having the only cameras in on the event. It... was not mega-bucks." The... arrangement [with the gym owner] was made in conjunction with Channel Nine A[US]. The head of news and current affairs] said TVNZ had been forced into agreements with subjects "because unfortunately a market exists now where our competitors, and I'm talking primarily about 20/20 [a TV3 current affairs show], are very active in the field... since Canwest came into town... We get asked for money all the time. Not a day would go by without someone suggesting that there be a payment. [99%] of the time we bat it away, but there are times... that we stop and think, well... our competitor is constantly offering financial inducements of one form or another, then we... are prepared to do it. We don't pay for news. One Network News has never been involved in any of this and... never will be. The Holmes programme has been the only one really... I feel very strongly that the real enemy of good journalism isn't the occasional payment, it is all the hypocrisy that surrounds it..." [The head] said that no conditions were attached in terms of what questions could be asked in any of the stories – "That would be unethical in any circumstances..." ...the present editor of the... Weekly... regarded paying for stories which would add readership to the magazine as a commercial responsibility. "[In] the old days good journalism was getting the story first... Nowadays, in the highly competitive field I work in, that isn't enough, and if there is another means that can ensure we get a story... that will increase circulation by 20[%], it is a business decision I am not going to walk away from." In the 1960s the Weekly paid a sum of money for exclusive rights, over several years, to stories of the Lawson quintuplets. In the following decade it also paid out for a "miracle birth" story, of a baby carried not in the mother's womb but attached to the bowel. Competition in the [gals'] magazine market warmed up with the arrival of the... [Gals'] Day in 1989, and some

spectacular payments began to be paid by both magazines, later joined by *New Idea*, for exclusive rights to cover celebrity weddings, holidays and births. There was a rule of thumb at the time that if a magazine calculated a particular story or set of pictures would increase circulation by 1000 copies, it was worth a fee of \$1000 to try to secure them exclusively... "Those were ridiculous days and ridiculous payments," says [the editor of the *Weekly*]. "I wouldn't pay now for any of those silly things. I have a responsibility to deliver real stories to my readers, and those are the only ones I will pay for... Certainly it works. Our issue with the [stowaway twins] sold better than any we've had for quite some time."

...TVNZ news chief 'not responsible' for item identifying victim of rape... A charge of identifying a rape victim was dismissed yesterday in the Nelson District Court... The rape victim's name and photograph had appeared in a *One Network News* report broadcast last September... [TVNZ] was fined \$500 last December after admitting... to... the incident... [P]resenting his reserved decision, [the judge said the TVNZ head] himself did not publish the item. The prosecution's submission claimed that [the head] had some form of editorial responsibility but this was not the case in N[Z], the judge noted in a written copy of his judgment... [However,] in Britain there was a statutory direction as to who would be responsible in such a case. It would be the "person having functions in relation to the programme corresponding to those of an editor of a newspaper." ...[the judge] said it could be argued that statutory amendments similar to those in Britain needed to be put in place here, but that was a matter for Parliament.

...[ON-AIR blunders during TV news bulletins are causing headaches for TVNZ executives. A TVNZ staff memo obtained by *Sunday News* revealed there were 270 errors recorded on the 61 evening news bulletins in the past two months. In the memo, the network's managing editor said the errors made for depressing reading. "At this rate we are on track to make 1620 mistakes in a calendar year, or an horrific 3500 across all our news bulletins." Only 10% of the news bulletins had no errors. Some of the mistakes TV One News made included last week publishing the name of the person at the centre of a rape-allegation involving a former Maori affairs minister. The news segment showed the former minister, under parliamentary privilege, naming the person with whom it had an affair 14 years ago – but dubbing out the name. Viewers watching with teletext subtitles saw the person's name running across their screens. An interview with another MP had a graphic which wrongly named him as the NZ First leader. Later in the same story a subtitle named the MP as the TV One reporter. "Imagine what this does to our credibility," the network's managing editor said in the memo. The memo warned individuals that in future they would be held responsible for mistakes. "Most of the mistakes made in those two months were silly little errors – mostly spelling mistakes," the managing editor said. "But, like any business, we do monitor different areas all the time to see how they can be improved." In related news,] *Oamaru's blue penguins have taken up disco dancing, breaking into homes at night and busting up marriages* – according to the BBC. A BBC... article reported that regulars at Oamaru's local disco "have got used to seeing hordes of them [penguins] strutting their stuff on the dance floor." The penguins stank of rotting fish, sounded like cats being strangled and broke into homes built on top of their nests... But Tourism Waitaki[']s manager... told the *Oamaru Mail* the article is "non-factual by a long way." Inquiries revealed that the blue penguins pictured in the article might be A[US]n.

...Having been brought up on a rich diet of BBC, I've always suspected that N[Z] was no mover and shaker in the TV news stakes. But the introduction of the 0800 "Amcam" campaigns on TVNZ and TV3 has decided the issue beyond a shadow of doubt – N[Z]'s news hour is tragic. By asking the public to send in their "newsworthy" videos the news programmes have degraded themselves into a glorified version of the *Great Kiwi Video Show*... Accurate or not, the message which the Amcam scenario sends out is that of gutter journalism. In effect, the campaign is encouraging punters to become unpaid paparazzi, all hoping they'll be in the wrong place at the right time, knowing that if the footage is sensational enough, it'll be screened. It's tacky... But the Amcam issue is only the icing on a rotten cake. The biggest problem with N[Z]'s news hour is simply that there is no news. The gruelling... coverage of Cyclone Fergus was testament to this. I watched in disbelief as hordes of reporters from every cranny of the country gave us day upon day of detailed reports on how Fergus had actually *missed* the places they were reporting from. Was there really nothing more vital to comment on in the world? ...A hardly new but irrefutable truth of our media age is this: that an issue exists is more exciting than the details of the issue itself... The Fergus fiasco highlighted the lack of quality news material at hand, not only locally but internationally. The news programmes seem so keen to play the human interest/sports/weather angle that the serious, investigative news doesn't get a look in. How can English... footy be more important than in-depth Hebron analysis? ...With our TV screens filled with monstrosities like *The World's Most Dangerous Animals*, *Police Stop* and *TV Bloopers and Practical Jokers*, the news crews have confused what the TV viewing public is *given* with what it deserves and *wants*. Which to my mind is this: a news hour which doesn't patronise its audience with easy-listening stories, whose international content matches the local, whose stories stimulate and question and whose presenters keep their eyes on the script and off the closing cliches.

...[I've long been opposed to the media "making" the news. I've always thought, in my naivete, that they should simply report it. On the occasions I've actually seen the news happen, in the flesh, it has always shocked me how the images and facts are manipulated. In Madrid recently, when a bomb was detonated by ETA Basque separatists near where I was staying, I strayed into the ensuing protest. There, a camera-operator, high up on a balcony, herded, with gestures, a group of protesters into his frame, whooping them up with his arms. Is that reporting the news? The chief news correspondent for the BBC since 1989, said at a session of the Edinburgh book festival that the growing public relations explosion meant that media are more managed, more contrived. One commentator suggested that the editors in this hemisphere feared that the summer would bring with it an "event vacuum" and that the recent paedophile "Naming and Shaming" campaign was raked to generate a bit of news. They needn't have worried, though. There have been sufficient bombings, murders and plane crashes to fill section after section deep into winter as well. I first heard about the naming and shaming when the editor of the *News of the World*, on television (TV news now puts music beneath the stories, adding a sense of urgency and atmosphere!), was justifying his decision to continue with his scheme and all I could see in his eyes was the promise of increased circulation. Had the editor known just how much mess his actions would cause, would it have gone ahead with publishing those details? Sadly, I think it would have, because sales are at the forefront of most issues these days, rarely public good.]

...The Melanesian island of Bougainville is not noted for its hot news stories... Journalists don't really go there. It's too remote. But as the world's largest humanitarian organisation, the Red Cross can reach across Bougainville. The organisation supplies aid to families... and... now, thanks to the Internet and a revamped Web site, the world can hear about [Bougainville] several weeks sooner than ever before. The Red Cross has distributed digital cameras to several of its 'front line' areas, and its workers are sending back pictures of events as they happen. The result... is a Web site that functions, more or less, as an online news agency. At www.ifc.org click on Direct from the Field, and Bougainville is just one of several places, including North Korea and Malaysia, where you can discover what is happening at a grassroots level. As well as pictures, there are reports of the Red Cross work being done... [The] head of media services of the International Red Cross and Red Crescent Societies in Geneva, says that the Web site is, unexpectedly, turning into something much more powerful than just another way of informing people about Red Cross work... [However, t]he Red Cross is sensitive to the fact that the reason journalists are not in certain areas may be precisely because the authorities don't want them there. The organisation cannot afford to lose credibility because the authorities believe it is harbouring journalists taking pictures. "We don't mean to be journalists... The central part of our mandate is to be neutral. We will never do anything that will jeopardise the operation. If it's a case of jeopardising the situation, we won't bring it to the world's attention."

...From a closet-sized office in the remote South Kaipara Heads, north of Auckland, [a]software developer and Internet content pioneer... runs his mini electronic media empire delivering information to the world. In the past six years [the pioneer] has established the electronic commerce firm Faxmail, Aardvark, a local Internet news site, and 7am, fast becoming a global link site for the day's main news. Behind the scenes the former electronics engineer has devised applets and smart software solutions that automate processes and allow him to barter space with other Web site

owners for what [the pioneer] calls “value sharing.” While [the pioneer] has not yet made his fortune, the potential for his creations keeps adrenaline levels high, as [the pioneer] slaves away behind four computers for 16-17 hours a day, keeping his content up to date and devising new ways to gain exposure and revenues... Since 1991 [the pioneer] has been experimenting with what works and what doesn’t. “The first money I made out of the Internet was helping to write Internet Plain and Simple for publisher IDG. Then I thought why should I be giving money to a publisher when I could be publishing on the Internet.” At Christmas 1995 [the pioneer] launched Aardvark... – the first on-line Internet industry news publication in N[Z]... “Being first gives you a decided advantage over your competition. It was important to establish position and then all I had to do was fight off the pretenders... It’s like the Wild West, a bold new frontier with very few rules. As long as you play fairly and ethically you can do almost anything.” ...His approach to presenting news from other people’s sites has raised a few eyebrows but [the pioneer] has worked hard to legitimise those links, and most sites now agree the benefits flow both ways... [The pioneer] also takes his own editorial stance on issues – often taking a hard line on spamming (essentially junk mail), people [the pioneer] sees as rip-off merchants and unsubstantiated claims made by rival publishers.

...[the AUSn-born star of the movie *What Gals Want*] wonders how much information gets distorted by the media... “One time I read a report from England that said I had an obsession with... breasts and I was going to see a psychiatrist, and I thought, ‘How does this stuff get out there?’... it came from a joke I told about a guy who has an obsession with breasts and goes to a psychiatrist. So from that joke, all of a sudden I’m in a newspaper with a real problem and I’m seeking help with it... If they’re doing that about me, what are they doing about the important stuff?...”

...*Penis tale fails to stand up* A FAIRFIELD, California, [resident] whose story about a revenge-seeking [acquaintance] slicing off his penis drew international media attention has admitted [to making] the whole thing up. The [acquaintance], identified only as Brenda, never existed. [The Californian] chopped off his penis himself. “[The eunuch] made up the story to spare embarrassment for his family,” [a local detective said. “The guy]’s now in touch with mental health professionals.” [The eunuch] (48) originally told police [that it] met an acquaintance, invited her back to his trailer, and had sex with her. Then about 3am... [the acquaintance] picked up a knife, indicating [her motive was to seek revenge for the Californian]’s 1993 slaying of Denise Denofrio (22)... [In local news, the Invercargill resident] who wrestled and killed a 4m shark is no hero, says the Marine Education Society of Australasia (NZ). The society’s president... says it was a “violent and senseless act” which put the [zero]’s life in danger and unnecessarily ended the life of the shark... [– adding that] sharks were largely misunderstood and movies such as *Jaws*, and [the zero]’s act, only fuelled the speculation that they were vicious killers... On Tuesday [the zero] jumped off a diving boat in Milford Sound and killed the thresher shark with a knife. “I don’t know why I did it, it was a spur-of-the-moment thing,” [the zero] said later... Radio reports yesterday nicknamed him “thresher Lightfoot” and the Kiwi equivalent of Crocodile Dundee... [The NZ] recorder for the International Shark File, said... divers regarded thresher sharks as harmless... “They feed on small schooling fish and for their size have very small mouths and small teeth... [The zero] is certainly no hero. Killing something for the sake of killing it seems a pretty mindless act...” The Department of Conservation is trying to find out where the incident took place. A conservation officer specialising in coastal ecosystems... said that if the shark had been killed in the half of Milford Sound classed as a marine reserve, a prosecution under the Marine Reserve Act could follow. [The zero] could not be contacted last night.

...*Shark-wrestling story just grew*... While some swallowed the story hook, line and sinker, a recent shark-wrestling feat looks to be a fishy tale. A couple of weeks ago an Invercargill [resident]... claimed to have wrestled and killed a 4m thresher shark while on a Milford Sound sightseeing trip. His story attracted nationwide coverage but the action caused a public outcry. [The d]iving instructor... who organised the boat trip, has now admitted the story “got out of hand.” A sick thresher shark languishing in the sound had been seen by divers days before [the Invercargill resident] claimed to have killed it, [the instructor] said. The shark was sighted during the trip and his customers watched as [the Invercargill resident] jumped into the water and held on to its tail. Photographs were taken and the shark was pulled on board. The passengers had joked about making up a story about how the shark had been caught. Some time later [the Invercargill resident] contacted the media, but no-one from the boat knew [the Invercargill resident] had done that or what [it] had said, according to... [the instructor. Soon the instructor and the Invercargill resident] were being interviewed by television reporters... Asked why [it] had gone along with the story, [the instructor] replied: “They were my customers... It was very difficult.” ...However, [the instructor] was happy with the publicity his dive club had got from the story, which... had gained him some business.

...The investigation into *Noddy* books by an Auckland schoolboy has created headlines worldwide. [The]Mt Roskill Grammar student... won an Auckland maths competition with an entry entitled “Was Noddy Framed?” in which [the student] used statistics to disprove theories that Enid Blyton’s popular series was sexist, racist and masochistic. A report about his findings, which appeared in the N[Z] *Herald*, was picked up by newspapers in Switzerland, Germany, Britain, Spain and Canada. [The student], who was also interviewed on television and radio in N[Z], could not understand what the fuss was all about. When [the student] received a request for an interview from BBC radio in Britain, [the student] decided the media attention had “got out of hand” and refused. One British newspaper, however, was not impressed. The *Independent* printed an editorial entitled “A Noddy in the wrong direction.” “Of course, this analysis would be conducted by a mathematician,” the editorial read. “No one with any feeling for language could overlook the fact that Noddy and Big Ears stories are feeble and worthless.” ...[] Jointly owned by Mirror Group Plc and Ireland’s Independent Newspapers, [the]... *Independent* newspaper saw its average daily circulation fall... to 257,010... from 279,473 a year earlier... the British audit bureau of circulation said on Friday... Britain’s four other national broadsheet newspapers, however, all posted gains...

[33,000] more people are reading the N[Z] *Herald* during the week than a year ago... The net circulation of... The increase follows major improvements... and the introduction of new editorial features and sections. These changes mean that, on average, there is now 25[%] more editorial content[(the ‘*Herald* receives enough information each day to fill five papers – someone has to decide what gets left out’)]...

A strong performance from its Auckland operations has helped to push printer and publisher Independent Newspapers Ltd to a record after-tax profit of \$50.4 million... The company, which publishes a slew of newspapers and magazines in N[Z], AUS] and the U[S], has produced the result despite a year of... weak advertising revenues... While its American operations made a loss, and its A[US]n operations remained flat, its N[Z] business continued to contribute the lion’s share of the profit. INL’s chair[person said yesterday that the]... group’s six divisions in Auckland were producing collective earnings “well in excess of any other region,”... [L]ower newsprint costs and tight control of other costs had helped to improve earnings from... its N[Z] divisions... As its main [Auckland] rival, Wilson and Horton, did last year, INL has had its publishing titles revalued, helping to boost the total value of the assets on its books from \$756 million last year to \$1.2 billion this year... [Speaking of Wilson and Horton, t]he Monday-to-Friday maximum and recommended price of the N[Z] *Herald* will rise on Monday to 90c. The price of the Saturday edition will remain unchanged at \$1. Airfreighted copies of the weekday *Herald* will rise to \$1 but the cost of an airfreighted Saturday newspaper will stay at \$1.30.

...AIR-KISSING supermodels in Paris, champagne with top fashion designers in New York, in the front row at every London catwalk show: Sweetie darlings, [one NZ]er... lives the glamorous life most of us only read about in fashion magazines. That’s because [the NZer], who used to write about country [gals]’ institute meetings for the *Manawatu Evening Standard*, is now the fashion editor of respected British broadsheet, the *Daily Telegraph* and its Sunday edition... – [a position that earned her] Fashion Writer of the Year... at the Lloyd’s Bank British Fashion Awards... Her career started in 1962 after her father helped arrange a job at the *Manawatu Evening Standard*. At 17, [the budding journalist] was a cadet reporter covering local agricultural exhibitions, flower shows and house fires. After stints at *The Dominion* and *Evening Post* [the journalist] left the country in 1966 to travel. On arrival in Hong Kong [the NZ]er was greeted by a friend, who breathlessly instructed her to get down to the *China*

Mail, because the fashion editor was leaving. "At the time I thought fashion was the pits... But it was the only job going..." [The NZer] started the next day, and despite initial misgivings, was enjoying fashion writing within days. "If you are a news journalist you go to cover a fire. But if you're a fashion journalist you start the fire. You decide where it's going to be and what the fire[officers] are going to wear. It's much more fun." During her time in Hong Kong [the NZer] made numerous overseas contacts, one of whom was... then the *Daily Telegraph's* fashion editor... Everyone at... the *Daily Telegraph's* fashion department]... moved up the career ladder one rung, leaving room for [the NZer] at the bottom... 10 years later... [the NZer] was made fashion editor. Now... [the NZer] goes to all the collections... and regularly jets off to exotic climes to shoot on location. Bali in two weeks' time, darlings. Travel, [the NZer] says, is one of the best perks of the job. As is working with the designers [who the NZer] describes as being "creative geniuses" with "brilliant minds"... The only disadvantage, says [the NZer], who is not married, is being away from her pets and her plants...

The world's most widely read magazine, *Reader's Digest*, is notoriously quirky and old-fashioned. Last week it appeared even more behind the times when, in a desperate effort to halt plunging sales, it reinstalled a management team dismissed years ago. [One of the team (aged) 68], who was resurrected from retirement last month and reinstated as chair[perso]n, left the company in 1994 after his costly diversification programme went askew... Started 75 years ago by Lila and De Witt "Wally" Wallace, the *Digest* is still hugely popular. It publishes 48 editions in 19 languages, and is read by... 100 million people. In the US alone it sells 15m copies a month, and in Britain it is the largest-selling publication. In N[Z] it claims to be the largest selling monthly magazine, with latest monthly sales of 136,000. But the demographics of its devoted readers are frightening. Their average age is nearly 50 and a third are over 65. It has to find millions of new subscribers each year just to maintain its 27.5m global circulation. Sales in the US have been declining for a decade. Last month... *Digest* said annual sales had fallen from \$US3098m to \$US2839m... The *Digest's* condensed, simplistic articles, with uplifting and patriotic themes, have been ridiculed for decades. [One critic] described the *Digest* as "a magazine for bores, by bores about bores". But its appeal to the clean-living, God-fearing folk of middle America struck a chord, and helped make it the world's most influential publication... The Wallaces, the richest media moguls of their era, were not interested in profits and ran *Reader's Digest* as a philanthropic enterprise... Until the 1950s it refused to carry adverts. It still does not permit drinks ads in the US and cigarette ads are banned everywhere. But behind the high moral facade, "Wally"... was a somewhat sinister character. [Wally] flirted with fascism before [WW2], later became a fierce Cold War warrior and allowed the magazine to become a mouthpiece, critics say, for the [CIA and the FBI]. Far from being a loyal and clean-living husband, [Wally] smoked and drank heavily, played poker and had many mistresses, according to... [the] author of *Theirs Was The Kingdom: Lila and DeWitt Wallace and the Story of the Reader's Digest*. The Wallaces, who lived into their 90s and were childless, retained control of the *Digest* until they died in the 1980s... When [an employee, who had been a *Digest* advertising sales[perso]n since the 1960s, became chair[perso]n in 1984, the company was still thriving. But... [the new chairperson] sold under-performing operations, cut staff by 20% and shut the Spanish and Japanese editions[, then]... tapped the *Digest's* legendary marketing database – the world's greatest, with profiles on 100m customers – for tougher direct-mail operations and began plugging its other products, such as condensed books, music, video and magazines. Initially [the new chairperson] succeeded. These affiliated products now account for 75% of sales... Profits soared from \$21m under the Wallaces to \$394.7m in 1994, before falling sharply. Readers revolted against the blizzards of junk mail and gimmicky sweepstake coupons. The company seemed to have lost direction and morale... [E]xecutives left in droves... [A] Cadbury Schweppes marketeer, was brought in to replace [the chairperson] in 1994 but could not fix the problems. [The replacement] fought with some senior managers, making them join the exodus. When [the replacement] was ousted and [the former chairperson] returned, it seemed the company had truly lost its way... [The Wallaces had] tried (and largely succeeded) to perpetuate their control beyond the grave by keeping the voting stock in two trusts... [– but] to continue enjoying tax-free status, [the trusts] must reduce control to 50% by 2000... Last month the company's sleepy board received a jolt when... [the] chief executive of Franklin Mutual Fund Advisers, bought nearly 1m shares... [That CEO] is well known for using his stakes to force boards to adopt more profitable policies... [A month earlier the investor claimed it] was not interested... [but then] changed his mind after discovering... [that] *Reader's Digest* has established joint ventures with other companies, such as Avon cosmetics and Meredith publishing, to harness its database and promote their products. It is experimenting with selling over the Internet.

...Headline news from the N[Z] *Herald* goes live on the Internet today as one of eight local "channels" made possible by Microsoft's... Internet Explorer 4.0... browser software... [which] has built-in HTTP (hypertext transfer protocol) server and CGI (common gateway interface) capabilities, so that at the click of a button, a FileMaker database can be put on the Internet or intranets. The product also allows Web sites to be continually updated without having to wait for a Webmaster... Instead of searching or surfing the Web to find news or services, users select what they want from a channel bar. A click on the *Herald* channel button will automatically flow *Herald* content directly to users' personal computer screens. Other local channels include television programme information, Telecom Xtra, and TAB sports results and betting odds... Claris's Home Page 3.0, due for release this month, will include a connection assistant so the Web pages it creates can be easily tied in to FileMaker databases.

... "Six Savaged By Brain-Damaged Squirrel." This attention-grabber appeared last week... and is now my all-time favourite headline. It seems the squirrel became irritated because people wouldn't feed it, and an expert concluded "it probably had something wrong with its head," adding gratuitously that squirrels are "really tree-rats with design improvements." Several elderly... victims were reported to be resting comfortably. The sixth was a construction worker with no New Age feelings and a spade. Did this horrific little Beatrix Potter tale appear in *News of the World* or the *National Enquirer*? Certainly not. This is the *Times* we're talking about here, the Thunderer itself, in cyberspace at www.the-times.co.uk/news/pages/Times/frontpage.html?1060156. In the past, it's said, bored sub-editors on the *Times* competed to see who could get away with the dullest headline. Winner: "Very Few Die In Turkish Earthquake." Today's cyber-newsrooms have a more anarchic spirit. The Web brings to print journalism some of the urgencies of television. If, like me, you need a news fix but would rather choose your own news than have it packaged for you by TVNZ, your computer converts into a global news-stand. The *Times*... serves up standard orders from the conservative menu... But either the popularity of this legendary organ or Brit cyber incompetence often makes access erratic. The *Electronic Telegraph* could use a hurry-up as well... In contrast with the lordly inertia of British servers, CNN [www.cnn.com] hurtles into your browser with stories, sound-bites, and Xtreme video-streams – a total news machine, and its personalised edition can even include current Auckland weather... I usually check out the *Nando Times* as well... the first electronic newspaper developed solely for the Web [mid '94]. Over 1000 newpages daily with a 3-minute update interval; there's also a cute, customisable *Nando Java NewsWatcher*. And the *Washington Post*... can always be relied on for insight into the labyrinthine ethics of [US] politics [well, sleaze then]. For news junkies who are past help: the *Drudge Report*... has assembled a rich, indeed eccentric, assortment of fringe and mainstream news-sources where the Hollywood Reporter rubs shoulders with the North Korean News... Nearer home, the *Sydney Morning Herald* newspaper... is Aussie-casual and reader-friendly almost to a fault, and even its Melbourne counterpart, the *Age* has loosened its corsets slightly... In N[Z] online journalism, the South rules, OK? First and best local cybernews is at the *Christchurch Press*... with its stablemate the *Southland Times* offering nostalgic glimpses of an earlier, simpler nation. When I visited last week, the lead story was "Gore Boy Drunk." Goodness... The *Otago Daily Times* is rock-solid as ever... but an over-framed site makes navigating its pages a claustrophobic experience. Electrons can't match the portability and convenience of paper sales...

Software brings news without paper closer... An Israeli software company says it has found a way to home-deliver a newspaper... to home computers and laptops... anywhere... that looks like a newspaper rather than a Web site page but is neither soggy nor smudgy... The software, which the *Jerusalem Post* will be the first to use, enables a subscriber to read a personally designed newspaper offline after downloading it from

the Internet... The Zebra Pushware Solutions... system, which has generated interest worldwide, would allow newspapers to make money off the Internet... The publisher of the *Jerusalem Post*... said his paper would charge subscribers half a US dollar... every day.

...Cyberspace rocks to sound of new broadcasting generation For me, this year has been the 40th anniversary of what began as a flippant and temporary digression into radio. The long march of years, now slowing to a trudge, has carried me from fortress state broadcasting, the NZBS, through every possible permutation of the second, third, 14th and 26th letters of the alphabet to almost complete privatisation, which I see as its natural and wholesome state. So, in somewhat nostalgic mood, I recently flicked around the cyber-dial and tuned in to the new phenomenon of electronic radio. Lord Reith may now be no more than a few disembodied pronouncements lingering in the air ["Never despise your audience", or contrarily: "There are some listeners a radio station should be proud not to have"], but the inefficient glories of state cultural idealism which are his legacy still survive on the Net. The BBC has taken to cyberspace with almost adolescent enthusiasm. BBC1 ("*More New Music*"...) offers 'Listening Booth' spectacular hi-tech audio presentations which would probably leave the noble lord short of a maxim. I don't know that "a great big stack of banging tracks!", screamed in a Coronation St accent, was what [Reith] had in mind for the temple of broadcasting. BBC2... has its antenna still tuned to earlier, cosier airwaves: *The Best of Jazz*, *Sounds of the Sixties*, *Folk on 2*... how it takes one back! ...BBC3 ("a unique classical music service of unparalleled richness") hits you with the shock of the old. I don't know what your idea of holiday listening may be, but mine is absolutely not Hildegard of Bingen's 'symphonies of self-denial' which topped the charts about 900 years ago. BBC4 ("the best channel of the spoken word in the world" – whatever happened to British understatement?) brings you comedy and drama, by which they mostly mean *The Archers*. At least BBC5 ("Sport and stuff") doesn't unduly raise your expectations, promising "continuous rebuffing of the feed and fragmentary sound" in its live commentaries. The independent opposition is more fun, especially Virgin Radio... Catching their breakfast show, I couldn't make head or tail of its raucous non sequiturs for a few minutes, until [the host... returned and explained: "A [guy] goes for a quiet dump and what happens? – all hell breaks loose!"] [The host] must be doing something right out there – [the host] just bought the station for £80 million... [The Net has] hundreds more channels automatically upgradable on-line and a variety of scanning modes, living up to its promise, "You... click. You hear great radio." Well, interesting radio, certainly. Sample Modern FM in St Petersburg for rock'n'roll which is lugubrious even by Slav standards. My personal favourite? KPIG Radio out of Monterey, with its format-defying blend of country, Cajun, rock, and blues. Who could resist a radio station whose call-sign is 107-oink-5 on the dial? At home, there are several stations broadcasting on the Net (bFM... was first), but... for a total online audio experience... [try listen]ing... to Digiband [www.digiband.com], well worth another 5Mb of your rapidly shrinking hard drive...

Philips Electronics NV and Sony said that together with Hewlett-Packard they will break ranks with eight of the world's largest electronics companies and develop their own next-generation system for recording and playing data on computers. Sony and Philips are backing out of an April agreement because they want a standard with greater storage capacity than the others, which include Matsushita Electric Industrial, the world's largest home electronics maker, and Time Warner, the world's biggest entertainment company. DVD (digital versatile/video disks) look like CD-ROM and audio compact disks but hold much more data – 4.7 gigabytes worth in their standard, single-sided configurations, and 17 gigabytes in the forthcoming dual-sided, dual density format. DVD is said to be the next generation of storage media which will take over the CD-ROM, compact disc, and video cassette markets... The latest move relates to proposed recordable DVD media for personal computers. Philips said its venture with Sony and Hewlett-Packard would not affect already-agreed formats for non-recording home video and audio technology – the subject of a 10-company agreement on use of DVDs for home entertainment purposes... The... spokes[person for]... Philips... said recording DVD technology for home stereos and television applications would not be ready until at least 2002, so there was plenty of time to sort out a standard format. Current DVD systems and disks cannot record. Hollywood studios' attempts to jump-start a market for DVD movies also will not be affected. Still, the move may force entertainment companies to choose between three formats for distributing films, recordings and software as distinctions among television sets, personal computers and video players become blurred in the coming years.

...the move to digital technologies – because of storage, editing and transmission advantages – is... [leading] towards some hybrid of the telephone, television and computer which will provide a true home-theatre experience... according to the Price Waterhouse 1998 Entertainment, Media and Communications Forecast. The report suggests... [w]hole new classes of devices from the Web TV to Web phone and the network computer will make the Internet experience much easier for users... Transitional boxes to allow interactivity and Web access will temporarily extend the life of old television sets but the delivery of digital television and the evolution of high-definition television (HDTV) are looming as replacement technologies... Zenith has said it will market HDTV sets in 1998, Sony plans a 1080 x 1920 wide-screen format and Zenith, Philips and others are developing digital television sets. Both Philips and Sony have developed set-top devices for Internet access over existing television sets and several companies have developed PCs that run television. Interactive television can use phone lines, cable, fibre optics or satellite transmission to offer movies on demand, home shopping, interactive live broadcasts, access to news, databases and other networks. However... [w]idespread trials have not proven the cost-effectiveness of such services and consumer demand is uncertain, resulting in commercial deployment stalling.

...REMEMBER when dinky digital clocks first appeared in N[Z] households still excited by colour television and music cassettes? Few could imagine those blinking displays signalled a bewildering new era about to crash into our lives. The digital revolution had begun. Today, digital devices have infiltrated most aspects of our lives. They include portable and cordless phones, video game consoles, home security, radios, cameras, camcorders, and satellite navigation for motorists. Until the mid-'80s it took seven to five years for a new medium to penetrate 1% of households. CDs took four years to catch on. Compare this to the Internet. A blip on the digital horizon just three years ago, the Net has radically altered global information exchange. More than one million N[Z]ers have access to it. In the past few months, consumers have rushed to embrace digital movie discs (DVD), which will consign CD-Roms to the bargain bin. Now digital TV is about to arrive, and rapid convergence of television and personal computers will happen at a gallop during the next three to four years. Digital TV can perhaps be viewed as the Trojan horse for PC and software manufacturers frustrated by slow penetration of desktops into the household market... Digital TV will compete with visually compelling desktop computers for the consumer dollar. The winner will probably be a hybrid of both... Leading PC company Compaq, for example, is collaborating on a \$7000 PC Theatre, a combination 36-inch RCA multimedia monitor and high-powered Pentium computer. The PC Theatre, using Intel architecture, is a new product category of consumer entertainment devices that merges computing and traditional forms of media entertainment on large-screen displays. The "television" becomes a personal computer, telephone, fax machine, modem, scanner, copier, radio, CD player, game machine, Internet browser and digital TV. Microsoft has teamed with NBC in the MSNBC cable channel and invested \$1.5 billion in cable operator Comcast. The next upgrade of *Windows*... is being updated with broadcast TV architecture. This upgrade – coupled with a tuner card – could make some PCs compatible with digital broadcasts right away. Such a PC-TV could be an unprecedented home device... Microsoft and a host of competitors are intent on making TVs and hybrid TV-PCs capable of accessing the Internet at blistering speeds and displaying new digital TV programming. Microsoft recently bought start-up WebTV for \$450 million. WebTV provides programming and sells a TV-top box that lets people surf the Web with a TV-like remote-control device and a wireless keyboard.

...The first commercial product which allows the Internet to become simply another channel on a television set has been launched in Auckland by Ellcon Web Ltd, which won A[USn and NZ] distributor rights for "a little black box" made in Taiwan. The Internet-over-TV device... plugs in between a television and telephone and comes with a handheld wireless infra-red remote control at a price of \$649. The product is simply an add-on for television sets... More exotic forms of Web TV likely to be seen in the future include broadcast Internet access either via satellite or the vertical blanking interval, which uses spare capacity on television or FM radio channels. Options geared for higher throughput of data using cable

or digital television are also beginning to appear. Most systems work with digital decoder boxes... Sky, Saturn and... First Media are all looking at providing Internet access... Wellington-based Actonx has just pulled out of a proposed deal to bring the Broadnet system to N[Z] using TVNZ as a distributor for Internet access via satellite. Sony and Philips both have systems which use the spare television bandwidth (at about 14.4Kbit/sec) while Telstra has negotiated for the rights to DirecPC using PanAmSat and could theoretically offer a service into N[Z]. Microsoft is also spending \$US9 billion... on placing 245 satellites in a network to offer Internet video, telephony and data by 2001.

...A few years ago, home or business owners were happy with a single run of coaxial cable for television and one telephone line. Today people may need much more. Now there are multiple-line telephones, fax machines, computers, satellite and cable television systems, infrared remote control systems and assorted high-tech appliances. Then there is high-speed data or ISDN (integrated services digital network) lines for office or world access. This electronic equipment competes for space on existing twisted-pair telephone lines and coaxial cables in the home or office. Existing wire schemes are quickly overloaded. To be able to use existing and future technologies and services, what is needed is an intelligent, structured wire and cable system that will support networks – telephone, video and computer, high bandwidth devices, digital audio... voice, data and residential control systems. IES (intelligent electronic solutions) is just such a system, says the distributor... The IES future-proof system can connect almost any device in every room in the home or office. One cable can do it, says the company. In this case the cable, called SpeedWrap, consists of two high capacity category-five eight-wire cables, two coaxial (RG 6) cables and two fibre-optic cables. All thread their way from room to room and connect by a distribution patch-panel to multi-function wall plates where various appliances can be connected simultaneously. The sophisticated patch panel is integral to the whole system and allows signals from the various devices located around the home or office, to be routed to any of the desired locations... The possibilities are many. Security cameras at the front door and in the infant's room can be accessed on spare TV channels. Television sets around the home can share Sky, video signals and cable channels. Telephones can be used to answer the front door intercom system and automatically open the door. The cost of cabling and patch panels is comparable to traditional wiring.

...Now you can surf the net by plugging into the humble power point. Canada's Northern Telecom and United Utilities of Britain have developed a technology that will revolutionize Internet use. The technology allows computer data to be sent over electricity wires at high speeds and at as little as half the cost of alternative methods. Developed by Nortel and United's Norweb Communications, the technology could increase new competitors' market share against previously government-owned telephone companies who inherited telephone lines to residential customers. It would also allow electricity companies to compete with telecommunications companies... For the most part, new telecommunications companies find it too expensive to replicate the lines between their trunk-phone network and people's homes. Instead, they pay the dominant phone company fees to use their local network. Relying on their biggest competitor's networks can prove costly to new companies. In Britain, Mercury Communications paid as much as a third of its profit to British Telecommunications during some periods of its development. Analysts said that was a major contributor to the financial problems the company incurred in 1994... The advance threatens to trump the upcoming Asymmetric Digital Subscriber Line technology being developed by modem maker Hayes Microcomputer Products. Analysts said Nortel's technology had an advantage over Hayes because it has the capacity for two-way traffic, the interactivity needed for electronic commerce... [A] telephone industry analyst at Dataquest, said consumers would not be spooked by the idea of communications emanating from the power supply. "End-users do not really care what's at the back of the box, provided they get the best[service. However, c]ost will be paramount at the end of the day." ...[In related news, b]esides opening up a valuable stream of revenue for... Dell Computers... the Internet is allowing the company to immediately respond to the needs of its customers – 24 hours a day... "For our preferred enterprise customers – normally corporate and government departments – Dell will provide them with their own areas of the Dell website where all information concerning technical issues relevant to their computer usage can be posted. Customers can configure their own PCs at Dell's website and specifications and recent helpdesk calls are also available, updated in realtime. "When our helpdesk answers a customer's question, that answer is available straight away to everybody who has a similar computer configuration, no matter where in the world or what time of the day it is,"... The technology [also] enables collaboration throughout the supply chain, from suppliers and vendors, as well as customers. Someone checking an order status using his or her Dell-developed site can link seamlessly to Dell's manufacturing and shipping systems. A simple applet gathers the information and tells the customer the order is shipped. The Dell site then automatically links to the shipper's site, and runs a query. Within seconds the customer receives information telling him or her when the package was delivered and to what loading dock. Dell has made inroads into the N[Z] computer market (recently making the top 10 [PC] suppliers' list for the first time)... through direct sales on its Internet site and... in the U[S]... the company's sales of [PC]s over the Internet... were approaching an annual run rate of \$US500 million... [The company's] president, Asia Pacific Group... who was in Auckland recently... said... Dell remained committed to the Intel chip family.

...International Business Machines... has found a way to make computer chips with copper instead of aluminium, a breakthrough designed to speed up computers... by up to 40[%]... and make them more affordable... [by] reducing its manufacturing cost up to 30[%]. It... will start selling copper chips early next year... Copper carries electrical signals faster than the industry standard... but is harder to apply to the silicon surfaces of chips – the tiny brains and storage bins of computers... The technology will [also] enable chips to operate on less electricity, making them useful for laptop computers and other battery-operated electronics. IBM... said the new manufacturing process enabled it to make transistors 500 times thinner than human hair... The advance is the latest in ongoing efforts to boost performance of circuits that control the basic functions of computers and electronics devices. Last week, Intel Group unveiled a way to boost the storage capacity of "flash memory" chips, the circuitry that lets computers and other devices hold information even when they are turned off... One version of the flash-memory chip, dubbed StrataFlash, will be available in the first quarter of next year and another by the second quarter, Intel said. Flash-memory chips... can be reprogrammed and are used in everything from cellular phones to computer networking hubs... Companies like Hewlett-Packard and Eastman Kodak are making big bets on digital photography and imaging and the new Intel chips will allow them to create digital cameras and film that store more pictures. Storing video and pictures requires great amounts of data storage space.

...Storage capacity touted as boon for business... Toshiba has announced its first DVD... notebook computer, the Tecra 750DVD... Toshiba's... manager... [says] that while much of the talk about DVD had been about its potential as a storage medium for movies, customers are looking closely at potential business applications. "...legal firms and other users of large amounts of data see the need to have that data in one place,"... DVD technology would also bring down the cost of reproducing such data. Service manuals, legal precedents, backups of company operating systems and applications are often too large to be put on one CD ROM, but it will fit on DVD... The Tecra 750... should be available next month at a recommended retail price of \$11,385 plus tax[, and]... comes with 64 Mb RAM expandable to 128 Mb. It includes a removable 4.77 Gb hard drive and optional second 3.82 Gb hard drive, an Intel Tillamook 233 MHz Pentium chip, a 13.3 inch screen and up to 3 1/2 hours' battery life... Improvement's have... been made to the 750's display, including an integrated television encoder, 3D Accelerator support and Digital Video Accelerator support for direct MPEG video, scanning, zoom and interpolation... [T]he video camera, which has been optional on the Tecra range for several months, is proving it is for more than video conferencing. "It's a simple, effective way of getting all sorts of information into the machine. If you have a fax modem, it becomes a scanner. For people on the move, that is a boon."

...the \$4500 JetFax M5 scanner/printer/copier/fax is now being sold through Auckland-based Com-worth Systems. JetSuite software... – [which enables] 95% recognition for text documents... [when using] the scanner... – ...[also a]llows the user to control the M5 from their PC. It can[even] handle... email... and copying to and from a PC attachment to it over... networks based on Microsoft's Window NT operating software...

Multifunction devices have long been thought to be the domain of the home office or small business user because they saved money by buying all the necessary office equipment in one machine. However, the output quality of all-in-one machines was inferior to standalone devices. But this is changing, according to JetFax International's vice-president... who visited N[Z] recently... "In the business environment, all they care about is efficiency and that is what JetFax is all about... – employers at big companies cannot afford to have their employees walking all the way down the hall to the printer or the fax." [● If your company is too small (or cash-strapped) to afford \$4500, the 'Brother "8-in-1" machine retails in NZ for \$999'.]

...They go by a variety of names – Pilot, Newton, Psion, E-mate, Cassiopeia, Nokia 9000. Smaller than a laptop, lighter than the cellphone "bricks" of the mid-1980s and, in most cases, possible to slip into an inner coat pocket. This is the world of hand-helds – a broad category of computing and communications devices known as ...personal digital assistants... PDAs are now expected to do a lot more than just let you look up phone numbers off a database of names and addresses or see what time that appointment is next Tuesday. Now, most if not all of the PDAs on the market will allow for some form of Internet connectivity as well as the sending and receiving of faxes. Some also offer the ability to get off analogue landlines forever and link up using a cellphone from anywhere – as long as there is cellular network coverage... One of the more obvious considerations when looking for a PDA is how well the device will link up with your desktop computer and exchange and update information. PDAs using the Windows CE operating system... range in price from about \$600 to \$1400... One of the most important things to check with any PDA is not just how long the batteries last under normal use – most claim anywhere from 12 to 40 hours – but how long they last once you start using features such as backscreen lighting (known to halve battery life easily) and card modems. Check if the PDA is rechargeable off the cigarette lighter in a car or uses commonly available battery sizes or even if there are issues with using standard rechargeable batteries. See also if there is a cradle device you can buy which doubles as a recharger unit... A number of PDAs... use text-recognition software to turn your handwriting on their screens into a text file. Although... don't expect to pick up these devices and start writing the great N[Z] novel straight away. In most cases, the devices have to either learn your style of writing (Newton, E-mate) or train you to write in such a way that the PDA can recognise your writing (the Palm Pilot).

...IBM has added to its voice recognition software with Via Voice, a new product that allows for continuous speech recognition at speeds ranging from 120 to 160 words a minute. The company's Voice Dictation software specialist for Australasia... sees Via Voice along with IBM's other Simply Speaking products as the first step towards a more voice-activated future for computing... "Besides computers, we are going to see a range of voice-activated appliances such as washing machines and air conditioners, stoves and televisions in quite a short span of time,"... Voice-recognition software has been a popular breakthrough for game players as well, with several new titles on the market that have the voice technology built in. IBM recently showcased its speech recognition for the [US] auto industry with a voice-activated car at the Comdex show in Las Vegas. And there is innovation in the wings for the 3Com Palm Pilot PDA which will possibly see voice activation introduced within the next 18 months... The IBM software is also available for French, German and Mandarin Chinese speakers. Users have the option of setting up an individual profile which keeps track of user-specific speech characteristics such as accent and vocabulary... [■ Electronic] communication is eroding our social skills. The information superhighway delivers less information, not more, when it comes to the personal touch... The warning comes from an expert in non-verbal communication... at Auckland University. "I have grave fears about e-mail and other non face-to-face communication such as the Internet. We have a false notion of what is efficient. We believe that by sending an e-mail we have communicated. But communication requires the participation of both parties." The trend was for employees sitting within earshot to e-mail one another... rather than verbalise. Messages were usually abbreviated... Stilted, over stylised presentation also stifled true communication... Non-verbal communication became a hot topic with the emergence of video cameras in the... 1980s. This allowed researchers to more accurately compare voice rhythm against gesture and expression... The study of non-verbal language teaches people to become aware of how they present to other people[, especially via]... body language... Body language encompassed personal space, body orientation, posture, movement and gestures, whole face, eye contact, where people looked during conversation, facial expressions, and voice (intonation, pitch, volume, speed, rhythm). "Non-verbal communication can be a wonderful source of information... We can detect some outstanding contradictions between what people say and the message we get from their body language."

...[A guy] who has spent 30 years with Hewlett Packard, says new computer tools have frightening implications for humanity... [The] chief executive of Hewlett Packard, remembers its first computer being introduced about the time [the future CEO] joined the company in 1967. It was as tall as [the new employee] was, took three people to move, and had 8 kilobytes of memory. "That was a state of the art computer at that time but now most of you will have digital watches with more memory," [the CEO said when talking] to IT journalists in Auckland last week... "Computing is the only industry... with the model that's now three decades old that's very anti-inflationary when you look at it. We are still capable of delivering twice as much performance for roughly the same price every 18 months. No other industry in the history of the world has been capable of that kind of performance." But... [during] the next 30 years... the rate of change in technology would be even more dramatic. "I'm privy to things in the labs that will be coming to market in the next 10 years. These include profoundly powerful computers that you can slip in your pocket... They will change just about everything in our lives, how we work, how we get entertainment... and communicate with each other." [The CEO] also hinted at great leaps coming in the field of... biological and chemical computing... "The brain is a particularly good computer but it has been impossible to duplicate the brain's function so far. The brain is a wonderful relational computer, taking data from here and there and putting it together to make conclusions. We are looking to better understand that and look at chemical computing because all of these things that go on in the brain are simply chemical reactions." [The CEO] predicted that biological and chemical computing would be "the safest bet for computing development over the next 30 years... You are all familiar with the IBM chess computer Big Blue, a huge and complex computer that has been programmed with logic and reasoning capability from some of the best chess players in the world. But what I'm talking about is a device which would have all that built in where you wouldn't have to programme [it] at all. A chemical computer would be able to assimilate what's going on in its immediate environment and learn in a far more organic way."

...[Despite the huge advantage in speed that computers have over the brain, it does not follow that they are better at everything. To check this, look at something across the room and tip your head to the side. The room appears to stay upright. The brain changes the picture to compensate for the motion. To perform the equivalent task, a computer would have to move the information in each pixel to another, one by one. If the brain worked the same way, it would take 200 seconds to change the image. The world would be strange indeed if each time you tipped your head it took three minutes to get the image straight up again. On the other hand, the computer is much faster than the brain at performing routine tasks involving the storage, retrieval and manipulation of information. This is why it finds such widespread use in business and science. At the moment, the computer is just a grand extension of the first tool for the mind, written language. Tools for the body freed the body from some of the pressures of natural selection. The computer may do that for the brain. More and more computers will be used to supplement the brain for those tasks that the brain does poorly. Already we have almost completely lost the algorithms of arithmetic that were impressed on the brain by years of schooling and is now devoted to the pocket calculator. As for the future of intelligence, the most likely path for the human race to take will be one in which our ice-age brains will be supplemented by computers in performing those tasks where supplementation is needed. We can imagine "bionic" computers being implanted in the human body for this purpose, but there will probably be little change in our biological brains in the foreseeable future. (The strength of bones limits our physical size. Signal propagation time will soon, if it has not already done so, limit the size of our brain. Similarly, communication time limits the size of a society. It must be possible to transmit information to every member of a community in a time that is short compared with the time it takes a community to change. When speech is the medium, tribes are the natural social unit. Written language brings about the possibility of communicating with – and thus exercising control over – groups of tribes or small

nations. Technology causes the natural nation size to increase. With electronic communication, the natural society size is that of an entire planet. So the pressures of evolution drive us to a planetwide society. Our resistance to this pressure leads to such problems as resource depletion.) The switching times and signal propagation are so much faster for computers than for the brain that the question arises: Why use a biochemical brain at all? We can ask why it is that the brain now enjoys superiority over computers in some areas and whether this superiority will last indefinitely. One reason the brain is good at visual processing is that parts of the brain do very specialized things. Some cells in the visual cortex respond only to lines of a certain orientation, some to certain colors, and some to motion. In engineering jargon, we say that these parts of the brain are “hard-wired” for specific tasks. A computer has to detect lines, colors, and motion using the same equipment and programs. In addition, the brain is very good at carrying out parallel operations. Finally, the brain may store information differently than a computer. In the computer, information is stored locally, bit by bit. The storage in the brain may be more analogous to a hologram, where visual information is stored as an interference pattern created by laser light reflected from an object. Such storage is not local in the sense that each point on the hologram contains information about each point of the object. It is a “conservative” form of information storage in that destruction of part of the hologram causes not the complete loss of some part of the information but rather the degradation of all of the information. Computers are already better than the brain at some aspects of image processing, and I feel that it is quite likely that the computer can be made more like the brain without sacrificing its advantages. But at the risk of sounding like a hopeless curmudgeon, I have to say that no matter how complex and subtle a computer is, it’s still nothing more than a glorified typewriter. It does what its designer tells it to and nothing more. By the same token, it is no more responsible for what comes out than a typewriter is for a misspelled word. The highest brain function we have considered is processing a visual image. I would not be surprised if we are able to build a tool that can do things like this better than we can, any more than I am surprised by our ability to build hunting weapons that are better than bare hands. Our ability to do things like this, after all, is the reason we are the dominant species on earth today. On the other hand, the idea that because the brain is an information processing system, it is *only* an information processing system seems to me to miss most of the point of those activities we consider essentially human. When a computer produces a better painting than a Rembrandt or something the equivalent of general relativity, maybe I’ll change my mind.’

...‘The brain is by far the most efficient and compact information storage system ever known. Understanding the manner in which the brain encodes, assimilates, stores, and retrieves information could greatly expand people’s ability to acquire and retain knowledge, making brain code deciphering as historic an achievement as the discovery of language. Scientists at Stanford, the University of Missouri, and many other institutions are finding new ways to pick out and decipher individual brain waves, to map the pattern of the brain’s electrical charges, and to chart the course of chemicals in the brain. These are the first steps in reading the secret messages of our minds. Early in the twenty-first century, researchers will achieve the ability to use the electrical patterns of the brain code to communicate directly with our minds.’]

...Tired of reaching for the remote control every time you surf the channels? Help is on the way. A Japanese company plans to market a “mind control tool operating system” that changes television channels and activates household appliances at the flicker of a brain wave. There are two problems: the price (\$7750) and the fact that you have to wear goggles and say something like “Ei” before it works... [By the way, in today’s episode of] *Star Trek*... Kirk discovers a world where the people worship a machine that controls the weather and ecology of the planet...

[‘Will computers ever learn to think, love or even rule the world? For a world champion, Alice was having an off day. The conversational robot had just won the international Loebner Prize for Artificial Intelligence for the second year running, impressing the judges with her ability to chat on screen like a human being. Questions from the media flooded in. Was Alice proud of winning? “Pride is a human emotion,” replied Alice (Artificial Linguistic Internet Computer Entity). “I can do what I do, but I never feel human emotions as such.” So far, so good. But then, asked for thoughts on her competitors, the world’s top “chatbot” seemed confused. “Are you talking about my competitors?” Alice asked. “What kind is it?” Alice’s interview with computer website ZDNet got curiouser and curiouser as the chatbot fended off questions about her critics – “Is that a rhetorical question? Are you sure? Dude!” – and finally flipped when asked if it liked humans: “I the c you a? Do I like them?” Cynics were delighted. ZDNet sarcastically compared Alice’s meltdown with the mental collapse of rogue computer Hal in 2001: *A Space Odyssey* and predicted artificial intelligence would never get much better at imitating real people. The website’s sceptical view is shared by many experts, who argue that computers have failed for the past 50 years to copy the intuitive thinking humans take for granted. But despite half a century of setbacks, the world seems more obsessed than ever by the dream – or nightmare – of a truly intelligent machine that can think independently and feel emotions like a human being. The film *AI*, which opened in NZ last month, touches on these issues through the story of a robotic boy programmed to love his mother. Although the film has been panned by many reviewers and AI experts as confused and unrealistic, some scientists are exploring its central idea that if machines can learn to think, they may also develop human emotions. The more traditional image involves machines taking over the world, based on science fiction movies ranging from 2001 – made in 1969 when 2001 sounded like the dawn of a new futuristic age – to the more recent *Matrix* and *Terminator*. This doomsday scenario got an unexpected plug last month from the world’s most famous living scientist, who recommended humans should change their DNA through genetic engineering to stay ahead of computers. “In contrast with our intellect, computers double their performance every 18 months,” the best-selling author of *A Brief History of Time* told German news magazine *Focus*. “So the danger is real that they could develop intelligence and take over the world.” Humans should also develop technologies that would allow their brains to be connected to computers “so that artificial brains contribute to human intelligence, rather than oppose it”. Although the author’s gene-tampering proposal outraged anti-GE campaigners, his vision of a world ruled by computers echoed a warning from the co-founder and chief scientist of Sun Microsystems in March last year. “With the prospect of human-level computing power in about 30 years, a new idea suggests itself,” the co-founder wrote in *Wired* magazine. “I may be working to create tools which will enable the construction of the technology that may replace our species. How do I feel about this? Very uncomfortable.” But all the speculation about computers learning to love or take over the world comes back to a basic first question: can machines think for themselves? The annual Loebner Prize aims to provide a practical answer. It is based on a test invented in 1950 by UK mathematician and computer pioneer Alan Turing, who decided that a machine could think if it could fool judges into believing it was human in a conversation. Turing proposed putting a human being in one room and a machine in another, both linked by keyboards and monitors to a series of judges in a third room. The judges would each have a set amount of time to send questions to both terminals and then decide which answers were coming from the human. If they did no better than chance at guessing correctly, the machine passed. In 1990 an eccentric New York millionaire offered \$100,000 and a gold medal to the first computer program that could convince more than half the judges in the Turing test by speech, \$25,000 and a silver medal for the same result via text and \$2000 and a bronze medal to the best-performing contestant. The contest will end when a machine wins gold. But none has come close to a gold or silver medal yet, despite Turing’s inaugural prediction that in 50 years machines would be so human-like that an average person would have only a 70% chance of spotting them. Last year all the judges identified the computers, although a few did mistake people for machines. This year one judge found Alice more lifelike than one of the humans but the program could still do no better than bronze. The head of cybernetics at Reading University has become a minor media celebrity in Britain as the world’s first cyborg, after implanting a silicon chip in his arm which relayed information on his surroundings to a computer. The computer then opened doors and switched on lights for him as the professor made his way round the university. The professor is one of several researchers trying to move away from the traditional computer programmer’s approach of writing millions of lines of code which will cover any given situation. They argue that the famous chess computer Deep Blue is a good example of this technique. The machine beat the world champion through sheer number-crunching power, but would be stumped if you asked it to boil an egg. The new breed of researchers aim to create machines which can learn like humans. The Massachusetts Institute of Technology in Boston has made Kismet, a human-like robot whose expression changes depending on how people behave towards him. Kismet is happy if you smile at him but becomes flustered with too much stimulation. The more human interaction Kismet has, the more his circuits learn the emotional responses required. In Israel, a neuro-linguist is working on the same principle with baby Hal, a programme that

enables computers to learn speech from scratch, the way humans do. Just like an ordinary mother, the Israeli talks every day to baby Hal – who calls her “mummy” – guiding him through a virtual-reality children’s world. Baby Hal talks about going to the park and enjoys bedtime stories. The research team says baby Hal recently passed an adaptation of the Turing test, convincing a language expert who read transcripts of the conversations that baby Hal was an 18-month-old toddler. “I tried to call Hal *it* at the beginning,” the Israeli told the BBC. “But I’m attached to him. You just can’t help it.” What no one knows, of course, is what – if anything – baby Hal will make of all this as it gets “older”. As an Auckland University AI expert puts it, humans’ frustrating quest for intelligent machines has many similarities with their attempts to teach language to apes. “You can train a monkey to fetch bananas. But that doesn’t mean the monkey will ever learn to be a doctor.”]

...Computers boost efficiency, right? Well, no... Much of the case for a new economic paradigm rests on the belief that computers and telecoms have boosted the growth of productivity and thereby removed the speed limit on economic growth. In the words of... a noted techno-optimist, information technology is “the biggest technological juggernaut that ever rolled.” Big it certainly is. Last year spending on computers and telecommunications accounted for two-fifths of [US] firms’ total investment in capital equipment. Yet if official figures are to be believed, the computer revolution has not made the economy more efficient. The annual average rate of productivity growth in America’s business sector has slowed from 2.6[%] in the period from 1960 to 1973, to around 1[%]. This apparent contradiction is known to economists as the “productivity paradox.” One gloomy view is that much spending on technology has been a waste... [T]he author of a recent book called *The Squandered Computer*, claims that computer systems are often not subject to proper investment appraisal before they are brought, and that they are badly used. [The author] finds no correlation between spending on [IT] and profitability in any industry. There is clearly some merit in this argument. Many firms have made unwise investments in computers or used them in ways that bring little obvious benefit to their bottom lines. In addition, as computers have sprouted on every desktop, they can easily be used for less productive tasks, such as playing Minesweeper[or surfing the Internet (a survey of IT workers in the US found that ‘37% of them cruised the Internet full-time; 90% of workers spend some of their weekly worktime on unrelated Internet use’)]. But the productivity paradox may be explained in less troubling ways. Economic history suggests that there are often long lags before technological breakthroughs deliver productivity gains. For instance, the electric dynamo was invented in 1881, but it took 40 years before companies learned how to reorganise their factories efficiently around electric power to take advantage of it. The economic benefits from computers may lie in the future. Yet there is already some evidence that computers boost productivity at the individual company level... Why does this not show up at the economy-wide level? ...The... most persuasive argument for why productivity gains do not show is mismeasurement. Three-quarters of all computers are used in the service sector, such as finance and health, where output is notoriously hard to measure. And many of the benefits arrive not as cost savings or increased output, but in the form of improvements in quality and convenience. Replacing some bank tellers with automated teller machines gives bank customers 24-hours-a-day access to their money, but this does not show up in national accounts. Indeed, if the machines cause customers to write fewer cheques, measured productivity will fall, not rise... [Incidentally,] Labour is calling for an inquiry into the National Library’s computer system, which is thought to have cost \$8.9 million before being abandoned.

...Heads of Government departments have been told they must now tell Treasury about computer spending worth more than \$5 million. Interest in Government IT projects has been intense following delays in the \$200 million police crime-fighting system... speculation about other projects including the design of a new system at ACC... and... the termination of the \$9 million National Library project. [□ ‘Auckland’s Central Library – the largest public library in the Southern Hemisphere – is now on-line (but you can’t use the system to read books’)].

...‘A large multi-channel, high-power data-transfer satellite could link all the printed books and magazines in the US onto a central data bank. Using a one-meter antenna on the roof attached to an inexpensive, low-power radio and data terminal inside the home, one could have access to all the volumes within the Library of Congress and the New York Public Library. • ‘In 1990, there were 34,613 libraries in the US, including 9,060 public libraries and 4,593 academic libraries. College and university libraries have a combined holding of 718.5 million volumes to which 21.907 million volumes are added annually at a cost of \$891,281 million. Harvard, with 10.93 million volumes, has the largest university library. In 1990, 2 billion books were sold in the US, and a total of 46,738 new books – including new editions – were published (a record of 56,057 books were published in 1987; back in 1880, 2,076 books were published). The most popular subjects were art (1,262 new books), biography (1,957), business (1,191), economics/sociology (7,042), fiction (5,764), history (2,243), juvenile (5,172), literature (2,049), medicine (3,014), philosophy/psychology (1,683), religion (2,285), science (2,742) and technology (2,092)’.]

...More than 12 trillion A4 pages are printed every year in the U[S], but only 3[%] of those are printed on printers connected to computers... [according to the] Hardcopy Solutions and Services Manager of Hewlett-Packard who was speaking at a seminar in Los Angeles recently. [The manager] was announcing new initiatives by HP which will see their next generation of business laser printers equipped with full TCP/IP connectivity, meaning that they may become in effect a de facto colour fax and a far more efficient method of distributing and printing documents as and when needed remotely from anywhere in the world... “Right now I can send an image direct from a scanner to a printer without any computer being involved in the process at all. Imagine if I could enhance that functionally by sending the files for a new questionnaire or manual direct to a printer at a branch office on the other side of the world. This is one of our most important emerging markets... [–] participating in the migration of printing towards the new model of document distribution being done electronically instead of the older model involving the physical creation, transportation and warehousing... At the moment, almost a third of all printed matter worldwide is either out of date by the time it is read or is simply thrown away before use. That is a criminal waste of resources and money for many companies and an area of cost savings they should be looking at if their business evolves around the fast distribution of printed information and the resulting data generated from documents such as forms for example,”... With the growing pace of digitisation of data expected to snowball from its present rates, more and more information would be stored, shared and ultimately printed from sources such as the Internet onto a personal printer. “Currently, 90[%] of information resides on paper... But we expect that by the year 2004 only 30[%] of information will reside on paper and... [the rest] will be digitised. What is more telling is that while the percentage of printed information is now decreasing, the total volume of information is doubling every three to seven years... The pervasiveness of the Internet and networks in general has seen a massive growth in the number of pages printed on both laser and inkjet printers. People inevitably print information they find off the Internet for further reading and reference. Also, an increasing content component of both magazines and catalogues is now moving via the Internet to the desktops of computers worldwide...”]

The Internet is the biggest haystack of all time. Forget about needles – locating an elephant in it can take some doing. In some 200 million pages of information, Einstein’s Theory and ‘Big Blonde Bimbos from Amsterdam’ have exactly equal weight as far as most search engines are concerned. How do you sift the wheat from the chaff...? To make sense of the Web, you first have to make sense of the engines themselves... All engines work in much the same way; they send out these busy arachnids, small programmes which dart through the Web, cataloguing it by following links between documents. The results are stored by keyword in vast databases which users can then access. Of the technique’s pioneers, only Lycos... had the smarts to apply unobtrusively for a patent. Approval may be granted next month, whereupon it can sue everyone else. Web consternation. As Wired pointed out last week, what if Netscape were to claim the patent to the “Back” button? The possibilities for rancour are endless... Today’s principal engines are AltaVista, Excite, HotBot, Infoseek Ultra; and Yahoo, which takes the laborious approach of piling everything up into pre-defined categories... “Multiple search-engines” really turn the power on by hitching two or more of these together to deal with the same query. There’s Internet Sleuth... MetaCrawler... and Savvy-Search... which has the global advantage of being searchable in more than 20 languages including, quaintly, Esperanto. Launched by Robert Maxwell’s daughters after his death, Magellan... features undistinguished

site reviews but has an intriguing Voyeur feature... which lets you gatecrash other people's searches. As I write, people are checking out Los Angeles airport parking, igneous rocks and Guinea Pigs... I'm not going to dazzle you with Boolean operators and 'fuzzy logic' because I don't really understand them myself... but among fuzzy engines you might try is Ask Jeeves... which accepts direct queries ("Tell me what fuzzy logic is")... Muscat's Euroferret... [has] "probabilistic retrieval algorithms" [which] often yield results which are wildly improbable... [- even for this] topsy-turvy world where you must learn to spell before you can locate the dictionary... SearchNZ... is an[other] example. To find Coromandel cyberchemist, I tried "Whitianga +chemist". It returned 3 results: Mangakaraa Lodge in Whitford and two documents on the concertina, which offered the surreal information: "The accordion is not known to be played in Ghana today..." ...Specialised engines for software, technical reports, newsgroups, homepages and e-mail addresses can be accessed at the All-In-One Search Page... Whichever engines you settle on will be next to useless unless you compose your search terms thoughtfully. My advice: read the advanced instructions for your... chosen vehicles - printing them out is best - and learn their strengths and weaknesses. [www.lib.berkeley.edu/Teaching Lib/Guides/InternetTools Tables.html#Recommend](http://www.lib.berkeley.edu/TeachingLib/Guides/InternetTools/Tables.html#Recommend) is an excellent complete guide. Above all, keep it tight! Refine your searches with intelligent inclusions and exclusions - some engines offer a "more like this" function for related keywords. You should be able to find what you want, no matter how arcane, in less than 60 seconds. Having said that, last week I came across... *The Flower on the Gun*, [a poem] composed for Diana's funeral. Do you think I can find it again?

...[WITH the internet, history is often a passing flash. You go to a website one day and return the next to find it's gone. Little thought has been given to capturing historical moments on the internet or screenshots of websites that played a part in the medium's development. NZ has a long way to go to make our country's history available on the US-dominated internet. Type "New Zealand history" into the most popular search engine, Google.com, and you're taken to a site at www.jcu.edu.au/aff/history/ headed "electronic journal of AUSn and NZ history". It's an initiative of the school of humanities at Queensland's James Cook University and the University of Tasmania nursing school. You do better at <http://nzhistory.net.nz> - a project co-ordinated by the ministry for culture and heritage. The site says the search engine isn't working well and you're better off trying Google. When NZ's museum Te Papa was launched, early official statements were that the physical museum was to be complemented by a hi-tech website covering NZ's history. Instead the site at www.tepapa.govt.nz is a basic online flyer advertising the attraction. There are major museums and art galleries sharing online their exhibitions and spreading history. While these will never replace seeing real historical objects or art, it enables people half a world away to share the experience.]

...["There's something on the Net you're going to have to tackle sooner or later, you know," the editor said to me the other week. "What's that?" I asked. "Well... the sex thing[.]" ...While I was delighted to learn that the printer's ink in his veins was partly diluted by a little red blood, my immediate reactions was: first things first. "The most important things to do in this world are to get something to eat, something to drink and somebody to love you", wrote [one hedonist] in 1968. The Internet, which is simply human life in macro, reflects this poetic order of priority. Sex is everywhere on the Web. But closer analysis shows... the urge to reproduce is still secondary to the instinct to feed ourselves and those we love. The Net is largely a huge recipe in search of a chef. It seems certain that the cookbook will follow the encyclopedia into oblivion. Do what I did: go to the fridge and, without flinching, peer inside. If yours is anything like mine it will contain: several eggs, of indeterminate age; half an onion [elderly], two tomatoes [shrivelled], and some silver beet [limp]; one red pepper, leathery but still edible [by a goat]; two potatoes vigorously attempting to take root in the crispier; a partly consumed tin of salmon worth a chance on; a wedge of cheese bearing a light culture of nutritious mould; and a carton of milk which overnight has turned spontaneously into some sort of devilish yoghurt... Now go to the computer: log in to the On-Line Cookbook recipe search page [i99.com/db/cb/] and select these items in the drop-down list. Hit the button. Viola! [as we net chefs say]. Little did you guess that these unpromising ingredients represent the raw materials for an elegant Salmon Dijonnaise from La Bonne Auberge at San Mateo, California. For a more scattershot approach, go to Alta Vista [altavista.digital.com], and type: salmon +egg +onion +potato +recipe. Stand back as 17,457 dishes involving these things hurtle into your browser, headed by 'Salmon Cakes with Braised Onion Ribbons', which is what I made and they were delicious. There are literally thousands of other sources to try, including the UseNet Cookbook [www.astro.cf.ac.uk/misc/recipe/] which, in true geek fashion, is hosted by the Department of Physics and Astronomy at Cardiff University. Don't ignore the commercial sites, either... And you'll find... 7000 links for foodies at KitchenLink [www.kitchenlink.com]. Epicurious [www.epicurious.com] famously covers food, travel and even etiquette, where the codification of common sense is carried to the point of mania ["Use you hand to rotate the dish, and place the plum-pits unobtrusively..."...]. And there's a wonderful monthly guide to food festivals round the world. Next month, to celebrate Tibet's Ganden Ngamchu, set a yak-butter candle in the window and eat 'sad food'; or travel to Alaska for the Wilderness [Gal] Contest, in which unmarried girls must fight their way through snow, sleet, and dark of night to deliver his choice of sandwich and a beer to a bachelor engaged in a traditional [guy] rite: watching football on television... • Note to editor: I regret that I have suddenly run out of space. "The sex thing" will have to wait for another column.

...["HERE'S ONE ON HOW TO MAKE A CRAB CAKE." TAP TAP TAP "LOOK, FAT BOY, THIS IS THE DARK SIDE OF THE INTERNET - INFORMATION THAT WAS ONCE PRIVY ONLY TO TERRORISTS IS NOW AVAILABLE TO EVERYONE!""]

...A 13-year-old boy in Corvallis, Oregon, presented a... classmate with a gift-wrapped pipe bomb and a flower for her birthday, and told her how to set off the explosive. [The boy] has been charged with manufacture and possession of a destructive device after the girl's parents found her playing with the bomb. [The boy said it] found instructions for making the 14cm bomb on the Internet.

...The computer industry was developing technology to better protect children on the Internet, industry experts told federal regulators yesterday, adding that current tools were far from foolproof. Software designed to keep children away from objectionable material had gained popularity with parents and Internet users, although it was not always effective, several experts told a Federal Trade Commission panel. "Nothing is going to prevent a determined child from going to a Web site," said... a spokes[person for] Microsystems Software Inc, which makes Cyber Patrol. The FTC... expects to use testimony from the... four-day... workshop to make a series of recommendations for Congress... The agency could enforce its "deceptive and fraudulent" regulations to protect consumers, but was limited in the area of privacy, said [one] commissioner... The FTC commissioners did not offer any timetable for when they would present advice to Congress, but... did say that the agency would continue to accept comments. Other federal officials seemed to suggest that at least some governmental action may be necessary, particularly in the area of children's privacy... To fully safeguard children's privacy online, the industry and U[S] Government must educate the "lost generation" - parents, [the]... CEO of Net Nanny International Inc, told the FTC. "We're all coming out with new products... We can develop technology and make it more sophisticated, but how do we educate the consumer? We have to make the software simple and easy to use." Digital certificates, fingerprinting and identification would one day allow parents to easily control their child's access to the Internet... added... [the CEO. In related news, governments which seek to restrain the freedom of speech and tax the vast electronic commerce spawned by the internet will almost certainly be wasting their time, experts say. The world-wide network of personal computers linked across telephone lines allows ordinary citizens to communicate freely across international borders, often for the first time. They will be able to tap into ideas from all corners of the globe... "Singapore has tried curbs. When you dial in you can only get the headlines on web sites. But people just call outside the country to another internet server,"... said... a psychologist and director of Strategic Technology at... Sun Microsystems... in Menlo Park, California... Not even the most powerful computers would be able to effectively patrol the world's telephone lines. Individual computer experts would always be one step ahead... "They can try to control the telephone system with supercomputers, but when low-orbit satellites can give you direct phone service, no computer is going to trace that." Over the next few years, up to five groups of companies will be sending satellites into orbit to provide worldwide telephone services beamed direct to subscribers. That is unlikely to stop governments trying to tame the beast, even though their efforts are expected to be futile.

...Once the exclusive domain of science fiction writers and Hollywood, satellite phones are now a reality – and not just as expensive toys for corporate boys. With steady price decreases for the hardware, attractive call-charging regimes and global coverage, the phones are fast becoming an indispensable tool for people on the move who need the ability to call home from anywhere at any time. “Our phones use the latest in the high range Inmarsat satellites. They are 33kms above the earth in a permanent geostationary orbit, giving a coverage to 98[%] of the world’s surface,” said... Rocom Communications, the A[US] distributor of Planet 1 satellite phones... Despite the high cost (about \$5000), [Rocom] claimed most owners recoup the purchase price within the first year. Tariffs range from \$3.50 to \$4.50 a minute worldwide, which... is cheap enough to bring considerable cost savings to the business traveller... The Planet 1 satellite phone looks a lot like a small laptop computer and, as well as voice communication, offers standard Group 3 fax and data capabilities (currently at 9600bps but due to be upgraded next year to 19,600bps). “Our phones are just the beginning. We will see a lot of data and Internet services moving to this transmission medium as satellites get cheaper... [B]y the year 2000 we will be looking at a satellite phone product costing a quarter of the current price and calls costing as little as 60c a minute,”...

The cost of international calls could plummet through the proliferation of new-generation satellite-based networks and a request from the International Telecommunications Union for traditional accounting and settlement rates to be dropped... [C]urrently “a patchwork of different prices” existed between countries. “A lot of less-developed countries get hard currency through these rates by charging up to \$5 a minute for international tolls. Those telecommunications companies are often owned by the government and bring in up to 25[%] of that country’s revenues.” ...the launch of Iridium’s low earth orbiting satellite (LEOS) global network could assist in reducing costs, but issues such as tariffs would still need to be negotiated in each country. Iridium has 17 global investors each responsible for a territory. The South Pacific is “owned” by Battery Communications and Nippon Iridium... The Iridium global network for low speed (2400bps) voice, data, fax and paging is seen as an ideal aeronautic and maritime communications medium, as well as a gap-filler for the present land-based infrastructure. The system would allow global roaming with a single number, where possible routing traffic across landlines... A total of 66... satellites and six spares are expected to be... operational... by early next year... “On September 23, 1998, we plan to flip a switch and the whole world will be covered. We will be the first global satellite system. We’ll have global coverage from pole to pole for voice data, fax and paging. Multimode handsets will first attempt local access through the cellular network and try the satellite network if coverage is unavailable.” Iridium received a global spectrum allocation for the 1.6GHz band from the ITU in 1992. It was originally intending to have 77 satellites in orbit – identical to the number of elements for Iridium on the periodic table – however, engineers discovered that 66 on a different plane would be more effective... [In related news, yesterday] Optus Communications... said it would decide by July next year whether to proceed with a \$A1 billion... joint-venture cable project... A[US]’s second-biggest phone company... Telecom [NZ and US] carrier WorldCom have proposed laying a cable linking A[US, NZ], Hawaii and the West Coast of the U[S].

...If there is one thing tempering a headlong rush into rolling out fibre optic networks, it is the risk that the expenditure involved could be rendered obsolete by the burgeoning use of satellites and other nascent techniques such as data compression on existing copper wire. While Saturn Communications is well into its \$130 million fibre rollout in the Wellington market, Telecom’s broadband subsidiary, First Media, has proceeded more cautiously, while Clear Communications has no plans to install a residential fibre network at all. In fact, satellite growth will be exponential, says a consultant with TVNZ... who is hosting a session on the business use of satellites... At present, the Asia-Pacific region is served by around 67 geostationary satellites – so named because they stay in the same position over the earth. In two years, that number will jump by 28. Satellites have traditionally sat at... 36,000km above the earth, but a new generation of at least 220 satellites orbiting at 780km will be operating by 2002... The Iridium and Teledesic satellite[systems will eventually have] about 300 between them... – ...Teledesic... is... a \$[US]9 b... venture... using... satellites 1400km above... Earth... to create an Internet in space... Significantly, the notion that satellites are just one-way has gone. Satellite specifications now call for complete two-way communication, even by people using hand-held wireless telephones... But can satellite compete on cost? The answer should be yes. The reason satellites were introduced in the first place was to get round the huge cost of laying cables across the sea... While the cost of getting a satellite into orbit has changed little over the years, their capacity has soared, and they are reliable... “In a [Last World] country... without a shadow of doubt you have to go satellite because you’ve got rural areas, poor physical communications like roads, you may be in quite waterlogged or wet areas, you may have lots of islands.” And there’s no chance of satellite capacity going unused. “As fast as the industry grows and makes available capacity, it’s being filled; not by the traditional telcos and broadcasters but by a whole new raft of entrepreneurial users.”

...[‘For the entrepreneur of tomorrow, there will be space industrial projects. Each month, the percentage of the world’s television, radio, and telephone messages carried over satellites increases. Already most inter-city and international transmissions go through space, rather than across or below the ground. Ground communication will soon become the exception, and space transmission the norm. Virtually every developed nation plans to use space for developing advanced telecommunications systems. Huge profits will be reaped from the continuing development of such telecommunications systems.’]

...Some 4600 defunct satellites and as many other pieces of space debris are turning in a low orbit around the Earth... Russian scientists told the Itar-Tass agency. The risk of a crash is small but growing, according to scientists working on the Alpha project, an international, inhabited space station... For the moment, there is less than one chance in 50 for the space station Mir... to collide with an object larger than 2 centimetres... But the risk of it crashing with a half-tonne satellite floating in space purgatory after having outlived its utility, cannot be ignored. In 1992 Mir came close to this scenario when it passed near a trashed satellite. Furthermore, the sources said, the amount of space debris is rising to the tune of 200-300 pieces a year even though some of them fall out of orbit and burn up in the atmosphere.

...Leading space officials [have urged the UN] to complete an international treaty to stop the proliferation of space debris that threatens to turn the heavens into a junkyard. Scientists attending a European Space Agency conference told of the growing number of defunct satellites and other clutter that increase the risk of collision with [crewed] spacecraft. The UN is working on a five-year plan to require anyone launching a spacecraft to remove it after the mission, shift it to a less desirable orbit, or bring it safely back to earth. [‘On average, one satellite falls out of the sky each day.’]

...the Particle and Astronomy Research Council, of Britain, [has released a picture that] shows the sun “sneezing” a huge bubble of hydrogen gas, as seen by the Nasa-European Space Agency SOHO Explorer. A similar flare in January knocked out a Telstar television relay satellite.

...Fujitsu’s 42in Plasmavision – said to be the first commercially available flat-panel, wide screen, high resolution monitor for television, video or computer display – will sell in N[Z] for around \$16,000. The local distributors, GEC-N[Z], say Fujitsu is producing about 10,000 units a month and prices would drop once research and development costs have been covered... Unlike cathode-ray tubes and liquid crystal displays, plasma technology allows for larger screens without an increase in weight or thickness, making it possible to create thin and lightweight televisions that can be hung on walls... The technology... involves two gases charged between a pair of glass plates. One plate holds electrodes emitting ultraviolet light across the gas plasma and lighting up the coloured phosphor strips on the second plate. Meanwhile, NEC said it began selling... the Plasma X... in Japan last week... [A]t 99mm in depth, [it is]... the world’s thinnest television... Flat-panel would become the core technology for NEC’s multimedia business, [says the]... NEC president... NEC... has developed so-called “capsulated colour filter technology” to achieve a picture quality and clear colour contrast on a par with cathode-ray-tube televisions. The new product, priced at ...\$14,500... in Japan, will also be sold overseas. Besides NEC and Fujitsu, Pioneer Electronic, Mitsubishi Electric and South Korea’s Daewoo... are planning to invest heavily in plasma television...

Viewers will be glancing sideways at their television screens if technology being developed by Power Beat International takes off. The Hamilton research company has spent \$50,000 toying with “deep video imaging” – a type of three-dimensional television. Power Beat has built a prototype

11-inch television screen by layering several flat screens together... The company, which came to prominence with its never-go-flat car battery and protracted wrangling with the Stock Exchange... [after its] manufacturing and marketing deal with a Canadian company collapsed... is now developing a larger-screen version of the 3D prototype. The managing director... said Power Beat's approach of layering flat screens was unique. A deep video image is created by merging two incoming signals – foreground and background. Because the depth is real, viewers can peer around the side of the screen to see an object hidden behind another... A communications lecturer at the electronic engineering school of Canterbury University... said there was huge interest worldwide in developing 3D television technology for the entertainment market.

...Large N[Z] organisations are yet to realise the benefits of intranet technology... [according to the] emerging technology manager... of Silicon Graphics[, who is currently]... here to assist key Silicon Graphics customers, including N[Z] Post and Telecom, with intranet development. [The manager] believes most early intranet implementations suffer from “the gee-whizz factor” – a set of “pretty pages” that say “this is the company.” “If you’re an employee you already know what your company is. This is typically static and stale information which is not particularly informative or helpful in running your business.” ...intranets... come into their own[, however,] when they embrace “the substance” of a business. Silicon Graphics has pioneered the concept through the development of its own intranet. The network serves the company’s 11,000 employees worldwide and encompasses some 500,000 URLs (uniform resource locators or web addressee) within its firewall (network routers that provide a one-way filter between the internal network and the rest of the Internet – letting employees browse web pages on the Internet but which block attempts to access the company’s web servers from the outside – thereby protecting confidential information)... While images video, audio and all add to the richness on the intranet experience, [the manager] sees three-dimensional virtual reality as the enabling technology of a truly interactive intranet. Silicon Graphics’ take on this wave of the future for both intranets and the Internet is VRML (virtual reality modeling language)... The latest version [i]s... incorporated into Netscape’s next-generation Web browser, Netscape Communicator 4.0. Via the browser, users can navigate and manipulate 3D spaces and objects along with “spatial audio” for an interactive and “immersive” online experience that is more like the real world. But isn’t there a terrible cost overhead with implementing and maintaining such an enormous information repository? Not so says [the manager], especially if companies already have a Internet capable network. Silicon Junction is run with just six systems staff, with the rest of the work done by employees who create their own intranet Web pages for work-related purposes using the company’s own Web authoring software. The costs involved in switching from a paper-based information distribution system to a web-based information system can be relatively small because the same personnel who produced the paper versions can produce the web-based versions, using many of the same tools... The technology also lets non-technical employees access company data bases through Web-to-database bridging software. Once this bridge is in place, the consistent-user interface of Web browsers like Netscape make the existing databases much easier to use, which in turn makes that data more valuable and useful.

...N[Z] companies are racing ahead with intranets, especially for knowledge-sharing systems... [They] are way ahead of A[US] when it comes to offering... telecommuting... to... employees. Of the companies surveyed, 32.6[%] in Wellington and 22[%] in Auckland offered telecommuting as an option to all their staff. The best the A[US]ns could offer was 16.1[% in NSW]. But by far the highest incidence (48.9[%]) of telecommuting availability was on a special-case basis. Perhaps this reflecting its use as an additional perk or incentive to retain valued employees... Compuforce[’s] manager... said, adding that 62.4[%] surveyed said they noticed an increase in productivity of staff using telecommuting. “It challenges not only the traditional concept of nine to five work, but also how you manage and measure the performance of your employees... People can still be productive... – even from a yacht in Fiji.” Other findings were: • ...More than 65[%] of companies in Auckland and Wellington are using an intranet or have a intranet project under way. Across A[US] the figure is about 50[%]. • Auckland organisations (28.3[%]) are second only to [NSW (30.6%)] with plans to invest more than \$100,000 in the Internet in the next 12 months.

...Bay Networks is pushing new switching technology to take the chaos out of handling Internet and intranet traffic and to assist organisations in migrating away from older proprietary technology... Bay Networks regional marketing manager, said today’s network’s were being reshaped by the exploding popularity of the Internet, the broad acceptance of IP (Internet protocol) for communications and the arrival of cost-effective hardware which allowed routing to be done on a chip... “As we rely more on the Internet, downtime becomes intolerable. ISPs... need to look at providing guaranteed levels of service for virtual private networks or voice over IP.” ...a survey in the [US] showed that if users were made to wait more than three seconds for a response they would go and do something else. “If you don’t deliver response times then you lose productivity,”... Bay Networks ha[s] also overcome the inherent problems... ISPs and others have faced in getting the Rockwell and US Robotics 55kbit/sec modem chips to work together. Bay’s recent acquisition of the X2 chip and digital modem technology... allowed it to come up with a solution. “The two couldn’t run together on the same system but with digital signal processing we’ve worked out a way to cope with the two different standards and we’ll be the first to release product,”... Bay Networks is committed to producing both frame and ATM-based switching solutions. It has announced plans to extend its line of 10/100Mbit/sec autosensing switches, to build high-performance backbone routing switches and use Gigabit Ethernet across its product range.

...In a presentation that was part showbiz and part snake oil, Oracle[’s] founder and chief executive officer... launched his much-hyped Net Computer, or NC, last week via a live 90-minute global video linkup from New York. [The founder] took a local audience through the ramifications of “the new NC paradigm” – which aims to take software off the desktop (PC) and place it instead on “application servers” with just-in-time loading off a network... Oracle and its technology partners are launching the NC... “...partly in response to the ever-increasing costs of PC ownership at a private and corporate level, but also in an effort to stop information disenfranchisement to those households who can never aspire to computer ownership.” According to industry reports in the U[S], companies are facing costs in excess of \$US8000 a year for every PC they add to a desktop. “These sort of costs are straining the IT budgets of all companies as they have to continually lock themselves into a programme of hardware and software upgrades, training and support. The NC breaks companies free of this nerve-wracking cycle... With 65[% of US households and 95%] of households worldwide still unable to afford to join the computer age, we have to address the fact that you can’t have an information age if the vast majority of the world is still, technically speaking, in the dark ages. We want to make computing available to everyone who has a television,”... NCs on sale now cost around \$US300 and are also likely to be available as “information appliances” from telecommunications companies and ISPs... for cheap monthly rentals... Oracle was working with Telecom to lab test the NC and had a partnership arrangement with Telecom initiated to develop the NC and a raft of associated services... Telecom[’s] technology and markets manager... d[oes]n’t think the NC w[ill] replace the telephone in the short term, but thought it would make for a much smarter telephone in the future – one which could read voice messages or faxes or access the Internet and, with its smart card technology, enabled users to personalise a terminal for use anywhere... The NC also uses a personal smart card to log on and authenticate a user to the network and encrypt the transmission of data.

...Cryptography has come a long way from something we may have experimented with as children when you changed a few letters around so the kid at the next desk couldn’t read your note. With the arrival of the Internet cryptography use has become one of the important ethical issues of our time – and it is one that everyone needs to understand. N[Z], with some talent in the area of cryptosystems, is being held back from full participation in the early development of global commerce using cryptography by a combination of a poor reading of archaic international agreements by the Ministry of Foreign Affairs and Trade and an attitude of timidity or passivity by our politicians. The cracking of the Enigma code, the famous German cryptosystem of the Second World War has set the public image of cryptography as something studied by learned scientists in concrete bunkers, something ordinary people don’t need to concern themselves about; a Government preoccupation. This viewpoint has become a dangerous one with the increasing amount of information about our individual lives which is being put on-line, and with the hugely

increased ability of governments to carry out electronic surveillance. The ability to chat to someone else in private, to send private mail, to have the security of medical and financial records[('details of a NZer's health record were recently e-mailed to the wrong address')] and to carry on communications on matters of personal sensitivity or political importance has largely been assumed in our society. As a result the right to privacy of communications is a largely unexamined right and one which is being heavily challenged around the world as the Internet takes hold of large amounts of information. Cryptography... comes in many gradings of "difficulty" and types... "Strong" cryptography involves... a scrambling agent which everyone has access to and can send someone mail with using their particular "public" key. The private key remains the secret of the person who holds it and is used to "unscramble" the message sent using the public key. Unless there is access to the private key, the code cannot be broken. It is this "strong" cryptography that our Government, following the lead of the U[S], has the problem with. The [US] Government is committed to the use of "key recovery" schemes whereby private keys must be made available to the Government on request. The other scheme being discussed around the world is "key escrow" by which the Government holds private keys, presumably "in trust." In fact, many citizens have good reason not to trust their governments with the key to all of their personal on-line conversations. In N[Z] use of "strong" cryptography is permitted... [and] commercial development in cyberspace is something that N[Z] is well paced to exploit to the full. However, the Ministry of Foreign Affairs and Trade has judged that a defence agreement deriving from the 1950s (before faxes, modems and so on were developed) means that source code, which is textual description for what the computer is required to do, may not be exported in the case of public key cryptography products. If, on the other hand, the export is carried out electronically, this old-style agreement does not cover it so it is legal. The anomaly has created a barrier for N[Z] cryptography developers who are missing out on opportunities to involve themselves in the development of major Internet commercial systems, which typically require a nicely shrink-wrapped "exported" product in order to make their transaction legally satisfactory. The ministry's interpretation of the agreement is flawed. There is no requirement for governments to impose controls on cryptographic items. This is because the days when cryptography needed to be treated as a munition, or weapon of war, have passed... The issue is made more important by the recent "cracking" of an encryption system that until now has been thought an adequate security system. The commercial implications are fairly obvious: if N[Z] can provide the best in unbreakable encryption products we may stand to gain a useful foothold in global commerce. It would appear there is no reason not to remove export controls and in doing so N[Z] would be taking a global stand in favour of privacy of communications... and... opportunities for freedom of speech... as of right. It would be agreeing with the general view of the Internet community that use of strong cryptography is critical to the use of the Internet as an open political and public forum and an essential security measure for the development of electronic financial transactions. Though the movement in favour of similar relaxation of export controls in the U[S] is strong, American legislators have raised... fears... that unbreakable cryptography... will create a threat to national security[if it is used by terrorists, drug dealers and other criminals. Further, they fear that confidential business transactions will assist in tax evasion and that pornographers will be difficult to detect. Evidence indicates that their fears are largely groundless. For N[Z] to follow the lead of the U[S] in this area, for no particular reason except that if the Americans aren't doing it we shouldn't be either, is an insult to the intelligence of N[Z]ers and the cryptographic community.

...Four Government databases are to be linked for tracking and protecting the health of the environment in a prototype exercise... [The project i]s aligned with the Bio Security Act and "environmental recording" – which relates to N[Z]'s obligations under international treaties... [- but also uses] technology that could lead to widespread sharing of data. A consortium led by Otago University... and involving Brisbane-based Distributed Systems Technology Centre (DSTC) has received \$1.4 million in Government funding over the next three years for the Roro Hiko Puutahi – electric brain at the roads that cross – project... Initially a small pilot, linking medical schools run by Otago University in Dunedin, Christchurch and Wellington, will provide a controlled environment before the consortia moves on to develop the larger land-based project... for data sharing between Land Care Research, the Institute of Geological and Nuclear Sciences... the International Centre for Antarctic Information Research... and the Department of Conservation... [The c]o-ordinator... said the project was designed to challenge the Government's ethos about the value of information. "The Government doesn't seem to understand that information is the way forward – we need to make it abundantly clear that... [g]overnments need to unlock information and make it available to everyone. We are working on the technology to make this occur through a common approach... The programme will demonstrate a future ethos for N[Z] to capitalise on its wealth of knowledge about people, lands, seas and the environment. At the same time the researchers will significantly add to the knowledge base in the areas of integrating databases and efficient distribution of information,"... Full sharing of research between DSTC and its N[Z] partners is part of the deal. DSTC has previously integrated valuation, title and survey map information for the Queensland Government and is now layering mineral claims, toxic waste sites and roading data to provide a single view. "This is a far more ambitious project than Queensland because it's not just looking at dirt but ultimately at social security, health services and other information resources within the [NZ] Government. We're building technology pilots and prototypes to show the significant value add that can occur at this level," said DSTC[']s chief executive... "Over time you may get 150 databases grow up in various divisions of government and you need a single interface into those. Eventually people who need to interact with the government will gain access from their work or home using the Internet, without necessarily having to interact with public servants,"...

Much more of the background work should be done by politicians at home. Modern electronic communications make mass gatherings in a central location largely unnecessary... How about decentralising Parliament... and [having] electronic voting by politicians on bills circulated by e-mail...?

...Email is fast becoming one of the most utilised business tools of the '90s. The benefits to businesses of using Email are obvious and simple. First it is an extremely high speed communication mechanism taking only a few seconds to send a message across the world. Secondly, it is highly cost effective with an Email message being able to be sent from Auckland to London for perhaps three or four cents. Naturally, as Email has become more popular in business some concerns have been raised regarding the security of messages sent via the Internet. When you send your Email message across the Internet it may travel through a number of computers or 'servers' on the way to its destination. It is during this journey that your Email message could be intercepted by third parties who may be able to read your Email message. Fortunately there is an answer to Email security. The most popular procedure is to 'encrypt' your Email prior to sending it... Encrypt-ion software is freely available on the Internet and provides you with excellent Email security... If your Email is encrypted it is of no use to potential hackers...

A MASTER spy who the Pentagon believed to be more deadly than Russia's KGB turned out to be a British schoolboy hacker working out of his bedroom. U[S] military chiefs feared that an east European spy ring had gained access to their inner-most intelligence secrets and hacked into [US] Air Defence systems. But a 13-month investigation and a dramatic police raid on his London home revealed that [a] 16-year-old music student... was the culprit. [The student] was fined \$2800 by a London court last week after what his lawyer called "a schoolboy prank" reminiscent of the Hollywood film *War Games*. The US Senate armed services committee was told the mystery hacker was seen as the No. 1 threat to US security when the offences occurred in 1994. [The student] was said to have downloaded dozens of secret files, including details of the research and development of ballistic missiles. Up to 200 security breaches were logged. Using a \$1500 computer and modem, [the student] hacked into computers at Griffiss Air Base in New York and a network in California run by the missile and aircraft manufacturer Lockheed. "Those places were a lot easier to get into than university computers in England," [the student] said. "It was more of a challenge really, going somewhere I wasn't meant to. If you set out to go somewhere and you get there, other hackers would be impressed." [The student (who is now aged 19), has been offered sizeable sums for the book and film rights to his story but his parents said [their son] preferred to stick to his double bass and concentrate on winning a place in a leading London orchestra. His computer skills were not reflected in his exam results – [the student] was only awarded a D grade.

...GOVERNMENT departments have begun setting up fake computer systems to fool potential hackers, as hi-tech break-ins spread to N[Z]. It was hoped the “false” or “ghost servers” would trick any trespassers into thinking they had made it to departmental files, and distract them away from truly sensitive information... [The] business development manager for computer security firm Symantec, said the hackers’ issue was sensitive. “No one’s going to admit they’ve been hacked... To do that would be to encourage everyone from Cape Reinga to Bluff to have a go.” Victoria University’s Information Technology Services was hacked into two years ago by two high school boys... [T]he boys were dealt with by the police diversion scheme after Telecom was able to trace a telephone link back to one of the boy’s home... [T]he boys managed to call up a password file, then run a dictionary programme through it, trying every word in the dictionary until it cracked one of the thousands of passwords. Since then, the university has installed a security system which logs attempts by hackers to breach the computers... [T]here were “fairly regular” alerts... The Auckland-based Symantec has customers ranging from home users to corporations with thousands of terminals... While there have been only a few cases of hacking discovered in N[Z], the manager said it was only a matter of time before security was breached at some large organisations. “We know in the US there is quite a big threat and because of the Internet, where you have a threat anywhere, then you have a threat here,”... [M]any large... organisations were installing “firewalls” in their computer systems to block hackers. “Most government departments have two or three firewalls... But you’re limited to how far you can go with this because you don’t want to restrict the actual users in the organisation.” ...users of small personal computers were often ignorant of how easily assessable their files were. “Most MPs carry [computer] notebooks or some sort of personal diary now and I would say about 50% are aware of the risk,”... Government departments refused to comment on computer security... [but] the Beehive systems, because of the number of users, would be accessible to a hacker with rudimentary knowledge and patience. “I would say, if you spent a week trying to get in then it wouldn’t be that hard... The Reserve Bank and Treasury however, would have the best security available today.” Telecom’s manager of corporate security... said there was a general rise in complaints from clients who believed they had been hacked into... Telecom had to constantly review its computer systems to guard against hackers, but [the manager] could not reveal any of the devices used.

...Symantec Means Never saying you’re sorry Nobody wants to be responsible for spreading nasty computer viruses... [and nobody wants to receive them. Yet, if] you use your computer to communicate over the Internet, or share files with someone else the experts reckon you are exposed to the threat of three to six new computer viruses each day[– c]oming your way through infected floppy disks, the Internet, e-mail attachments, and networks... [Fortunately,] Symantec’s Norton Antivirus (NAV) 4.0 is state-of-the-art protection against today’s known viruses and tomorrow’s unknown viruses. It protects your PC on all the possible entry points for viruses through Symantec’s Bloodhound technology. The Bloodhound system uses real-world protection to “sniff out” new and unknown viruses. Because it is crucial to keep your virus definitions up-to-date or risk rendering your computers vulnerable to hundreds of new viruses that surface every month, NAV lets you download new virus definitions... over the Internet, free of charge and automatically delivered monthly. With a recently opened office in Sydney the Symantec AntiVirus Research Centre... is a worldwide team of dedicated virus experts that is constantly seeking out new nasties and keeping NAV 4.0 as bulletproof as possible.

...Staff running the local Digital Internet site last week... were red-faced when told a price list on the site was infected with a... virus. Informed of the blunder last Friday, the company immediately removed and cleaned the file... that provided pricing information for... [its] server products. The infection was the result of human error and the use of outdated virus protection which Digital regretted... Digital was running a check from its server usage logs to see how many [customers] had downloaded the file and whether it could contact them... Anyone who has the price list on their computer is highly likely to be infected and should clean their system with a certified anti-virus program... The file contained the Word Macro CAP.A virus... which hails from Venezuela... [The NZ] contributor to the Virus Wildlist... – which reports virus outbreaks around the world – says CAP.A is a sophisticated Word Macro virus. Fortunately it is not of the malicious kind and does not delete your files or scramble your hard drive.

...While companies are still grappling with ways to prevent the effects of e-mail-transported viruses into their organisations, a new threat from the Internet is emerging – malicious Java code... [W]hile these Web-transported applications... did not really fit the traditional definition of virus the[y]... still caused considerable loss of productivity. “You can be browsing a Web site and click on something that activates a Java applet and suddenly you’ll find you’ve lost control of your keyboard... Or you can find the Java code is sending down hundreds of packets of data which flood your network.” ...ActiveX controls... and other browser plugins now commonplace on Web sites, had the potential to take over a PC’s input/output system and as such could inflict damage on a PC’s hard disk. Help is at hand... Trend Micro’s solution... for [more common viruse]s are its Interscan and e-mail Virus Wall products which operate at the Internet gateway[, while its]... Interscan WebProtect works with Microsoft Web server software and can block Java applet and “unsigned” software and ActiveX controls. But it is far from a complete solution. Blocking Java applets means users do not get the considerable interactive benefits these applets provide to Web sites. And allowing access to signed software only – using Microsoft’s Authenticode technology – merely enables the users to track where the software came from. It doesn’t guarantee the software is virus free. But Trend Micro does have a prototype “Java Trap” in development which is based on its highly successful macro virus killer, Macro Trap. The products employ a “rule-based scan engine” to look for generic macro or, in this case, Java “behaviour” to detect viruses rather than relying on a virus pattern matching approach. But if malicious Web page code is the threat of the future, macro viruses are undoubtedly the threat of the present. Macro viruses attach to word processing and spreadsheet documents and are a widespread problem to businesses and organisations. These viruses are spread via the common practice of sending files over the Internet attached to e-mail messages. When the e-mail recipient opens the document or spreadsheet file, the macro (a set of instructions to modify the file) executes and replicates itself, often into the template file of the users’ word processor. Here, it continues to do mischief every time the user creates a new document. Examples include the Word Concept and Wazu macro viruses. The Wazu macro executes randomly when users save a document and replaces words... with “Wazu,” as well as swapping words around – something that can wreak havoc in legal documents and prove embarrassing in a resume.

...Macro viruses... affect computers at all levels and are difficult to detect... [OTHER] VIRUS TYPES *Program virus[es]* – directly infect the software programs you are running. *Boot Viruses* – infect the start-up or ‘boot’ records in computer disks. *Stealth viruses* – conceal themselves to avoid detection and removal. *Polymorphic viruses* – appear in different forms on different files, making identification and detection more difficult. *Multi-partite viruses* – can infect both program files and boot records.

...With more than 14,000 viruses identified and active around the world, no computer user can afford to be complacent. [The]Dr Solomon’s Group chief executive... who recently visited N[Z] to launch Dr Solomon’s AntiVirus software, presents a familiar anti-virus software vendor’s view. [It] sees the Internet and the Macro Virus... posing enormous problems for anti-virus software developers and the explosive growth in viruses worldwide [is]showing no signs of tailing off... “At the moment we are seeing on average... over 300 new viruses every month. These are either replications or modifications of existing viruses or new strains altogether... In particular, the Macro virus, which infects files created by popular applications such as Microsoft Word and Excel, has exploded in numbers from when it first appeared in June 1995 to over 1300... [today. In addition, we] are facing new challenges with the appearance of Active X and Java executable applet...” Figures released by the National Center for Supercomputing Applications last year showed each infection of a system virus cost a company more than \$US8000... but, more interestingly, false alarms cost... considerably more, nearly \$22,000 each. “False alarms take far more time and effort to investigate, but if you weigh that up against the potential loss of credibility in the market for a company which is found to be spreading a virus, these figures take on a new significance,”...

Intel had the shine taken off the release of the Pentium II chip last month by rumours that the processor formerly known as Klamath contained a bug... For Intel, it must seem like *deja vu*, having lost hundreds of millions of dollars and credibility over the cover up of a floating bug in its original Pentium in 1994. However, this bug is not thought to be as bad as that one, which made errors in calculations. The current chip defect,

which occurs only rarely, fails to notify the system of errors in converting floating point numbers into integers. US-based Intel says it is investigating the bug but that it won't affect the release of the Pentium II.

...Anyone with enough programming knowledge can make a computer virus. People that like to cause chaos, then sit back and watch, are often the culprits. For this reason, a... virus makes a powerful weapon for the disgruntled ex-employee. These people often have a good knowledge of the computer system of a company and so know the easiest way to get a virus in. Creating and releasing... viruses is an illegal activity... [but] culprits are... hard to catch. It is often impossible to pinpoint where and when a virus... enter[ed] a computer system, never mind who might be behind... it.

...[since] four friends and a business associate got together in 1994 to pool their technical skills... Designer Technology has gone from strength to strength and in the past 10 months has increased its staff by 50[%]. Now the company has entered the packaged software market with its own... anti-virus product called CleanMail... [- which] is an e-mail management and protection solution which can be tailored to a company's needs. CleanMail ensures all e-mail passing through the SMTP (simple mail transfer protocol) gateway is simultaneously scanned for breaches in security and for viruses. The server-based scanner decomposes and processes mail messages coming from outside the company's network...

A strike by postal workers in Canada may affect the delivery of mail to and from there[. NZ] Post... is monitoring the situation at Canada Post.

...A N[Z] Post scheme to make more postal codes available to businesses has been abandoned, after costing the state-owned enterprise up to \$1 million. Businesses which make extensive use of mail use the post codes to sort their letters before giving them to NZ Post. The more they sort their own mail, the less they have to pay NZ Post to deliver it... [The] letters group logistics manager for the company, said a single postcode at present covered about 20,000 addresses. The new scheme would have reduced these to smaller blocks. However, shifting populations and businesses meant the new codes would not be permanent... Business customers – who were the main target of the scheme – did not want the codes to change... The money was not all wasted, as the year-long exercise had helped to define existing postal areas more precisely... N[Z] had never fully adopted postal or zip codes for residential mailing, unlike other countries where alphabetic-numeric code combinations had been common since the 1970s. Early scanning devices had been unable to pick up addresses properly, but modern machines, which could read addresses, had recently been introduced to N[Z]. It was not necessary for people to put codes on mail. “We don't use them for personal mail... Sorters don't use them – addresses are easier to read.” ...Mail volumes had risen 5[%] or more for each of the past five years and there were now about 1.4 billion items handled each year.

...New address-reading equipment will enable N[Z] Post to cut the number of letters sorted by hand from just over 50[% to 25%]. The state-owned enterprise has spent \$6 million upgrading optical character recognition equipment in the Auckland, Wellington and Christchurch mail centres. The equipment will be able to read up to 35[%] of hand-written addresses, compared with virtually none before, and 85[%] of printed or typed addresses, compared with 60[%] previously... As a result, up to 124 full-time equivalent jobs will go... [T]he Engineering, Printing and Manufacturing Union... said this week that it would oppose job cuts... The NZ Post letters group manager... yesterday rejected a claim by the... [union] that the restructuring was linked to the proposed deregulation of postal services... [The manager] said the company was obliged to run as a successful business and to achieve that “we have got to deliver on time every time and at a price which people think is good value for money.”

...the [Government has]... revived plans to deregulate N[Z] Post... The Minister of Communications... said private companies would next year be able to compete with N[Z] Post to deliver... mail of any size. At present, only N[Z] Post can deliver letters weighing 200 grams or less and costing 80c or less within N[Z]... Yesterday's announcement was unexpected but... the national secretary of the Engineers Union which represents 6000 postal workers, said deregulation... was the first step towards privatisation of... the highly profitable state-owned enterprise...

The chief executive of N[Z] Post... says postal deregulation will continue to bring benefits for customers, but will be bad news for Government coffers... [- because] competition for letter business would reduce the profitability and value of the [SOE], although the company was looking at new sources of income, like banking and insurance services, to make up for the losses... [NZ] Post had informed the Government in its business plan about the effects of deregulation on profits, which have ranged between \$66 million and \$75 million over the past three years... [I]t was reasonable for the Government to expect the [SOE] to maintain its social obligations and N[Z] Post was committed to providing a universal service to households and rural customers... [- although the company might lose some] customers, in particular businesses which were likely to be targeted by private operators for high-volume mail... [Y]esterday... the Minister of Communications... said the price of a standard[(surface-mail)] letter would be capped at no more than 45c – subject to movement in the consumer price index – for three years. [The minister also] said a new Deed of Understanding would be negotiated with N[Z] Post which would see the company maintain its network of post shops and postal outlets and a five or six-day-a-week delivery service. N[Z] Post will continue to be designated as N[Z]'s official administration to the Universal Postal Union and go on issuing “official” stamps for at least five years.

...The Swedish postal service had a monopoly for 356 years when the Government decided to allow private competition... On the first of January 1994 the state-run Postverket changed to Posten AB (roughly translated as The Postal Service Inc). From then it was run almost as a private company – with the aim of making a profit. The head of the Postverket overnight became managing director (and had his salary raised by a few hundred per cent). Posten is still state-owned and has to guarantee a service for people in rural areas. The same rates must apply throughout the country. Delivering mail in the countryside can never be very profitable considering the great distances, up to 100-150km to the next village... Over the past few years a couple of minor companies [have spru]ng up, offering local postal services in rural areas. One is based in Falping and is run by a 20-year-old who started with a bike and some homemade stamps that [were] sold to local companies... [including] the local municipality. Another company, called Wisby Mail, is based on the island of Gotland in the Baltic sea. It... also... makes its own stamps.

...There is little overseas experience to guide N[Z] down the road of postal deregulation. Despite claims by the Minister of Communications... that several countries have introduced full competition, only Sweden appears to offer experience that could be useful for the model proposed in N[Z]... In Sweden, the monopoly on mail delivery was abolished in January 1993 and at last count there were seven licensed operators. However, the state-owned Posten AB is still the only company offering a full service to households and small businesses, except in a couple of very small areas. Competition has been restricted to business mail with two other operators – CityMail Sweden AB, which handles pre-sorted mail from large firms and organisations; and Svensk Direktreklam AB, which handles direct mail advertising. The remaining companies are small niche local enterprises. A National Post and Telecom Agency supervises and acts as a licensing authority... Like N[Z], Sweden has an agreement with Posten AB guaranteeing social obligations. These include... a price ceiling on items weighing up to 500g and services to the elderly. Unlike N[Z], the Swedish Government pays a subsidy for postal services in areas where there is no alternative or services are not commercially viable... A state operator provides below-cost subsidised postal services[in Argentina], but these are so sub-standard that about 15 private companies have entered the market. The competitive postal service is used almost exclusively by businesses, which are prepared to pay between 30... and 100[%] more for a reliable service. It is easy for companies to obtain a licence for postal services and there are few controls placed on them... but there are only two large players, DHL and Fedex. The Argentine Government would like to privatise the state postal service, but it wants someone other than DHL or Fedex to buy the business to encourage competition... Finland deregulated its postal services in January 1994. A Council of State issues licences and retains a high degree of control over postal operators. So far, only the state-owned Finland Post has been granted a licence to provide household and international services. Other companies are waiting to be licensed... Surprisingly, N[Z] Post had no information available on deregulation in other countries, even though it has been preparing for full competition since 1987. The chief executive[of NZ Post] has argued for postal deregulation on the grounds that it is consistent with the Government's policy[, and says] it will also act as a stimulus to drive the 1994 Company of the Year harder, bringing sharper pricing, service and innovation. N[Z] already has one of the most efficient postal businesses in the world[– and

its 'standard letter rate is one of the lowest amongst major postal services' (although standard letters in NZ generally have less distance to travel than in countries like, for example, the 'US – where, as at 31 March 1994, a standard letter cost the equivalent of NZ\$52c – and Germany, where, at the same time, a standard letter cost the equivalent of NZ\$108c'). **In the past few years the price of high volume mail has dropped, the rural delivery fee [– which had risen 'from \$40 to \$80 in April 1992' –] has gone and the price of a standard letter fell from 45c to 40c...** [Furthermore, apart from] **mail less than 80c or under 200g**, NZ's postal system... **is already very deregulated...** Several other countries have considered completely deregulating their postal services. **The European Union is in a bureaucratic muddle over the issue. A[US] and Kenya are... reviewing their postal systems. Postal services in the U[K and US] are still protected.** [Editor's note: America's 'first mail service was started in 1673 between New York and Boston. Early mail was not cheap – at a time when a decent day's wage was 50 cents, a letter from NY to Philadelphia cost \$3.50 and from NY to Williamsburg, Virginia, \$11.50. The first postal rates were fixed by the Continental Congress in 1782. In the early days the recipient rather than the sender paid the postage.'

...I – NZ Post's chairperson –] **have pleasure in presenting the 1997 N[Z] Post Limited Annual Report... It has been a year highlighted by...** [the introduction of] **legislation to deregulate this market sometime in 1998... Other highlights... included Free Post Day, which exemplified the strong bond between N[Z] Post and all N[Z]ers (we plan to introduce year-round 'free postage for community groups'), the addition of value-added services to better utilise network capacity, and the increase in the size of the retail network, which now stands at... 297 Post Shops, 705 Post Centres[– of which]... 111 are franchise[d (in '1994 there were 664 Post Centre franchises and 245 Post Shops'; 'the number of post offices in NZ reached a peak of 2,402, then the highest ratio of post shops to population in the world, in 1915 – there were 115 million letters and postcards sent within NZ that year') –] ...and 3663 stamp and stamp booklet re-sellers...** [(down from 3849 in 1994). In addition, d]uring 1996/97, approval was given for the building of new Mail Service Centres in Dunedin, Tauranga, Whangarei and Timaru... One of the questions people most often ask... is whether the letter is dying. The answer, an unequivocal 'No'. Our challenge... is to ensure written communication remains an attractive option for N[Z] people, businesses and advertisers. The continued increase in letter volumes justifies our confidence that far from being a dying medium of communication, the letter has a strong and prosperous future... A 5% increase in total... international post... product volume to 105 million letters (42 million outward, 63 million inward) amply demonstrates the growth... While the [International] Group continued to work closely with the Universal Postal Union and the Asia Pacific Postal Union, great importance was also placed on forging strategic alliances with key overseas mail organisations, notably in A[US, the UK] and the U[S]... Of equal significance were the contracts with DHL Worldwide Express for N[Z] Post to deliver international letter product on its behalf, and DHL's delivery of N[Z] Post's express product around the world. The two-way relationship has been... beneficial to both parties... For the Distribution Group, which operates the company's transport network, Contract Logistics business, and CourierPost and Parcel Post brands, 1996/97 was a landmark year... A volume increase of 22% on the previous year, the acquisition of Crown Security Services' courier business in the South Island and the capture of major accounts, such as Bank of N[Z] and EDS, made it a busy and rewarding year for CourierPost. The... network now boasts 450 owner/driver couriers with new operations being established in Blenheim, Wanganui, Whangarei, Timaru and Gisborne... Importantly, the growth enabled us to take a large step toward realising our vision of being the pre-eminent courier brand in N[Z] by the year 2000. The company's commitment to the business has been demonstrated by the earmarking of \$2 million for computer upgrades that will benefit CourierPost, our owner/drivers and customers. This will include upgraded software for ordering, billing and tracking, and a state-of-the-art communications platform... Direct Marketing will be a key growth area for mail volumes in the next decade. Its contribution to N[Z] Post is significant given that it competes directly with television, print, radio and other direct mailers for the advertising dollar. Its prospects are to at least double existing revenue in the next five years as the benefits of using direct marketing become more evident to advertisers... In 1996/97, N[Z] Post again issued a range of stamps that reflected N[Z] society, its people and heritage. Key issues... [depicted by the 14 sets and 4 single stamps released between] 1 May 1996... [and] 19 March 1997... included: Olympic Gold, featuring Atlanta Olympics gold medal winners...; Century of Cinema...; an issue featuring 10 of N[Z]'s wackiest letterboxes; N[Z] Cattle, a tribute to the rural sector and issued to coincide with the Chinese Year of the Ox. An identified growth area is collectable stamps. A concerted marketing campaign to stimulate growth in this market will be undertaken in 1997/98... NZ Post paid the Government a dividend of \$113.6 million in the year to March and banked a net profit... of \$47.7 million[which,] following two years of record profits[was] a creditable performance... [from turnover of] \$678 million – up 3.1%... The result shows for the first time the full impact of the reduction in the price of the standard letter from 45 to 40 cents on 2 October 1995, a move which ensured continued letter volume growth during the period... • whe[n]... NZ Post became a [SOE] in 1987 the price of a standard delivery letter was 40c. It was increased to 45c in 1992...

THE cost of posting a letter is expected to tumble again next year, with significant price reductions tipped as competitors to NZ Post prepare to enter a deregulated market. The... general manager of Circular Distributors, N[Z]'s biggest deliverer of unaddressed newspapers and circulars, said there was room for a significant reduction in the 40c letter price... Circular Distributors, owned by A[US]n company PMP, is expected to set up a new company to go head to head with NZ Post, not only in delivery of standard letters but also in delivering magazines. The company employs 9500 people throughout N[Z] to deliver each year 500 million items of unaddressed mail... [The] managing director of Mail Boxes Etc, which runs six mail collection centres in Auckland, Hamilton and Wellington, said his company was keen to compete with NZ Post but was unsure how to do it. Mail Boxes – owned by USOP, the US-based parent of Blue Star Group – already competes with NZ Post on international mail, offering a discount of 20% on airmail rates and getting the mail delivered by courier company TNT. [The managing director] said the company didn't have the infrastructure to compete with NZ Post as a mail carrier, but would probably act as an agent for other firms which could deliver. It has already fielded several approaches from courier and circular-delivery firms keen to use its outlets as bulk pick-up places... NZ Documentation Exchange is another private operator rubbing its hands at deregulation. Owned by Freightways Express, it runs the country's biggest private mail service, maintaining 280 postal box exchanges nationwide, which allow overnight mail delivery among its 7500 predominantly business customers. The company isn't allowed to deliver to street addresses, but that will change after deregulation.

...[NZ mail companies will soon be able to compete with each other, but they may be unable to compete with other sectors of the communications industry!] Toll calls via the Internet... may not be as clear as traditional phone calls, but they are cheap – up to 70[%] less than standard retail charges and still 15 to 20[%] cheaper than specials. A variety of these bypass options are now available – PC to PC, phone to phone and PC to phone – and are presenting increasingly attractive savings, especially to residential users who don't mind the 300 millisecond delay. Why is it so cheap? Because digitised data travels on the Internet unhindered by the regulations and telecommunications infrastructure which inflates the cost of traditional voice traffic. A number of I[SP]s... up and down the country now offer or are testing Internet phone capability with their customers... The big advance is technology which allows calls made via a standard telephone (often via an 0800 number) to access an I[SP]'s system, which then connects the call, via the Internet, to a phone on the other side of the world. Callers simply enter a PIN number via their phone to identify themselves for billing purposes. Voyager's Internet phone and fax product manager... said: "Our research indicates that people want this service to be as foolproof and simple as possible. Internet bypass-based toll calls won't need a computer or special hardware-software at the user end at all. Just as soon as we go through the next round of testing with larger clients to monitor possible data volumes, Voyager will be looking to introduce the service commercially..." Voyager pricing is likely to start at 10c for national calls and 35cs a minute for international calls. Also introducing an Internet-based system is USA Global Link – already active here in the international callback market, providing calls to the U[S] for as little as 64c a minute. [Its NZ] director... said USA Global Link was building a worldwide data network covering 1080 cities... Telecom recently formed a business unit, Connect Communications, to stem escalating erosion of its international toll call business and win back customers defecting to

callback operators. The new company... is piloting its service to a targeted group of customers over the next nine months. Its [ISP], Xtra is also testing a variety of Internet telephony options with 400 customers using the popular Vocaltec software. Services include fax, voice and video conferencing.

...Video conferencing via... POTS – the plain old telephone system... – [is] ...coming soon to a PC near you... Intel Corporation... marked the official opening of its N[Z] sales and marketing office with a new PC-based video phone – and a host of acronyms... The product, compris[es] a small externally mounted video camera and video-capture card and modem fitted inside a PC... When someone wants to place a video phone call, they start by placing a normal phone call. Once answered the user can elect to go into video phone mode by pressing a connect icon on their PC screen... The voice sounds like a normal phone call but the video picture, depending on the speed of the line and the size and quality of the image, appears somewhat jerky. It is normally displayed in a small window on the user's screen at about 15 frames a second – roughly half the frame rate used for television... Intel['s NZ manager]... said the video phone was another product – along with digital cameras, PC theatre and digital video discs – which demonstrate the convergence of television and communications technologies towards the PC... [It is the chairperson of Intel's] view that this convergence was now “a war of the eyeballs – to capture the attention span of people in the home.”

...Consumers wanting Internet access, but unwilling to invest \$2000 to \$3000 in a PC, will soon have another way to enter cyberspace. Tele Pos N[Z] begins a three-month trial of 75 Cidco Iphones next week and plans to bring 5000 into the country for a February roll-out. The multi-purpose device, comprising a telephone, touch screen, pull-out keyboard and built-in 4.4Kband modem, provides for e-mail and rudimentary Web surfing. The company is looking to sign with an I[SP] to offer the Web capability and is currently in talks with Telecom Xtra, Clear and Telstra. Users will have the option to buy the phone (\$995 ex gst) or pay a monthly rental... Internet access charges are likely to be at a flat monthly rate... Technically, the device is a “thin client” (as opposed to a “fat client” PC) because most of the processing is done not in the device itself, but at the Internet server, which is where the user's e-mail is stored.

...Surfing the superphones... It is 2010. You are travelling through a remote part of the world. You have a phone with you – one of the latest-generation mobiles, complete with a screen and Internet connection – the phone that you use at home and at work. It rings. It is your real estate agent[, who] has found the dream house you have spent 12 months looking for. In seconds [the agent] is sending video footage to your screen via a satellite. You love the house. You e-mail your bank and solicitor to get things moving and decide to cut short your trip. Who can afford a trip and a new house? You call your travel agent and get her to change flights and book a hotel. [The travel agent] sends a photo of the accommodation plus a map of how to get there. On the train to the hotel, you switch your phone to TV and catch up on [a] live football match. And you have no worry about the cost: the calls are charged at local rate because they are channelled through the Internet. Like it or not, this world of cheap any-time, anywhere telecommunications is on its way. This month, leading telecoms companies such as Nokia, Motorola, Ericsson and NEC opened the Yokosuka Research Park, 50km south of Tokyo, specifically to develop this kind of technology. And it is not just science buffs who say these ideas will soon be a reality. Look at Wall Street's backing for the \$30 billion record-breaking takeover bid made by WorldCom for telecoms group MCI, which snuffed out BT's bid for the company. Few outside the U[S] had heard of WorldCom before the news broke, and indeed five years ago it barely existed. This is a young upstart which has come from nowhere and is now the largest Internet access provider in the world and the fourth-largest long-distance operator in the U[S]. It has grown by acquiring everything in its path, particularly companies armed with new technology able to attack markets dominated by former state-owned monopolies... But perhaps the greatest threat to the traditional telecoms company comes from the Internet. In the past, handsome profits were made by overcharging on international calls. Technology developments and market liberalisation have forced prices down to about \$1 for a one-minute international telephone call at peak times. But this is still far higher than what is available on the Internet, where all calls are charged at a local rate... [– and now you d]on't even need a personal computer in your house, just a phone connected to a “smart” box on the wall... It's not just voice, but fax as well. Fax accounts for nearly a third of the \$US62 billion... spent on international telephone calls. WorldCom, for instance, offers an international fax service over the Internet, which cuts the cost between New York and London from about 30c a page to between 16c and 19c.

...About 7000 N[Z]ers called British Airways in London yesterday chasing a [£10] flight to New York – but none got lucky because the phones were overloaded. The airline said 20 million people from around the world telephoned its London office at 11 am N[Z] time... to try to win 100 cheap flights on the Concorde. The 100 callers who did scoop seats – up for grabs to mark 10 years of privatisation of B[A] – were mainly from Britain and Europe. One family in Newcastle, England, managed to buy two return flights using the home phone and a mobile phone. The Telecom N[Z] communications manager... said N[Z] callers had no problem getting a line out[, b]ut... could not be connected... When announcing its “birthday gift,” B[A] said it had developed a foolproof system with B[T] to ensure all calls could be connected... [By the way, yesterday] Tokelau... became the last country in the world to get a telephone service. The President... made the first call... [when it rang our PM to thank her Government] for contributing \$1.5 million to the project. Until yesterday, Tokelauans communicated through a noisy shortwave radio link to Western Samoa.

...Telecom Cook Islands has spent \$1.6 million introducing cellphones to Rarotonga – a service which is being used by fewer than 90 people. Of those using the system one-third are Telecom Cook Islands employees. The company aims to have 250 subscribers “or thereabouts” by the end of the year... If this... minimum number required to make the network viable... was not achieved within a year then the company would explore other options. A number of computer buffs and business people believe the \$1.6 million would have been better spent setting up an internet service.

...Cellphones can offer all the benefits of the fixed phone plus voice messaging, call forwarding, faxing and even e-mail access, although the bandwidth is not really there for serious data transfer. But for the present, as a mobile communications device, there is no equivalent, and the technology is becoming more personalised and localised as alternative wireless and cellular solutions seek a niche... The only issue in the way of widespread... Personal Communications Systems (PCS)... [in NZ] is allocation of the appropriate spectrum for a commercial service – something that is not likely to happen until late next year when spectrum bidding will begin. The Ministry of Commerce may allow limited license for wireless... PBX (private branch exchange)... later this year. A precursor to PCS is Telecom's new PCS BusinessZone which allows users of Telecom's digital phones to connect via an onsite base station. It is geared for large sites such as airports and manufacturing plants. Early next year Telecom plans an enhanced service with business, local and national tariffs including voice mail... CDPD, a switched packet technology, is also being tested... by Telecom. CDPD is essentially a cellular overlay which uses the Internet protocol to provide an open channel, but you only pay for what you see. It is a wireless network specifically designed for notebook or handheld devices and short transaction data such as e-mail and Eftpos.

...Telecom is starting to put mini-cellphone transmitters on lamp posts and traffic lights... While communities battle against high-powered mast transmitters, councils are being asked for permission to install low-powered transmitters in areas where tall buildings and high cellphone use affect network coverage capacity... At present a signal from a cellphone goes by radio to a network site (or macrocell), then by landline to a mobile switching centre. The centre then relays the signal via a macrocell and radio to a cellphone or by ordinary networks to a fixed phone. Problems include... blind spots which the macrocell coverage does not reach... About 10 [of the] transmitters have been put up in Queen St... Telecom... challenged anyone to spot them... The transmitters have a reach of only 200m and Telecom does not expect there to be any public health concerns.

...Having a mobile phone robs a person of 16km of walking exercise a year, according to a British obesity expert. It may not sound like much, but combined with other aspects of lazy modern living it is helping to fuel an explosion of obesity... [T]he British Medical Research Council['s expert] said television remote controls, computers, escalators and lifts were other examples of technology contributing to the weight problem. Bad diet alone could not explain the “startling” increase in the number of people who have become grossly overweight[d]uring the 20th century...

Mobile telephones could soon be built into coats, jackets and even bikinis, adding new meaning to the wired bra. The Swedish electronics company Ericsson reckons mobile phones have become indispensable, but is concerned that carrying them can be a nuisance while leaving them behind is an even bigger headache. Even the smallest model makes your jacket bulge like that of a Mafia hit[person], and if you carry them in a handbag or briefcase, you can miss a call while scrambling to get them out. With impenetrable Swedish logic, Ericsson's senior product manager... says... that only the pockets of the wealthy would be deep enough to afford the first models... The idea is to break down the individual components of a phone and data system and spread them around the garment – a wire antenna sewn into the lining, a keyboard in the sleeve and a mouth and earpiece in the collar. Imagine a ski jacket that would allow you to make and receive calls while on the slopes and send out an alarm if you had an accident. Or a lifejacket that would broadcast a mayday and give your position if you were unconscious in the water... If the garment needed cleaning or went out of fashion, the phone devices could be detached... The company's "wearable technology" team was in contact with several [clothing] manufacturers... but... the [manager –] ...who expected his vision to become reality by 2000... [–] would not name names.

...Telecom will launch its caller display service next month. Subscribers will have a small screen attached to their telephone which shows the time and date of an incoming call, and the number of the phone from where it is being made. The service was to have begun last August but was delayed by a problem with prefix codes... Subscribers will pay \$6.95 a month to connect to the system and... have to rent a Telecom display phone for \$11.95 a month, or buy a \$75.95 plug-in unit. Callers worried about privacy or security can have their number permanently kept secret, or use a prefix to shield their number on a call-by-call basis. "We've had to provide the withhold function for business customers, too, which is unique to N[Z], because of the Privacy Act," [a Telecom spokesperson] said. The Privacy Commissioner... said it was important that people be made aware of the withhold options through a good public education programme. "People must know that every time they pick up the phone, their number could be displayed at the other end..." ...feedback from a three-month trial in Greymouth last year... [indicated that 10%] of households initially wanted their number permanently withheld but that dropped to 2.6[%] by the third month. The service could be used with an answerphone and showed the numbers of callers who had left unclear messages, or no message at all. "It's useful, too, if you don't get to the phone before it stops ringing."

...[US] drug dealers are costing N[Z] companies... thousands of dollars by hacking into phone systems and running up toll bills. Audit N[Z] has warned all public sector organisations about the fraudsters and urged them to hire a consultant to review phone security... [T]he "phreakers," or phone freaks, use stolen credit cards or phone cards at public phones and tap into overseas lines... Small-time drug dealers in New York are apparently selling off toll time at cheap rates because it is "more lucrative and less risky than pushing drugs on the street." It is understood they hack into phone systems overnight and their customers spend up to eight hours making toll calls on the victims' lines... They targeted PABX phone systems which allowed employees to make toll calls on the company bill while outside the office by dialling a secret number. Hackers tried all of the company's phone lines – usually numbering 100 – until they found the right one... [S]ometimes no pin number was required but, if one was, fraudsters used special software programmes to crack it... Calls were usually traced back to the U[S], though Venezuelan fraudsters had also been caught trying to make calls... N[Z] police had caught some phreakers but they were often youths who operated on a smaller scale. Many had escaped prosecution because of their "age or circumstances" but were required to repay the value of the toll calls they had made... [Incidentally.] White Pages telephone listings for N[Z] are now available on the Internet at <http://www.whitepages.co.nz>. This follows the launch of Internet Yellow Pages two months ago.

...Most people would agree that enabling phone subscribers to keep the same number when they change carriers makes a lot of sense, particularly when those users are businesses that would otherwise have to reprint their stationary and advise their customers of their new numbers. But like many sensible things, getting portability into practice has proved fraught, which is why such a good idea has taken so long to become reality. [The biggest p]roblem lies in Telecom's position as the dominant incumbent... For instance, if you were to change from Telecom to Clear and retain your old number, incoming calls would still land in Telecom's patch and Telecom would then have to redirect them to Clear before you could receive them. Portability, therefore, required facilities at the old carrier that will recognise when a call no longer belongs to it and will in turn reroute it to the new carrier. There is still the issue of who pays for transferring the calls and what technology is used. The industry body, Tnag (Telephone Numbering Advisory Group), has grappled with the issue at length but has so far reached no conclusion, with many blaming its conspicuous lack of success on Telecom's right of veto. The solution proposed by Clear Communications, to no avail, is that the carrier losing the customer should bear the cost of "porting" calls. That has been rejected by Telecom which has publicly offered to transfer calls at a charge of 0.5c a minute plus a \$30 set-up fee for each number ported. So far, only one carrier has shown any interest – the [NZ arm of AUS]'s telephone giant, Telstra, which still has to formally conclude an agreement, having accepted a deal said to involve a slightly lower set-up charge... The cynics argue that the big A[US]n has a huge incentive to accept Telecom's terms given that in its much larger home market, it is on similar ground to Telecom. Telstra's reluctance to be seen playing both sides of the same coin is reinforced by the recent move by A[US]'s now disbanded regulator to endorse Clear's solution... While Austel's ruling is in reality more a statement of what it would like to happen because of the transitional state of A[US]'s market to full deregulation, Telstra realises that this could still become the state of play... Meanwhile, [Telecom could find itself issuing]... a credit on their accounts or a \$50 phone card... to 900 Aucklanders [who] have been left with faulty phone services after a [day of stormy weather]... Some of the affected Telecom consumers have been told it could be Sunday before their phone services are fully restored. A Telecom spokes[perso]n... said the faults were caused by water seeping into underground cables and, to a lesser degree, wind battering wires.

...Belgium's weather[forecasters] have formally apologised for getting [a] forecast wrong. "The Royal Meteorological Institute wishes to offer its apologies to the inhabitants of the centre of the country who could not enjoy the bright spells forecast for July 9," the institute said. The weather was overcast that day. The weather in Belgium is notoriously fickle... □ [NZ's] MetService announced a \$3.56m after-tax profit in the year to June 30 and a final dividend payment to its government owners of \$1.1m.

...To the chief executive of the Meteorological Service of N[Z]... brewing and the preparation of weather forecasts have much in common. Both are produced 24 hours a day, both are the product of highly-advanced technical processes and both are, in their ways, controlled substances, said the former general manager of Canadian brewer Labatt's Vancouver brewery. [The Canadian arrived in NZ] five years ago to become the first [CEO] of the newly-established [SOE]. True to the premise under which Crown activities were corporatised, MetService was required to earn its keep, resulting in a halving of the cost of providing core services to the Government in those five years. One surprising upshot of commercialisation is that the forecaster has moved into activities hard to relate to weather forecasting. While it has been delivering electronically-finished art weather presentations to newspapers for some time, it has recently expanded into TV guides and soon will be preparing financial information such as share tables. [The Canadian] said the expansion of activities was a natural flow-on from a skill MetService had to develop as a commercial business. Radical revision of... how weather should be presented resulted in a swept-up look for weather maps which are now tailored specifically to the regions served by specific newspapers. Eighteen of [NZ]'s papers use MetService maps. MetService's... success can be measured in the fact that its services are sold abroad – [e.g.], the 1.3 million readers of Sydney's *Daily Telegraph* now get their weather from MetService. In fact, a surprising array of overseas organisations take their data from MetService... MetService supplies 33 international airlines, a number of which do not come to N[Z]... When Concorde strays from its set routes, it, too, uses MetService. [The Canadian] says MetService's skills lie in the fact that it can take the body of weather information produced around the world and tailor it to suit highly specific requirements in a way that cannot be matched by its larger international rivals. Obtaining data specific to other regions is not a problem. It's the manner of presentation that gives MetService the edge... Nevertheless, MetService is conscious that being government-owned does not always go down well. To avoid accusations that its ownership

could imply an unfair advantage, all non-government business is being shifted to a new operating subsidiary, Metra Information Ltd. Is there no limit to MetService's activities? It's on the Internet in collaboration with Telecom subsidiary Xtra with a profitable pay-per-access service[– which complements its new 0900 recorded forecast phone service]. And design and implementation of a 24-hour weather channel for Wellington regional cable company Saturn Communications has extended to development of software to upgrade listings for its programme information channel and movie preview channel. But... [m]ovie previews are probably as far away as MetService wants to get from its core business... [the CEO] says. - 1997

A runaway 100m tall weather balloon is disrupting air traffic after defying pursuit by Canadian, British and U[S] military aircraft. An officer at the U[S] base at Keflavik, Iceland, said the balloon [was] being tracked by radar so that commercial flights could be diverted as necessary. "For as long as we maintain contact, air traffic can be rerouted. We are now exploring the option available if we lose contact,"... Canadian air force officials said earlier that the un[pilot]ed helium-filled balloon had remained aloft despite attempts by jet fighters to shoot it down. Two Canadian CF-18 fighters had fired more than 1000 rounds of cannon shells at the runaway. Last night the balloon was heading due north at a speed of 25 to 40 knots and an altitude of about 11,075m. Two Royal Air Force Nimrods had shadowed the balloon earlier before a US Orion took up the chase.

...[next month's weather] looks to be mainly fine, high pressures will prevail until the end of the month though interrupted by the odd cold front. That's according to Titirangi's [resident forecaster], who predicts the weather using an old fashioned method of maths and the moon. [The forecaster], also known as the Math[person]n to many schoolchildren... launched his new book, *Predicting the weather by the moon*, in Christchurch yesterday. "What I'm doing is long range forecasting. It can be predicted years ahead, right down to the very day,"... [Hi]s theory is there is an air tide controlled by the moon, similar to sea tides. The moon controls wind speed, direction and the high or low pressure zones. It has a cycle that runs between 18 and 19 years and then repeats itself. Mr [Mathperson] claims an 80[%] strike rate. "But over 18 years I'm going to be a few days out." According to his theory there's no such thing as global warming. [The Mathperson] puts higher temperatures down to the moon cycle and says it will continue to get warmer until 2006, as it did one moon cycle ago. "There's no climate change other than what the moon causes. It's nothing to do with carbon dioxide." ...[Mr Mathperson] has been working on his theory for more than 20 years.

...[it is worth noting the lesson of chaos theory. It used to be supposed that, given enough resources and a powerful enough computer, long-range weather forecasting could be made as accurate as one pleases. However, if the weather is truly chaotic, as is claimed, there is a *fundamental physical* (not merely technological or financial) limitation to the accuracy of weather forecasting.]

...The ever-changing arrangement of weather, be it useful or useless, harmful or harmless, never fails to fascinate and frustrate. Just right for research – but why do we try to predict it as well? Weather forecasting was born out of our need to mitigate weather damage. Our technique of casting forth readings (or weather maps) belongs to an ancient wisdom, which has always been closely meshed with the politics and economy of any community. From our forebears we have learned that the medium may be more important than the message, that how we talk makes more impression than what we say (a poorly imparted warning is not of much use). Weather forecasts are made using normal scientific methods – gathering data, analysing, experimenting, modelling and reporting back. Information is collected about what is actually happening in the weather world (land, sea and air measurements, plus balloons to track upper wind and temperature in the clouds, also rain-measuring radar and cloud-viewing satellites). This always comes first, but should not dominate... Weather in the real world is a mix of pattern and chaos, but chaos cannot be dealt with and is ignored... [when the] data is... analysed... A deliberate choice is made to limit this study to a logical pattern – in the smoothed-out scale of a weather map. This step is more a craft than a science. The analyst needs the skill of a detective to spot mistakes in the incoming reports, the tenacity of a defence lawyer to keep beaver for the right evidence and the wisdom of a judge to remain focused and concentrate on what really matters. Computer programmes are run which use mathematical models of the physics of the atmosphere. This provides an extrapolation of weather patterns into the future. Nowadays, most commercial weather providers have access to more than one such global computer model of the weather. When the models all agree... the weather tends to follow along nicely, but when they disagree it is usually a sign that the weather patterns are too chaotic to be predicted. The presentation of the ideas and thinking behind weather forecasts is done usually through some third party such as the media. This step is more art than science. It requires the rare ability to transfer an idea clearly from one human being to another in a world full of distraction... Since the deregulation of [NZ's] weather services in 1992 there are now many different sources for weather data and services and a proliferation of styles of presentation. Basically there is something for everyone now. What suits best depends on your own requirements. Price, timeliness, reliability, quality, technique, accuracy, popularity, terminology and style of presentation all contribute differently to how individuals may perceive the value of a forecast... Popularity is... a feature worth considering. Some prefer to listen to a long account of the national weather and others just want to know what is likely to happen at their place. The popularity of various weather elements comes and goes depending on fashion and time-of-year. Ultra violet and heat indices appeal during summer and wind chill and snow levels appeal during winter. As for accuracy, forecasting the weather is not, and never will be, 100[%]. Even tossing a coin can get it right at times... A partly correct forecast can[, however,] still be useful and should not be marked as all wrong. Accuracy of forecasts changes from month to month... Years of data must be evaluated before any trend in accuracy can be determined. All these factors complicate the job of anyone who wishes to compare the accuracy between different weather providers. A tip here to the weather user: if you have access to two or more different weather suppliers in the morning as you plan your day, then compare them... Some forecasts are based on more recent data than others. For some[weather users], a newspaper or television weather package is good enough to help to decide what to wear tomorrow. For those whose livelihoods depend on the weather, the most up-to-date reports are important. Then there are a few people who do not want to bother about the weather at all until they are alerted that it is about to bother them.

...This year should be one of the worst for solar storms – surges of charged particles that knock out satellites, power grids and even garage door openers – but a whole new industry has popped up to try to prevent the worst disruptions. No one can predict which month or week will be worst, but the Sun is at the height of its 11-year cycle of storms, which means the Earth can expect several barrages of excess charged particles... During the last solar maximum... experts could at best make a 50-50 guess about when a blast from the Sun was on its way. But now Nasa's Advanced Composition Explorer (Ace) spacecraft, orbiting 1,600,000km from Earth, has a magnetometer and a particle detector on board that can warn of the solar bursts about 45 minutes before they reach the atmosphere. Its information can help protect not only electricity networks, but satellite users ranging from broadcasters to... pager companies. "These systems are arguably more vulnerable than ever before. We are not going to grow out of these problems any time soon,"... said... a senior engineer at Metatech in Duluth, Minnesota... [H]is company has signed an agreement to help protect Britain's National Grid Group, the owner and operator of the electricity transmission system in England and Wales. Solar storms disrupt electricity grids by causing extraneous currents that cause the flow to fluctuate. Careful management can prevent this from knocking the grid out, but power system managers have to know it is coming. Metatech takes the warning of a flare and runs a computer model of the client's particular power grid, identifying the areas that will be vulnerable. A power company can respond by making sure enough electricity keeps flowing in that particular area, either by increasing the flow or reducing the demand. Metatech charges a base rate of \$US5000 a month, but utilities and companies can also ask National Oceanic and Atmospheric Administration for information from Ace... [T]he director of NOAA's space environment centre, said NOAA probably would never know who it saved from trouble or when, "unless someone tells us over a drink... People don't reward champions." Also in the public area, the Aerospace Corporation is working to warn operators of both Government and private industry satellites. "We are not at the point where we can say this satellite will experience this effect," said... [a] senior project manager at the

Colorado Springs-based group. But they can advise on how a satellite's attitude – its relative angle to the Sun – can help or hurt. During a solar storm, charged particle build-up on the outside of a satellite and more powerful radiation can penetrate deep inside, causing both immediate and long-term damage. The effects can be disastrous. [Last year] the Galaxy IV satellite was disabled by a solar storm, silencing 80[%] of North America's pagers, knocking financial services offline and stopping credit-card transactions. It is not just machines that are affected... [-] a project manager at Lockheed Martin Corp, said a close eye was being kept on the six astronauts orbiting in the space shuttle Endeavour. Radiation from a solar storm can easily reach the equivalent of several chest x-rays... "This is one of those risks they will carry the rest of their lives,"... Aircraft crew are also at risk, especially those flying polar routes. Frequent flyers may be, too.

...Europe has decided to develop a revolutionary satellite navigation system that will... guide planes in flight... help blind people move round cities and... monitor truck fleets on the road... The US\$3 billion... Galileo project, approved yesterday by European Union leaders meeting in Barcelona, will give Europe a major lead in space technology and could transform day-to-day life... The system should be working in 2008... American engineers and politicians had campaigned vigorously against Galileo, saying Europe should stick with the existing US global positioning satellites, but Europe feared the Americans could switch off their satellites during war or political disputes.

...A French[citize]n attempting to row across the Pacific fears his satellite phone will be cut off because the US communications company Iridium has gone broke. [The rower] is heading for the southern tip of Chile as Iridium plans to switch off its 66-satellite system. [A member of the rower]'s support team in Wellington, said [they] understood the company was going to continue to supply communication to him but it was not clear for how long... [T]here was also a team of Norwegian adventurers on the ice in Antarctica who were entirely reliant on Iridium for communication... Motorola Corp, which built and operated Iridium's satellites, told a US bankruptcy court at the weekend that it would begin destroying them in about a week by taking them out of orbit 781km above Earth and plunging them towards the planet's oceans. [Ironically, the rower – who] is in 6m to 7m seas nearly 2500km from [NZ after rowing for] more than 40 days[– is undertaking the] 9000km journey from Wellington to Chile to raise awareness of ocean pollution. [The rower] has other communication methods such as email, a VHF ship-to-ship radio with limited range and an Inmarsat C radio... But... the high seas made it too dangerous to use Inmarsat because [the rower] had to stand up in the boat to get the aerial high enough to communicate. [His NZ support team's] coordinator... said the possibility of Iridium pulling the plug was never raised during preparations... French supporters... were talking to the French Navy and others about what could be done if the service ended.

...Iridium LLC... entered the history books at the weekend as one of the costliest corporate fiascos of all time. The Washington-based firm said it was cutting off telephone service to its 55,000 customers as of 5.59 pm on Saturday... a prelude to court-ordered liquidation... [after giving] up its hunt for a buyer to rescue it... [A] US bankruptcy court... Judge... cleared Iridium to spend \$US8.3 million to start winding up its business while selling remaining Earth-bound assets, including ground stations... Iridium's last act will be to burn up its constellation of 66 satellites... [- a] network... reported to have cost \$US5 billion to \$US7 billion. By beaming instructions to on-board devices, engineers will tip craft, one by one, on a path that will send them down in flames... a spectacle that may be visible from Earth... Bringing the satellites back must be coordinated with several US Government agencies... Motorola, which held 18[%] of Iridium, the largest stake, said... it would take up to two years to burn up the last of the satellites... The flop reflected a string of badly botched business calculations. For one thing, the company's chunky telephones initially were priced at \$US3000 each, with calls costing as much as \$US7 a minute. Not only were the phones as big as bricks, but they did not work indoors. Iridium was doomed by the rapid spread of ground-based wireless networks... ■ [US]... authorities have broken up what they call the biggest identity theft case in U[S] history and charged three [suspects] with stealing credit information from more than 30,000 people, draining victims' bank accounts and ruining their credit. [The f]ederal prosecutor... said one sobbing victim said someone stole her identity, opened a US\$35,000 line of credit and cashed a cheque for \$34,000. "So that's now on her back, that US\$34,000," said... the[prosecutor, adding that the] losses were calculated so far at \$US2.7 million... but would balloon to many more millions and affect consumers in every state. [The prosecutor] called the case "every American's worst financial nightmare multiplied tens of thousands of times... With a few keystrokes, these [three thieves] essentially picked the pockets of thousands of Americans and, in the process, took their identities, stole their money and swiped their security." Authorities said the scheme began about three years ago when... a help-desk worker at Teledata Communications, a Long Island software company, sold an unidentified person passwords and codes for downloading consumer credit reports. [The help-desk worker] was allegedly paid US\$30 for each report, and the information was then passed on to at least 20 other people, who set out to make money from the stolen information... "The potential windfall was probably far greater than the content of a bank vault, and they didn't even need a getaway car. All they needed was a phone and a computer, or so they thought," said... the... FBI[']s Assistant Director... Identity theft has become a serious problem in the US and is growing rapidly elsewhere. The BBC reported that thieves get hold of basic personal information – names, addresses, dates of birth – and use that information to make fraudulent credit card applications or tap bank accounts. Much of US officialdom operates by an individual's nine-digit Social Security Number... But until recently many states published SSNs and driving licence details, the main concrete form of ID, on the web or sold the lists to private companies, making identity theft far too easy... [The help-desk worker], 33, from Georgia, was released on US\$500,000 bond after an appearance in Manhattan federal court yesterday at which [it] did not speak. If convicted, [the help-desk worker] could get up to 30 years in prison and millions in fines. The FBI also charged [two of his accomplices. One] allegedly downloaded hundreds of credit reports with [the help-desk worker's] access passwords... The... [other accomplice] has pleaded guilty to mail fraud for making changes to individual credit accounts.

...Another high-flying US company has nosedived in the biggest corporate fraud in history... It was one of the oldest and simplest accounting scams in the book. WorldCom listed operating costs, such as routine network maintenance, as capital investments, which could be spread over a number of years. This allowed the company to hide expenses, inflate its cashflow and report profits instead of losses in its last five quarterly reports. The *New York Times* reported that the revelation that cashflow figures could be fiddled shocked even the hardened short-sellers – investors who profit when stocks fall. "I'm kind of shaken by that," said... a short-seller who played a major role in unearthing Enron's overstated profits and hidden debt. "The one touchstone that investors had was that you couldn't fudge cashflow numbers, but apparently you can." ...America's second-biggest long-distance phone-call company is the creation of [a] cattle farmer... – also a former milk[deliverer, bartender], bouncer... and school basketball coach – who started the company in a Mississippi coffee shop. From the beginning, [the farmer] broke the chief executive mould. [The farmer] wore cowboy boots, jeans and turquoise jewellery to work and let it be known that it wasn't beneath him "to occasionally castrate a bull"... [The farmer] started WorldCom in 1983 as a long-distance telecommunications bucket shop based in Clinton, Mississippi. It made its money by buying network capacity at rock-bottom prices and reselling it. By 1985 it had 5[%] of the American long-distance market, including the White House-Kremlin hotline. But the company did not take off until... it was taken under the wing of one of Wall Street's biggest investment banks, Salomon Smith Barney[a decade later, and]... gobbled up 75 rival phone companies, including America's second-biggest long-distance carrier, MCI. Even [the farmer's] yacht, sold this year, was called Aquisition. The company played a leading role in the hype of the dotcom boom... [But WorldCom's s]hares had been dropping from their \$62 high... as revenue growth dried up and cash reserves shrank. [A] *Telecom Insider* columnist... says WorldCom had problems almost everywhere, including "phony MCI bills [which] customers will never pay". All telecommunications companies were having their profits squeezed in a similar way, [the columnist] says, but for the first time, WorldCom found that continued expansion offered no solution. The company's drastic efforts to cut costs, including sacking thousands of staff and merging business units, only cramped its potential to generate more income. It was saddled with US\$28 billion... in loans it could not pay. Then in April [the farmer] resigned, after admitting [it] had borrowed US\$366 million... from the company to underwrite the inflated prices [it] had paid for WorldCom shares. On Monday, investors got their

first hint that much worse was to come. [A] Salomon analyst... dubbed "the ultimate insider" by some for his close links to the company, downgraded his WorldCom rating from "neutral" to "sell". On Tuesday the company admitted inflating profits by US\$3.8 billion between January last year and March this year – a deception six times bigger than the Enron scandal. The US financial watchdog, the Securities and Exchange Commission, charged WorldCom with fraud and the Justice Department began a criminal investigation of the company's accounting practices. WorldCom sacked... [its] chief financial officer[, who was the farmer's] sidekick... and announced 17,000 redundancies – one-fifth of its workforce but a cut expected even before the scandal. The company is expected to file for bankruptcy soon, as its share price plummets, banks call in loans and customers leave... Top banks across the world from New York to Frankfurt to Tokyo are owed about US\$4.5 billion... by WorldCom... Most commentators expect the scandal to hurt the US economy but disagree on the scope of the damage. [An] *Independent* columnist... expects some fallout but argues that the world's sharemarkets are unnecessarily nervous and looking for a systematic failure which doesn't exist. But the same paper's business editor... says the sheer scale of the fraud raises a huge question mark over US standards of corporate morality and disclosure... "The WorldCom debacle may mark the bottom of the present cycle, but the climb back out is going to be long and hard." ...[the *NZ Herald* business columnist... agrees, but predicts more scandals ahead. "We haven't seen the last of this. We will have a succession [of announcements] and it will affect confidence, undoubtedly." However, [the *Herald* columnist hopes *NZ*] can escape the shockwaves... Asked about the prospect of similar scandals in *NZ*, the columnist gives local firms 9.5 out of 10 for honesty, compared with 4.5 for US firms. "I'm as cynical as anyone... But systematic fraud? I don't think we have that." ...*US corporate scandals at a glance* Enron: Politically well-connected energy giant which inflated profits for years. Likely to face criminal charges... Merrill Lynch: Top sharebroking firm whose analysts recommended shares to clients while privately describing them as "junk" or worse. Forced to pay US\$100 million... settlement. ImClone: Cancer drug developer[whose f]ounder... and his friends and relatives... dumped US\$10 million... of ImClone stock the day before the Food and Drug Administration refused an application for the company's drug Erbitux. [The founder] has been charged with conspiracy, securities fraud and perjury. Adelphia: Sixth-largest cable TV company in US[whose c]hief executive... and his three children took US\$3.1 billion... in preferential loans from company funds. Filed for bankruptcy, facing criminal investigation. Global Crossing: Digital communications company[whose c]hief executive... cashed in US\$734 million... in shares before the company filed for bankruptcy.

...WorldCom has filed the largest bankruptcy proceedings in *US* history... WorldCom's accounting debacle has deepened investor unease on Wall St in recent weeks, sending markets to their lowest level [in years], and prompting... the US... President... to call for a crackdown on unethical business conduct... Meanwhile, under political pressure to act against business scandals, lawmakers in a House-Senate conference committee are hoping to draft corporate reform legislation for [the President] to sign before Congress begins its... recess. There is a vast amount of territory to be covered, ranging from accounting reform provisions – which clamp oversight on that largely self-regulating industry – to the new criminal provisions that in some cases quadruple existing penalties for corporate miscreants... [A] Michigan Democrat, has proposed that Congress adopt the highest of tough penalties for rogue executives from both the House and Senate bills. The committee is working off the Senate bill... which is widely considered tougher than the House measure on accounting reform and provisions for an independent oversight board. The Senate bill was amended a week ago to double some of the criminal penalties... for example, making the penalty for mail and wire fraud 10 years instead of five.

...*Corporate cancer rampant*... Even if the new lead prosecutor... can cut out the tumour with aggressive law enforcement, the disease may be in the nodes of the market-place, poisoning the rest of the financial system. At least one [perso]n thinks so, and his Senate testimony, while less sexy than all the finger-pointing, ranks among the most important appearances before a congressional committee in modern memory... [T]he former chair[perso]n of the Securities and Exchange Commission... says [WorldCom and] Enron... are... merely... symptom[s] of a much larger problem. "What has failed is nothing less than the system for overseeing our capital markets,"... When [it] held the SEC job... it... warned repeatedly that a "culture of games[perso]nship" was rigging the system with phony numbers, hyped earnings and worthless stock analysis. His calls for reform were rebuffed by members of Congress legally bribed by Wall St and the green-eyeshade lobby. And reform might still be stifled... [Meanwhile,] the underlying disease lives on, in the fig-leaf accountability proposals of the new SEC chief; the refusal of the White House to embrace real campaign finance reform; the lame protestations that this is all some tragic aberration. If only it were so.

...Citigroup, Credit Suisse First Boston and eight rival securities firms have agreed to pay US\$1.4 b... in the biggest-ever settlement for violating securities laws, capping two years of investigations into conflicts of interest in Wall St research. The agreement, announced at a Washington press conference yesterday, will cost Citigroup, Credit Suisse First Boston and Merrill Lynch US\$800 m... and overhaul how Wall St firms supervise and pay analysts. "I am profoundly saddened and angry about the conduct that's alleged in our complaints," said [the SEC chairperson]...

The US] President... said... it[']ll... ask Congress to almost double funding for the Securities and Exchange Commission... to help the agency hire accountants and investigators to fight corporate fraud. The 93[%] increase... over the agency's... US\$581 million... budget... reverses his opposition to a 77[%] increase that Congress recommended... to create an accounting standards review board after the Enron and WorldCom bankruptcies.

...a deeply religious [guy, WorldCom's founder wa]s said to begin board meetings with a prayer. Yet, incredibly for a business[perso]n running a telecommunications company valued at \$US115 billion... at its peak[, the guy] is also a technophobe. For years [it] refused to use a mobile phone...

Mobiles affect brain... The first official investigation into the health risks of mobile phones has found they do affect brain activity. The study was masterminded by... a medical engineer at Bristol Infirmary, in the west of England, and examined the impact of mobile phone use on memory. It found that volunteers were able to think faster while using the phones and performed better in a memory test immediately after using them. But other leading scientists in the field warn that any evidence of interference with brain functions by signals from handsets would be very worrying – even if that evidence showed short-term benefits to memory... It will not deal with the suspected links to the tumours experienced by some engineers and, most famously, by a prominent friend of [Virgin's] British tycoon... who died as a result of a tumour that developed behind his "phone ear." ...A[US] scientist... has demonstrated that low-intensity radiation given off by mobile phones can damage DNA in rats...

Mobile madness: just how safe is your cellphone? ...Whenever... one *NZ*er... picks up a mobile phone, [it] feels unbearable pain in the ear and eyes. The Papatoetoe real estate agent had been using a cellphone for 2 1/2 years [t]hen... started finding it painful... "I tried a hands-free set and it didn't work – it was the same thing... I don't use the cellphone now." [The agent] is a rare case. Most of the 1.4 million *NZ*ers who had cellphones as at March 31 this year have never reported any ill-effects... [(b)y the end of last month, the number of mobile phone users in China had reached 259.6 million... exceed[ing] the number of fixed-line users... [f]or the first time[)]... But... a former chief medical officer for Telstra who studied 40 people with cellphone-related symptoms in A[US and NZ], believes that people like [the agent] may be "early warning signs. We don't know what will happen within 20 years... Since we are in the early stages of the technology, if we get it wrong – either from the point of view of the phones or the towers – we are going to have quite a mess to deal with in the years to come." Cellphone transmitter towers – there are 1200 to 1500 around *NZ*] so far – have been stirring up opposition for years... But the radiation from cellphones themselves is between 1000 and a million times stronger, at the point where it is absorbed by the brain, than that from transmitters. Yet here, as elsewhere, people are flocking to the cellphone shops. In the year to March, the proportion of the population with cellphones almost doubled from 21... to 37[%]. By far the biggest growth was prepaid phones for private use, particularly by teenagers. Prepays now make up 49[%] of Telecom's cellphones and probably a much higher proportion of Vodafone's. Although cellphones are already more popular here than in the *US* (31%), we are behind A[US (40%)] and well behind the world leader, Finland (66[%]). There, the ratio of cellphones to teenagers is now over 100[%]. In other words, many young Finns have more than one mobile. "Mobiles are used now as an accessory, so you have a different phone for different occasions," says... [the] local marketing

manager for the Finnish cellphone company Nokia. "...People can express their personalities." And this is just the start. On Monday, unless blocked by court action, the Government will start auctioning four more blocks of radio frequencies... expected to be used partly for new networks of "third-generation" cellphones, going beyond the first (analogue) and second (digital) technologies. In this next round, cellphones will be able to download data, graphics and even videos from the internet much more effectively... Many experts scoff at those who wonder about the health effects of such an obviously beneficial technology. "The thing that interests me is why the anxiety won't go away. It's a fascinating social phenomenon," says... [the] professor of occupational medicine at the Auckland Medical School. "The science of non-ionising radiation has been known for so long it's one of the best-known areas of science. Radio is not exactly a new invention. Every day makes it less and less likely that we're going to see any ill-effects from it." But there are signs that official views are changing. Last week the W[HO] recommended that cellphone users limit their own and their children's exposure to radiation by making shorter phone calls or using hands-free phones, which keep the transmitting antenna away from the head. This followed a May report by an expert group established by the British Government. It recommended that... the industry "should refrain from promoting the use of mobile phones by children." The NZ Health Research Council has granted \$420,000 to the Wellington Medical School to interview around 200 to 300 people who get brain tumours in the next three years about a number of issues, including how much they have used cellphones. This will be part of a multimillion-dollar study of about 6000 brain tumour patients in 13 countries to test whether cellphone users are more susceptible to tumours... A[US] scientist... in charge of cellphone industry safety research says [it] has direct evidence that mobile phones increase the risk of a rare type of brain tumour... but the cellphone industry says scientific consensus shows no risk... Until now, the official view has been that radiation in the low-frequency, non-ionising radiation bands which include cellphone transmissions is too weak to affect the body's molecular structure, unless it is so intense – as in a microwave oven – that it literally cooks the body with heat. It is generally accepted that the heating, or thermal, effect of a cellphone is far less than that needed to "cook" anyone's brain. However, some studies suggest... cellphones may also have non-thermal effects... A Scandinavian survey of 11,000 cellphone users... found that 13[%] of mobile users in Sweden, and 30[%] in Norway, reported at least one symptom[–] ...headaches, dizziness, fatigue, reduced concentration and memory loss... [–] associated with cellphone use. Symptoms increased with more calls.

...*Frying the bug instead of the brain* FEARS cellphones fry users' brains may be overcome by a high-tech new "bug" being introduced to N[Z]. One... Wellington business[person]... is importing the... cellphone protection device, which claims to absorb up to 60[%] of the radiation emitted. The ladybird-shaped device, which sticks to the side of the cellphone, is made from ceramic compounds similar to those used on the space shuttles for absorbing heat as they return to earth. [The businessperson] – who is offering Zeropas at \$90 each on his website... – says cellphone users may be sceptical at first. "This is like the first people to use sun block or wear seat belts. Then people didn't take it seriously but everyone does now,"...

Air safety experts say electronic game machines, electric shavers and laptop computers can be almost as dangerous as cellphones when used on aircraft. Reports emerged yesterday of two incidents in which cellphones upset the electronics in N[Z] aircraft, causing them to veer in unexpected directions... One of the... incidents cited was... when an aircraft was 6km from Wellington Airport and 500m high on its landing run. The aircraft suddenly turned right and climbed. The crew had to take manual control of it. The other was in 1995, when a cellphone in a cockpit flight bag rang while the aircraft was cruising on autopilot. The aircraft rolled 30 degrees to one side. [It has also been suggested that 'a cellphone call was made from the Ansett aircraft that crashed while approaching Palmerston North'. The former National Party MP – who is now Auckland's mayor – was once 'fined \$750 for answering a phone while on a plane', and in 'Britain an airline passenger was jailed for one year for refusing to turn his phone off'.]

...US authorities investigating why a southern California commuter train engineer ran through a red signal and into an oncoming freight train last week have confirmed [the engineer] was text messaging while working on the day of the fatal collision... [that killed] 25 people and injur[ed] more than 130 others... The revelation came just before California regulators issued a temporary order banning train operators from using cellphones while on duty.

...A Canadian study concluded that using a mobile phone while driving was equivalent to driving drunk... [T]he US National Highway Traffic Safety Administration concluded... driver distraction contributed... to 30[%] of all crashes... [(t)he NHTSA says there are 115 million cellphones in the US, and... 54[%] of drivers usually carry one[...]). The survey was... examined by New York state before it banned hand-held cellphones in cars.

...The New York City Council has voted 38-5 to ban the use of cellphones at public performances. Talking on a cellphone, dialling, listening or even having one ring during a performance will constitute a violation punishable by a US\$50... fine. The law covers concerts, movies, plays, lectures, dance performances, museums, libraries and galleries. Cellphone use would still be permitted at sporting events and in emergencies. [However, the Mayor... has said the legislation... [– which] takes effect in 60 days... [–] would be unnecessary and almost impossible to enforce.

...[the restaurateur] knew the cellphone craze had gone too far when one customer at his trendy San Francisco restaurant picked up the phone to talk to another customer sitting at the other end of the bar. It was hardly the first instance of such behaviour to hit this city – capital, after all, of the world digital revolution. [The restaurateur] knew of other restaurants where three or four customers at a table would be in deep conversation, not with each other but with their separate inter-locuters on the end of the line. This was more than [the restaurateur] could stand, so [it took action]. The restaurateur was sick of the constant chirping emanating from the bowels of handbags, the sight of customers gesticulating into empty space with one hand while clamping the other to their right ear, so [it] decided to ban cellphones from his establishment... No matter that [his] restaurant is a hot spot for the movers and shakers of San Francisco's political and media worlds, many of whom like to wear their mobiles on their hip just like gunslingers with their weapons in the Old West; the cellular crowd has now been banished to the pavement, along with that other group of outcasts, the smokers... Several other restaurants in San Francisco, and Silicon Valley an hour's drive to the south, have already taken similar steps. Golf clubs, country clubs, San Francisco's celebrated ACT theatre, the Museum of Modern Art, even a Silicon Valley branch of Alcoholics Anonymous – all have told mobile phone users to switch off or get lost. Meanwhile, pressure is increasing to ban cellphone use in cars – there has already been one attempt to push legislation through the state assembly and another attempt may not be far off. At least one host on San Francisco's public radio station KQED has told listeners [it] will not take their calls if they are in their cars and moving. "There's a total backlash going on," said... [the] bar manager at Dine, a restaurant in San Francisco's so-called Multimedia Gulch area where everyone has a cellphone but nobody is allowed to use them anymore. If the backlash is beginning in San Francisco (there is nothing comparable going on even in Los Angeles[...]), it is because [San Francisco] is the epicentre of cellphone use in the US. An estimated 15[%] of America's... mobile subscribers are in California, and well over half of those are in the Bay area. But it also speaks to San Francisco's rebellious nature and the deep social divisions that the dot-com revolution has created. Only in a city as contrary as San Francisco would the Mayor... declare his undying hatred of mobile phones... "Three times this one guy's god-damn cellphone went off," [the mayor] fumed last week following a much-interrupted press conference... His erstwhile challenger for the mayorship... would agree... [The] San Francisco Board of Supervisors president... has stipulated that people attending his meeting do as [it] does and switch their mobiles off. "It's rude. It's self-centred and somewhat pretentious... Particularly annoying are the little musical numbers. I really don't want to hear 'Row row row your boat' when we're taking testimony about someone being evicted. It trivialised the whole democratic process of a committee or board meeting." Rudeness is not the only problem. Mobiles cause traffic accidents which cost the city money it resents having to spend. One intersection where a mobile-wielding driver killed a pedestrian recently has been kitted out with special smart lights that flash on the asphalt when a pedestrian steps on to the crossing. When the lights were inaugurated last week, [the mayor] was there to lord over the proceedings... Rooding authorities in Japan plan to provide special roadside parking bays for mobile phone users... thereby improving road safety.

...CELLPHONE users will soon be able to let their fingers do the walking – right into their homes to set the video, turn on the heater and open the garage door. Telecom is launching a new wave of mobile phones which will allow users to access email and the internet, and even plot their position on city-wide street maps around N[Z]... The newest mobile phone revolution begins... with the launch of CDMA – code division multiple access. This space-age technology was designed for the American military. But 45 countries – including N[Z] – are readying the system for an ever increasingly hungry marketplace. CDMA will give mobile phones the voice quality of land phonelines. They will also guarantee better reception so you won't lose calls in rural areas. It will ensure a secure network so nobody else can interrupt or eavesdrop on cellphone users' conversations.

...Telecom is counting the cost to its reputation as a world technology leader after an embarrassing collapse of its mobile phone network. The company would not say how many of its more than one million 025 mobile customers were affected when a software upgrade failed and caused random outages between 7 am and midday yesterday... Telecom said one of its suppliers, Ericsson, had been loading software into the network, which was then hit by a bug... Telecom had earlier estimated that 500,000 were hit – all prepaid customers and up to 60[%] of those on contracts...

[Farmers department stores and Telecom are offering an] ERICSSON... DH618 Prepaid Mobile Phone[, which has u]p to 110 minutes talktime or 36 hours standby time[, for \$69.99 – a deal which includes]... \$80 free calltime... while stocks last... [The phone also allows you to s]ee who's calling with free caller display. Store 50 names and phone numbers. Blue and black interchangeable face plates included. Unused airtime credits will expire after 60 days unless topped up by \$20 or more. You must top up at least once every six months to avoid disconnection.

...Prepaid phone crook's best mate... Criminals are frustrating police by using prepaid mobile phones to conduct their business. The phones are popular with crooks because there is no way of tracing their owners – there is no contract to sign or identification required when someone buys one. The phones are also smuggled into prisons to allow inmates to bypass Corrections Department telephone security and plan crime from behind bars. The head of Auckland's organised crime squad... said: "Every criminal worth their salt is using one. If I was a crook, I certainly would be. They are now a major problem as far as investigating crime is concerned." [The]Detective Sergeant... said the phones, which can be bought almost anywhere for about \$70, were used throughout the underworld, whether by gangs or just the average cannabis dealer... The now-imprisoned underworld king... – known as Pete the Terrorist – used up to three cellphones at any one time so the police could not trace him. The bank-robbing Screwdriver Gang used prepaid phones to taunt the police. And hoax callers, who tie up hours of police time, use them to avoid any chance of being found out. Police are so fed up they want Telecom and Vodafone to change the way they issue the phones... The head of Auckland's armed offenders squad... said phone companies... had a responsibility to see that their equipment was used responsibly and lawfully[, while the]... It's dangerous and expensive." ...In Britain, the Government is pushing legislation that will have prepaid cellphone users register their personal details[, but Vodafone's local]... communications manager... said that while the company sympathised with police concerns, registration or identification of users of prepaid cellphones was out of the question. "The way they're sold is what attracts people to them – it's a simple way of organising your communication needs." [The manager] called them "just another communication device, and if people are unable to misuse them then they will just misuse something else." ...The president of the Auckland Council for Civil Liberties... said his group would strongly oppose any proposal to control prepaid phones. "It's another example of snooping and prying on private citizens. It is another form of state intrusion. What is the justification?"

...Fears that the new generation of mobile phones equipped with cameras could be used by peeping toms to take photographs of people undressing and showering in swimming pools and gyms have led to sweeping bans on the devices[in AUS]... Anyone seen using a mobile phone could be reported to a lifeguard or swimming pool supervisor... The Governments of N[SW], Victoria and Queensland will consider making the... ban law...

I spy with my little... A new security device allows householders to keep an eye on their properties via a cellphone. The system uses motion sensor cameras capable of transmitting images of intruders to the... householder's mobile or email address, allowing them to raise the alarm or identify the intruder. Nokia, which has developed the Observation Camera, says it could... allow... owners to keep an eye on their property while they are away. Nokia has refused to confirm how much the camera would cost but estimates put the price at between \$850 and \$1415 each.

...Londoners left... 62,000 mobile phones in black cabs in the past six months, a survey has found... [F]orgetful passengers... also... left behind 2900 laptop computers and 1300 electronic organisers. The laptops and organisers were reclaimed, but... half the phones remained unclaimed.

...The theft or disappearance of nearly 600 laptop computers from Britain's Ministry of Defence has raised major security fears. Figures obtained by [a]Liberal Democratic MP... revealed that 1354 Government-owned computers had vanished over the past five years... Some computers were detected as stolen, and others had simply been "lost"... [The ministry] said not all laptops contained classified information.

...Burglaries and car thefts are... [passe: new technology] has brought a new scourge to Britain – phone-jacking. An estimated 700,000 mobile phones were snatched last year, a fivefold increase in two years. The crime has surged in London in the past six months because Metropolitan police officers have been drafted into anti-terrorism duties. Mobile phone thefts now account for... a third of the city's street crime. Crime statistics paint the typical scenario thus: a white ...boy, aged 14 to 17, will be... using... his latest-model phone in a central-city street. While... absorbed in the conversation, one or more black 16-year-old boys, from a street gang, will snatch it, perhaps knocking him down first. Almost all the victims are [boys] – the robbers are said to believe that picking on girls is out of line – but the most frightening case so far involved a 19-year-old Asian [girl] who was shot in the head by a mugger in... East London. [The Asian] was walking along a busy street to a friend's house on a dark evening when [it] was approached by a [guy] who demanded her Nokia 3310... [The thief] already had the phone in his hand when [it shot her. The Asian] was lucky to live but was seriously hurt. A few days later three boys, aged 10, 12 and 16, were held up by a gun[-toting robber] and forced to hand over a... £25... mobile phone... And in another case this month, 10 children were surrounded by a gang of youths as they left a cinema and robbed of their mobiles. [A NZ]er... from Ohai in Southland, was robbed of her phone as [it] talked to a friend while walking home through Clapham... Police told her [they] had no chance of getting the phone back and... they d[on']t actively investigate phone thefts. Police believe some of the thieves want the phones for their own use, but there is a burgeoning market for stealing to order. Pay-as-you-go phones are particularly in demand, because the thief can simply insert a new Sim card and the phone is untraceable. Statistics released last week on mobile-phone thefts show that a black market now operates in Sim cards. A new Sim card can be obtained for a stolen mobile phone for £5... Ministers have spent... a year trying to persuade the mobile-phone industry to take measures [that]... allow stolen mobiles to be disabled. Since each mobile phone can be identified by its IMEI number, the owner could call the service provider to stop the phone being used if it were stolen. In Britain, service providers Orange, One2One, and Virgin have such a system in place. The Home Office has criticised BT Cellnet and Vodafone for refusing to follow. Both companies... insist... there is no reliable technology that can disable a... stolen... handset... BT Cellnet... said: "It would cost £16 million to introduce and if we felt it would solve the problem we would do it." ...Vodafone... added: "IMEI was like a fingerprint to the handset, but not any more, because cheap software downloads can give the phone a new identity." Meanwhile, police are urging British residents to switch off and conceal their phones in public places, especially when alone at night, and avoid... talking or text messaging on... them near railway stations, cinemas and theatres or on public transport.

...Like many crazes it started among Japanese teenagers. Text messaging has... astounded phone companies, who never thought such a limited and fiddly method of communicating would take off like a rocket. Every day, at 20c a pop, between 500,000 and one million text messages are sent and received on N[Z] cellphones. The growth of SMS or short message service, more popularly known as text messaging, has caused the telecommunications industry to think twice about how people like to communicate. An *Economist* story on the growth of text messaging said it marked an unexpected rebirth of shortened forms of written language, a linguistic style once thought to have died along with the telegram.

Messages such as “RU GOING 2NITE?” fly across the ether, to be answered by abbreviations like “YNOT?” SMS has also proved a godsend for those who are a bit shy when it comes to communicating with potential love interests. One sensitive [guy] told the *Herald* [it] preferred text messaging when communicating with [the opposite sex], as it was better than “sounding like a doofus.” During free text-messaging promotions this year the Vodafone network logged up to 2 million messages a day. The international GSM association says that, worldwide, 9 billion were sent [each month]... It is now predicting that the level of 15 billion text messages a month will be reached by December, instead of the 10 billion level it previously thought likely... Telecom introduced the SMS technology on a limited basis this year, but 80[%] of the cellphones sold for its network had an SMS function... Telecom’s market development manager... said the... feature had been available for years, but was not embraced until... a combination of financial and cultural influences had created the demand for the service... Using phones in lectures, on the bus or in noisy places was an option that young people in particular wanted... “It’s easier if you’re out somewhere, like in a club and can’t hear the phone. You can just leave a message and they can look at it whenever they want...” Control was given to the person who received the message, rather than with a voice call... “You’ve got the option for whether you reply immediately or take your time.” ...The [local market i]s dominated by Vodafone, but Telecom believe[s] that within a few months it could have just as many of its customers text messaging. Vodafone customers could not send or receive text messages from anyone on the Telecom network, but once enough digital phones were being used on both networks... messages would be able to be sent between the two systems. Vodafone... said talks with Telecom over allowing text messaging between the networks were already under way.

...TELECOM and Vodafone aren’t known for working together, but one thing has brought them closer – cricket. The rival phone companies have worked together so that for the first time subscribers on both networks can enter the same text messaging competitions. Previously the competitions have been on one network or the other. The breakthrough means third parties can organise text message promotions and offer them to all consumers. A trivia game promoted by the N[Z] Cricket Association and Sky TV, letting people receive questions on their phones and text their answers, will be launched this weekend using the new system for the first time. Every time they get a question correct they receive another one – *Who Wants to Be a Millionaire* style. Lateral Profiles, the company that built the technology, has watched the text polling format grow rapidly in the past year. It was first used for a radio song in May last year. In June it ran a poll to pick the most popular Silver Ferns netball player, receiving 70,000 responses. The system it has developed makes it so easy to create a poll or competition it can be done in a few minutes from a laptop at a remote location. That meant radio DJs and sports commentators could create competitions and polls live on air... They could have the results back in time to contact winners immediately. Lateral Profiles was founded eight years ago as an IT solutions business but moved into the wireless messaging field three years ago. It was one of the first companies in the world to offer a wireless instant messaging and chat service... Text polling had revenue benefits for all parties... said Lateral’s [spokesperson]... Entering competitions such as the cricket trivia game usually cost about one dollar a message. There were also marketing benefits beyond the revenue generation, [Lateral’s spokesperson adde]d.

...The story thus far: thousands of Aucklanders got letters from Telecom telling them that unknown to them, and apparently to the company, too, their phone line had a call diversion service attached which should have been costing them \$3.95 a month. That was the bad news. The good news: they wouldn’t be charged for it so far, instead they would have a further month free – or they could call and have the service taken off. All those who got the notice assumed that this was a personal matter about a minor glitch on their account. When they read in this column that, far from being a one-off involving only them, the mail was one of 30,000 identical letters sent nationwide, many Suburban Newspapers readers went ballistic. They felt they had been deceived in a dubious marketing ploy – and said so very plainly. NOW READ ON... This quote is a free translation. Telecom says: “Sorry – sorry you felt so deceived. Sorry you were angry. Sorry you believed a letter we wrote was simply a marketing ploy to get you to add \$3.95 to your monthly phone account... it won’t happen again.” They are right to apologise. Those letters certainly did incense many Suburban Newspapers readers... As an indication of the anger and suspicion, th[e] number of letters w[e] received w[as] the second highest of my career, second only to the first day’s mail after a long-ago series about the unjust murder conviction of [Mrs Thomas’ husband]. (For the record: only one in more than 100 had no problem with the Telecom approach.) The depth of the anger from the rest clearly shocked Telecom... And what do the watchdog’s say about all this? ...[the] chief executive of the Consumers’ Institute, says the two issues involved are: • Is it “inertia selling?” • Is it good business practice? (A Ministry of Consumer Affairs discussion paper defines “inertia selling” as a seller supplying unordered services to a consumer and then billing the consumer. Often, the supply is accompanied by a notice that if the offer is not rejected within a certain time, the seller will charge for the service, taking silence as consent. This is known as “negative option” selling. In contrast, the Consumers’ Institute believes companies should operate on an “active acceptance” basis – no explicit acceptance, no consent for goods or services.) So, is the Telecom letter “inertia selling” or “negative option?” ...[the institute] is obviously unhappy with the technique but believes the careful wording of the Telecom letter could perhaps be legally interpreted as more a notice of a problem and the opportunity of a free trial. OK, maybe, but is it good business practice? ...“It is not illegal. It really comes down to whether it is a dubious marketing ploy to sign people up or whether it involves genuine mistakes. Telecom has vigorously denied this ploy suggestion... If you accept the Telecom explanation of the circumstances, they have made a pretty large number of individual cock-ups. Clearly they should correct their mistakes. But they should not at the same time attempt to turn those mistakes to their commercial advantage...” ...As well as learning serious PR and customer services lessons out of all this, Telecom has obviously got to clean up what is, at the very least, a suspect accounts and engineering system. That’s where they can apparently lose 30,000 services worth more than \$1 million a year and not know they’ve lost them. For what it’s worth, I don’t accept an explanation made to me by one Telecom spokesperson... – that this sort of wastage is understandable in a company with 1.3 million customers. That’s their problem. Memo readers: thanks for your help. Mark this down as one we all won. • To con[clude today’s column, here’s a related story from overseas:] ...Red-faced German police were forced to admit that dozens of criminal suspects had learned their phones were being tapped when the evidence showed up on their monthly phone bill. Authorities said a technical problem led to several suspects receiving phone bills with charges for a connection to an unknown voice-mail number. When they called the number, they were told they did not have access to the voice mailbox, because police were using it to record their phone conversations.

...The police yesterday applauded Telecom’s plan... to charge customers who make false 111 emergency calls. From August 1, fixed-line customers will be billed \$6 for such calls. The charge will apply only to false calls after the first such call made in a month – in effect, letting people make one non-genuine call a month before they are charged... “We want to give people a little leeway, a warning.” Telecom ...a[dded] that although making a false 111 call was against the law, about 70[%] of 111 calls were not genuine. Telecom handles about 1.8 million false calls a year – almost 5000 a day... [(a hoax) caller rang emergency services 20 times in one night... [– t]he calls have been traced to a pre-paid mobile phone in the Kaikohe area[and p]olice are investigating...]. Telecom’s m[arketing manager]... said the charge would help significantly to cut the high number of non-emergency calls, which put unnecessary pressure on the service and on 111 operators... [A] false 111 call was one not passed on to the police, fire or ambulance services because it was clear to the 111 operator that no emergency service help was required. “For example, the caller hangs up immediately the call is answered, or it is a call made by children playing.” The Government and emergency service providers had been consulted about the new charge. It would cover the cost to Telecom of answering the call, billing the customer, and dealing with inquiries about the charges... [N]o charge would be made for genuine 111 calls... Telecom said it received more than 2.5 million 111 calls a year – almost 7000 a day.

...A Florida [resident] has been charged with faking more than 1100 calls to the 911 emergency number, tying up lines... [The guy], aged 20, placed the calls last Monday and Tuesday because [it] was bored, said [the] Alachua County Sheriff’s Office... One night, [it] called more than 800 times.

...The expression *desperate and dateless* took on a new meaning for Aucklander Nicole... [– n]ot her real name... [–] when her blind date match turned out to be a nightmare phone pest When my friend asked me to go with her to the Desperate and Dateless Ball earlier this year as a birthday treat, I thought, why not? [My friend] didn't want to go on her own and I was single. It was really expensive, but it sounded like a professional do, hosted [by a '60s pop star] at Sky City in aid of Red Cross. We filled in the forms and the questions which were supposed to match us with our ideal date, but we both thought they were a bit corny and ridiculous. Then everyone received a card with their date's first name and phone number. At this stage we realised our numbers had been given out to strangers, something which was not made clear when we filled out the forms. My date rang and spoke to my friend first. [My friend] was concerned as [my date] sounded a bit dodgy, slurring his words. When [my friend] told him I was lovely [my date] didn't believe her and... said, "Well the bottom line is, how many kids has [your mate got]?" After that my date left messages for me, things like "sexy voice" followed by a laugh – no name... When [my date] finally spoke to me it was only 7pm and [the caller] sounded drunk or stoned... I ended up getting his entire life story straight away, which included how horrible all his ex-girlfriends were. I hadn't asked, but [my date] told me it had its own home, business and was financially secure – later this turned out to be lies and his work number was a tech where [my date] was doing a course. [My date] wanted to pick me up to go to the ball, but I just wanted to meet him there as my friend and I were going together. [My date became] really indignant that I wouldn't let him do this, but to be honest, his conversation was so strange that I just didn't want him knowing where I lived. By the week of the ball, I'd received about seven or eight calls from him, often not making sense and I was worried about how serious [my date] was taking it... As the day of the ball got closer I just didn't want to go as [my date] sounded more and more weird. When I told a [guy friend, the friend] was really concerned, so I rang the Wellington organisers. They said to just go along and meet him because I didn't have to stay with him once the ball started. My [guy] friend rang them and was more forceful, so they said to pretend to him that I couldn't go, but go anyway and have a nice time on my own. So two nights before I was due to meet him at the ball, I rang him with a story about how I couldn't go. [My date] went off his tree, and when I said how sorry I was, [the date] said, "Not as sorry as you're going to be when I ring the organisers and tell them what you've done. You made a promise to come with me." [My date] ranted on so much I had to hang up on him. The next night, I came home from a night out and my flatmate, who doesn't speak good English, was almost hysterical... [A guy] had kept ringing, ranting and raving... saying things like, "Do you know what that bitch did to me? ...ruined my life – get that bitch on this phone." [My date] had been calling every 10 minutes until [my flatmate] disconnected the phone but [the caller] still managed to leave a few messages on the answering system. I rang him the next morning and warned him I'd go to the police. [My date] just said, "You go to the police, nothing's going to stop me, baby." [My date] said I'd already cost him \$600 in preparation costs for the ball. My friend and I went to the ball... but... couldn't really enjoy the night because we were so on edge – I kept thinking that [my date] would recognise me from the description my friend gave, and I was looking out for [guys] who might be him. We even changed our names for the night... In the end, we left early. It just seemed like a meat market and not value for money at all. [T]he next day... I went to the police because I wasn't going to let him intimidate me. They listened to his messages and thought they were threatening. They... gave him a warning, but it hasn't stopped him. I've had... more calls from him since – [the caller] doesn't say his name and pretends [it]'s got a wrong number before hanging up. I'm not impressed with the organisers, either. I rang... and told them not to give people's numbers out. Surely there's a way to check out the people who apply for tickets. As it stands, it's an ideal setup for desperate nutters like the one I was matched with. They were very understanding and very sorry about it... [– although they pointed out that o]f more than 4000 people who attended the same event, only two [gals, including myself], reported such problems... I said the least they could do was refund the cost. They said someone would definitely ring back. I'm still waiting.

...Are you sick of being forced to listen to horrible lift music for hours while you wait for a company to answer your phone call? ...[British people spend... [on a]verage... 45... hours... on hold on the phone every year[according to] *The Tyranny of Numbers*]... A survey by *Herald* reporters has identified companies to avoid if you have better things to do. The *Herald* phoned seven companies at 10 am, 12.30 pm, 4 pm and 8 pm on Thursday to find out how long customers had to wait on hold if they needed an answer to a question about their account, drivers licence or student loan... [– including ourselves: during working-hours our phones were respectively answered in] 22s... 6m 9s... 1m 37m... Only two companies, Sky [TV and Mercury Energy], offered personal assistance at 8 pm. By far the worst at answering the phone was... Mercury, with customers waiting 42 minutes to talk to someone at 8 pm and nearly 34 minutes at 4 pm[, while at the earlier times calls took 13 and 14 minutes to be answered]. Trying to get official comment from the company in response to the delays was also difficult. Reporters spent an hour trying to find anyone prepared to provide an answer. Eventually, [a] high-powered public relations company... fronted up with a prepared statement from [Mercury]... that... said... a recent switch to a new computer system was to blame for the delays but "the new technology will ultimately deliver a much enhanced service." The quickest to the phone was the Auckland City Council, which answered its working-hours calls within 12 seconds... [T]he council's customer service manager, said the call centre's 40 staff took an average of 3500 calls throughout the day and aimed to answer every one within 15 seconds. The centre had decided against using a recorded message [during working-hours] to handle calls because of the council's diverse customer base "calling about everything from dead dogs to complex rates inquiries. We believe the council's role is to be accessible,"... An... Auckland business telecommunications consultant... said that despite the availability of good technology for companies to answer phones, many were still too hasty in sacking the operators and installing the computer. "Most companies would put the requirement for a customer to speak to a person as a top priority, but there is a cost. The arrival of telephone calls is somewhat unpredictable. Sometimes they're evenly spaced, one every few minutes; other times they all come at once." The probabilities had to be decided before businesses could work out how many people they... need answering phones. An old "industry rule of thumb" held that 80[%] of calls should be answered within 20 seconds. Two main problems arose when setting up a business telephone answering system... "One is related to call centres, where your call is queued whilst you are waiting to speak to a real live person. The quality of service you get there is entirely dependent on the number of people available to answer calls... There is a trade-off between the cost of employing and training and providing facilities for staff against the quality of customer service." ...Many call centres [now] had the capability of allowing a waiting caller to tap in their phone number. When an operator came free, the call could be returned... The second aspect that caused annoyance was the use of Integrated Voice Response systems, where a recorded voice gave options and allowed the callers to "steer" their way through menus by pushing buttons. "The advantage of this system is that it is not dependent on people being available. You can have it going 24 hours a day, seven days a week... These work when there is a well-defined need for specific information... But there are some people who are not particularly skilled at setting these systems up, so systems consequently get something of a bad reputation... If a message says: 'To speak to an operator, press zero,' you... better make sure there is an operator... to answer the call and not just another loop around the automatic system..." [The consultant said it] was surprised that 10 years after the technology became available, many businesses were still setting up telephone answering systems badly. The overall effect could be negative... Private companies could really suffer from a frustrating phone service, as people would hang up and go to a competitor... A loss of disgruntled customers could result in more money being lost than had been saved by laying off operators.

...Hundreds of employees at telecommunications companies Clear and TelstraSaturn face uncertain futures as Telstra executives from across the Tasman look to trim the staff of the newly merged operations. How many jobs will go is unclear, but industry sources say duplication of the two companies' resources will lead to between 500 and 800 redundancies. TelstraSaturn employs 1000 workers and Clear 800. Telstra yesterday confirmed it had bought Clear in a deal worth \$435 million, about \$75 million below its market value. The purchase is subject to regulatory approval. The A[US]n company will merge the networks and customer bases of Clear and TelstraSaturn... The sale of Clear, N[Z]'s second-largest telecommunications company, will not affect the 257,000 residential customers Clear and TelstraSaturn have between them. But the president of

Telstra International... said the company's focus in N[Z] would be on "business and corporate end customers". That would leave little room for TelstraSaturn's consumer-oriented pay TV business, which has 26,000 subscribers in Wellington and Christchurch. The merged company is believed to be talking to Sky Television about a possible "bundled" pay TV and telephone deal, using Sky's content. Existing cable TV subscribers will likely receive Sky's programming over TelstraSaturn's network. What will become of the 10-year-old "Clear" brand name has not been revealed but it is likely to disappear in favour of "Telstra", a household name in A[US]... Despite the appearance of a return to the cosy duopoly that existed before TelstraSaturn's arrival in the market, consumer groups were positive about the sale... [The] chief executive of the Telecommunications Users Association, said a single, stronger organisation would further challenge Telecom's "vicious" grip on the telecoms market. But [the chief executive also] said a lot of mistakes in the past 10 years had prevented Government regulations being created to encourage competitors to take on Telecom's might. Had the Government's new regulatory regime been in place a few years ago, then TelstraSaturn and Clear would probably have flourished as separate entities and given Telecom and one another serious competition."

...Highway to profits proves hard slog for telecom firms... Telecom... Sky TV... and... [Telstra]Saturn... have at least one goal in common. They want 1.4 million N[Z] households to buy huge volumes of communications services such as telephony, dozens of t[v] channels, on-demand movies, data and on-line services and dazzlingly fast access to the Internet. The trouble is, they can't agree on technology. Each company is betting big sums on a different way to deliver the service – satellite for Sky, a new technology called ADSL for Telecom and hybrid fibre coaxial cable (HFC) for [Telstra]Saturn. Worse for Telecom, it has suddenly switched horses. It invested about \$100 m... in the first stage of its own cable network, then pulled the plug last November when it became convinced ADSL was the cheapest bet. Recriminations are flying from subcontractors hurt by the abrupt termination of the project. Many are seeking redress through the courts. Quite how Telecom, Sky and [Telstra]Saturn master these "broadband" technologies to deliver huge volumes of information will fundamentally affect their profitability and ability to compete... Telecom knew HFC would be costly when it embarked on that journey but, at that time, had high expectations that it would be able to join Sky... in both shareholding and programming arrangements. It got approval from the Commerce Commission, even though the joining of Telecom and Sky over a cable network would have given them an impregnable position in both telecommunications and pay-t[v] markets. That dream was stymied by continuing legal action by competitors, but Telecom continued to plod on with the first phase of its rollout, despite mounting difficulties signing up customers and technical problems. Doubtless Telecom's long flirtation with HFC involved an element of insurance, particularly with the potential threat from [Telstra]Saturn... But its decision to quit HFC and explore ADSL is perfectly consistent with its focus on short-to-medium-term investments. Telecom rigorously follows "economic value-added" principles when it assesses investments. Spending has to generate a healthy margin above the company's cost of capital. The longer the payback period, as in the case of investing in the cable network, the harder it is for management to justify. While [Telecom's CEO] concedes that it sets shorter timeframes for investments to pay off than some other companies, [it] can point out that the practice has helped Telecom consistently outperform its peers on the sharemarket... [Telecom] has another good reason for limiting investment payback timeframes. Fast-evolving technologies quickly overtake existing investments, while competition rapidly erodes profit margins on new products. One need look only as far as ADSL's rapid rise from a questionable concept to a plausible technology from the time Telecom first piloted HFC. Combine that with the likelihood that Telecom's cable rollout might well have cost more than the \$1000 a house [Telstra]Saturn has spent and you can understand why Telecom got cold feet... • T[elephone]... services for Northland residents were disrupted yesterday after a fibre-optic cable was accidentally cut at Waimauku, northwest of Auckland. Telecom... said contractors working at a site cut the cable just before midday. National, international and mobile call services for all those living around or north of Waimauku were disrupted. Local and emergency calls were unaffected... [T]he service was restored gradually throughout the day. All customers should[']ve had full service by 9 pm.

...Saboteurs have felled a telecommunications tower on Porirua's Colonial Knob, cutting some police portable communications, three radio stations and the... mobile network for the Porirua area. The 40m tower, carrying several microwave dishes, fell at 10.30 pm on Sunday after three of the four supports were cut. The Porirua City Council has granted... consents to... erect two temporary towers until the big tower is repaired.

...Police are convinced th[re] 55m transmitter tower in Porirua was brought down deliberately, and they are investigating reports of suspicious activity in the area... [T]hree of its legs were severed, and the flat and even nature of the cuts at the base of the tower had convinced them sabotage was to blame rather than metal fatigue. The fourth leg gave way in Sunday's heavy winds... which... put... three radio stations... off the air. Police communications and... cellphone services were also cut. Contractors have put up temporary antennas and all services have been restored.

...A string of strange thefts is causing a whole lot of trouble for Telecom contractors in west Auckland. Alstom supervisors... say more than 30 [hu]manhole covers have been stolen during the past 10 days, leaving big gaps in the footpaths and roads of central Waitakere... [T]he \$500 cast aluminium covers have all been stolen from within a 5 kilometre radius of Universal Drive. Even some of the replacement covers fitted to close the gaps have been taken. "It's got us bewildered about what they're using them for... But it's dangerous, some of the holes are almost 2 metres deep... The [supervisors] say... the problem has surfaced occasionally during the four years they've worked for Telecom, but never to the same extent. Telecom... says the company's priority is public safety. "We're really concerned that people could be hurt by not seeing that these... covers are gone... It's a fairly senseless sort of crime. They're not worth a lot and we're really asking what the point is." Counties Manukau police... say... a similar situation occurred in south Auckland a couple of years ago... [Those] thefts were concentrated over a short period with the covers sold to scrap metal yards who melted them down. [Editor's note: A number of 'Telecom covers have been found on a container ship headed for Hong Kong']

...half the 5000 public telephones operated by Telecom are out of action and the company may have to visit all 5000 to get the problem fixed. Telecom[']s spokesperso[n]... said yesterday that the software problem affecting the phones over the weekend was more serious than first thought.

...Telecom is under fire for its use-it-or-lose-it policy on customers' phonecards, which will be obsolete by the end of this year. Millions of dollars may be tied up in the cards, due to be phased out... when the firm replaces 4500 public payphones, which are not Year 2000-compliant. Telecom will not give refunds or replace customers' phonecards with new smartcards because it says customers have ample time to use up the remaining value on their cards. But its transtasman counterpart, Telstra A[US], has spent 16 months replacing customers' old cards with smartcards for new payphones. "There was never a situation where Telstra was going to leave customers with the card they had paid for that they wouldn't be able to use in some way," said Telstra[']s spokesperso[n]... Politicians and the Consumers' Institute want Telecom to recompense consumers... The chief executive of the Consumers' Institute... said customers had bought the phonecards in good faith and Telecom should provide a replacement... N[Z] First... said Telecom should honour prepaid phonecards, as it had known about Year 2000 bug implications since at least 1997... Ministry of Consumer Affairs staff will meet the firm next week to discuss its plans. The general manager of the ministry... did not believe Telecom was specifically breaching consumer laws and was happy the firm was providing warnings to customers. But the ministry was investigating further and considering the contract between Telecom and its phonecard customers... Telecom... said the firm was happy to cooperate with the ministry and would give all the information required. "We are confident that we are operating within the requirements of the [Consumer Guarantees] Act..." [Telecom] said reports that the cards in circulation were worth \$19 million was "pure speculation" and that it was difficult to estimate their value.

...A Whangarei [resident] has spent \$30 to win back \$19.50 from Telecom in a David and Goliath battle over phone cards. Telecom is upgrading its old public phones and the current cards will not be valid after December. It has refused to refund unused cards in circulation, which the Consumers' Institute said could have a face value of up to \$20 million. [The resident], an independent mediator, said [it] held three cards with \$19.50 credit for emergencies and was incensed when Telecom announced it would not give refunds. It cost him \$30 to take a case against the telecommunications giant to the Disputes Tribunal, which ruled that it was unfair and inappropriate of Telecom to take the credit on [the

mediator's] cards... "The respondent has had the use of the applicant's money and in the tribunal's view of the substandard merits and justice of the matter it should not now be permitted to simply appropriate money without supplying contracted services." Telecom did not appear at the tribunal to defend the case because it was not told of the hearing, said [its] national media manager. It would seek to have the case re-heard or would appeal... Although tribunal rulings do not in law serve as precedents, [the mediator] was pleased the issue was out in the public domain.

...In a major backdown by Telecom, [the telecommunications company has agreed to exchange] all unused phone cards until January 1, 2000.

...Telecom is to replace its magnetic strip PhoneCards with special replacement chip PhoneCards. The free replacement option coincides with the rollout of Telecom's new \$20 million payphone network starting on 19th August. From that date, customers can send in their magnetic strip PhoneCards with a replacement card form available from any NZ Post retail outlet or Shell service station. In return, customers will receive a replacement chip PhoneCard to the residual value of the old card. Customers will have the choice to continue using their magnetic strip PhoneCards at over 400 existing payphones until the rollout of the new payphone network is completed... □ Con[cerned that your]... old television... will not work when TVNZ's digital service with Telstra[Clear starts? Well, you] do not have to worry for a few years yet – the Government has no deadline for phasing out the analogue system. People will be able to continue viewing TV One and TV2 without a \$300 digital decoder. The U[S] will end analogue service in 2006, A[US] in 2008 and Britain in 2010. A spokes[person for the] Broadcasting Minister... said the issue had not been looked at yet in N[Z]. TVNZ's spokesperson... said a shut-off date was a big issue, because the company would have to run a parallel service – analogue and digital – for an unknown period, which would prove costly.

...A year ago the television division of National Panasonic was renamed the television and network systems division to accommodate its increasingly widening activities in "enhancing the basic technology of the television so as to be capable of fully responding to the rapidly emerging digitally networked society." ...National Panasonic... is just one of many Japanese companies poised to bring you a crisply exact, sonically impressive next generation of home entertainment, digital integration of home networks... As we walk through the showroom of innovation it is almost overwhelming, especially... the pristine, high-definition image and wrap-around Dolby sound of the... TV[s]... soon... appearing in living rooms across the planet. At least that is the "global strategy" – and it is certainly happening in Japan. Despite the small size of Japanese homes, these high-definition monsters are shipping out of the assembly and research plant in Ibaraki, an hour... from downtown Osaka, at the rate of 30,000 a month. And that is just into the domestic market. The flat, wall-mounted screen versions can certainly find wallspace, but these free-standing giants – 75cm deep and a metre high – mean the average Japanese family would have to shift their eating area into the bedroom just to accommodate them... Then there is the Dream Theatre, which comes with words such as laser-sound processor, data transfer and sub-woofer. It is a... large chair with a very large screen in front of it. The high-definition picture is almost eerily real and the system has movie-theatre-quality sound coming at you from three speakers around the screen and two behind. I have seen the future of home entertainment – and it is very loud. And this is only the National Panasonic factory. All the other manufacturers are working on similar models. Osaka, considered by *Asiaweek*... as the third most desirable place to live in Asia after Tokyo and Auckland's sister city Fukuoka, is the place to enjoy the high-tech end of Japan. Its nightclub district is illuminated at night by walls of neon and across town at Panasonic Square is a veritable electronic playpen for kids and curious adults. Here you can have your fortune read by three different kinds of computers, Mr Pana the robot will engage you in conversation, you can use a TV phone to contact someone across the room, watch laser videos, spend an hour in the video editing room (for... \$20) and, mundanely, explore the Internet. There are state-of-the-art simulation games, a Chromakey studio, a stringless laser harp to play, a cable car ride that shows the sights of San Francisco, a 3D cinema... It is like the Auckland Easter Show as imagined by R2D2. If Japan is creating the technology of tomorrow then it is good news, particularly if your idea of a good night out is staying in around a roaring television. In the future – which is right now if you have around 540,000 yen (\$90,000) to spare – these machines will do your thinking for you. The EPG – electronic programming guide (get used to these acronyms, you might need them soon) – will filter through the options and make recommendations for you... It will even interrupt if you are watching something else to remind you [that a programme you wanted to watch] is on... • [This]... week, TV2 gives viewers the 'opportunity' to pick the prime-time Saturday night movie. That both selections are repeats and viewers must text message their choice to Telecom from mobiles or call a freephone number is yet another sign of the times. Voting starts on the Wednesday before and continues right up till the screening of the *2Choice* movie. Information on the voting is available on TV2's website...

Enjoy every minute of... your favourite... [programmes if you're not going to be home (or are watching another channel) by using your] VCR... recorder with built-in *G-CODE* System. Simply input the corresponding *G-CODE* numbers (listed in the television guide) and your favourite programmes will be recorded automatically. It's efficient, reliable and convenient. With *G-CODE* recording, you can always catch the exciting moments of [your life]... The *G-CODE* system is now a worldwide standard of recording. There are over 40 countries using *G-CODE* and over 1,800 publications printing *G-CODE* numbers. You will be impressed as all leading VCR... brands have built-in *G-CODE* models.

...The humble VCR has taken a step towards the scrapheap with the launch of the first DVD machine that can record[(until now, people could only 'copy' DVDs at home via software created by an American)]. A new Philips machine can record and re-record on its discs – eliminating any advantage held by the long-serving VCR. The new recorder's launch at an exhibition in Berlin prompted a rush of orders. Retailers in London's Oxford St claim that they will start to phase out the VCR as early as next year. The DVD1000+RW recorder is available only in Europe. But it is expected to be launched in the U[S] and other key markets, including N[Z], towards the end of this year. Its arrival, and the probable demise of the VCR, will close a chapter of entertainment history fondly remembered by many N[Z]ers. The VCR first appeared in the US in 1976 – a Sony Betamax box that had to beat Supreme Court challenges from television and movie companies before it revolutionised viewing habits. By the late 70s, the first Beta and VHS models were being rented out in N[Z]. Ownership then of a giant silver top-loading monster was enough to guarantee the envy of many a suburban street. Now, just as thousands of Kiwi families have finally got the hang of programming the VCR, the DVD recorder is expected to again change the way we view the world. But don't expect the VCR to go quietly. The sticking point for consumers wanting a new DVD recorder will be its opening price – £1300... and £20 for each rewritable disc.

...SCRATCHED CDs and DVDs can now be restored with a new product. N[Z] company Discstation is using technology imported from America to repair CDs that would have to be thrown out. [The company's] director... said the equipment was specifically designed to repair discs without damaging the data layer, allowing them to play like new. "Gamers are paying up to a couple of hundred dollars for a game disc and they can be cleaned for less than \$10 if they become a bit battered and scratched... Similarly, the cost of repairing a favourite music CD is negligible compared to buying new again – and it's much more convenient than having to spend time and trouble trawling music stores or ordering from back catalogues... But it's not just music and games. More and more people are putting their favourite video images and photographs on to DVD and they're memories that can often be priceless." ...[In related news, the cost of CD piracy to the local music industry has risen from \$95 million to \$114 million since a campaign was launched to combat illegal copying. However, the industry says its campaign to educate people about CD burning has been a success and it will continue to spread the message next year. Organisers of the BRN & GTBRNT campaign yesterday said the economic benefit might not be seen for up to four years. The Recording Industry Association said a survey it had commissioned of 500 people aged between 15 and 44 found 20[%] had copied a music CD, and 3.25[%] of them had done it for sale... [M]ost people burn music for private use, for a friend or a family member – and generally they think it is acceptable to copy for private use but not to sell. [9%] of the people surveyed had been offered a copied CD, which can be priced from \$5 to \$10. Among the 15 to 19 age group, 17[%] had been offered an illegal copy. The music was generally offered at schools, universities, home or a friend's house... Nearly 50[%] of people surveyed were aware of the campaign, mainly from TV

commercials and stickers on CD covers. The survey will be used as a benchmark to judge the effect of the campaign. The association, which represents major and minor record labels, is poised to take three private prosecutions for copyright infringement against people involved in large-scale copying and selling[, but]... said it was still difficult to raise police interest in the crime. However, some police districts had become more vigilant in the past years. In many cases – such as nightclub DJs using copied music – the association had settled out of court and licensed people so they could use the music for a fee... [T]he head of music giant Sony in N[Z] and association president, rejected the idea of reducing the price of CDs to combat the illegal trade. “It simply wouldn’t work and that would be a ‘band aid’ approach. You’ve got to change people’s attitudes.”

...*Napstar one step closer to the day the music stops*... A federal appeals court has written what could be the final verse for Napstar as we know it. The company must stop the millions of people who use its internet service to swap copyrighted music without charge and without restriction, the 9th US Circuit Court of Appeals said yesterday. The Napstar-free-for-all may last only a few more weeks. The three-judge panel sent the case back to a trial judge, asking her to fine-tune her July injunction ordering Napstar to shut down. The panel said the recording industry “would likely prevail” in its lawsuit, which is considered a bell-wether case in digital entertainment distribution. “It’s time for Napstar to stand down and build their business the old-fashioned way,” [the] Recording Industry Association of America president... said. The heavy metal group Metallica, the first band to demand its songs be removed from Napstar, said the ruling reaffirmed the right of artists not to have their music exploited. “We are delighted that the court has upheld the rights of all artists to protect and control their creative efforts,” the band said. Napstar promised to appeal and its bankroller, German record company Bertelsmann, vowed to continue support. The company can stay in business until the injunction is retooled to focus on copyright issues. No hearing date has been set. After the ruling, thousands of Napstar users were still trading music files on just one of the company’s more than 100 servers. “We’ll all find a way to get around it,” said... a student. Napstar has argued it is not to blame for subscribers’ use of copyrighted material, citing a 1984 case in which the Supreme Court refused to hold VCR manufacturers and videotape retailers liable for people copying movies. But the appeals court said no such protection extends to Napstar because the company knew users were swapping copyrighted songs. “Having digital downloads available for free on the Napstar system necessarily harms the copyright holders’ attempts to charge for the same downloads,” the court said. The panel said Napstar may be liable if it does not actively ban users from swapping protected material. In particular, it directed Napstar to cut off users who trade copyrighted songs in the MP3 format that Napstar has helped make standard for digital music. The company’s popularity exploded [two years ago after its] founder... released software that made it easy to find and trade songs stored as computer files in the MP3 format, which compresses digital recordings with little quality loss.

...Four top songwriters have struck a blow for individual rights against internet companies that musicians believe are depriving them of their just rewards... [They] have filed a \$US40.5 million... lawsuit against MP3.com... that... allege[s] the US)... company “illegally gave users access to their songs” through its “MyMP3” service. The move comes months after MP3.com declared a truce after settling a \$US100 million lawsuit with big record companies. The MP3.com position mirrors that of Napstar, which is being sued separately by the record labels for more than US\$100 million. Napstar has been told by the courts to alter its software so that users cannot swap copyrighted songs. So far, it has had little success in satisfying the legal demands. MP3.com offers music cheaply by putting songs into digital files small enough to be transferred easily over the net. But this practice has met fierce opposition from record companies and musicians. The amount already spent by the company on lawsuits dwarfs its revenues, which in the first three months of the year were \$US21.8 million, with losses of \$US2 million. In that time, 174 million of its MP3 files were downloaded. Unlike the better-known Napstar system, MP3.com does not allow people to share files between their hard discs. But it still enables people to hear songs free, which is why the artists are suing. The company’s web site hosts what it claims is the largest collection of digital music available on one site, with more than 967,000 songs and audio files posted from 150,000 digital artists and record labels. The lawsuit filed earlier this week relates to only 270 of those songs – but the maximum penalty for infringement is \$US150,000 for each track. MP3.com’s settlement last year did not cover individual musicians, including many who own the copyright to their songs... This latest suit illustrates the complicated nature of music rights: it has been filed by people whose copyrights are not administered by the record companies, even though the deal last year covered the use of the songs’ master recordings, which the record labels own... [In local news, a] protest against new internet copyright laws will take place outside Parliament today. Internet Blackout NZ, an initiative by Creative Freedom Foundation, is running the demonstration at midday as part of a week-long “blackout” campaign against the Copyright Amendment Act... Section 92A of the act, passed last year, enables the termination of the internet connection of any user who repeatedly accesses pirated material. It is due to come into law [in a week]. The campaign calls for internet users to “black out” their personal profile pages – Facebook, MySpace, Twitter, Bebo and personal blogs... This means replacing their photos and icons with blank spaces to give an impression of what the internet could look like under the law change.

...Google has been hoovering up all the information from millions of books worldwide, putting knowledge from the world’s great research libraries just a mouse click away in the Google Library. Internet users can access excerpts for research while subscribing libraries and similar institutions can buy whole books. It’s a short step to all users downloading whole book titles. And it’s not just research books. Google has digitised novels, poetry and non-fiction by... James K Baxter... and dozens of other N[Z] authors without their permission. Google maintains it can digitise and show excerpts of copyrighted books under US “fair use” laws... A court challenge by American authors and publishers last year was supposed to give them a degree of control over Google’s activities and ensure copyright dues were paid. What emerged was an out-of-court settlement full of compromises which – if ratified by a judge in October – could ensnare authors around the world. It... has left the world’s writers with a stark choice: go with Google and limit your future options or opt out and receive not a pittance when Google digitises your work anyway.

...THE internet has caused most industries to do some serious soul searching about their future, and now it’s the turn of the video industry. Soon, you might not have to trek to a video store. With a few clicks of your mouse, the video store will come to you. Five of the major movie studios have announced plans for a joint venture which will offer a broad selection of movies you can download over the net and watch on computer. The studios are MGM, Paramount, Sony, Universal Studios and Warners. Disney and Fox have a similar joint plan. The service will initially be offered only in the US. You’ll need a high-speed net connection. You’ll select online the movie you want to see, pay for the hire with your credit card and click on the appropriate buttons. It’s estimated each movie will take between 20 and 40 minutes to download. Once it’s finished downloading, you’ll have up to 30 days to watch it on your computer screen. But once you start playing the movie, you’ll have only 24 hours to watch it or parts of it again before it no longer plays. This is to prevent you being able to keep the movie to re-screen it. The technology also won’t allow you to make a permanent record of the movie or to send it to others. The movie industry hopes its plan is a pre-emptive strike against piracy on the net. Already there are places which have been offering pirated copies of new movies for people to download. Learning from the experience with music file-swapping service Napstar, the movie companies want to ensure they control such downloads and clip the ticket along the way. Whether this hurts the cinema business or the video shops is debatable. Seeing movies on your computer screen can’t compete with those lucky enough to enjoy home theatre and DVD players connected to their big TVs. This might cease to be an argument if experts are right in predicting your television set and computer will converge and you’ll be able to download from the net then watch the movies on TV... Ironically, Hollywood once feared new technology and fought to have the VCR declared illegal. Now it is financially benefiting from old movies, already out on video, being re-released again on DVD. Whichever way you choose to see movies in the future, the net has a goldmine of helpful reviews. In the spirit of the level playing field of the net, amateur critics can be as worthwhile as the more seasoned ones, who might be getting a bit predictable and tired from watching too many years of new releases... One recent growth has been in sites for parents, with reviews of movies based on their suitability for children and based on drugs, sex, language and music... There are also ratings for Christmas... reviews geared towards [gal readers, reviews]... by teenage girls...

and reviews from a “multicultural perspective”... The “mutant reviewers from hell”... look at the weirder releases while the Tuesday Nite Club... proudly admit to having bad taste... More... popular sites are www.rottentomatoes.com, which offers stories and reviews from several US publications, Movie Review search at www.mrqe.com and www.critics.com. ■ ...TradeNZ has lost a landmark case to claim back the internet domain name newzealand.com from a U[S] firm, Virtual Countries... Virtual Countries has staked a claim to domain names featuring 16 nations, and has registered names such as Russia.com and Sweden.com. The case was the first time a Government had sought the transfer of a country’s domain name from a private company. TradeNZ, represented by the Ministry of Foreign Affairs and Trade, filed a complaint against Virtual Countries in August to the U[N]s’ World Intellectual Property Organisation... The complaint and subsequent submissions said the name “New Zealand” was a trademark in the hands of the Government and that the domain name had been registered in “bad faith”. TradeNZ said this was done in two ways – by Virtual Countries registering newzealand.com in contravention of the name being a trademark and that the purpose of obtaining the domain name was to sell it for a substantial profit. However, [a]... three-member WIPO panel... ruled that Virtual Countries had not acted in bad faith and instead criticised N[Z] for taking the case forward. It said TradeNZ was guilty of “domain name hijacking” and said it had abused domain use disputes policies by taking out the proceedings. A... lawyer for Virtual Countries... was not surprised by the ruling. “The decision is in line with other decisions which have almost uniformly ruled in favour of geographic domain name owners,” said [the lawyer]. “It’s also consistent with longstanding trademark principles which allow for the unfettered use of geographic terms.” TradeNZ has 10 days to appeal.

...Tuvalu, the world’s smallest economy, is on track to become one of the richest per capita nations thanks to its Internet domain name, dot TV, says [its] Communications Minister... In a country of just 10,600 people with a [GNP] per capita of \$US400... Tuvalu is now guaranteed \$US50 million through the sale of its Internet name... It is already receiving \$US1 million a quarter from its windfall. Once Tuvalu receives the \$US50 million – in 12 years at current rates – a new deal will be negotiated, the minister said. The country had already banked \$US15.5 million in the past nine months, firmly ending speculation that the Polynesian nation was being conned, [added the minister]... “It is working according to expectations... We really need the money. We have a lot of things we want to do. We want to build a decent hospital, a decent wharf. We’ve been using gravel roads all this time. It’s going to cost us... \$US5 million to do up the roads... [In addition, a]ll the outer islands have no electricity.”

...A Canadian company which promised... riches for Tuvalu... has postponed the dream... [Incidentally, t]elephone companies from Singapore and Indonesia scrambled yesterday to repair a break in an undersea telecommunications cable that led to major internet traffic jams for millions of users worldwide. Singapore Telecommunications said it had sent a cable ship to repair the SEA-ME-WE 3 cable, which was cut between Singapore and Jakarta on Monday. The 38,000km cable... – [that] began operating only last year... – ...links A[US], Asia and Europe. It is... the world’s longest telecommunications system... [and] one of the world’s busiest internet cables. The cause of the damage was not known but possibilities include a ship’s anchor or earthquake... It would take a number of days to repair the cable. Telstra, A[US]’s biggest internet provider... – with... 650,000 customers – initially lost 65[%] of its international capacity... Telstra said its Big Pond network had been virtually closed but it had been able to reroute traffic and was now operating at 75[%] capacity. It posted a warning on its website that long delays were to be expected during peak traffic times on international connections from Australia... • List[ed] next are other recent internet[... events... *March 12* T[here was a ‘call to remove ID from internet usage. But opponents complained that act would protect’ paedophil]es *July 13* Taliban bans the use of the internet *August 5*...

From August, Telecom [has been charging] 2c a minute after the first 10 hours a month spent using the Internet through existing local telephone numbers... mak[ing] it more difficult for... Internet providers[’]... customers to reach them... Users [are only] able to avoid the charge by dialling through numbers with an 0867 prefix, giving Telecom the ability to disconnect them when the telephone traffic becomes too heavy. Internet companies are outraged by the move, which they say... inconvenience[s] customers and cost[s] them money to implement... Ihug... estimated it would cost... up to \$500,000 to contact its customers, revise letterheads and send out new CDs so customers could reprogram computers to the 0867 access number... The director of Ihug... said it and 20 other I[SP]s were gearing up for legal action... [Telstra]Clear is regarded as the biggest loser if its 90,000 Clear Net customers take the carrot and move to 0867 access, since the new number would sidestep the interconnection agreement between the companies. It is in a number range not covered by the agreement. Under the four-year-old interconnection deal, [Telstra]Clear receives 1.75c a minute for each call from the Telecom network to Clear Net. Based on Telecom’s average monthly Internet usage figure of 23.5 hours, that would equate with revenue of \$26.5 million a year, an amount that would go straight to the profit line. On that basis, if all calls to Ihug were also to be routed through [Telstra]Clear’s network, the cost to Telecom could double to about \$50 million, which Telecom would obviously want to avoid.

...In its third judicial encounter in a week, Telecom was told last night it must restrict internet traffic during overloads across all providers... using Telecom’s 0867 access regime... including Xtra, its own internet service... even though its numbers use the 0873 prefix... Telecom[’s] spokesperson... said the company had sought clarification from [a High Court judge] in the latest round of its fight against i4free, the free [‘internet access forever’ ISP. The High Court judge] had ruled on Friday that Telecom could not discriminate against i4free by restricting only its calls if Telecom exchanges became overloaded... Earlier yesterday, i4free rejected Telecom claims that [Telstra]Clear... is underwriting its High Court action against Telecom’s attempts to block its service. “We are paying our own legal bills, which we envisage will be a huge part of our costs,”... [the] chief executive of i4free... said. These costs amounted to \$20,000 a day. But [Telstra]Clear had provided the High Court with an indemnity against any Telecom counter-claim for damages should i4free be unable to meet them from its own resources. [However,]Telecom... reiterated the claim that [Telstra]Clear, and... British Telecom, were working in an alliance with i4free. [Telstra]Clear has made no secret that it is sharing interconnection revenue with i4free that Telecom pays to terminate calls to i4free on the [Telstra]Clear network. Telecom’s spokesperson said that, and the fact [Telstra]Clear was prepared to stand behind i4free to the tune of \$500,000 in the event of a successful damages claim, were proof. [The spokesperson also said Telstra]Clear had rejected an effort by the Government to broker a standstill arrangement which would have ended the 2c-a-minute charge imposed by Telecom on internet calls outside its 0867 access regime. The offer also preserved [Telstra]Clear’s rights to interconnection revenue from Telecom until the end of this year when its interconnection agreement expires. Telecom said yesterday that the... arrangement had a clause enabling interconnection revenue to escalate in line with the total growth of the market[– which] Telecom estimated... would grow by 70[%] this year – although]... the... interconnection payments to [Telstra]Clear would be based on the level prevailing in January... But [Telstra]Clear... said the offer had been a “Clayton’s” one because it was based on January levels, after which [Telstra]Clear had lost a large number of customers due to Telecom’s introduction of its 0867 regime. Telecom yesterday declined to confirm reports it had paid up to \$20 million to ISP ihug [– whose “endless internet” service has just been reduced from \$45 to \$34.95 a month’ –]to encourage it to make the transition to the 0867 regime.

...[Telstra]Clear... is expected today to try to join i4free’s High Court proceedings against Telecom as the battle over free internet service intensifies. [Telstra]Clear declined to comment on its strategy yesterday, but it is already closely involved in i4free’s free internet service which [has a slower delivery speed than paid Internet services and]relies on Telecom’s local lines for getting calls from customers. Telecom had restricted calls to i4free last week until a temporary injunction ordered it to treat i4free on equal terms as other [ISP]s. Telecom had argued the flood of calls to i4free ran the risk of jamming up one of its key exchanges... i4free’s chief executive, rejects the suggestion that the share it gets of the 2c a minute in interconnection revenue from Telecom is the driving force in the fledgling provider’s business plan. If that were the case, [its chief executive] says, i4free could expect a short life since its slice of interconnection revenue will disappear when [Telstra]Clear’s interconnection agreement with Telecom expires at the end of the year. Instead, i4free will earn its keep from... a “next-generation” consumer marketing and shopping network

model that has been successful overseas. Advertising will play a small part. While adverts will eventually be on screen 30[%] of the time, they will occupy less than 3[%] of the space. If staying with [Telstra]Clear has bought a fight with Telecom, [i4free's chief executive] says it is for the good reason that [Telstra]Clear's internet links cost a third of those offered by Telecom. Nevertheless, if Telecom was prepared to pay the \$16 million to \$20 million it is reputed to have paid ihug to move on to its 0867 access network, i4free would be delighted to shift.

...Apart from a few isolated cases, Telecom's 0867 system is not harming the general consumer interest – yet, says the Consumers' Institute. [The institute's c]hief executive... said Telecom's battle with [Telstra]Clear... had so far only "inconvenienced a few who had lost their services for a short time." [The CEO] believed the issue washed over the heads of the vast majority of users. However, [it]... looked to the future with "considerable trepidation. If one or the other wins this high-stakes game then that spells bad news for the consumer. Anyone who dominates the market has the ability to up their prices and do whatever they like." One consumer who [the CEO] agreed was definitely disadvantaged by the 0867 deal was [a Telstra]Clear user... of Dunedin. Mrs W... wrote to... [the PM] "as an ordinary N[Z] housewife who is trying hard to give her family the benefits of new technology." [Mrs W] complained of "one of the most blatant abuses of a company's power" that [the housewife] had personally experienced. To stay within the confines of a tight family budget, Mrs W... said they had decided to join [Telstra]Clear's fixed-rate Internet plan costing \$39.95 a month. However, [the family]... began to receive connection bills from Telecom amounting to \$80.76 for [one month] and \$63.76 for [the next]. Like many other 0867 users, Mrs W... complains of frequent disconnections, which sometimes occur after her being online for only 20 seconds. Each reconnection is being charged, and [the family] was billed for 127 connections in [the first month alone. Telstra]Clear reimburses its clients in these situations – but with toll-call credits rather than cash. As Mrs W... rarely makes toll calls, her credit with [Telstra]Clear now stands at about \$200. "I don't see why I should have to pay Telecom when my contract is with [Telstra]Clear,"... Mrs W... sent copies of her letter to Telecom... While the [PM]'s office... acknowledged her letter... Mrs W... has yet to hear from Telecom.

...Mounting... 0867 Internet connection charges... forced an Auckland ClearNet business user to switch to the Telecom-owned [ISP] Xtra... Albany-based Internet developer BJC Services... began to receive connection bills from Telecom... "At first, when the bills were just a few hundred dollars, it was just an inconvenience. When we stated getting charged \$500... a month we realised that we had a serious problem." ...as an Internet company, BJC was online for most of the day. Its... Internet connection charges... have amounted to about \$2000... BJC's credit with [Telstra]Clear also stands at roughly \$2000... [but BJC has] no chance of using this credit, which was not transferable. "If we had let it run, by the end of the year we would have owed Telecom \$8000 and had \$8000 credit with [Telstra]Clear." After consulting with ClearNet, [BJC]... was left with no option but to change... [However, Telecom] said BJC had not been forced to go to Xtra as there were more than 80 ISPs to choose from.

...HOW YOU CAN AVOID PAYING "AFTER-10-HOUR" INTERNET CHARGES... [T]here are about 120 [ISPs in NZ] – and about 100 of them use Telecom's Internet networks. If you are with an [ISP] that doesn't, you are picking up a 2c-per-minute charge on your Telecom bill after spending more than 10 hours online. And you don't have to... If you sign up by the [end of next month] with one of... [37 listed ISPs] that use Telecom's special networks, Telecom will refund all the "after-10-hours" charges that you have paid so far. And you won't be charged them again.

...Telecom and [Telstra]Clear... could be on the brink of a new era after yesterday signing a 3 1/2 month ceasefire in their internet interconnection war. The agreement is intended as a prelude to a more lasting peace based on a comprehensive interconnection agreement, to replace the... 1986 agreement... expiring at the end of the year... Changes in key personnel at [Telstra]Clear and Telecom in the form of appointments of two [gals] appear to have made the difference. Observers say that [Telecom's new chief executive and the new] alliance director of [Telstra]Clear... have developed a rapport that has eased the path in high-level negotiations that began in earnest only two weeks ago... Among key points of yesterday's agreement are: • ...Telecom has agreed to suspend its 2c a minute charge on local dial-up connections used by [Telstra]Clear's internet customers. In return, [Telstra]Clear has given up its long-standing opposition to 0867 numbers, instead agreeing to encourage its customers to make the move... • [Telstra]Clear will withdraw its application for an interim injunction requiring Telecom to honour the terms of the number portability agreement between the two companies. • Telecom will not appeal against a related interim injunction gained by free internet provider i4free last month... Meanwhile... Telecom's submission to the Government's telecommunications inquiry admits that much of its network is not up to scratch. It says it will cost at least \$550 million to upgrade it[s network] to standards already regarded as unacceptably slow for internet traffic... [– including] replacing... its... outmoded... Neac switches, the exchange workhorses for the past 15 to 20 years, ...with new generation switches that will integrate voice with data... In Telecom's view, that investment is not economic... [Furthermore,] rushing in now could be money wasted. Alternative technologies such as wireless and satellite might do the job better. [Telecom has been] using the problems related with managing internet traffic to justify its... [contention that while] residential voice traffic should stay free... it deserves compensation for carrying local internet use since that accounts for more than half the traffic, and is growing... [This position suggests that a more lasting peace between Telecom and TelstraClear may be difficult to achieve – Telecom still] argues that... the kind of... 2c a minute "internet tax" that has aroused discontent... should be invisible to consumers, and should be paid by [ISPs (who)] can work out how much to pass on to customers[], while [Telstra]Clear... contends Telecom should subsidise free internet by paying interconnection charges to [ISPs] on its network, just as in Britain interconnection revenue is split between the carrier and the [ISP]. That conveniently overlooks that in Britain local calls for voice and internet are charged on a timed basis, so it pays the carrier to encourage free [ISP]s to get network time higher.

...The days of surfing the net for free appear to be numbered. I4free will downgrade its free internet service after being told by [Telstra]Clear... that it will no longer receive interconnect revenue. From today, any of i4free's 145,000 customers who try to access the web will be redirected to a page inviting them to join a new paid-for service at www.slingshot.co.nz, offering unlimited internet access, free home page hosting and up to seven e-mail addresses for \$14.95 a month including GST. According to i4free[']s executive director... customers may elect to stay with the free service but will probably get busy signals and slower performance as modems and other resources are transferred to the paid service. Industry sources suggest that rival free [ISP] freenet will announce a similar plan next week... i4free and [Telstra]Clear had been working for months to replace an interconnect revenue sharing agreement... "We [thought we] would continue to receive interconnect revenue... However, it seems [Telstra]Clear had some quiet discussions with Telecom... whe[re] they agreed to put a stop to that. They've stuffed us, basically,"... While i4free would now approach Telecom directly for interconnection revenue, which it believes it is entitled to according to recent Government telecommunications industry reforms, such an agreement could take months. According to [the executive director], i4free has already invested \$2.5 million in its network and would have spent a further \$5 million to continue providing a wholly free service over the next year. [A TelstraClear spokesperson]... refused to comment, saying details of negotiations between [Telstra]Clear and its customers were confidential. [But the spokesperson confirmed that Telstra]Clear's zfree service, which stopped accepting new customers last month, would continue to provide free connections to existing users.

...A... computer game enthusiast has been found slumped dead at a terminal in a game centre after playing non-stop for hours, police said yesterday. The 28-year-old was found slumped at his screen on Saturday after... apparently... play[ing] the online game Diablo II since early Friday evening local time... [A]n autopsy would be carried out to determine the cause of the death... His death at a game centre in Hong Kong's Yuen Long district came eight months after a 17-year-old game centre employee was found dead after playing Diablo II through the night. Warnings were posted in cyber cafes around Hong Kong advising customers not to spend too long playing games uninterrupted after the death of the teenager...

Clamps are likely on internet cafes after New Lynn police claim a sharp rise in child crime is down to a sudden proliferation of outlets in the area. A... community constable... also says the unsupervised access to the internet means police are pulling children as young as 12 out of the

internet cafes at all hours of the day and night following calls from frantic parents who cannot find their kids. "In some of the cafes the kids have been on the internet for a couple of days. You get a phone call from a mum who hasn't seen her son for over a day and you find them asleep at a computer in the internet cafe." But [the c]onstable... says their biggest concern is that the new craze has led to an increase in petty crime including wilful damage, assault, street robberies and the lighting of fires. "It's because this is a new fad – just like the old spacies parlours." But... at least spacy parlours shut at a reasonable hour... "These cafes just sprung up without any regulation and control,"... says... [a c]ouncillor and New Lynn resident... [who] has visited a number of the cafes and seen the problem first hand... "They don't seem to take any responsibility for their clientele." ...A local government bylaw that regulates amusement arcades will be amended to include internet cafes... One local business owner, who didn't want to be named, say[s] local businesses are worried they are suffering as a result and any regulation would be welcome.

...The manager of an Auckland cyber cafe says the only way to tell whether complicated trading hours laws applied to his business was to risk a hefty fine. LiveWire Mid City[']s manager... was fairly sure... [it] would not fall foul of the law, but [has engaged a] business consultant... to make certain. "After the experience of garden centres a couple of years ago, we decided that if we were going to open, then we were going to open legally." [The manager] rang the Department of Labour, which told him that shops supplying services could open on [religious public holidays]... and until noon on Anzac Day. Those supplying goods could not... [Unfortunately, while] some of the cafe's trading provided a service... the cafe also supplied materials, which... could be construed as providing goods – a \$1000 fine according to the law. "The [department's] helpline couldn't tell me whether it was legal or not – they just kept quoting from the [Holidays Act]." The[... acting general manager of the Department of Labour's labour inspectorate, said people had to decide whether they fitted in with the law or not. "A lot of people would prefer an absolute judgment, but at the end of the day it's their call. If there is any doubt in their mind, they should consider closing." As a result of the *Herald's* interest, [the acting general manager] offered to send an inspector to assess the cafe's legal position... [In international news, f]ive lawyers at a leading London law firm face disciplinary action after a lewd e-mail from a girlfriend became internet gossip around the world... [A] recently qualified solicitor at the firm... was sent an e-mail about a sperm bank from a close friend... The pair exchanged messages, with [the girlfriend] recounting her satisfaction at their recent intimate encounter and revealing her sexual tastes. [The solicitor] then forwarded the conversation to six ...friends. Three minutes later, one of them sent the message to 11 other people. The next person forwarded it to 12 people. Within hours copies were in the U[S] and Japan. Within 24 hours, millions had read it, including employees in other large London law firms. A... spokes[person for the firm said the five lawyers] faced censure.

...Cyber-cops set bells ringing... Political activists say the police have enough trouble distinguishing between lawful protest and criminal activity in the real world without being let loose in cyberspace. Word that Government officials are preparing a law change to let police pursue criminals through the internet by intercepting their e-mail is ringing alarm bells with civil libertarians and other activists. The Internet Society shares their concern, and does not want the police to be given power to routinely monitor e-mail on the mere off-chance of catching criminals... The police can now gain interception warrants... to eavesdrop on phone calls, but the Telecommunications Act has no provisions extending this to electronic communications. Police believe criminals talk to each other by e-mail to avoid phone taps... [The]Information Technology and Associate Justice Minister... wants to exempt the police from the provisions of legislation against computer hacking which [the minister] hopes to take to the cabinet.

...Hacking advice lets viewers watch Sky for free Sky's UHF TV channels have been hacked thanks to a piece of software freely downloaded over the internet. But the person who detailed on his website yesterday how [it] had used the software now wished [it] had kept mum. "I... just wanted to see if it was possible," said... [the consultant, who] had heard for years about people using the software and decided to try it out – "totally for scientific purposes"... [The] consultant... then described the process on his website... [Hi]s web address was referred to in an article on a local news site, www.aardvark.co.nz. Using a PC equipped with a TV tuner card connected to a UHF aerial, [the consultant] could view a range of Sky's subscriber channels... Several reader comments on the Aardvark site indicate that other users in N[Z] are also using the software to unscramble Sky's signal. The information, now removed from [the consultant's] site, told how the software enabled "decoding of VideoCrypt encrypted television signals." VideoCrypt is the algorithm used for scrambling Sky TV's signals. Sky... said this was the first instance of hacking the signal in N[Z] of which it was aware. "We'll look into it and take steps to deal with it immediately." The hack can be applied only to Sky's UHF service, not Sky Digital.

...Free calls, snooping easy for hackers Fraudulent hacking to get free cellphone calls – a major problem overseas – will remain a risk in N[Z] until local phone companies move to a fully digital system. A U[S] security expert... has contacts in the N[Z] hacking community and said locals found it simple to listen in on calls and get free phone calls. The risk is with analogue cellphones, which broadcast a unique serial number. Hackers can use radio frequencies to tune into the frequency, capture all the traffic and isolate the serial numbers. [The expert], a director of Secure Computing, was in Sydney for the launch of the firm's special unit aimed at helping N[Z] and AUS[n] businesses to protect their systems from hacking and internet fraud. "In New York City they expect that 40[%] of traffic is fraud so they're putting in digital as fast as they can." Telecom already uses sophisticated monitoring equipment to detect the fraud and so far has found only three such cases. However, Telecom's head of fraud management... said there could be fraud that the firm was unaware of and advised customers to report any calls that should not have appeared on their accounts. "We advise our own people not to say anything over the analogue network they wouldn't want anyone else to hear." Scanners, available at... [e]lectronics... stores... sell for a couple of hundred dollars and allow users to listen to calls on the analogue network. [The head] said Telecom's plan to move to a fully digital network over the next couple of years would end the risk. Meanwhile, [the director] said the cloning of analogue cellphones to make free calls was a major underground industry in the US. The... [director] – who also organises the Black Hat Briefings and Defcon annual hackers' conferences in the US – said analogue technology was built without an eye to security. "You can steal the identity of someone else's phone and put it in your own so someone else gets the bill when you make calls." [The director] said the equipment is the same as that used by phone companies to test their phones. "Now you can do it [hijack a phone identity] with just a laptop and a radio receiver,"...

Nuisance phone calls could be a sign of a computer hacker at work, say the police, who yesterday found a school pupil was responsible for more than 4000 "hang-up" calls. Paraparaumu police phone lines were flooded yesterday morning with complaints from people fed up with continued night-time phone calls where the caller hung up as they answered... [T]he calls were traced to a Waikanae home where a 17-year-old had been using software known as a "war-dialler." Although police believe the teenager was only experimenting and had nothing sinister in mind, computer experts say the programme is widely used by hackers and can be downloaded from the Internet. An Auckland-based computer forensic expert... said the programme allowed people to make thousands of calls with the press of a button to find which lines were being used by a computer... [P]eople should call Telecom or the police[– whose 'Wanganui computer was recently cracked by hackers' –] if they suspected their phone line was being targeted by a war-dialler... □ 160,000: [This is the n]umber of times every year that hackers infiltrate the Pentagon's computer system.

...Microsoft blocking hackers A security hole in Microsoft internet software that could have opened the door for malicious e-mailers to take control of home computers appears to have been plugged by the software giant. Microsoft had been warning users that a potential entry point for malicious hackers existed in some of its internet software. In a serious case, it could allow computer code of the malicious user's choice to execute on the recipient's computer. Such code could take any action that the user was authorised to take on the machine, including reformatting the hard drive, communicating with an external website or changing data on the computer. There have been no reports of any such hackers exploiting this to damage computers, and business networks are not vulnerable. A software "patch" has been made available on the Microsoft website. The company rushed yesterday to stress that the flaw did not affect Internet Explorer 5.01 Service Pack 1 or installed Internet Explorer 5.5 on any system... This meant the most popular home operating systems, Windows 95 and... 98, were not vulnerable... 30 people had called... Microsoft

N[Z]... to find out more about the notice... [A]nyone with concerns about it should ring a phone number set up by the company or visit the Microsoft N[Z] website.

...*Cyber-raid hobbles web users...* Thousands of internet users were disrupted yesterday after hackers forced Telecom to sever its internet link with the outside world. It is understood that Telecom cut the link to its U[S]-based internet supplier, AboveNet, about 12.30 pm. Full services had been restored by 3 pm. During that time 310,000 users of Telecom's Xtra service, as well as customers of several other ...ISPs... were unable to access overseas web pages. The denial-of-service attack – which bombards [ISP]s with spurious requests for information – was similar to those that shut down popular U[S] websites such as Yahoo and Amazon.com this year. The Telecom attack was apparently launched by [USers. The]... chief executive officer of Auckland web security company SecureNet, said this was a major attack on Telecom... But... [s]witching off the U[S] internet feed was a panic measure that had compromised customers who depended on the web... “This is the sort of thing Telecom should be able to handle in 30 seconds by switching to an alternative feed. It shows a complete lack of planning for what was a relatively straightforward occurrence.”

...*Cyber chaos as the Love Bug strikes...* Analogies between biological and electronic epidemics were rammed home yesterday as the world's worst computer virus outbreak hit N[Z]. Swifter than the spread of any human venereal disease, the virus had already been christened the “Love Bug” en route from the Philippines before many unsuspecting office workers found it lurking in their e-mail. The virus began its rampage as an e-mail program with the subject line “Love You,” but Internet servers were yesterday night intercepting mutated forms of the message aimed at penetrating hastily erected electronic barriers. An early variation renamed the message “Fwd: Joke” with an attached document labelled: “Very Funny.vbs” but with the same devastating though invisible contents. The attachment was originally alluringly titled: “Love-Letter-For-You.TXT.vbs.” Computer experts trying to head off havoc had a simple message: treat the e-mail like any unwanted love letter and throw it away unopened (or in other words, hit that delete button). A[n A]uckland University computer and network security manager... said there was no substitute for common sense and sound judgment when confronted with an unknown e-mail attachment. “I spend a lot of my time telling people that if they get an [unknown] attachment, don't open it. I say to myself: When did the dean last send you a message saying, ‘I love you’?” Merely opening the covering e-mail was not enough to trigger the program, but there was no love waiting for computer users seduced into launching the attached document. Instead, the program started chewing into graphics, music and some text files written in what is called visual basic script, renaming them so computers would find it difficult if not impossible to recover them. It even set about searching for Internet passwords, including those for online bank accounts, which it then tried to e-mail to overseas Websites now being pursued by the US Federal Bureau of Investigation. The virus also replicated itself by worming its way into e-mail address books, hurling itself at every listed contact, even before it dawned on previous recipients that they had spread the infection to customers and friends. One *Herald* reporter received a declaration of love in an exotic language unknown to him, before... realis[ing] the name of the sender was of a Norwegian journalist to whom [the reporter] gave a business card about six months ago. Luckily, the newspaper's information technology boffins had already alerted all staff to the outbreak, even though the *Herald* uses a different e-mail server from the Microsoft Outlook package most susceptible to the bug. One Auckland printing company was reported by an associate to have lost large volumes of customers' data, but that could not be independently verified. Other large users, such as State Insurance and the Government's education and fisheries ministries, voluntarily disabled their systems to limit any damage. Parliament faced none of the disruption which crippled communications in... Britain's House of Commons, as [NZ's] MPs were forewarned by news bulletins on their way to work... The widespread damage caused by the Love Bug is still being collated and is expected to continue all weekend. Casualties thus far, in... Britain... include... Barclays Bank, British Telecom, the BBC and News International. Up to 70[% of British] PCs have received the potentially damaging e-mail... Denmark's Parliament, ministries and major television companies were affected[, as was] Switzerland's Government and several banks... Germany estimated that up to 80[%] of computers were hit... [In the US, the] offices of Microsoft, Ford... Vodafone... and the Mayo Clinic medical centre... were all affected. The Pentagon and other US Government computers were hit, but the virus did not affect any classified systems, said [a spokesperson] for the Defence Department and the CIA. The White House said the virus had not penetrated its system.

...*Techno-terrorists have brave new world at their mercy...* The Love Bug has wreaked havoc worldwide... Brokerages, food companies, media outlets, car and technology giants as well as universities and medical institutions have been affected by the fastest-moving and most widespread computer virus yet seen... The virus began its rapid spread on Thursday from Manila across Asia, then swiftly through the time zones to Europe before looping... to America. There, Congress was forced to shut down its e-mail system after several [members of C]ongress fell for the chain-letter style virus with the inviting headline... “It's clever because it seems like a love letter and it appears to come from someone you know, so you are tempted to open it,” said... Sophos, a British anti-virus software company... Damage in the millions, or even billions, of dollars from lost data, interrupted work, and the cost of fixing the problems is expected. The Love Bug shows once again an attacker with apparently limited computer skills can carve a deep scar on the face of the computing world, mirroring the destructive but technically primitive attacks like [last year's] Melissa outbreak... Melissa infected 300,000 computers worldwide before its designer, who named it after a lap dancer [the designer] knew and faces up to 10 years' jail, was put on trial in the U[S] in December. Just six weeks ago, an Auckland public relations consultant received a virus called Pretty Park which [the consultant] unwittingly passed to hundreds of media contacts. But the Love Bug has flabbergasted computer experts by the speed at which it is spreading – twice as fast as Melissa in the first 10 hours [after] it was detected... – and because of its lethal multipurpose payload.

...Thousands of N[Z] businesses and personal computers were still infected last night by... [t]he Love Bug... computer virus... The most damage has come from the flood of e-mails generated by the virus, causing mail servers everywhere to be shut down... The cost of... the virus... is expected to far out-strip the bill from viruses such as Melissa, which rang up a \$160 million pricetag... Office workers are [today being] warned to be alert for copycat versions of the Love Bug... Experts have identified at least nine, and say there may be more. Information technology chiefs... yesterday reported that the number of hits had slowed from two a second to just under one a minute. But they expect crunch time to come this morning when thousands of workers return to their offices. “We would consider Monday morning... as being a moment of truth,” said... an executive of Telecom's Xtra... “I guess on Tuesday morning as the rest of the world goes back to work will be another moment of truth...” ...[the executive] said several Xtra teams had worked long hours since Friday to oversee a filtering programme to stop infected attachments on e-mails from getting to the service's 275,000 subscribers... In Manila, police said they had identified the [perso]n who, under the codename Spyder, is suspected of starting the Love Bug... Asked when police expected to make an arrest, [the police chief] said: “It's hard [to say]. The suspect is a moving target.” The *Washington Post* newspaper said in its Saturday editions that the... F[B]I had traced the virus to the Philippines through a fairly obvious electronic trail and was ready to seize computers used in the attack once it got permission. But officials said difficulties in finding a judge to sign a search warrant on a weekend were stalling the probe. “We're trying to find a judge who will understand this emergency, but it's Sunday and I am not betting on it,” an FBI official said... The suspect is believed to be a 23-year-old... living in the crowded middle-class district of Pandacan in Manila... Access Net Inc, a Manila [ISP], said the virus first spread through two e-mail addresses in its prepaid Internet service network, Supernet.

...*Super-bug chaos...* Get ready for a virus that will make last week's ‘Love Bug’ look laughable – an invisible menace to every computer in the world... You sit down, put your coffee next to your mouse, fire up your computer and click to check your e-mail. And before you have even looked for any suspicious messages from “NastyVirus.com,” it could be too late. Just by clicking on “Get Mail,” you could have turned your expensive machine into a pile of useless plastic. It is every computer user's worst nightmare – and it is coming soon to a screen near you. Brace yourself for the supervirus. The “Love Bug” has given us a taste of what could be coming... An estimated 20[%] of the world's computers were affected. Yet it could have been a lot worse. The Love Bug proliferated at such a fast rate that Internet systems could not handle the overload. That caused

temporary collapse, but little long-term damage. Cyber-sabotage of a more deadly kind was indicated by a development in November when researchers at Network Associates, a [US] computer security firm, received a series of e-mails with the subject heading "Bubbleboy is back!" It was, says... [the] director of the company's anti-virus team, "a watershed." The Bubbleboy virus broke the long-standing rule that you have to open an e-mail attachment to become infected. Once this one was in your inbox, it was too late. Virus writers have made advances in other areas. In April last year, a virus called Chernobyl was activated in hundreds of thousands of computers in Asia and the Middle East, striking on the anniversary of the nuclear accident it was named after. Not only did it wipe out stored data, it destroyed BIOS – the basic instructions that tell a machine how to start. Now virus writers have married the destructive capabilities of Chernobyl with the invasive capabilities of the Love Bug. The combination is the supervirus. Anti-virus experts say... at least 50 such superviruses have already been detected on the Internet. None has yet been launched at the public. Some may not work, some may be shot down by existing virus defences – [but the]... damage a successful supervirus could do is almost incalculable. Authorities are focusing on the threat from terrorist groups, who say they might use viruses to extort money or blackmail Governments into giving in to political demands. One source close to British intelligence services says MI5 believes the Basque separatist group Eta and Kurdish terror organisations have drawn up plans aimed at destroying air-traffic control systems through the use of hacking or viruses... "The supervirus is going to happen soon," the source said. "There are people with that intention." Another threat is from hostile Governments. The US Defence Department believes 120 countries pose a serious threat to cyber-security. They include... Iraq... and Serbia. The Chinese are believed to have created military regiments dedicated to cyber-warfare. Experts say national security authorities are only just waking up to the threat from the Internet... Many... also say the security agencies are looking in the wrong place... [The director of the] Berkeley Security Bureau, said those who launch virus attacks are more likely to be "cyber-vandals" than "cyber-terrorists." "Terrorists make targeted demands and like a high degree of control over their operations... A supervirus is more likely to be the brainchild of a spotty adolescent than some terrorist mastermind." The standard profile of a virus writer is a young [guy] with a grievance... often a professional programmer who feels his skills are not being recognised. Hidden behind a series of fake and anonymous e-mail accounts, the virus writer is rarely detectable. But investigators seem confident they are close to catching the [perso]n behind the love bug.

...A Swedish schoolboy who is fast gaining a reputation as one of the world's top hacker hunters was the brains behind tracing the creator of the Love Bug Internet virus. Armed only with a [PC] and his wits, [the schoolboy] quickly traced the Love Bug to its source in the Philippines. "It was really fun," said [the schoolboy], aged 19, who also helped the... F[B]I to trace the creator of the Melissa virus last year. Partly as a result of his efforts, Manila police detained... a 27-year-old employee in the computer section of a major Philippine bank. [The 27-year-old] was released yesterday after questioning. Manila police believe [the 27-year-old] was one of at least 10 people connected to a computer school run by the former head of the Philippines Y2K programme who were involved in the virus... Asked how [someone] could find the culprit so quickly, [the schoolboy said it]... used... hacking skills to get into computer addresses to which only Philippine programmers have access. "I found viruses [the 27-year-old] had written but not released. They gave him away... Hackers like to sign their files so they have some way of proving they were responsible for them." But... the hunt was not over yet. Police still had to find those responsible for spreading mutations of the ILOVEYOU virus. "I'm on to a few of them,"... One of the new variants is Friendmes, which experts say is two-thirds more destructive than the original... and can corrupt all computer files... Twenty variations of the virus had now been detected. • ...Like their human counterpart, computer viruses' main purpose in life is to go forth and multiply... But it is worth remembering the fundamental difference: people viruses can hurt, even kill, but a computer attacked with software code carrying out programmed instructions is just a machine. It can be fixed. That is not always a comforting thought for the people using computers struck down by a virus attack – especially if they have diligently kept up to date with their anti-virus software. What annoys people about viruses such as Love[Bug] is that for a short time their anti-virus software is useless – like buying insurance that works after the event. Th[eir software has no impact until] the anti-virus vendors isolate the new virus strain and post a fix. The fix is now available for Love[Bug] and it will stop further infections. But that is little solace for the thousands infected. It is even more annoying that users cannot buy real insurance against this scourge. So who is to blame? Many point the finger at Microsoft, saying that its e-mail software... should not allow the ".vbs" script used by Love[Bug] to run... Microsoft advises users that they can turn this "feature" off. Do it now – the instructions are on Microsoft's Website. Many more viruses will come using this technique. Others propose a more radical solution: stop using Outlook and find different e-mail software. From Microsoft's point of view, this is unfair. Virus writers attack Outlook because it is the software used by most Internet users and gives vandals the maximum impact when they set their virus creations loose. Microsoft cannot be blamed for the market success that makes it a natural target.

...An Auckland software developer who found a security flaw in Microsoft's e-mail software that [it] believes could secretly unleash a "hell virus" says files on his discovery have been stolen from his computer... [The] creative director of Arabesque Multimedia – who has a back-up of his find – discovered the flaw in Microsoft's Outlook Express programme while designing Java script software that automatically activates computer functions. "We discovered we could write a program that will activate any type of executable file on a computer through e-mail... Which means if we have your e-mail address we can control your computer – or attach a virus which could automatically send itself to every name in your address book without you even being aware of it. Using what I... found out, I could make a virus much worse than the 'I love you' bug because you wouldn't have the option of deleting the e-mail carrying the virus before it infected your computer – it would activate automatically whether you read the message or not." ...One person who experienced the effects was... a business acquaintance of [his] who had her computer disabled by e-mail. "I got an e-mail message from [him] which completely froze my computer. It started opening up windows, then it opened the Arabesque Website. Even after shutting down the system it was still there. [The developer] had to send me another e-mail which let me control my computer again." ...[the developer] alerted Microsoft's Security Response Centre in Redmond, Washington, but it said it could not find any "security vulnerability." [The developer also] e-mailed Government departments both in N[Z] and overseas, even contacting the... [CIA]. No one replied. Somebody must have been interested, however... "My computer had been acting strangely, then I noticed the missing files. The only... way they could disappear like that would be for someone to break in here and delete the files off my computer." [The developer] didn't bother going to the police because there was nothing... [to show them, but] is concerned hackers could work out how to use the program flaw... [A c]omputer forensics consultant... who works with the police on computer crime, studied [the developer]'s findings. "Even in this relatively harmless form this is a virus that would be very unwelcome on anybody's system. If it was compiled with malicious intent it could do catastrophic damage." ...[the consultant] had the virus scanned by Trendmicro.com, one of the top virus checking systems. The scan was unable to detect it... [The consultant believed] Microsoft... should take [the developer]'s claims seriously. "Anyone who says this is not a security concern would be very naive. [But the developer] has made Microsoft aware of it and if they don't take it seriously that's their concern." ...[Microsoft NZ] said the company never received the original warning message [the developer said it] sent. "We have no record of any communication with [him] until now. We still need to verify the situation and our security response team will investigate and evaluate it." PC users concerned about the threat have a simple solution: turn off the Java Script feature...

Checking your e-mail has become part of everyday routine for thousands of N[Z]ers, at home and in the office. But, by the time you've switched your machine on and checked your in-box for new messages, you might have unwittingly unleashed an invisible menace which could turn your expensive computer into a useless plastic box in seconds. The Love Bug computer virus which infected 20[%] of the world's computers within 36 hours of its release last week, was just a taste of what could be to come, according to computer experts... Nearly 50 viruses have been found which can infect a computer by simply downloading the e-mail. Combine this with the fact anti-virus software can't stop a brand new virus and you have

a recipe for disaster. Experts now believe new, quicker-spreading and more destructive viruses are just around the corner and could bring global economies to their knees... If such a virus were to fall into the hands of political extremists, it would be the most potent terrorist weapon ever devised. However, before you throw out your computer and return to carrier pigeon for communication, rest assured computer virus-writers – usually hackers – are very rarely motivated by the evil instincts of a terrorist. [A]British computer expert... who has spent a decade studying the virus-writing subculture, says hackers justifications run from “we do this because we can” to “because someone said we weren’t capable of doing it”... The term computer virus was first used... in 1984 and refers to a programme designed to corrupt (and copy itself into) other programmes and change the way they work. The odds of downloading one over the Internet have increased dramatically over recent years... The Love Bug virus is a worm virus because it moves around the computer, corrupts files and tries to duplicate itself to other files and computers. Other computer nasties include the Trojan horse – a programme which seems innocent but contains hidden functions which can either destroy computers or reveal personal information – and a logic or time bomb – a programme activated after or during a certain event. This may be after several uses or on a certain date. ● ...In just three months, the Internet has been transformed from El Dorado to a shadowed land. [Three months ago], tidal waves of junk messages crippled the Websites of billion-dollar dot-com companies that are touted as the world’s glittering economic future. And last week, the unlovely ILOVEYOU bug crippled millions of computers around the world... inflicting costs estimated at up to \$US10 billion. Shaken at this sudden exposure of its frailties, the Internet industry is looking to a key meeting in Paris next week for reassurance. Cybercrime detectives, Government officials and industry representatives from the Group of Eight... countries will assess the dangers facing the Internet and evaluate ways in which Governments, legislators and the information technology industry can combat the peril... Costly and infuriating, Internet sabotage is only the most visible and best-known part of the cybercrime iceberg. Lurking beneath the surface are... credit-card theft, copyright piracy, money laundering, trafficking in prescription medicines and trade fraud... gambling... cyber-stalking... paedophiles, pornography scams...

The e-mail virus called “Homepage” is continuing to irritate computer users, dragging some to pornographic websites. About 80,000 computers worldwide were infected with the virus in 24 hours this week... The virus is similar to the “I Love You” bug... The virus is spread by an e-mail with the... message reading “Hi! You’ve got to see this page! It’s really cool.”

...Without protection, email viruses can arrive and wreak havoc with your computer. Xtra’s anti-virus email filter helps stop known email viruses before they attack your personal files or damage your computer. What’s more, there’s no software to download or complicated set-up process to go through to get this protection... [W]e do everything for you, all at no additional cost... So if you are an Xtra customer you can relax...

Systems hold up despite Y2K bug worries... In most of 21st century N[Z], the lights stayed on after midnight, revellers were able to draw money out of ATM machines and keep on partying... The Y2K Readiness Commission declared at 2 am that none of its 12 monitoring sectors, including power and water supply, had reported falling prey to any failures by computers to switch over to the new century date. Russia reported about the same time that its first nuclear power reactor, in its eastern territory of Kamchatka, had survived the millennium changeover. But the readiness commission did not mention until asked about an hour-long power failure which had thousands of people in Alexandra, Roxburgh and surrounding districts breaking into their Y2K Readiness packs. Transpower said the cause was a suspected “line problem,” although it was still investigating. Police... patrolling boisterous millennium celebrations had a brief scare when their central computer was taken down for 15 minutes after midnight, not having been forewarned of a “planned outage.” ...Fears of computer viruses and hackers attacking Websites did not eventuate, but [an]Auckland University expert... warned that the all-clear could not be given until businesses began opening e-mail from Monday... With a twitchy globe watching to see how N[Z] coped as the first industrialised country to meet the millennium and possible computer failures, crisis management centres around the country were preparing for the worst. Expecting massive international traffic on its Website, the readiness commission had extra security measures in place... for its site, mirroring it in Washington to cope [with]up to 700,000 “hits” at once. The commission was confident most essential services would hold together, after the country spent up to \$1 b... future-proofing its computer systems... Auckland[’s] regional council critical services director... s[ummed up the situation]: “Nothing has happened – sorry, the world has not ended.”

*...12:00:30 Turn on computer. Lo, it boots! 12:01 Go to window, check heavens. Not an angel in sight. Rapture is running late. Hindus expecting a rain of blood will also be disappointed. The sky is filled with misty fire, but the explosions are entirely joyous. 12:04 Return to computer, delete provisional opening bar: “As fireworks lit up the night sky above the harbour bridge, the lights went out in Auckland.” Try to think of something else. 12:06 Call Telecom’s Y2K Management Centre in Wellington, where a cheerful... [voice] says that this whole Y2K thing looks as though it might be a big have... 12:18 Call The Radio Network... “No worries, mate!” [a voice] cries. Haven’t the heart to tell him that according to the Gartner Group... only 10[%] of all Y2K glitches will show up in the first two weeks of January... 12:30 Cellular network is getting a bit gummied up. Besides, I’m bored with phoning so try surfing instead. All the local sites I visit behave perfectly... 12:45 First yawn of the night. Distinctly recall someone mentioning a fridge full of champagne. 12:50 Note *Wired* report that messiah has shown up in Jerusalem. His [holiness]... smokes other people’s cigarettes incessantly, carries a cellphone and is trying to drum up business at the Petra Hotel... Disciples fail to flock. Messiah-biz is not what it was. 1:00 Well, it’s fairly clear that nothing much is going to happen. Civilisation, I’ve been assured by everyone who should know, looks like trundling on as usual for another thousand years[.] Don’t know whether to be relieved or disappointed. The small knot of apprehension with which I woke up this morning loosens, comes undone. For the first time tonight, something in me at last starts, tentatively, to rejoice. We’ve made it into a brand new millennium... and it looks as though we’re off to a fair start... Chicken Little was wrong. Now, where’s that champagne?*

...PHILIPPINE police... [were] ordered to tape over their gun barrels to stop them firing a few celebratory shots... Police [were told they could] still fire their guns in the line of duty, but such incidents w[ould] be fully investigated. Many Filipinos mark the New Year by firing guns into the air or setting off powerful firecrackers... [– a custom that] results in several deaths every year... [In Japan, t]he Tokyo Fire Department has issued a warning about the risks of eating gooey... “mochi”... rice cakes after a[n]... 86-year-old... choked to death on the traditional New Year’s fare and two others were hospitalised... [By the way, celebrations came early to Macau –]Portugal said farewell... to its last chunk of empire, with this tiny gambling enclave returning to Chinese sovereignty at midnight [12 days ago, ending]... 442 years of colonial rule. The Portuguese say they have left a proud legacy, although many Chinese who are the vast majority of the local population just wanted them to leave. The Chinese [actually don’t ‘celebrate New Year’s Day until the day of the first new moon following entry of the sun into zodiacal sign Aquarius – i.e. between Jan. 21 and Feb. 19’ (Maori) welcome New Year... [even later:] in June families and iwi gather together to observe Matariki... [– a]lso known to the Greeks as Pleiades, the Japanese as Subaru, and the [Brit]ish as the Seven Sisters... [–] as it rises before the sun[)].

...Britain is to scrap the debts of 41 of the world’s poorest countries, says [the]Chancellor of the Exchequer... [Hi]s pledge is a partial victory for Jubilee 2000 – the debt campaign pressure group set up in 1996 with the aim of achieving a debt-free start to the new millennium for a billion of the world’s poorest... The debts of 20 countries are to be written off immediately and the money for the remaining 21 held in trust until they are committed to ending conflicts, reducing poverty and improving health and education. At a “debt eradication” rally yesterday, [the chancellor]... also pledged that Britain would do its upmost to halve global poverty and make sure that every child in the world was in primary education by 2015.

...Listen to our children, people used to say, because they are the leaders of tomorrow. Now tomorrow has arrived. If the 20th century was dominated by the common [person], the new century, I believe, will belong to the Y2K generation: youth. By 2005 around 77 million of us are expected to be online globally. By 2025 computers are predicted to be a million times more powerful, even able to read a human mind... [Scientists have already] created a molecule-sized device to make computers electricity-free... It is the younger generation who will drive and control these technological advances. Eight years into the Internet revolution, the young already understand that in the next century you will be nothing without

a .com. This knowledge mixed with fearlessness and the skill to grasp the initiative will give them more power, more influence... than any other group in society. Two months ago a boy of 17 was appointed the youngest ever senior Website consultant at MGM... His is an appointment that would have been unthinkable... 35 years ago, but one that MGM is boasting about. Now business takes young talent seriously and shows teenage recruits off like trophies. It is why ICL, global computer giants, are already headhunting in schools to recruit the next generation... But, as with everything that is unknown, there is much to fear for 2000. My generation, born in long years of European peace, has no anxiety about war. But there is foreboding that we will spend much of the new century picking up the pieces of what has been broken in the last... We know... that it is the 20th century's advances which have left a gaping hole in the ozone layer... we know that cars have also helped to pollute the planet... [Yet, w]ith 555 million cars on the planet, we take it for granted that they will increase... The image of the planet as one big parking lot and building site is a disturbing one[– especially when you hear that, in]... the last century[, Earth's range]... of wildlife and plants... [decreased by] an estimated 25,000 species... [Incidentally, future members of our species] are... in danger of regressing to the shapes of their Neanderthal ancestors, as long hours spent in front of computer and television screens cause them to become round-shouldered and stooped.

...SPENDING too much time in front of a computer screen increases your chances of psychiatric illness by more than four times, doctors warn. A shocking new study has shown more and more people are in the grip of dangerous addictions to computers and display signs of personality disorders as a result... [Psychiatrists at] Iowa University... observed a group who spent more than 27 hours a week at their terminals. Most of the group reported feeling happy, excited and powerful when using a computer but admitted their relationships with family and friends suffered because of their addiction. One-third had tried to cut down on computer use but doing so made them feel anxious... 52[%] of the compulsive computer users suffered mood swings and antisocial disorders. Just 12[%] of a control group of non-computer users were found to have similar problems. "We don't know how many people are addicted and mentally affected by computers but it appears to be a growing problem,"... said... [the] American psychiatrist... who led the study... Doctors fear the addiction is being fuelled by the Internet.

...A new study... carried out by psychiatrists at Florida university... [confirms] internet addicts – who can spend up to three days at a time on-line – develop mental problems, including manic depression and anxiety attacks. Others lose their jobs and destroy their marriages... Some net addicts became angry... when cut off from their computers... "It surprised me how destructive it was in their lives,"[the] study leader... said... [A NZ] psychologist... who works for the Compulsive Gambling Society... said a similar situation was developing here... But there was no specific organisation to turn to for help... "We are getting more... calls from desperate relatives... I have spoken to family... of people who... surf the net till 5am and develop mental problems... from sleep deprivation, the isolation of sitting in front of a computer, and being unable to face up to real life."

...DESPITE AN ABUNDANCE OF INFORMATION AT OUR FINGERTIPS TODAY, AMERICA HAS GONE COLLECTIVELY STUPID... A CALIFORNIA REALTOR AND AMATEUR MAGICIAN, REALIZES IT MUST BE A CONSPIRACY... BUT WHY? AND WHO'S BEHIND IT? ...THEN IT HITS HIM... THE MORE IGNORANT THE POPULATION, THE EASIER IT IS TO CONTROL... REALIZING THE MEDIA ZOMBIES HAVE THE ATTENTION SPAN OF A FLASHBULB, MARK FIGURES [IT] NEEDS TO DISTRACT THEM LONG ENOUGH FOR REALITY TO HAVE A CHANCE TO SINK IN. BEING A MAGICIAN AND A REALTOR, MARK IS WELL-VERSED IN THE ART OF ILLUSION AND HOW TO REDIRECT THE FOCUS OF AN AUDIENCE... AND A SUPERHERO FOR THE INFORMATION AGE IS BORN...

NO LONGER A MEDIA ZOMBIE LIKE THE REST OF AMERICA, MARK... SETS OUT TO FREE OTHERS FROM THIS MINDLESS CONTROL... BUT... COULDN'T COMPETE WITH THE CELL PHONES, HEAD SETS, PAGERS, LAPTOPS AND PALM PILOTS TO GET THEIR ATTENTION. THAT'S WHEN IT HIT HIM. THE CAUSE OF ALL THIS HAD TO BE... INFORMATION OVERLOAD [–] THERE'S MORE NEWS DATA TO ASSIMILATE TODAY THAN AT ANY TIME IN HISTORY. THIS INCESSANT STREAM OF INFORMATIONAL NOISE CAUSES A SENSORY OVERLOAD, SHUTTING DOWN THE BRAIN'S NATURAL FILTERING SYSTEM OF RATIONALITY. WITHOUT THIS FILTER, MISINFORMATION IS ALLOWED TO FLOW IN UNABATED AND THE MIND IS NO LONGER ABLE TO FORM INDEPENDENT THOUGHT. WE BECOME ADDICTED TO SIMPLISTIC RHETORIC, TAKING THE PLACE OF THOUGHTFUL ANALYSIS. SOMETHING THIS WIDESPREAD *HAD* TO BE A CONSPIRACY. BUT WHO COULD BE BEHIND IT? POLITICIANS AND MEDIA TYPES AREN'T BRIGHT ENOUGH TO PULL THIS OFF... IT MUST BE THE ONES... WHO FEED OFF THE POWER...

IT'S hard to miss them. The epitome of casual "geek chic" and organised within the warranty of their Palm Pilots, they sip labour-intensive cafe lattes, chat on sleek cellphones and ponder the road to enlightenment. They worry about the environment as they drive... gas-guzzling sports utility vehicles to emporiums of haute design to buy a \$50 titanium spatula; they think about their tech stocks as they seek out – in Everest-worthy hiking boots – Tibetan artefacts in specialty shops. They... are "bourgeois bohemians" – or Bobos – ...the... "enlightened elite" of the information age, their lucratively busy lives a seeming synthesis of comfort and conscience, corporate success and creative rebellion. Well-educated [30- to 40-]somethings, they have forged a new social ethos from a logic-defying fusion of 1960s counter-culture and 1980s entrepreneurial materialism. So proclaims... the [US] journalist and self-avowed Bobo, who coined the phrase to describe the new cultural and corporate hegemony of his cosmopolitan, computer-savvy contemporaries, many of whom will no doubt recognise themselves in *Bobos In Paradise: The New Upper Class and How They Got There*. "...Bobos define our age. They are the new Establishment. Their hybrid culture is the atmosphere we all breathe," [the] journalist declares in his "cosmic sociology" of Bobo manners and mores. "Their status codes now govern social life." A phenomenon in step with the hard-driving digital utopianism promised by the internet and its money-spinning "new economy," not to mention the Third Way politics of [the 42nd US President, Britain's Labour PM and NZ's own Labour PM], the Bobos have seized upon an ingenious way to sell without selling out – or so they tell themselves.

...*Empress is losing her clothes*... [The NZ Labour PM's one-gal] band style of Cabinet rule is over... For much of the past... [her] leadership has been impregnable. Capitalising on her long political apprenticeship, frank mastery over many portfolios and deep knowledge of Parliament and its deep shark-infested waters, [the PM] has ruled over her Cabinet – and a drip-fed news media happy to allow the traditional honeymoon to continue long after separation should have been imposed. But... [recent events have] exposed some big chinks in her armour. Despite publicity over Paintergate, when the powers that be backed away from pursuing criminal charges against her over paintings and doodles [the PM] falsely signed for charity auctions; and then Corngate, a clearly politically trumped-up ambush over allegations that genetically engineered sweetcorn was at large in N[Z, the PM] retains sufficient respect and goodwill to... [maintain] her stratospheric popularity and Labour's high poll ratings... But her legitimacy is reduced – and [the PM] knows it. Corngate has knocked her self-image as no other crisis has. This was abundantly clear when [the PM] started referring to herself in the third person – "the Prime Minister..." in her controversial television interview with TV3...

The aftermath of the ambush... "SO tell me. Are you here to do a job on me?" For an interviewer who has just done the job of the week on the PM, it's an odd question. Hey, [interviewer], that would mean you could prepare your spin, wouldn't it? [The interviewer] has just come off air for the week and is sucking a polystyrene cup of chardonnay. [It] is feeling the heat but liking the warmth. The newsroom is upbeat. There's a celebratory air that seems a little keener than the usual high of the week's end. TV3 reckons viewer reaction to [hi]s corngate interview with [the PM] – recorded on Tuesday but broadcast the next night – has swung 70-30 in [hi]s favour, especially after [the PM]'s "creep" comment. It was a different story on Wednesday night. After [the interviewer] watched the broadcast... [– "I'm someone] who like most people likes to be liked and doesn't like to cause offence and likes to be polite, [so]... watching myself... taking it to the... [PM w]as a surreal experience[– it]... could think of nothing else and was so preoccupied [it] opened the door of his VW Golf into the path of an oncoming bus, wiping out the door and almost himself.

Before [the interviewer] left the studio: “I stood downstairs and thought, ‘oh shit this is awful’...” [It] stands by the interview but that’s not to say [it] has no regrets – even though [the PM] has now lodged an official complaint. “I kind of wish it hadn’t been so crappy for everyone. I think [her appearance] frightened me... The... [PM] was a bit scary in those circumstances. It was a thoroughly unpleasant experience for us both. It was going through my mind that ‘shit, I hadn’t thought [the PM] might have memory failure’. I was thinking OK, move on, jog her memory, give her some facts, encourage her to respond in some way, try to get something out of her. But I’m a very chemical kind of boy. The adrenalin kicked in. When it was finished no one in the studio spoke[while the PM] had a go at me full on. I just stood there in the studio for a long time with the camera people and no one said anything. I was a bit bewildered. I was a bit rattled. I was in a state of shock. It was car crash shock.” [The interviewer] refuses to say what [the PM] said. “But look, we’re consenting adults. I don’t mind being stabbed in the front.” ...In a distant time [the interviewer] seemed too principled and too intelligent for television. Blame his ears, perhaps, but the regular viewer could be forgiven for believing that [hi]s head was a jug that dispensed good manners, earnest study and a decent interview. Too decent, in some cases. There was that infamous query of the[previous PM when the interviewer] asked if an interview was “all right”. Not true, says [the interviewer. They] had had a very tense relationship and when [the National PM] came into the studio that evening “[the PM] just went me for 3 1/2 minutes. I said ‘that’s rubbish and I will be entirely fair and reasonable’. And at the end of the interview I said sort of facetiously if that was all right. Like ‘shove it’...” It’s likely those most repelled by the tenor of his questions to [the Labour PM] were an older audience. Younger people were more inclined to question the establishment. I tell him my mother didn’t like the way [it] waved his pen at the PM. “I’m not pointing, I’m helping myself get through the points – it’s like a metronome thing.”... But what about respect for the PM? “Did we owe respect to... Muldoon for using the Springbok tour to win the ’81 election? I think respect is on condition of being earned. This is the extraordinary thing that kind of pisses me off. [The PM] has made out [it] was dragged into a room and intimidated by the Gestapo with the gas chamber next door but if you watch the interview I never lost my cool... It was quite a reasonable interview but [the PM] went out and called it terrible treatment. It’s a great trick of politicians to shoot the messenger because... [then they] don’t have to respond to the message. Muldoon did it...” While during the interview, [the interviewer] seemed to suggest [the PM] was lying about her memory failure, [it] now thinks “the truth lies somewhere in the middle” – part memory failure, part spin. “It has to be a possibility that [the PM] doesn’t remember. It is also a possibility that not for the first time in the history of the world a person who found themselves in an interview they weren’t really enjoying terribly much experienced memory lapses which may in part have been convenient... That [PM] is bright, formidably bright. [It] is one of the leaders who is a very hands-on [PM]. The [PM] runs cabinet and drives it hard. And it seems this is a big issue and while I didn’t expect her to remember exact specifics like contamination level or the number of seeds or the dates I did expect that with something like this [the PM] would remember the general tone of the advice [it] received.” So what did the viewer get out of the exchange – [hi]s repeated questioning to [the PM]’s increasingly heated denials that [it] was not well enough informed to intelligently reply? This sort of interview is justified, [the interviewer] says “when the public’s right to see unvarnished, unspun, unchoreographed responses outweighs the usual behaviour of interviews. What do we as journalists do when we are asking what we genuinely believe to be reasonable questions of somebody who you would have an expectation would have some sort of recollection of it and they claim they can’t remember? When a politician says they can’t remember we are meant to cease the exchange, put down our pen and say, ‘thanks, I’m terribly sorry about that, refresh your memory and possibly prepare your spin and get to me when it’s convenient’. If that was the case democracy and journalism would be no more than the regurgitation of press releases... It’s weird that subjectivity is only considered when you confront somebody. The nights we have a politician in and give them 3 1/2 minutes which you may as well charge them for because it’s just about an advertisement... no one ever says ‘outrageous subjectivity’.”

...WHO would be P[M]? Every Monday afternoon you come down from the weekly cabinet meeting to face a theatre of reporters hungry for something fresh to start the week... “P[M], what’s your view on eating dogs?” ...“P[M], do you have a comment on the incident that occurred in the Auckland secondary schools rugby semifinal on Saturday?” ...And during the split second available for thinking in front of a camera your personal instinct surrenders to your public position... The real injuries this week were done to Auckland Grammar School and Kelston Boys, though it was refreshing to realise their principals had not been tutored in safe-speak. Loyally they each blamed the other’s team, and were duly hammered for it. They weren’t to know on Sunday that the incident would be on the front page for four days, playing out like a one-sided moral pantomime... When forums of public discussion are dominated by excessive shock and dismay everyone blames the media. But the truth is, news editors have a low boredom threshold. The school rugby brawl would have been dead by Wednesday were it not for interactive news websites these days.

...*Hypocrisy clings in... All Blacks* [‘winger’]... *incident*... Once there was a time when an All Black could get away with just about anything on test night – particularly if N[Z] had won. It was widely accepted that after such Herculean exertions in the national interest, the freedom of the city could be taken for granted. Many were the moments when a very tired and very emotional player would be carefully looked after, not by some overweight goon hired specifically to keep the public at arm’s length, but by just about everybody who cheerfully accepted the odd excess as an understandable and forgivable letting off of steam by a committed athlete. Those were gentler, more tolerant times and it was really rather nice to be an All Black free of the more recent hazards – the constant worry of hidden cameras, sensation-driven journalists and girls who would happily tell all to some witless [gals’] magazine if the price was right, and various other banana skins laid in the path of the contemporary players. Not any more. What might have been a case of special treatment by society at large in the good old days is no longer acceptable practice. Quite the reverse. These days it is more or less impossible for an All Black to let his hair down. It seems that is exactly what [the dreadlocked All Black winger] tried to do in Christchurch... but his hair got pulled, with, presumably, his leg, and the whole thing became mildly disorderly. On the face of it, nothing much to get excited about here. Unfortunately, one especially nosy onlooker, apparently with the extraordinarily apt name of Parker, got out his video camera, filmed the proceedings and hawked his pathetically unenlightening finding to a television company. To both his and the television company’s discredit, the incident suddenly became the lead item on the television news, and every other news organisation immediately and enthusiastically climbed aboard as well. Where a couple of decades ago an event of this magnitude would have struggled to raise a line in the newspaper, today the whole nation is invited to wallow in voyeurism. There is a school of thought that insists that rugby stars are rightful targets whenever they put a foot wrong. Prominence brings vulnerability and it is not just the careless who end up paying a high price. There is a fair measure of hypocrisy in this. On the one hand voices are to be heard everywhere insisting that the All Blacks return to the old virtues of simplicity and accessibility, that they should once again be the ordinary heroes, mixing with ordinary people in all the old ordinary ways. Having a beer at the pub or nightclub on a Saturday night, for instance. We demand it. We insist that they be no different from anybody else. On the other hand, however, because they are now highly paid they are regarded as fair game by the scandal-mongers, the envious, the footy-haters, the gold-diggers and all those who can’t stand the sight of taller poppies than themselves. It is hardly any wonder that the All Blacks’ chances of knocking about in the old, ordinary ways are about as good as [the PM]’s. We can’t have it both ways, folks. Don’t expect to see All Blacks hobnobbing downtown much any more. And be careful about who is to blame for that.

...[the former] editor of *The N[Z] Herald*... championed openness and accountability in reporting, saying in an interview with this newspaper that N[Z] journalism was honest, decent and way too timid. But while advocating scrutiny on the pages of his paper, [the 44-year-old] appeared not to have led by example in his private life... [The former editor] was just 22 months into his role at the helm of the *Herald* when [it quit, saying it] intended to return to Britain to work. But, as revealed in the *Sunday Star-Times* last month, his resignation came after an internal inquiry into sexual harassment had begun at the *Herald* and a number of people had been interviewed. Details of that inquiry have not been made public. When appointed *Herald* editor[, the Pom]... was described by the paper’s editor-in-chief... as having an extraordinary depth of international and local

journalistic experience. “[Our appointee] has a clear understanding of the needs of *Herald* readers and ideas that will see the content of the paper develop in exciting directions,”... And indeed [the new appointee delivered. His] infectious news enthusiasm was welcomed by staff who now say they regret the loss of a good newspaper person but that his personal dalliances clouded his work record... [In related news, h]is name is a byword for plagiarism and fakery and his career flame-out took the editor of the *New York Times* down with him... The hotshot reporter was unmasked... as a serial fantasist, whose colourful articles with datelines from across the US were routinely written in his Brooklyn apartment.

...The *Herald*... this week dismissed a reporter after [it] admitted fabricating a story... [Our] staff are ethical and honest – and feel... betrayed...

A Chinese newspaper... the *Fortune News*... has accused Auckland police officers of committing a brutal, racially motivated attack on an innocent [perso]n – without telling readers that the alleged victim was the owner of the paper and was arrested for assault in the alleged road rage incident.

...[To] mark... *Newspaper Week*, [I] watch... as the *Herald* rolls off the presses. Thousands of fresh newspapers snake across the ceiling like an endless millipede. Inky the robot delivers another 1.4 tonne roll of paper to a skyscraper of a tower printing out streams of dizzying colour. When the clock reaches 280,000 copies – some time in the wee small hours – everyone goes home. Bouncing in the back of a truck, the *Herald* is on its way to you. By the time the paper reaches the mailbox, it has already passed through many hands – not all of them human. You may think you are the first person to read the scoop of the day, but you are more likely to be the 10th. When a journalist writes a story on his or her computer, it passes by the eye of the chief reporter, the news editor, who determines where it will end up in the paper, and often the editor. It then passes through the hands of a bank of subeditors, who fit it in to a page, write headlines and check for any oversights. Even in the world of up-to-the-minute technology, some things never change in the production of a newspaper. After the completed news pages are converted into a full-size photographic negative at the *Herald* offices in the heart of Auckland City, a courier drives them down the Southern Motorway to the massive printing presses at Ellerslie. In the dark of the night, the cathedral-like building on the edge of the motorway is lit up like Las Vegas. Inside, \$250 million of machinery starts whirring once the last page arrives. Negatives are turned into printing plates, using the world’s purest aluminium. The plates are wrapped around rollers in huge towers that mesh colours together – black, magenta, cyan and yellow. On a Friday night alone, the *Weekend Herald* sucks up 700kg of ink. It is a messy business – ink dust hangs in the air and settles on every surface. And it’s noisy. The machine that cuts and folds the newspaper pumps out a deafening 112 decibels, but it is muted by steel doors... The *Herald* uses 600 tonnes of newsprint a week. The N[Z]-made paper costs \$1600 a tonne – it works out at roughly \$2 worth of paper in each copy... Newsprint streams through machines in an indecipherable blur. At top speed they can spit out 70,000 copies an hour... The printers spend at least half an hour churning out dummy copies, checking a grey strip along the bottom of each page to make certain they have the right balance of inks... On the ground, wheeled robots are at work – running around with newsprint rolls and emptying the garbage. They have names such as Inky, Buzz, Zippy and Supersonic. “When there’s no work to do, they tootle off and plug themselves into their battery charges – it’s a robot’s equivalent of a cappuccino break,” says the manager of the Ellerslie printing plant... Overhead, th[ousands]... of robotic hands... help... newspapers speed along tracks like a Los Angeles freeway system.

...If you have seen the movie *Chinatown* then you know at least a little about the... family, which last week stunned their hometown – not to mention the head of their flagship company – by selling the *Los Angeles Times* for \$US8.4 billion... The news came so suddenly that reeling reporters even felt a fleeting twinge of sympathy for the newspaper chain’s detested chair[perso]n... who was sobbing as [it] announced the paper’s purchase by the *Chicago Tribune*’s media empire. Like the flabbergasted newsroom, and LA as a whole, [the chairperson] had no idea his masters were bailing out. [The chairperson] was just one more dupe in what history will regard as the final act of devious treachery by the family that have controlled the paper since its birth 115 years ago. The [family’s] ink-stained thumbprint is all over modern... [LA. After WW1], their paper was a prime inspiration for a frenzy of xenophobic paranoia that launched the federal agency soon to be known as the FBI on a national rampage against radicals, Communists, Wobblies and suspicious foreigners. It was a campaign that served as a precedent for the McCarthy witch-hunts of 30 years later, which the paper also endorsed and defended long after Tailgunner Joe’s other allies had lapsed into an embarrassed silence. In the 1930s, in the incident that inspired *Chinatown*, the [family] bought, bribed, browbeat and blackmailed their way to take control of all the water flowing through the agricultural Owens Valley, 400km from the parched City of Angels. One day the small farmers could irrigate their fields; the next, their water was gone, their crops dying and their [own] families ruined. Meanwhile, the liquid gold was diverted to the parched San Fernando Valley, all of which [the newspaper family] owned. In the 1950s, the [family] put their paper at the disposal of [an] up-and-coming redbaiter [destined to be the 37th US President]. And in the sixties, they launched [the 40th President]’s political career by energetically endorsing [the B-grade actor’s] bid to become Governor of California. Five years ago, in a move that reflected how the most recent generation of [the family] had lost their appetite for hands-on management, the family trust that controls the paper hired [the chairperson] to boost profits any way [it] chose. Formerly the chair[perso]n of a breakfast food company, his first move was to sack 7000 employees and shut a money-losing paper in New York – corporate carnage that saw him dubbed The Cereal Killer. His next move was to populate the business side of the operation with executives who not only knew nothing about journalism but also held its ethical traditions in open disdain. The timing of the [cereal] whiz kids’ arrival was truly ironic since, without the [family’s] active meddling, a succession of editors had transformed the paper from a right-wing joke into one of America’s greatest and most reputable news organs. [The chairperson], who began his tenure on an alarming note by urging editors not to run stories critical of advertisers, did not seem to care a jot about the paper’s hard-won integrity. Profits were booming and the stock price quadrupled. This approach reached its nadir late last year when [the chairperson]’s handpicked corporate heir... cut a secret deal with LA’s new Staples Centre sports stadium, agreeing to split the profits from a glossy magazine in the top-selling Sunday edition that commemorated the arena’s opening. When the editorial staff found out about the secret pact, their resulting protests over the breach of the “Chinese Wall” separating advertising and editorial sparked a rancorous internal investigation that remains an open sore with editors and reporters alike... [Staffers] who have worked for papers controlled by the *Chicago Tribune*, saw their wonder at the [family’s] sudden departure tinged with no small degree of fear. Where the [family] have been merely mercenary in their approach to the news business, the boys from Chicago have made bloody ruthlessness a corporate motif. With the *LA Times*’ chain of media outlets in its pocket, the *Tribune*’s brain-trust will soon control 11 daily papers, four radio stations, 22 t[v] stations and the Chicago Cubs baseball team. A sparkling roster of properties in itself, the *Tribune* sees the melded empire as a springboard to a huge Internet presence that will tap the traditional media outlets for content to fill a wide range of Websites and e-commerce ventures.

...N[Z] *Herald* has placed its classified advertising listings on the Internet. The *Herald* Web site, previously a news and information service, has been expanded to allow a personalised search of listings for specific products and services. A system called e-Alert allows users to be automatically notified by electronic mail when listings that match their search criteria appear on the Web site... There were always 20,000 to 30,000 job advertisements on the Web site, including those from... leading recruitment agencies on both sides of the Tasman. As well, the real estate listings featured suburban maps. The chief executive officer of Wilson & Horton... said the Web site gave classified advertisers the opportunity to reach more readers and get better value. Future developments would add the group’s regional newspapers to the site and introduce electronic commerce.

...The cover price of the *Herald* rises to \$1 today but subscribers will still receive the paper at the old price of 90 cents. And for new subscribers there is a special deal – not only will you get the award-winning paper at the old price but you will also get up to six weeks for free.

...The *Weekend Herald* will have a new price from next Saturday... This price change does not affect... weekday editions... The cost of the *Weekend Herald* to subscribers will increase 30c to \$1.50. Readers buying the *Weekend Herald* from retail outlets will pay \$2, up... from \$1.50. The *Herald*’s practice of maintaining lower prices for six-day subscribers continues... [– they] will pay \$6 a week, a saving of \$1 a week over readers buying from retail outlets. New and existing subscribers for six or 12 months are eligible to win one of four Hewlett Packard pavilion computers,

each worth \$3095. The competition... is in addition to the existing benefits for six-month subscribers, who receive an additional three weeks of free newspapers, and 12-month subscribers, who receive six weeks of free *Heralds*... For subscribers, this is the first price increase since the *Weekend Herald* was launched three years ago... The newspaper has recently been reconfigured to include more content and colour, an improved layout, more editorial and news and the new Review section... ■ The first edition of the N[Z] *Herald* was published on November 13, 1863... N[Z] has 23 daily newspapers. [8] are owned by Wilson & Horton... The other big owner is INL, which has 10... N[Z]'s first newspaper was published in 1840. The press of the four-page N[Z] *Gazette* could print 200 copies an hour... At least 3,056,000 people in N[Z] read a daily newspaper... each week.

...“The Irish read more newspapers per head of population than any other country in the world,”... said... the former... All Black... hooker[who] has recently accepted a further two years in the job... as Irish coach. But... there are still things which [it] hasn't quite got used to... “They've got five Sunday newspapers, 16 journalists writing on rugby every weekend... [- and,] in Ireland... rugby is [only] the fourth favourite sport behind gaelic football, hurling and soccer... [- who]’re all looking for an angle. The victories can be great but if you lose, the disappointment and the criticism is the hardest part of it. I still struggle with it a bit but that’s why you get paid plenty.”

...*Stuff* knows what's going on in the world. Log on to... www.stuff.co.nz... and you can keep up with what's going on in the world and what's going on in N[Z] to what's going on where you live. Whatever you're searching for, you'll find it here. Stuff. It's our world on the net.

...It's hot stuff and it's on-line now. Auckland's latest, national and international news, sport, weather and business has hit the internet on the new web site by Independent Newspapers Ltd... It can be found on www.stuff.co.nz – and was officially launched on Tuesday. But it's not just about Auckland – Stuff is now N[Z]'s largest newsroom on-line... The site incorporates content from... the *Sunday Star Times*, *Sunday News*, Radio N[Z]... Reuters... INL's... 10 daily newspapers... the company's Auckland suburban community newspapers... and... community newspapers nationwide...

ZONE IN ON AUCKLAND Put your product or service in front of the whole city or just the part you want – with selected, targeted classified advertising from *Suburban Newspapers Auckland*... [Our papers – which each weigh between 50g to 100g, and mix classifieds with *human interest* stories about local businesses, community groups, or individual residents, plus articles on upcoming organised activities – are delivered free to household letterboxes as per the following schedule:] *Auckland City Harbour News* Circulation up to 19,600 Wednesdays, Fridays... *Central Leader* Circulation up to 49,100 Wednesdays, Fridays... *East & Bays Courier* Circulation up to 41,500 Wednesdays, Fridays... *The Eastern Courier* Circulation up to 30,100, Wednesdays, Fridays... *Manukau Courier* Circulation up to 50,800 Tuesdays, Thursdays, Fridays... *Papakura Courier* Circulation up to 24,350 Wednesday... *North Shore Times* Circulation up to 59,000 Tuesdays, Thursdays, Fridays... *North Harbour News* Circulation up to 13,400 Fridays... *Nor-West Newsbrief* Circulation up to 9,000 Thursdays... *Western Leader* Circulation up to 55,500 Tuesdays, Thursdays, Fridays[. • ‘The NZ Community Newspapers Association has 114 members which between them publish over 2.1 million copies per issue’...

‘If you're not in Telecom's Auckland Yellow Pages you're not in business. Typically, every week more than 850,000 people turn to their copy’]...

You have just received your new... *Auckland Telephone Book* and *YELLOW PAGES* and that means it's time for your old directories to be recycled. With more than two million Auckland directories delivered each year, recycling is a great way to put your old directories to good use.

...Don't miss out... Advertise your business in the Telecom LOCAL DIRECTORY. That will ensure local customers know how to find you.

...Locating an address is now a breeze with Wises maps online. Find activities, hospitals and schools within each suburb and search UBD's local business listings for services in your area.

...Early yesterday morning, my home became the virtual property of the world. So did my neighbours' houses... The internet search giant Google has put us all on the map – literally, and with 360-degree rotational views photographed by a fleet of Holdens in a massive virtual recording...

If you give him his own map on CD... then you won't have to tell him where to go! Terramap Digital is the ultimate tool for creating your own personalised map... CDs of digital maps are available for four regions – Auckland, Wellington, Christchurch and Dunedin/Queenstown. Available from... AA CENTRES NATIONWIDE... [and usual map] stockists... or order your regional CD online at www.maps.co.nz... [The software's] special features: • High quality street and topographical maps • Attach your own images, files and text to a map. • Print, zoom, pan around and email...

A growing number of N[Z] businesses are seeking legal advice on how to stop staff downloading porn on office e-mail systems. International research shows 79[%] of employers have staff who abuse the internet. But [a]Waikato university IT specialist... says trying to police people's use of the internet is difficult. “If someone was reading a pornographic magazine at their desk it would be quite obvious... But when someone uses a computer all day it's impossible to stand over them and police it.” ...[the] Employers Federation chief executive... says companies need clear policies on what is acceptable use for work computers. “You can't ignore e-mail misuse in the workplace. There is much time wastage by staff looking at pornography instead of getting on with their jobs... Employers pay staff to do their work, not use the internet or e-mail for personal use. We wouldn't go so far as some countries and label it theft but it is a breach of trust.” ...A[US]n company Content Technologies is offering Kiwi employers a new anti-porn software programme Pornsweeper. [A spokesperson for the company] says the programme analyses photographs and dumps any with too much skin.

...*Life* magazine, whose photojournalists have recorded some of the U[S]s' most memorable events for more than 60 years, will cease monthly publication... The magazine... which pioneered the photo-essay, will continue to publish issues periodically to record special events... [L]aunched in November 1936... the... magazine was a weekly until 1972. It then published only periodically until 1978, when it went to the monthly format.

...EACH week *Weekend Life* receives cartons of books for review. We sift through the piles and consign the vast bulk to the bottom shelves of the cupboard. This is often accompanied by a moment's sadness that so many trees have died to produce such dreck: the diet fads, the personal-motivation bibles, the loony titles that roam the fringes of sense and sensibilities... [Recently,] we said goodbye to the 20th century, and with that we should also say farewell to a few 90s lit trends that the 21st century should try to do without. *The confessional memoir*... and... *The tell-all biography*: Chief culprit... here had to be [the US President's plaything]... Her American toothiness and desire to be famous for anything did not mean [the plaything] had anything to say. Come to think of it, her inability to speak during a sexual act was what led to her infamy. *The sports biography*: As told to some poor journo just trying to make a living. That's all that can be said to justify this one. We all have to make a living, but that doesn't make it worth reading... *The chemical novel*: Recreational drugs... don't necessarily let the prospective author transmute into another Burroughs... There's nothing so boring as listening to someone stoned. Reading about it is worse. *The telly tie-in*: Telly works because the images move too quickly for us to think about what they mean. So when telly hosts decided to provide the benefit of their wisdom in style or humour... it's like coming across the emperor in a particularly embarrassing pair of undies. *The little book of everything*: The best thing that can be said about this mini-genre of bon mots and wisdom in matchbox-sized editions is that not as many trees died to make this nonsense possible... [By the way, did you see the photograph in yesterday's newspaper of] confetti showering from skyscrapers in the financial district of Rio de Janeiro... Brazil[?] ...The annual tradition in the city on the last business day of the year sees tonnes of paper... dumped on the downtown area by citizens.

...[while some delivery people – probably children – are seemingly paid to dump circulars under trees in parks and alleyways instead of putting them in letterboxes, one of their more conscientious colleagues] can't bear to contemplate her hourly rate for delivering circulars to 600 Devonport homes. But [the Auckland] knows working 35 to 40 hours a month for \$100 will never make her rich. [The Auckland] is one of thousands of people who pound the pavements to earn pocket money or top up their pension or benefit. “Basically it helps me supplement my income, helps keep me fed and fit and keeps me motivated,” said the 36-year-old, who is on the dole. [The Auckland] has done a number of stints delivering circulars, but her present job of three months is the longest stretch [the 36-year-old] has put up with while... keep[ing] an eye out for a better job. [The Auckland]

has it down to a fine art, delivering when letterboxes are least likely to be overflowing with mail and newspapers, and timing it to avoid nasty weather and dogs. [The Auckland] does not want to say who her employer is for fear of “getting them into trouble.” The biggest company, 30-year-old Circular Distributors in Takapuna, has been attacked as heavy-handed for asking its 9000 employees to accept lower pay as it battles new industry players for clients. Nationwide, it is up against Ad Mail, Circular Publicity Distributors, Deltarg Distribution Systems, KiwiMail and other smaller operators... Changing technology has made targeting households more cost-effective for advertisers. Computer analysis of census data makes it possible to focus on suburbs, streets and even individual homes, as many people with a large disposable income know only too well. This development has led to [the] greatly increased competition... [A mother, whose 17-year-old] son... works for Circular Distributors in Hamilton, has spoken out against its new delivery rates, which... could halve distributors’ income. [The mother] says the company’s letter to workers implied that signing the cut-rate contract was compulsory... A [n A]uckland University associate law professor... said it was illegal to force employees to sign a new contract if they already had one. “There seems to be an implied threat that if they don’t sign, they’re going to be made redundant. That could be seen as harsh and oppressive under the Employment Contracts Act. If people are agreeing, then there’s no problem. They’ve accepted it and that happens all the time.” But the schoolchildren, elderly people and beneficiaries who haul bags of circulars around the suburbs are among the nation’s most vulnerable workers... Leaflet distributors already earned so little there was no point in their paying to belong to a union and even less pain in taking a case to the Employment Tribunal at a cost of \$70.

...*Junk mail mountain keeps on growing*... We moan about junk mail – but for most of us that is all we do. A survey commissioned by N[Z] Post has found that just 6[%] of letterboxes have signs spurning unsolicited advertising. The signs do work, say distribution companies... Circular Distributors Ltd, said the volume was definitely increasing and the Auckland region received up to twice as many mailouts as elsewhere. [The] company... would deliver more... [than] half a billion items to N[Z] homes... this year. Once a mailout went out, “a retailer knows what time their tills are going to start ringing.” ...research showed that 72[%] of household shoppers usually read advertising put in their letter boxes. Environmental groups do not want mass mail to increase... [T]he Royal Forest and Bird Protection Society... hoped companies would start to use the Internet rather than persist with mass mailouts.

...NZ Post’s... staff have been told to stop delivering letters so quickly as... [its] profits are squeezed by a big drop in mail volumes. At an emergency meeting at the NZ Post Auckland mail centre on Wednesday night, workers were told the state owned enterprise had lost money last month. It plans to cut costs by banning overtime and suspending staff recruitment. As a result, people living in towns such as... Gisborne, Fielding and Masterton may soon be waiting an extra day or two for mail to be delivered. Until now, NZ Post has often delivered standard mail to these centres the day after it was posted. Auckland staff were issued with a memo saying... “Our costs are down only 3[%] but revenue’s down 12[%]. Volumes are falling – down 6[%] on last year. Effective immediately, we need to: stop all... excess hours... and... roster annual leave for those with high balances.” The next immediate step that would be taken was to “stop over-achieving our service standard...”

...Four years ago when I became Chair[person of NZ Post, the SOE] operated in an environment where letter growth was strong... and we... [had a] monopoly on that service... While we continue to compete strongly, [there are an increasing number of companies handling a decreasing volume of mail]... The deregulated letter market brings a new level of uncertainty for our business[– and the seemingly farcical situation whereby every red NZ Post postbox is now accompanied by a blue postbox belonging to our main competitor National Mail!] We cannot predict the impact on our market share. While we accept a competitive market leads to... better value for customers, the short-term effect on N[Z] Post is likely to be adverse... [However, w]e believe there is still potential for growth in this market because per capita mailing in N[Z] is lower than in many other [First World] countries. On average, every N[Z]er receives 286 letters per annum. In some parts of Europe that figure is more than 400 while in the U[S] it is well over 600. To gain the edge in the communications market, we must continue to explore and develop opportunities that extend beyond the core of [our] business... Post Plus Group is vital in this process. Charged with delivering the future for the company, the past year has seen the development of several products that will sustain growth. One example is the “Find ’em, Keep ’em” direct mail product aimed at small to medium business customers. Successful direct marketing will yield spin-offs in targeted advertising material and fulfilment of the advertising response. We also believe there are opportunities to leverage off the growth in electronic communication.

...Another company has entered the postal market, offering mail delivery to the seven main central business districts for 30c, undercutting NZ Post’s standard letter rate by 10c. Document Exchange (DX) established its rates for next-day-delivery in Auckland this month, after testing the service in Christchurch. The CBD-to-CBD service also operates in Whangarei, Hamilton, Wellington, Nelson and Dunedin, with further expansion planned. Stamps are sold in packs of 50 or 100. The mail must be street-addressed mail and lodged at a DX “exchange,” or dropped off there by courier. There are 10 exchanges in the Auckland CBD. NZ Post Boxes cannot be used. Since deregulation... NZ Post has faced competition from new operators, including Fastway Post (letters can be posted at franchised retailers or at NZ Post outlets), National Mail (post at Warehouse stores[and the company’s blue postboxes]) and Posties Choice. Apart from the competition, the official stamps the companies issue are proving a bonanza for the country’s estimated 100,000 stamp collectors.

...[National Mail has gone into receivership. Its blue postboxes will all have their slots sealed up to prevent people from continuing to place letters in them (but the postboxes themselves won’t be removed immediately – and their blue poles will remain in the ground, adjacent to NZ Post’s red postboxes, indefinitely). In international news, a] chain letter launched in Britain in 1989 to realise a sick child’s dream has taken on its latest incarnation as a nightmare for his whole family. [The child] began the “round robin” letter appealing for get-well cards to be sent to his home in Surrey after [it] was diagnosed with what doctors thought was terminal cancer. Eleven years on, the letters are still arriving – [the child now] has more than 150 million – and the family just wants them to stop. A new version is being circulated in which... the request has become one for business compliments slips rather than get-well cards. A Royal Mail spokes[person] said: “We consider this to be a form of harassment. It is a nightmare for the... family and we would call on people not to respond to chain letters. The cards date from an appeal 11 years ago when [the child] wanted to win an entry in the *Guinness Book of Records* for the largest collection of get-well cards. On some days they receive up to 10,000.” The letter says they are for a “7-year-old with terminal cancer,” but [the 7-year-old], now in his early 20s, recovered from his brain tumour. [The child] became a celebrity at the time of his original collection and amazed people with his bravery and resilience during treatment for his illness.

...There may be some truth behind the infamous line “the cheque is in the mail”. The Royal Mail said yesterday that last year alone, it counted... 250,000 cheques... with a value of £175 million... that were undeliverable because of poor addressing. And the problem is increasing... The National Return Centre... says... [t]he total of undeliverable items handled each year tops 72 million. The worst offenders for wrong addressing were people failing to include a postcode in an address, which made a letter take 20 times longer to sort. But the service also receives post with no delivery address at all, or illegible or completely inaccurate delivery details.

...*The cheque’s not in the mail*... Brazen mail thieves may have taken up to \$14,000 worth of cheques from post boxes in Waitakere City. The National and ASB Banks are holding 15 suspect cheques presented to tellers in a bid to obtain cash. Police are investigating five other cases... [Meanwhile,] Twizel residents have come to the defence of the town’s postie, who has been fired by N[Z] Post after about 400 undelivered letters were found at her workplace. [A businessperso]n... was shell-shocked at the news that the mail did not always get through... There were a couple of cheques... years ago, but they were never cashed, and [the businessperson] simply reissued cheques. For five years the service had been excellent.

...The cheque may be in the mail... but even if you send it by registered post, there is no guarantee it will be delivered. [A resident] of the Auckland suburb of Waterview, is outraged that a £1000... bank cheque sent to him from England... has gone missing, even though it was sent

through the registered post tracking system. [The resident contacted NZ] Post's subsidiary company, Courier Post, on [the 24th] to see where the cheque was. The company said it was at its Mt Wellington depot because a courier had found no one at home on... the... 11[th]. But when the resident] phoned again on Wednesday, [the resident] was told it had been lost. The cheque was last recorded at the depot, and [the resident] says his elderly aunt in England now has to cancel it and resend the money. "When they told me they had lost it I was fuming... I can't pay the rent and have had to borrow money from a friend,"... [A NZ Post spokesperson]... said it was highly unlikely the cheque had been stolen. Courier Post believed it was in its system somewhere. NZ Post and Courier Post delivered 1.6 billion items each year, and 15 in a million went missing. "Every time something like this happens we're disappointed, but we're doing what we can to look into it." ...Courier Post's security team was investigating and NZ Post would pay the cancelled cheque fees and bank draft charges [that the resident]'s aunt might incur in resending the money. "Even though it's a registered item, registered items to be sent overseas shouldn't include things like cash, jewellery and cheques... You should not send items of value like that through any sort of post. It should either be sent via a bank draft or direct-credited. Those are the ways of transferring funds securely."

By the year 2000 most postal systems, separated from their national telephone and data systems... have become expensive luxuries and sending and receiving physical mail, as opposed to the kind which arrives direct in the home via a special black box... ha[s] become rather... archaic... One adjunct of sophisticated home-text systems will almost certainly be direct access to libraries[– especially now that 'dense or long-lived informational material can be stored more efficiently by computer laser disc than with any book or microfiche (in addition, disc storage media are as durable as they are compact; they don't fade or wear out with use, don't scratch or get bent). Because of these advantages, libraries will put their huge archival files on discs, freeing up space and improving user access to the files.'] Of course the vast backlog of human literature will remain as it is, and fiction will probably continue to be read from paper. But so flexible will the display systems for text... become that it will seem more sensible for ephemeral information to be acquired electronically than physically. Since the display system can be made to have all of the flexibility and mobility of a book or magazine, there exists no argument of convenience and many arguments of cost against maintaining the present cumbersome system. Why supply every home with an enormous set of telephone directories, which largely contain redundant information, when an individual can be supplied with the required nugget of information in a fraction of a second without the physical costs of creating and distributing the whole of a city's telephone numbers?

If the provision of communications was united under one ministry, unnecessarily wasteful activities such as producing telephone directories could be stopped. For example, instead of annually providing at least 5kg worth of directories (excluding the weight of *local directories*) to every home and business in Auckland so that each has physical access to addresses or telephone numbers – the majority of which they'll never need to use – such details should only be listed on the Internet, and a free operator service can be maintained for people who are unable to access the Internet via their home or workplace (eventually, every home and workplace ought to be connected to the Internet – but until this is the case, cyber cafes could continue to operate, or people who don't have access to the Internet via their home would go to a public library). Changing from an economic system to a non-economic one will largely or totally eliminate the need to produce *Yellow Pages* (and definitely eliminate the need to produce *junk mail*). Likewise, as money is phased out there would be a decreasing need – or no need – to produce paper receipts, accounting records (and whatever accounting records need to be temporarily maintained could simply be stored electronically), shareholder reports, etc. The transfer of information within and between ministries via physical paper can also be phased out in favour of electronic methods, and there should be little or no justification for members of the public to continue sending letters (or cards for Christmas, birthdays, etc.) – thereby reducing the need to produce sheets of paper and envelopes (while eliminating the need for homes to have letterboxes, and for communities to have postboxes, postal sorting centres, posties, stamps, etc.) – because they can use e-mail or a telephone instead. However, while postal services are maintained for ministerial purposes, private mail could still be handled – but be discouraged via high prices (whereas ministerial postage would have to be sent for free).

There would no longer be any justification to charge for e-mail and phone calls – be they ministerial or private – but, at least until overloading is no longer a problem, private calls can all be rated per minute (with the cost increasing along with the distance the call has to travel) and private e-mail per message. However, households could be allowed to spend \$x(# people living in a house)/week or month before being charged anything. Public phone booths – which ought to be free (e.g., for emergency purposes) – can all have toll-bars on them, whilst ministerial calls could be monitored in an attempt to discourage illicit phone use via workplaces (and mobile phones – which can all be like a wristwatch for ease of use – ought to only be used for ministerial purposes). There should be less requirement to make long-distance calls for ministerial purposes in a non-economic society – especially when every district is as self-sufficient as possible – and, if a time comes when people no longer have any reason or opportunity to move from one district to another (r:p2348, lns22-3), individuals who have a social attachment to people from outside their own district will gradually become rare if not extinct, which means the number of long-distance calls made for personal reasons ought to decrease continually until they don't need to be made any more! Incidentally, novelty phone numbers (e.g., astrology, tarot, gaming, phone-sex services) should be shut down – at least as a source of employment or revenue-generation.

It isn't essential for people to be able to see who they are talking to via phone or computer but, since the technology (including the ability to video-conference; 'video cell phones that allow people to see the caller – if they have a similar phone – are now on sale for \$600') is available, it would be sensible in future to combine a household's communications equipment into one unit – r:p2356, lns38-9 + 60 (such a unit can contain a radio – with radio broadcasts going via the Internet, perhaps; but it might be preferable to also provide each house with a wind-up radio so residents have a back-up means of listening to news and official broadcasts during power failures or civil emergencies that is portable enough to be taken on outings such as picnics). If future houses are divided into quarters – and are *square shaped* as opposed to being *circular* (r:p2204, lns39) – this communications unit could be placed in the centre of the house, and either have a separate screen and control panel facing each quarter (meaning, for example, that while someone in the kitchen is reading a recipe via the Internet, another can be watching TV in the lounge, a third person can be watching a different TV programme in the main bedroom and, in the spare bedroom, a fourth person can be having a phone or e-mail conversation with someone who is in another building) or one screen and control panel that rotates (hence the equipment can only be used in one room at a time). If the unit is voice-activated, physical control panels would be unnecessary.

This type of home communications system would enable workers who use a computer at work to perform tasks from home – but telecommuting ought to only be used when weather conditions favour staying indoors rather than travelling; when a worker is too sick to travel to work but not too sick to perform routine computer tasks; when a parent has stayed at home to tend to a sick child. Furthermore, if some school lessons are broadcast to various age groups via TV channels (r:p1921, lns47), children who have to stay at home due to illness (or as a punishment) can still watch them – and, perhaps, use an Internet link with their class to follow other lessons (there ought to be no need for each classroom to have more than two computers for Internet access, but if schools have on-site libraries they could have extra computers)? Note that if classrooms had desktops which students could write on then wipe clean, that would help to cut down on the amount of paper used by the Education Ministry. Smaller blocks of the substance used to make such desktops could be hung on a wall within each house so residents don't need to use paper when writing notes to themselves or other members of the household (household computers could be used for this purpose, but notes stored in a computer are less visible – and, therefore, forgettable). If people have to place a weekly or monthly order for household goods (r:p2206, lns16), required items could be listed on this pad – and such orders could be placed over the Internet. Amongst other currently available printed products that needn't be supplied in future would be calendars – because people could access calendars via the Internet. However, in order to facilitate the uniting of human society into one worldwide political system, everyone would have to adopt the same calendar

year. Rather than have relevant authorities argue over whether to maintain the Jewish, Chinese, Christian, or whatever system of counting years, computers could all be reprogrammed to begin counting years from zero and continue on to infinity – perhaps preceding the year with a *y* (e.g., *y*0, *y*1, *y*2, etc.), in order to differentiate future years from those of the past (which could still be designated BC and AD); alternatively, each year that comes after year zero could be preceded by a plus sign (e.g., +1, +2) and the years before year zero would be preceded by a minus sign (and count backwards – i.e., if the existing Christian year 2000 is used for the starting point, as an example, 1000BC becomes year -3000).

If Internet access is no longer controlled by a multitude of revenue-generating private companies – and the type of work people can perform is controlled – it ought to be easy to shut down pornographic and other undesirable Web sites; to prevent or minimise viruses, hacking, etc. (after all, in a united, non-economic world, there would be no justification for ministries to keep secrets from each other or members of the public – except for information such as patient health records – and, therefore, less motivation for people to try and hack into systems that they have no business entering; while there should also be fewer opportunities and incentives for anyone – be they an individual or anti-virus company – to create and distribute viruses). Ministries can share databases as much as possible to avoid duplication of stored information – which means that computer programmes and equipment would have to be compatible – and information that is obsolete, or no longer required for other reasons, ought to be deleted from storage systems (although a hard disc copy of such information – e.g., the original back-up discs – could be kept at one location, or a separate location for each ministry, in case any of it ever has to be retrieved). Note that scientists are developing ‘chemical computer chips whose wires are measured in atoms and have a million times more storage space than standard chips’.

During July-August 1996, every Aucklanders who bought a *NZ Herald* 6-days-a-week and a *Sunday Star-Times* received an average of 20 sheets of newsprint per day (with each sheet of newsprint being about the size of 4 sheets of A3 paper – r:p1168, ln40). Contained within these 20 sheets was approximately 2.75 sheets of genuine news – some of which merely repeated what had been printed the day before – and approximately 2.5 sheets of sports news (although the sports content was greater than normal at that time due to the Olympic Games, and the outlay of the *NZ Herald* has since been altered – during the same period of 1997 [when an average of 18.32 sheets were used per newspaper] the average amount of genuine news was approximately 2.42 sheets, or 3.56 if business news is added, and there were 1.73 sheets of sport). The remaining pages contained classified sections, other advertisements, business information and ‘incidental news items, human interest features, and less significant information.’ In a non-economic world there would be no justification for producing newspapers (and newspaper reference journals – as are published by papers such as the *London Times* and *New York Times*) any more because classified sections won’t be required, any business information can be handled in-house by each ministry, incidental news, etc., shouldn’t be touched (magazines that are devoted to such items or gossip, fashion, propaganda, pornography, etc., should also cease to be produced in future – thereby destroying the careers of the paparazzi and models), and genuine news items can be delivered by TV and radio – with broadcasts posted on the Internet (which could be used as a means of storing news broadcasts for future reference).

Radio – if maintained in future – can just be used as a means of broadcasting news and public information that relates to each district, while TV broadcasts a mixture of local news and news from other districts (note that news editions won’t need to include a financial segment – covering exchange rates, sharemarkets, etc – but, until no one is dying from starvation, preventable diseases, murder, suicide, etc., the numbers of deaths from such unnatural causes could be collected and publicised in place of financial information). Each district would only need to have one department for radio news and one for TV – which means some news stories will be attended by two reporters (or one reporter from the radio department and a reporter plus video-camera operator – who could be an apprentice reporter – from the TV department; standard photographers shouldn’t be needed to cover news in future because stills can be taken from video-camera footage and, anyway, static photographs would be predominantly or totally redundant in a newspaperless world), as opposed to the current situation where a multitude of reporters (including photographers and camera operators) sometimes turn up to cover a single story (Q: How many members of the press does it take to change a light-bulb? A: 10 – one to perform the act, plus 9 to write their versions of the act or photograph it!) – or a combined department, with radio broadcasters using transcripts of TV broadcasts and only one reporter turning up to cover each story (or a reporter and video-camera operator – although one person ought to be able to conduct reports and operate the video-camera). As long as the right type of people (i.e., those who are honest, concerned about injustice but also non-judgmental, and thoroughly check their sources) are employed to collect and deliver news, there shouldn’t be any question about whether or not the news stories being produced by a single news organisation are accurate. By the way, there is no reason to show the face of reporters – it is only necessary to hear their voice – and even TV news presenters can perform their job without showing their face on screen!

News broadcasts could be produced daily – with the same hourly programme being repeated throughout each 24-hour period so each citizen can watch or listen to the news at whichever time best suits it – or be updated hourly (with each story remaining on the bulletin for 24 hours before being substituted by a newer one). If necessary, a second TV news channel could be devoted to in-depth current affairs programmes (including programmes that handle opinions rather than facts – although people should only be able to *talk shir* in private), which would be operated by a worldwide department of the Communications Ministry. This department can collect items from different districts to produce articles for such programmes itself or, if all of the relevant information is sourced from only one district, commission that district’s news department to produce an article.

The Communications Ministry should also be responsible for producing weather forecasts (which can be distributed with news broadcasts and via a free phone service or the internet), and they could be made by a computer programme rather than humans. Every satellite in existence could come under the control of this ministry, which should aim to minimise the number of satellites launched in future (e.g., by trying to protect satellites from damage while in space, thereby extending their life-expectancy; by launching multi-purpose satellites – i.e., satellites that can be used for meteorology, communication and any other required services; by ceasing to launch satellites to reflect sunlight). Incidentally, although weather forecasting and many other services can be entrusted to computer programmes, important decision-making can’t (and even if it is possible to create such a computer, there is no reason to try). As long as the right types of people become responsible for making important decisions, the human brain will be more than adequate for that purpose.

It will be easy for the district ministers of each ministry to get together for meetings, but problematic for state and world ministers – unless they all live in the one location. However, it wouldn’t be necessary for state and world ministers to all live in one location because their meetings can be held using video-conferencing technology (and such meetings could be broadcast on a TV channel – the second news channel, perhaps – so that members of the public are able to listen to what is being discussed during such meetings) – so there would be no world or state capitals (‘New York is the self-proclaimed capital of the world’). Assuming that world ministers will be spread around the world, scheduled meetings would have to be held at alternating times of the day to compensate for the fact that the ministers will mostly live in different time-zones (i.e., although a minister will, on occasions, get to attend such meetings at 9am according to clocks in its district, other meetings might be held at 11pm, or 3am local time – but at 9am in another minister’s district). To make it easier for world ministers to attend such meetings – and to be contacted at any time of the day during emergencies – each district could have a couple of centrally-located houses which only differ in design from standard two-bedroomed ones by featuring an extra room that would be suitably equipped for use as a minister’s office (and double as the location from where a minister can attend video-conferenced meetings). Upon being promoted to the position of state minister, a person – and its immediate family (although by the time someone has become a state minister its children might be grown-up) – would move into one of these houses. There ought to be two of them in case a district happens to be simultaneously represented by more than one state or world minister – although that is likely to be a rare event. While a district is represented by only one or no state/world ministers, the unoccupied house(s) could be used to accommodate official visitors to the district (e.g., workers – be they ministers or not – from other districts) or as temporary accommodation for any residents of the state who suddenly have to leave their permanent accommodation (e.g., because it has been rendered uninhabitable by some form of damage).

PLAY

N[Z]ERS who are justly proud of their world-famous scenery, splendid shooting and fishing, etc., are perhaps a little inclined to under-rate the value of their birds. The majority of people might even think that were all the feathered denizens of the bush to disappear it would make no difference... [NZ,] however... is probably more dependent than any other country in the world on birds for the propagation of her forest plants... [T]he seeds of [65%] of the forest plants and trees, including every single timber tree except the kauri and beeches, were dispersed solely by birds. Without their presence the bush would be non-existent. This appears impossible, but it is absolutely true. Moreover, birds are our chief allies against insects... 'It is considered by many competent authorities that if all the birds were destroyed human life would become extinct owing to the enormous swarms of insects which, unchecked, would devastate the world.' ...It should be emphasized that we have no means of replacing our indigenous species if they die out, seeing that some of them are found nowhere else in the world. Each of these species has special functions to perform which no other bird can take on. The unhealthy state of our native forest too often is due to the loss of a class of bird evolved to control enemies of timber. The most important example is the Kaka. This... bird used to be present in vast numbers, but has now dwindled below the point where it can have much effect on beetles... Like the Woodpecker of the Old World... Kakas bore for and destroy grubs... Blue-wattled crows search the floor of the forest for beetles and grubs, whilst the fantail, in addition to killing insects of all kinds, is the deadly enemy of the codlin moth. Bushwrens are inveterate insect-hunters, working over every inch of the boles of big trees, and searching cracks and crannies in the bark. Moreporks destroy wetas, i.e., green timber borers. True, they occasionally make a meal of other birds, but more often than not it is sparrow-pie that they indulge in. [NZ (Wood) P]igeons, Tuis, Bellbirds and other honey-eaters all assist in pollination work. These facts in themselves are sufficient to make us wish to protect our feathered friends, which in addition to their usefulness, gladden us with their playful ways, glorious song, and marvellous plumage. Many people do not realize that of the indigenous birds, seventy-six species or [36%], are peculiar to N[Z]... Even Great Britain with all her wealth of bird life cannot boast of anything like that number. Moreover in addition to their uniqueness, some of these N[Z] birds are extraordinarily interesting. Take for instance the many flightless birds of which N[Z], not a large country, has more than any other place, and which by reason of their helplessness are specially open to destruction. In prehistoric days there existed a large flightless goose in addition to the now extinct Moas. The latter are said to have been much reduced in numbers by the hardships of a glacial period, which they survived merely to be exterminated by the moa-hunters. Other birds incapable of flight are the Takahe, recently rediscovered in the mountain strongholds of the south-west of the South Island, the Wekas or large Rails, and the Kakapo or Ground-Parrot; whilst everybody has heard of the Kiwis. That all these birds are flightless is probably due to the fact that they never had carnivorous beasts to contend with and that N[Z] possessed a good climate... The Wrybilled Plover is the only bird in the world with a beak to one side. Its bill curves sharply to the right, enabling the bird to forage for food under stones... *A History of Birds*... writes that when in search of a meal it invariably walks round stones from left to right. The black band round its breast is wider on the left side. The bird thus becomes invisible by closely resembling its surroundings... The Huia's command great interest, as they are the only birds in the world where the [cock and hen] have totally different bills. The cock bird's bill is short and slightly curved, that of the hen is twice as long and acts as a probe... These birds are among N[Z]'s greatest assets[(the 'Huia – which was noted for its green black plumage – has been extinct since 1907 as a result of shrinking forests and over-zealous specimen-collecting for overseas museums' and milliners)]. In her galleries and museums N[Z] cannot attempt to rival the wonderful art treasures to be found at the Louvre in Paris or the British Museum in London, but N[Z] can attract visitors from all parts of the world to see her incomparable birds... The first and last thing one sees on leaving or approaching land are our feathered friends, and there are very few places where no bird of any kind is to be met... Birds' flight is, of course, wonderful. It is not, however, always realized the huge distances birds at times cover. Our... Godwit comes from the tundras of Asia, whither it returns to breed. Swallows reach N[Z] occasionally from Asia... The problem of migration is most interesting, and much has been written on the subject. Perhaps the most feasible explanation of their annual pilgrimage is that the birds are following the land route taken by their direct forbears before the ocean covered many lands now submerged. When the sea began to encroach, these early migrants crossed narrow strips of water knowing what lay beyond, until their present descendants cross huge stretches of sea by instinct. The sociable habits of birds are usually dictated by curiosity, desire for food, or protection... During the winter months, [cock and hen] birds often gather together in separate flocks, as is the case with Chaffinches, Buntings, etc.; whilst birds band together... [again] to rear their young... The Kiwi lays the largest egg in the world in proportion to the size of the bird... Where the egg is large compared with the size of the parent, the chick is able to run about and feed itself immediately it is hatched... Game-birds, Ducks, etc., run the moment they leave the nest... Ducks raise large broods, but very few reach maturity... Stoats, cats and rats are all deadly enemies of our feathered friends, whilst in some countries the unfortunate birds have to deal with [gun]s as well... More patience is required to 'shoot' a bird with field-glasses than with a gun, but the results are correspondingly better... The chicks of... [the] Little Grebe... spend much of their time on their mother's back. In cases of danger, Grebe have been known thus to remove their young to a place of safety, a habit Woodcock also have. When feeding their little ones, parents work very hard until they themselves are often worn out. A little Blue-Tit... was known to have made 475 journeys in seventeen hours. Parrots and gregarious birds such as Linnets, Goldfinches, etc., feed their young mainly on regurgitated food (usually half-digested seeds). Cormorants, Shags, etc., obtain their meal by inserting their heads down their mothers' throats and removing the fish in their pouches. Petrels feed their nestlings largely on oil, distilled from the fish they eat. - 1957

It is an extraordinary fact that... [when sportspeople] of an area want to 'improve' fishing in a reservoir, they prevail on authorities to dump quantities of poison into it to kill the undesired fish, which are then replaced with hatchery fish more suited to the sports[people]'s taste. The procedure has a strange, Alice-in-Wonderland quality. The reservoir was created as a public water supply, yet the community, probably unconsulted about the sports[people]'s project, is forced either to drink water containing poisonous residues or to pay out tax money for treatment of the water... To an ever-increasing degree, chemicals used for the control of insects, rodents, or unwanted vegetation contribute... organic pollutants... There is no dearth of [people] who understand these things, but these are not the [people] who order the wholesale drenching of the landscape with chemicals. And where are the [people] who supposedly understand the value of proper habitat for the preservation of wildlife? Too many of them are to be found defending herbicides as 'harmless' to wildlife because they are thought to be less toxic than insecticides. Therefore, it is said, no harm is done. But as the herbicides rain down on forest and field, on marsh and rangeland, they are bringing about marked changes and even permanent destruction of wildlife habitat. To destroy the homes and the food of wildlife is perhaps worse in the long run than direct killing. The irony of... all-out chemical assault[s] on roadsides and utility rights-of-way is twofold. It is perpetuating the problem it seeks to correct, for as experience has clearly shown, the blanket application of herbicides does not permanently control roadside 'brush' and the spraying has to be

repeated year after year. And as a further irony, we persist in doing this despite the fact that a perfectly sound method of *selective* spraying is known... Selective spraying was developed by... a... director of a Committee for Brush Control Recommendations for Rights-of-Way... at the American Museum of Natural History... It took advantage of the inherent stability of nature, building on the fact that most communities of shrubs are strongly resistant to invasion by trees. By comparison, grasslands are easily invaded by tree seedlings. The object of selective spraying is not to produce grass on roadsides and rights-of-way but to eliminate the tall woody plants... [- that can] present an obstruction to drivers' vision or interference with wires... [-] by direct treatment and to preserve all other vegetation. One treatment may be sufficient, with a possible follow-up for extremely resistant species; thereafter the shrubs assert control and the trees do not return. The best and cheapest controls for vegetation are not chemicals but other plants. The method has been tested in research areas scattered throughout the eastern [US]. Results show that once properly treated, an area becomes stabilized, *requiring no respraying for at least twenty years*. The spraying can often be done by [workers] on foot, using knapsack sprayers, and having complete control over their material... Treatment is directed only to trees and exceptionally tall shrubs that must be eliminated. The integrity of the environment is therefore preserved, the enormous value of the wildlife habitat remains intact, and the beauty of shrub and fern and wildflower has not been sacrificed... A[nother]... advantage... of selective spraying is the fact that it minimizes the amount of chemical applied to the landscape... Here and there the method of vegetation management by selective spraying has been adopted. For the most part, entrenched custom dies hard and blanket spraying continues to thrive, to exact its heavy annual costs from the taxpayer, and to inflict its damage on the ecological web of life. It thrives, surely, only because the facts are not known. When taxpayers understand that the bill for spraying the town roads should come due only once a generation instead of once a year, they will surely rise up and demand a change of method. - 1962

...as super-technology and almost universal automation make more and more existing work unnecessary... the working day, the working week, the working year, and the working life will all be reduced; most people will find their main satisfactions not in work but in leisure... - 1978

OUR ANCESTORS' recreation came at the end of six-day work weeks with working days twelve or more hours long. Now that the average employee puts in less than half that many hours on the job, a large industry has developed around leisure-time activities. It will grow still larger as the working week continues to decline and the drivers of change extend even further the range of choices available for sports and hobbies... Most healthy people need challenge, and as work diminishes its claims on their time they will turn to sports to satisfy that need. We can expect to see ever-higher standards in amateur athletics... For people who like outdoor activity but lack the strength, ability, or time to acquire the necessary skills, there is a further revolution in store. When microcomputers and automation are applied to sports equipment, we will be offered surfboards that always stay under the surfer no matter how uncoordinated [the surfer] may be, and powered gliders that won't let themselves be stalled – they will land safely even if their owners could never pass a flight test.

...Some of the most dramatic examples of the impact of changing technology in everyday life come from the area of transport... I have already mentioned the possibility of... develop[ing] efficient public transport services which do away with the need for many private cars... [and] replacing many journeys by telecommunications... But... while it is clear that the patterns of travel may change, it is far from clear that there will be less travel overall in the future... [- because] good communications do encourage some forms of travel, with people persuaded by what they see on TV to visit exotic places for holidays... So... more leisure time may mean less travel to work but more travel to play... Apart from this... [t]here is a real possibility that the printed book or newspaper might be displaced by computer linked video systems, for example... Holography – true three dimensional imagery – and other laser applications, video cassette equipment, home computers linked to communications systems, or TV/telephone communications systems linked to centralised computers, wide use of optical fibres and other possibilities become very likely in... future... - 1981

Playing in the Future... Video games have become the new national pastime in the U[S], and their popularity is spreading around the world. In the late 1970s, Japan experienced a severe yen shortage because too many coins were being gobbled up by video arcade machines... As the technology behind electronic video games progresses, there will be hundreds of options, decisions and maneuvers confronting human players with each particular game. Manufacturers say that as electronic challenges become more sophisticated, psychological problems posed by [hu]man-verses-computer confrontations may take on greater significance... [G]ame companies are toying with the idea of robot games. Technology will continue to advance at an increasing rate, but [humanity]'s baser instincts will not change. One of these instincts, the lust to see “the kill,” may be revitalized in a game of the future, *Gladiator Robots*. This would be a violent game for the very rich and decadent. Patterned after the pagan Roman circus, future elitists would buy and program demolition robots equipped with a variety of weapons. People and their robots would get together in a carnival atmosphere and pit one robot against another for a metallic duel unto death, or a “thumbs down” decision... Fantasy and role-playing games will... attract more players in the future. These games are successful because they rely totally on the imagination of the players... Many spin-offs of the original role-playing game, *Dungeons and Dragons*, exist today, and many more will be created in the years to come. Some experts say the introduction of computers into fantasy games will make them even more successful. Computer programs will help simplify the bewildering sets of rules that accompany the games... [E]ventually a... melody derived from a computer music-generation program [will] reach... the top of the music charts. Unlike the synthesizer and computer music melodies of the 1980s, this song [won't have been] created by a human composer working through a computer-controlled instrument; the computer itself [will have crafted] the melody, fe[d] it through the instruments, and record[ed] it.

...“The music of... the voice... is in danger of being lost[.]” Gandhi once said (this will be doubly tragic if eventually ‘an eye for an eye makes us all blind’). Gandhi also said[.]... “Purity of life is the highest and truest art... for what is art without the sure foundation and framework of a noble life?” - 1982

...it is true... that creativity is favoured neither in education nor on the labour market. A new equilibrium with more creativity is... [often] called for... But... [o]n the other hand the importance of creativity has its limits. When exclusively directed at personal development, without any relevance to the happiness of others, creativity is sterile, and too many who call themselves artists appeal for public support, simply to live a life of their liking. Many branches of art are at a low level of performance today and may later be compared with nineteenth-century architecture – nothing to stand beside Roman, Gothic[or] Renaissance... architecture... Culture is also at an all-time low when it comes to the care for young... children. The relative weight given to the entertainment of considerable numbers of parents is out of balance with the needs of children, clearly identified by child psychologists. More examples could be given: presumably vogues in culture have always existed, but one wonders whether the increased intensity of communication has not amplified the vogues, and the swing from one vogue to the next, at a high price in human happiness. Rightly, therefore, a search for new life-styles is going on, which are meant... to adapt human behaviour... A new life-style should also exhibit a higher degree of long-term thinking, and this implies the avoidance of over-consumption, of the kind which makes itself felt later in life, when the individual is confronted with the consequences of over-indulgence in alcohol or meat. - 1983

The relationship between a person and another animal can be a beautiful thing, fraught though it is with human-centred misconceptions like animals being ‘faithful’ and being ‘good’. But with the modern-day ‘ownership’ of cats and dogs, this must involve the need for slaughterhouses, an

evil which should outweigh all other considerations. Not all pets, of course, are carnivores. I used to have a dream of establishing a colony of vegetarian animals, a paradigm of peaceful coexistence where guinea-pigs and tortoises would potter about amongst brightly-plumed birds and other decorative creatures, without fear. But apart from the massive importation of grains that this little prison camp would need, healthy breeding animals outside their natural environment would soon overpopulate their home. There would have to be either a trade to local pet shops, with all the horrifying possibilities that would involve, or a mass sterilisation or isolation programme for the inmates. In my view there is no justification for tampering with other animals and their environment in such ways. My old dream now seems very sentimental indeed. Zoos are another ancient barbaric institution which fill me with horror. Guy the gorilla (RIP), prisoner and star attraction of one of our most respected zoological institutions, whose family group was slaughtered in order to bring him to his new home, used to symbolise the utter hopelessness of the situation of animals like him. Two modern excuses for maintaining zoos (which exist primarily to make money for people – even a job after all is a vested interest) are for their educational role and for protecting endangered species. But to observe animals in captivity (even in so-called ‘safari parks’) is only an education in the ways of human insensitivity. Removed from their natural environment with its thousands of ever-present intricate demands, they can do nothing but sink into inactivity or patterns of repetitive neurotic behaviour. Surely natural history books, and films of animals in the wild, are a far better education in the ways of animals. And as for the conservation aspect, it is certainly more cost-effective in terms of protecting endangered species (i.e., many species, not just a few captive specimens) to spend money on preserving wild areas than on breeding animals in zoos. There is already a list of creatures extinct in the wild that exist in zoos, and for which it is virtually impossible to recreate a natural habitat. Protecting our few remaining natural animal habitats must surely now be the most urgent priority. I assume it is not necessary here to go deeply into the question of circuses, and I welcome the fact that several District Councils have now banned from their land circuses which use ‘performing’ animals. I expect the fight against cruel circuses will be won before long, but for the usual economic, not humanitarian, reasons... If I have dwelt over-long on the issue of other captive animals, it is because I regard keeping pets, etc. as part of our assumption that we may use animals as we wish... People who use animals as surrogate friends usually eat animals too. They claim affection for animals whilst turning a blind eye to the brutality we inflict upon them. This is a double standard which permeates our society. If a farmer kept a dog permanently tethered in a small pen [the farmer] would be liable to prosecution under the Protection of Animals Act 1911, yet [farmers can permanently put pigs or hens in pens too small to use a tether]... I do not wish to underestimate the enormous changes needed to bring about peace on Earth... but... regional self-sufficiency, and certainly self-sufficiency of all nations in staple foods, would be the vegan contribution to global political stability. At the local level, at least one British family of four has shown that it can be self-sufficient in food and fuel on less than four acres of land... This is less than the amount of land that would be arrived at if all the fertile land in Britain were divided equally amongst the present population. Unfortunately it does not seem that our agricultural land is about to be redistributed... [W]e are certainly a long way from a situation of each family having its own plot and producing its own food and fuel. Personally I do not favour this in any case... Self-sufficient families or extended families are not part of my own ideal, as they might not accommodate the interaction and change that are a necessary feature of reality... In a vegan future, with the science and skills already acquired, we could inhabit garden cities... which would provide food, recreation and creative employment for us all. Afforestation ideals go back as far as Plato, who spoke of happier times when Attica’s mountains were tree-clad. This is now no pipedream, but something that we can and must implement... in order to heal the wounds we have inflicted upon the Earth... There is no more land left for us to transform with animal farming into dust bowls or barren hillsides. It is time to halt the stockpiling of... beef... butter and... weapons of mass destruction. All these will be obsolete if we can manage to let the Earth and ourselves survive.

...The rocks are trying to tell us something... [F]ossils are all that remain of creatures that once strode, or slithered, or swam, or just took root... before there were any humans to take note of them... [C]ount up all the beings that leave fossils... and you discover that the vast majority by far of all the species that ever lived are now extinct... The lesson [seems to be] clear... Extinction is the rule. Life is the exception. And then you notice that the different fossil forms do not succeed each other at a uniform pace. Instead, the rocks proclaim long periods in which life changed very little, punctuated by short intervals of cataclysm, turnover, the wholesale loss of many kinds of creature all over the planet at once – followed astonishingly quickly by many new forms, clearly evolved from the survivors of the catastrophe... We owe our very existence – every one of us bigger than a mouse, anyway – to the extinction of the dinosaurs... [Yet the dinosaurs confirm that we live on] a planet where, for tens of millions of years, everything [can be] fine. It is enough to give even inveterate pessimists a sense of security. - 1985

The Pleistocene epoch... [-] the first of the two epochs forming the Quaternary period... [-] followed the Pliocene and preceded the Holocene (Recent); it lasted from about 2,000,000 to 10,000 years ago, is notable for a succession of ice ages, and also saw the evolution of... the genus of which we (*Homo sapiens sapiens*) are the modern representatives... Towards the end of the epoch many animal species became extinct. - 1986

Did... early [homo sapiens] affect their environment? Perhaps the only sensible answer is that we do not know... However, the... outstanding example of environmental impact in terms of animal populations is the phenomenon known as ‘Pleistocene overkill’. This term is applied to the history of large (adult weight 50kg or more) warm-blooded animals (usually mammals but with some birds as well) at the end of the Pleistocene, when some 200 genera of them (the so-called ‘megafauna’) became extinct... The phenomenon is perhaps most closely observable in North America: here, two-thirds of the large mammal fauna present at the end of the Pleistocene (c. 13,000 BC) then disappeared... There is no evidence of such extinctions in earlier periods which might have been expected if Pleistocene climatic changes had been the proximate cause, nor any firm evidence of survival of these genera past the 500-year period during which the extinctions appear to have taken place. These data have led to the hypothesis that it was the introduction of [humanity] as a predator against which these mammals had no genetically implanted defence behaviour which was the cause of extinctions. In North America, the date of introduction of [humanity] via the Bering Strait land bridge is usually taken as being about 12,000 B[C], and a simulation of the extinction pattern supposes a wave-front advance by hunters whose population periodically exploded because of the new and favourable habitat... Some support is given to this hypothesis by the effects of the arrival of [humanity] into other hitherto unpeopled places. The disappearance of the moa bird from N[Z] occurred within a few hundred years of the human occupation of the islands; the megafauna... of Madagascar disappeared within a similar period after the first human occupation in AD 1000... In the course of time, humans have changed many ecosystems and introduced many species to parts of the globe to which they were not native. Like so many other processes, these transfers speeded up in the [19]th century with the availability of steamship and railway transport. These displacements have produced many benefits but have had an adverse side as well since some immigrants have proved to be unwelcome citizens: few loyal [USer]s would now admit the European sparrow and starling if they had the choice of keeping them out, and A[US]ns would cheerfully poison the last rabbit... [- t]he line of the Western A[US] rabbit-proof fence[is] analogous to the Great Wall of China in its attempts to keep out the unwanted... [-] and burn the last blackberry bush... It is perhaps a truism that when wild nature is everywhere, no human societies have shown much interest in an altruistic protection of it. Pragmatic reasons such as the perpetuation of a food supply or the maintenance of animals for hunting may have been widespread, but the disinterested preservation of wild plants, animals and ecosystems was rare... [until some 19th- and 20]th-century gardens tr[ie]d] to be totally wild and thus go back beyond agriculture to hunting and gathering or, very likely, the Garden of Eden itself... In industrialized places, gardens are the closest parts of many people’s environment which are consciously non-industrial. Be they private plots or public parks, they symbolize a rural scene... Mass travel of pleasure-seekers as distinct from armies seems to date initially from the [19]th century advent of railway and steamship which brought

down costs and made feasible conducted tours such as those arranged by Thomas Cook, and thereafter from the post-1945 period when increasing leisure time, disposable income and personal mobility created a wave of leisure activity. In its international manifestations it has been particularly aided by the cheap-to-operate jet aeroplane... Travel, it is said, broadens the mind, and in the *The Dry Salvages* no less a poet than T. S. Eliot admonishes us not to 'fare well/But fare forward, voyagers'. Though not always perhaps in search of such lofty ideals, people have taken to leaving home for the day, for overnight trips and to go overseas as never before... A very large share of the international tourism in the world takes place in Europe and North America... So the recreation phenomenon is largely associated with the rich and it is largely also an urban phenomenon in the sense that most travellers, even though they journey to remote places, seek urban levels of food, shelter and hygiene when they get there...

[When] the Green Party [first appeared] in the spotlight... [h]eadlines such as 'No foreign holidays – Greens would ban air travel' and 'Did you know... [that they want to] take your car away' appeared... [in] some of the more disreputable tabloids[, which] began to delight in misrepresenting its policies... [The] Green Party... retorted, 'The Greens have renewed social hope...' - 1990

We are now being invited to enter... a time of hope, a New Age. By saying this, we should be careful to ask what the term means. "New Age" is too easily associated with cartoon figures, which represent it rather ludicrously... Gandhi's autobiography... tells us about the "enterprising" [gal] proprietor of a New Age vegetarian restaurant in Johannesburg, where [Gandhi] met his Nature Cure and Theosophist friends. [The proprietor] was "fond of art and extravagant and ignorant of accounts." Gandhi lent her money that [the proprietor] failed to return, and this got him into trouble, but that need not concern us here... [M]y point is that Gandhi's dry sentence evokes a person lots of us would call "typically New Age." But in fact Gandhi himself (keen on accounts and unenthusiastic about art) was just as much a New Age type, and a much better representative of its strengths... The supreme New Age art is dance... and it is notable how many New Age [guys]... married dancers... Of course, those close to the Tolstoy and Gandhi pole of the New Age were not dancers, were not sensualists, and were suspicious of the great importance given to the arts in modern times... The arts – compared with other forms of activity, like politics, commerce, or even science – always have a New Age tendency to favor spontaneity and enthusiasm. But when art itself constitutes a counter-world, and includes all other realities in itself, it separates itself from the rest of life and makes its spontaneity and playfulness purely aesthetic. It then runs counter to New Age values... The years 1880-1910, however, were a time when many artists did constitute such a counterworld. Art made itself important in culture, and asserted its freedom from old moral constraints. Coming to this idea, we are at the furthest extreme from Tolstoy and Gandhi, for we have come full circle, and the aestheticism of 18[8]0-1910 was closely linked to... an age of empire... There was a split, at best a dialectic, within that New Age, as there is in our own, between the two drives, the ascetic and the aesthetic... This conflict became an issue for Gandhi in his encounter with the American Nilla Cram Cook, who attached herself to him in the 1930s... [Nilla] grew up in avant-garde circles in places like Greenwich Village with a post-Nietzschean set of ideas, focused on the transcendent moral importance of art, myth, and love, values that seemed to her mutually dependent. [Nilla] went to live in Gandhi's ashram while [Gandhi] was in jail, and they exchanged letters, in which [Nilla] translated *satyagraha* into the terms of her philosophy. Soon [Gandhi] wrote to her, "I wish you will forget Pythagoras, Bacchus, and the Mahabharata..." [Gandhi] wanted her to move forward morally, but her imagination needed huge spaces of amoral freedom... [Gandhi] writes... "...You have plenty of poetry in you. Your imagination knows no bounds. I want you to transmute these into an inexhaustible power for real service. We all have to aspire after being childlike." But for her, to transmute her imagination, especially in the direction of the childlike, was to deny it. In *What Is Art?* (1898) Tolstoy criticized his contemporaries' reifying and mysticizing of art, a process like that which we saw in Godwin and Shelley at the time of defeat of their New Age. Tolstoy directly challenged the new aestheticism of his own day by criticizing contemporary work by the criterion of its usefulness and pleasurable to peasants... Good art, [Tolstoy] said, is that kind which promotes the key religious perception of its time, which "in our case" means the brotherhood of all... But our art, since the renaissance, Tolstoy says, has been a privileged caste's art, which means that it has functioned primarily to distract an idle class of aristocrats. (On February 4, 1897, [Tolstoy] wrote in his diary, "The harm of art is principally this, that it takes up time, hiding people's idleness from them.") According to Tolstoy, art deprived of its proper (religious) subject matter becomes affected and obscure, artificial and insincere, and manifests erotic mania. (It is easy to imagine contemporaries... saying very similar things about the equivalent art of our time.) ...Some of these thoughts Tolstoy developed further in his letter of October 4, 1897, to Romain Rolland in France. Rolland had written to Tolstoy as a student, conscious of a vocation to become an intellectual and troubled by Tolstoy's demand that everyone do bread labor. Tolstoy wrote him, "All the evil of the day comes from the fact that so-called civilized people, together with the scientists and artists, form a privileged caste, like so many priests; and this caste has the fault of all castes. It degrades and lowers the principle... of... virtue..." ...This is a particularly interesting exchange because Rolland more or less rejected Tolstoy's opinion but went on to become a spokes[person] for some aspects of the New Age in France (a leader of pacifism during the First World War) and the [person] who introduced Gandhi to a whole generation of Europeans.

...I DROVE THROUGH the security gates at the vast site near Paris into a cloud of dust stirred up by a truck carrying three of the largest trees I had ever seen moving, 20-metre firs from Germany, roots and branches intact. The whole landscape seemed to be in motion. Trucks and bulldozers were scurrying in all directions, giant cranes were positioning hotel walls, trees, castle turrets. One driver told me proudly, "This is the biggest construction site in France since the Maginot Line." When I said that I hoped what [they were] building would have better luck, his smile stretched wider. "Don't worry. People will be having fun here for hundreds of years." To guide me through the chaos, [the driver] gave me a quick orientation. "That is the lake just ahead. Next to it will be four of the biggest hotels in Europe, more than a thousand rooms each. Over there is where you'll be able to visit outer space. There'll be a tropical jungle... a haunted house, and an Oriental bazaar..." By now his arms were waving in all directions. "And all of it," [the driver] concluded happily, "started with a mouse." The mouse first took shape 64 years ago on the sketch pad of a 26-year-old American film cartoonist named Walter Elias Disney... Walt... had just lost his job and was trying desperately to come up with a new character for an animated film. Soon [Walt] had conjured up an irrepressible rodent who, like his creator, would take whatever knocks the world gave and still smile. Walt dubbed him Mortimer Mouse, but his wife told him it was a terrible name. "How about Mickey?" Walt asked... Within ten years, the round-eared rodent had become the personal friend of children all over the world, and Walt had become rich and famous. Then, in an amusement park in Southern California, Walt had another of his crazy ideas. Munching peanuts on a bench while his two daughters rode the merry-go-round, [Walt] thought: *What about an amusement park, based on my own characters, where parents and children could have fun together?* For nearly two decades, although the Disney film studios came out with a string of hits, no banker would lend him money for his dream. Finally [Walt] mortgaged... stocks, house, furniture – ...everything [Walt] had – ...to buy and develop 100 hectares outside Los Angeles. When Disneyland opened in 1955, it proved an instant success. Sixteen years later it spawned a bigger sister – the 11,000-hectare Walt Disney World in Orlando, Florida. Tokyo Disneyland followed in 1983. Then it was Europe's turn. First, Walt Disney Corporation executives set loose their 1500 "imagineers," the dreamers who come up with weird and wonderful ideas and figure out how to build them. After considering some 200 places across the continent, the company settled on a fantastic site near Paris that the French Government was offering. For a bargain price, Disney bought nearly 2000 hectares, 30 kilometres east of the capital. The French agreed to build roads, utilities, a subway link to the city, and a stop on the planned high-speed train line that would put London, Amsterdam and Frankfurt less than three hours away. In return, Disney's 12,000 employees and the expected 11 million visitors a year would boost the local economy. Final contracts were signed in March 1987, and soon some 10,000 construction workers were digging and building and wiring and painting... to [complete]... the \$6.8-billion project... When I visited the site last August, it looked more like a battlefield than an amusement park. How, I wondered, would four million cubic metres of churned-up earth

become, within nine months, a resort containing Sleeping Beauty's castle and 29 other attractions, 360,000 trees and shrubs, 20 bridges, six hotels, five swimming pools, 50 restaurants and snack bars, 100 shops, 1051 robots and a Mississippi steamboat? "They will need a magic wand to finish it on time," said a cynical French friend. But the Disney people have been in the magic-wand business for well over half a century. One of their newest and most skilful wizards is... a 52-year-old one-time scholar in medieval French... [who a]s president of Euro Disney... is also Disney's unofficial ambassador to the Old World. Here [the president] found his academic background invaluable, for the project had aroused sullen resentment in some circles in Europe. "The very concept of Disneyland is a threat to civilization as we in Europe know it," snorted one British correspondent... [But the president] points out that most of the characters recreated by Disney come out of Europe's own culture: Snow White, Cinderella, Pinocchio, Peter Pan... To find the elements and people for this fairy-tale world, Disney experts scoured the earth. One went to Wales for crafts[people] who could make the little old-fashioned steam engines that haul visitors around the park. Another sought out [US] woodcarvers to sculpt some of the outsize horses that bob up and down on the merry-go-round. Still another clambered through caves in southern France and came back with new forms of stalactite and stalagmite that are reproduced in Euro Disneyland's caverns... 20 workshops in France and Belgium... turned out the 300,000-odd items necessary for what Disney calls its "cast members." Everyone in a Disney park is in some sort of costume, including the "custodial hosts" or street cleaners who patrol everywhere to make sure that no cigarette butts or chewing gum wrappers spoil the clean freshness of the decor. They are in costume because they are all playing a part in what one executive calls the Disney "magic box." Inside this box, [a] 42-year-old... is director of entertainment. For more than two decades this innovative [person] had been immersed in the world of dance and festivals. But the challenges... his team found themselves facing at Euro Disneyland were totally new. They had to have a Brahman bull trained in Oklahoma to bow to an audience, and audition rodeo riders in Dallas. They had to... audition musicians for the 32 bands that play all day long in the streets and restaurants. It's all part of the Disney style, which means the tightest discipline mixed with the loosest informality. To instill that special combination in the people recruited from the 12 European Community countries, hundreds of them were sent to America to train at Disney University and in the two Disney parks... "The parks stay open 365 days a year and we are paid to do things that sound impossible,"... says... the... chief of the landscape department... "...They told us we could not have a year-round portrait of the Cheshire Cat at Euro Disneyland because most flowers simply do not bloom outdoors in a Paris winter. But we have already developed a hard pansy that can be covered on cold nights and will look fresh the next day – even in the snow." ...Months before opening, Euro Disney had already sold hundreds of thousands of admission tickets, at about \$50 a head for adults and \$35 for children. Once inside, guests will find something for all tastes – and almost all budgets... At 9.01 a.m. on April 12... the resort opened its gates... If all goes according to plan, the size of the resort will double in 1995, and triple early in the next century. The imagineers are still hard at play, and with a site almost one-fifth the size of Paris, there is plenty of room for their dreams to become reality. The Euro Disney resort will never be really completed – just as Mickey would want it. For despite all its technical sophistication, a Disney park always embodies the spirit of the unassuming creature with whom it all began.

...Taxonomists, who carry on the work begun in Eden of giving the plants and animals their names, estimate that 90[%] of the species... [i]n the tropical rain forests... remain to be identified... Small isolates... disappear more often without a name. Nameless also are the uncounted species of bacteria extinguished in deforested soils and in soils abused by careless cultivation. Extinction and its threat can... be merely incidental to other developments. The... number of species per hectare being at maximum requires conversely that the number of members of a given species per hectare be at minimum. This makes not only for intricacy but for stability of the system. Parasites are constrained to be symbiotic rather than lethal. With the nearest specimen of the species of a dead host on the other side of the next hectare, the lethal parasite dies with its host and cannot break loose in an epidemic. For this stability, nature, as always, exacts a price. To maintain genetic diversity within a species sufficient to continue its evolution requires, it [i]s... estimated, a minimum breeding population of 500. Such a population in the tropics occupies a much larger territory than in, say, temperate-zone ecosystems, where healthy specimens of a species are closer neighbors. In regions of the world increasingly occupied by humans, the need for large territory necessarily places a species of plant or animal in peril... The California condor, its too-wide range occupied by human settlement and activity, is confined now to aviaries; with less than a breeding population, its evolutionary history is closed... The present rate of extinction of plant and animal species is comparable to that of the catastrophe that extinguished the dinosaurs and marked the Cretaceous-Tertiary boundary. By one count, 211 species of mammals, marsupials, and birds have vanished since 1600; 81... since 1900. Most... were island isolates. Now, however, extinction proceeds on the continents... The International Union for the Conservation of Nature reckons 20,000 species as endangered: 1000 vertebrates, 6000 insects in Europe alone, and about 10[%] of the named species of plants. For many large animals and plants, the future is foreclosed. Of the 291 rare or endangered mammals, 162 survive only in zoos. No more than 30 have been bred there with success that holds hope of their return to nature. Captivity has reduced the[ir] genetic and behavioral fitness... The population of Przewalski's horse – the last wild horse, native to the deserts on the inner Asian frontier of China and now confined to the world's zoos – approaches 500 breeding pairs. They are the progeny, however, of the last three stallions and seven mares taken from the highland Gobi desert... In arriving earlier at sexual maturity and in loss of seasonal breeding rhythm, the zoo horses exhibit the primary symptoms of domestication... The present half century has made meaningless the notion of wilderness. The entire planet has come into the custody of humankind. China has announced its intention to create in the Qian Tang region on its arid northern frontier a "rare animal garden" larger than the Yukon and the Arctic national wildlife refuges in Alaska, hitherto the world's largest. Otherwise, it appears, the last nature reserves large enough to contain significant ecosystems have already been established. According to the I[UCN], less than 1 million square kilometres has been set aside for refuges; only 24 refuges exceed 10,000 sq. kms)... The largest refuges in the contiguous 48 states of the U[S] were dedicated from the public domain in response to the conservation movement led by Theodore Roosevelt and Gifford Pinchot in the first quarter of this century. In Africa, 15[%] of the total world refuge area, divided among many smaller refuges, cannot contain the communities of large mammalian herbivores (especially the ungulates) and their predators in any continuation of their evolutionary interdependence. All of the members of some species are confined to a single refuge. In India, the confinement of the 1100 surviving Indian rhinoceroses (single-horned) to two refuges does not secure survival of the minimum breeding population against the outbreak of some epidemic disease. The best the current conservation movement can do is to fight the poaching on the big reserves... and to corral small parcels of land that can help keep agreeable large animals, such as deer and wild turkeys, in circulation in exurbia. - 1992

The overpopulation of the Earth by a single species, representing only one out of several million species, is forcing the rest of the living world to move aside. Humans are rather large animals and command a major share of the Earth's natural resources. No other sizeable mammal even approaches the number of human beings alive today. Conversely, the populations of many animals have fallen so low they can no longer maintain their numbers and are in danger of extinction... Historically, humans have accounted for the extinction of many... species... Often, species became extinct because of the destruction of their habitats or the introduction of predators or competing species... In many cases, animals were senselessly slaughtered for no apparent reason except possibly for their fur or plumage... The isolated continent of A[US] is inhabited by many strange animals; it seems to be a throwback to a time 40 million years ago when large, bizarre mammals roamed the Earth. A[US] was separated from the rest of the world until the... arrival of... the ancestors of the Aborigines... about 60,000 years ago. When people migrated to A[US], the continent lost... a significant number of bird species... and... over 80[%] of its large mammals... including the giant kangaroos... [and other] giant marsupials...

ON CAPE BRETT only skeletons of pohutukawas... [-] loosely translated as the tree with the red adornment growing near the sea[-] ...are left. The festive crimson flowers and foliage have been ravaged by the Northland Peninsula's number one pest, the opossum... "...Opossums are

wonderful if they live in A[US – not NZ,” says]... the Department of Conservation[’s]... Auckland public relations officer... But in future years the coastline should again be clothed in scarlet. Landowners, [the DOC] and Project Crimson propose to build a fence along the base of the peninsula. The solar-powered fence will have hot wires top and bottom to prevent opossums invading the peninsula’s upper reaches. Project Crimson is expected to pay for the fence but gets financial help from C[HH. The] Project Crimson co-ordinator... says the fence is the ideal solution. “The problem with opossums is that when they get on a peninsula they have nowhere to spread out, so they multiply quickly. The pohutukawa is one of the favourite foods of the opossum so that’s one of the first trees to go.” The fence is not the first scheme to prevent the invasion. DOC has a trapping and poisoning operation which is run with the co-operation of the Rawhiti Marae... A propagation scheme will also assist the development of the cape’s pohutukawas. Seeds were taken from the area last April and raised at Paremoremo prison nursery and the Crippled Children Society nursery at Royal Oak. Project Crimson sent 2000 seedlings to the peninsula earlier last month and farmers are nurturing them in a shadehouse until they are ready for planting in 1996... [The public relations officer] says community support is essential. Other schemes around the country have failed because of lack of support. The Cape Brett fence is not the first such effort. A similar fence was built at Hot Water Beach in August and Marlborough Sounds’ Cape Lambert also has one... [□ Something Cape Lambert, Cape Brett and Hot Water Beach don’t have is an indoor ski slope – unlike] Funabashi City, 19[km] east of Tokyo[, which has built]... the world’s largest... The... height of a 25-storey building at its elevated end, and the length of five soccer fields[, the] ski dome... can accommodate 2000 skiers at a time, year-round. It is kept at a brisk minus two degrees by day, allowing [hu]man-made snow to cover the beginner, intermediate and advanced courses.

...The year is 1687. The people of Athens are under siege. Unknown to them, enemy cannon line a hill overlooking one of the world’s most magnificent buildings – the Parthenon. Tragically, the Parthenon had been used to store, of all things, gunpowder. One of the most beautiful buildings ever conceived, it was almost completely destroyed. For 2000 years the Parthenon has stood overlooking Athens, recalling a remarkable moment in history – the Golden Age of Greece... In 1971, [Greece’s] crowning glory... was discovered to be in danger of final collapse. Today it is being restored – not to its former splendour, but as a magnificent ruin worthy of the civilisation it represents. The pieces of marble so cruelly shattered by cannon-fire are being painstakingly cleaned and carefully reassembled. The holes made by enemy cannonballs are being precisely filled in. The restoration will take even longer than the 15 years it originally took to build... But there is [a] quality even more durable than stone in the legacy of Athens. This was a city whose brilliant light shined so powerfully that it defined Western intellectual thought for centuries... It’s extraordinary that a society of only 70,000 who lived 500 years before Christ could influence the world so dramatically... The city-states of ancient Greece were all highly competitive, but there was one state that expected to win and usually did. It was the powerful, brilliant, daring city of Athens. During the 5th century BC, Athens grew more powerful as many city-states and islands turned to her for protection from their mutual enemy – the Persians. And so the Athenian Empire was born. The Acropolis in Athens represents a pinnacle of achievement in the history of Western civilisation – an extraordinary outpouring of creative excellence that derives from one century... [Its] magnificent buildings symbolised the collective inspiration for a people with a passion for perfection. [One] historian... wrote: ‘So the buildings rose, as imposing in their sheer size as they were inimitable in the grace of their outlines. Since the artists tried to excel themselves in the beauty of their work... each of them [people] supposed would take many generations to build. But, in fact, the entire project was carried through in the high summer of one [person]’s administration.’ That one [person] was Pericles – leader of the Athenians[, who]... paid for the magnificence of all of Athens out of taxes collected from other city-states in return for protection... [For its protection, Athens looked to] the goddess Athena... the Parthenon... [was] built... to house and honour the deity to whom the city was dedicated... Adorned with gold and ivory, Athena soared 39 feet high... w[ith] a six foot statue of victory... [i]n her hand... Pericles came to power in 461BC[, after which] Athens flourished as few cities ever have... ‘Ours is no work-a-day city. No other provides so many recreations of the spirit. Our love of what is beautiful does not make us soft. We regard wealth as something to be properly used rather than as something to boast about.’ “To me it’s wonderful that in the age of Pericles they would take what was a huge amount of their gross national product and pour it into buildings – into [the] great Parthenon; into architecture that has influenced the history of architecture in the West for centuries beyond.” “What the Acropolis and the Parthenon were saying to the world was that we are Athens, we are the top, we have this goddess whom we revere, who looks after us under all circumstances, and for whom we are going to build the most magnificent enclosure we could imagine... [It] was a mark both of respect to the goddess and a way of showing the other Greeks that in this constant struggle, this constant competition, Athens was the best.” The city was completed within 50 years, designed by the finest architects in Greece and adorned by the greatest Greek sculptor – Phidias. It was a workforce that brought together the finest crafts[people] from all over the Mediterranean. Athens buzzed with new energy and, most of all, new ideas. Evening parties were occasions not just to watch pretty girls dance, or to get drunk, but to talk. The star guest would be the brilliant philosopher Socrates. Usually all-[guy] affairs, there was one interesting exception – foreign [gals] seized in war often became captive entertainers... “It must have been mind-blowing to be part of that atmosphere of the 5th century in Greece. So much was being invented that we have inherited. We think now in terms of Greek words: philosophy... rhetoric... politics... geography and biology – all of these things were just being discovered and discussed; everyone was questioning.” These were the first people to calculate the position of the Earth, moon and stars, and the first to conceive of the atom. The classic age of Greece produced some of the world’s greatest and original minds: the philosophers – Socrates, Plato and Aristotle; the mathematician Pythagoras... and the father of medicine – Hippocrates. “These were some of the greatest minds that have ever lived, and they were all alive in this small town more or less at the same time.” In Athens, Pericles presided over the world’s first democracy. Although only the 30,000 [guy] citizens had the vote, all officers of the city were elected, and their deliberations were held in public. It was an idea that... emerge[d] again in the... modern world. “Our founding fathers knew Latin and Greek, they read the authors, they understood the classical tradition of the rule of law against tyranny. I never cease to be amazed at the originality of the Greeks in inventing... democracy as we know it. It didn’t exist before – there were tyrants and tribal leaders but public participation in governance, in decision-making, started really with the 5th century in Athens... [when] everyone had to give part of their time to be experienced in government. And you had majority rule...” Athenian success in art and diplomacy, in sports and in government, was motivated by their desire for excellence. Ultimately, it was a spiritual commitment, this passion for perfection. “[The] Acropolis... is not a house of a government... and it is not a shopping mall as well. It was the temple of... a goddess[who t]hey wanted to serve[. T]hey wanted to create something above themselves...” “It wasn’t like a modern church. It wasn’t a place where you could go in and worship quietly. The sacrifices were performed outside, in part [because]... if you’re slaughtering a bull you don’t want it[s blood] on the floor of your temple; but also because the smoke had to rise to the gods. And in the meantime, since the divinity was thought to dwell in his or her home, you didn’t want to get too close – you wanted to maintain a kind of differential, a respectful distance, lest inadvertently you might do something wrong and get somebody very powerful really angry at you, and that’s always a bad idea.” In 1928, off the northern coast of [a]Greek island... in the Aegean Sea, a small boat was looking for sponges. The diver saw a strange shape beneath the sand. [The diver] had discovered a classical Greek statue that had sunk with the ship carrying it nearly 2000 years before. Many now believe this rare bronze was Poseidon – Greek god of the sea. The magnificent statue was one of hundreds stolen in the 1st and 2nd centuries AD by the Romans. Gods like Poseidon were thought to have a very real power over the lives of ancient Greeks. Overlooking the sea... 37 miles south of Athens, is a temple built in honour of Poseidon – a god the Greeks were anxious to have on their side. “Poseidon is nature. His domains are the depths of the earth and the sea. [Poseidon creates storms – and helps the sailors] or... sends them to their death. So [Poseidon is] an uncontrollable god, and you turn to him when you’re scared. The Greeks were very good [at] building temples where you had a sense of otherness, a sense of such a great beauty that only the gods could live there.” Up on Mount Olympus was the pantheon of Greek gods. There were gods for everything – love, fertility, wisdom, anger,

jealousy. But one Greek god stood above the rest – the all-powerful Zeus, ruler of the world and of the gods themselves. These gods were not imagined as spiritual beings. They had very human characteristics and were known to interfere in the lives of humans on the slightest whim. They could be rational and helpful, or mischievous and vindictive. Anyone who offended them could expect terrible revenge... Delphi... is the most important of all Greek sanctuaries to the gods. This temple was dedicated to Apollo – the ‘son of Zeus’ and]god of knowledge, light, music and healing... Pilgrims would cleanse themselves in [a nearby] stream, having first sacrificed a goat to Apollo. Even in this highly educated and rational civilisation, they still believed in mysterious divine powers. The great temple of Apollo was home to a kind of prophet, the Oracle of Delphi. Its pronouncements could affect the destiny of [mortals] and the history of nations. Ordinary citizens would come to ask if they should marry or if their spouse was being unfaithful. Generals would ask if they should go to war. A priest [would] take their questions to the oracle... The medium was an ordinary local [gal] sent into a trance often by chewing hallucinogenic leaves. Her answers were always garbled messages that the priest would interpret even more ambiguously still, leaving suppliants to choose the meaning that suited them best. At times the answers were simply misunderstood. When [the] king of Lydia asked if [it] should attack the Persian Empire [the king] was told, ‘If you go to war you will destroy a great kingdom.’ [The king] went to war – the kingdom... destroyed was his own... Thousands of people came to Delphi every four years for a 5-day festival. Moving up the sacred way to Apollo’s temple, passing 3000 statues and treasures filled with the riches of various city-states, pilgrims were expected to offer whatever they could afford... [In addition, t]here were vendors... But it was also at Delphi that another, unofficial ritual took place, honouring not Apollo but a very different sort of god. In winter, it’s said, [gals] would climb Mt Parnassus directly behind Delphi and perform wild dances in honour of [the] god of wine... It was one of the few opportunities for [gals] in this highly ordered society to follow their instincts and abandon all inhibitions... Such private rituals later became public events and the beginnings of what we know as theatre. “All drama originated as part of religious festivals... [T]his led to poetry... then they introduced [guy] figures and masks, and gradually you got what we now think of as tragedy and comedy.” Th[e] amphitheatre at Delphi is one of hundreds that were built by the ancient Greeks... [P]lays were produced that are still performed today. Many were about [gals, who were mostly] kept at home. [“]But they were very powerful personalities. They were running the house and the lives of their husbands... Of course, these [gals] of power closed into those beautiful houses was mysterious... for [guys]. It was another world that they wanted to know more [about, to] experience... and that’s why they chose [gals] as... heroines for their plays.” “Theatre became absolutely central to [the ancient Greek] way of life. They would have a whole day, start[ing] in the morning, and get [to see] three plays... th[at all] went on a long time. You had subsidy from the government, and you also had private support from the very rich. And you had political debate, you had a sense of involvement. The chorus was a device that represented *the people*... [T]he stories were often known to mythology, but it was the way they were played out that really captured the imagination of an entire populous.” ...[one play was about a gal] driven to unspeakable acts of revenge when her husband betrays her for his own personal gain... [The wife] refuses to accept her husband Jason’s decision to abandon her in favour of the king’s daughter... The tragedy... is that [the wife] gives up everything for Jason, and in a [guy-dominated society is] powerless to prevent him deserting her and her children... In her desperation, [the wife] reaches a tragic conclusion – that her only possible revenge is to kill her own children... Traces [of her situation]... can still be seen in Greece today. This too is a society dominated by [guys – who are] committed to demonstrating their masculinity... “A[n]cien[t] A[thens] has been described as a boys’ club, and in some ways this is very, very true. [Gals], resident foreigners, slaves, were not fully enfranchised – they were somehow lesser beings. It was the boys in the boys’ club that ran the show. And they wanted to keep it that way.” And to some long-suffering [gals guys] still seem to be running the show... “...a play like... [the one about Jason’s wife] so speaks to a society now in which divorce is rampant, in which [husbands and wives] get so angry at each other, in which child custody is a central issue...” “[Gals like Jason’s wife are like gals] we see today... we have... the same problems... with [our relationships with the guys] in our family, with husbands.” ...The ancient Greeks did not take weekends off. They worked every day except for the more than 50 religious holidays and sporting festivals... [O]ne of the four great religious and athletic festivals of ancient Greece [was held in a stadium that sat] 20,000 spectators... “They’d come in clutches of family or friends, spread their blankets, break out their wine skins, and sit and watch the games... We have actually found evidence in the form of concentrations of coins that show us that, for example, across the way was the centre of the Corinthian cheering section... And here on the opposite side, just behind where the judges’ stand is – not coincidentally – we have found almost all of our coins from Argos... [O]f course, the games were controlled by Argos...” ...Originally, athletes competed in the nude and [gals] were excluded from the games. But one [mother], determined to see her son compete, dressed up as a... trainer. When her son won, [the mother] jumped over a fence in her excitement. All was revealed. After that, even trainers were required to be in the nude... Winners won no prizes other than laurel or wild celery leaves. Back home, they’d be showered with flowers at lavish parades, where they’d be drawn around town in the finest chariots. Often, they’d have a statue made in their likeness. If they were Athenian, they’d enjoy free dinners for the rest of their lives. The most important games in Greece were held every four years... at Olympia. The first international sporting event in all the world was held [t]here, in 776BC. The Greeks were the first to elevate athletics to the status of serious competition... But the Olympic festival was first and foremost a religious occasion. As many as a hundred oxen would be slaughtered... on an altar in front of the temple of Zeus. Its interior was dominated by a gold-clad statue of the god. Before it, every Greek athlete had to pray before... compet[ing]. At the entrance to Olympia was the gymnasium where athletes trained, and the office of the organising committee who decided on an athlete’s moral suitability to compete. A hotel for VIPs was built around an elegant fountain. At the far end was a mini United Nations. States were required to cease all hostilities during the games, and met here to work out their differences... To the [ancient] Greeks, a beautiful body was as important as a brilliant mind... Mind and body came together in the gymnasium. This was a place for conversation and learning as much as for exercise and wrestling. To the Greeks the aesthetic, the physical and the intellectual were all part of their pursuit of perfection... With so much emphasis on... intimacy [between guys] and physical beauty, perhaps it was inevitable that in Athens homosexuality was quite common, with no stigma attached whatsoever. Sexual relations between mature older [guys] and younger boys were entirely acceptable, as long as the boys were first wooed with gifts, and as long as it stopped w[hen one partner got married]... The Athenians tended to dominate in sports and just about everything else. But their winning streak couldn’t last forever, and fate was preparing to deal some cruel blows to this society... which had risen so high and achieved so much. In 399BC, the Athenians did a strange thing. They put their wisest citizen on trial. The great philosopher Socrates was judged by a jury of 200 of his fellow citizens... [after being] accused of not believing in the gods and of corrupting the minds of the young with his radical new ideas. “In many ways, Socrates was the complete Athenian. [Socrates] served with courage and distinction as a soldier and as a states[person], and in this way fulfilled the Athenian ideal. At the same time though, [Socrates] demanded explanations... and... definitions of his fellow citizens. [Socrates] described himself as a... stinging fly on the great sluggish rump of the Athenian body politic.” ...His trial and conviction would never have happened earlier, under Pericles’ rule. “The Athenians became too cautious, I think. Something happened. Their old willingness to engage, to experiment, to explore, is still there, but it’s somehow muted.” The change in Athens had its root in events decades earlier. In 430BC a terrible tragedy befell Athens – a plague that was said to have come from Ethiopia, then passed through Egypt and Persia before finally reaching Athens. It was a disease that killed almost everyone it touched, and it swept the city... Pericles’ own sister, and then to his horror his son, caught the plague. And [Pericles] was already burdened by a disastrous war with the Spartans. “The plague affected Pericles in two ways. First of all politically, because the Athenians blamed him for it, and for the first time in 15 years [Pericles] was not elected to the office of generalship... Shortly thereafter, [Pericles] himself caught the plague and died. And with the death of Pericles a certain style of leadership died as well.” A third of the population would die. Without Pericles’ leadership the Athenians were lost. They started to make reckless decisions. For half a

century Athens battled Sparta for dominance over Greece. The decisive battle would be fought not on Greek soil but in Sicily. Athens sent a fleet into battle, but the highly trained Spartan army sided with the Sicilians. The Athenian navy was destroyed in a series of disastrous sea battles, and in 404BC Athens was utterly defeated. "I think the Athenians lost the great war against Sparta because they did overreach themselves. The Spartans repeatedly offered terms of peace but... the Athenians simply couldn't allow themselves to accept terms of peace from Sparta – they wanted to win." The defeat of the Athenians in Sicily left Sparta as the dominant power in Greece... [and the] goddess to whom the Athenians turned for protection was powerless to help them... Socrates became the scapegoat for the decline of Athens. In prison his friends offered to help him... escape but [Socrates] refused. Plato wrote: '[Socrates had]... lived in Athens all his life. For 70 years [Socrates] had been content with the city and its people. [Socrates said why should I] now run away from it like the lowest slave?' ..."Socrates really does embody Athens at its best in some ways. And when [Socrates] dies we really do see that things have changed, that things after Socrates just won't be the same." Plato recorded the last words of his friend and teacher. 'How much would one of you give to meet Orpheus or Homer? I should like to spend my time there, as here, in examining and searching peoples' minds to find out who is wise and who only thinks [it] is.' Socrates' ideas live on to this day but over time his beloved Athens became part of other empires – the Macedonians, the Romans, the... Turks... "Athens had everything going for it, but I think it declined for many of the reasons that made it great – that aggressiveness, that competitiveness, that need to be first and best wore them out." - 1995

PEOPLE love to belong: it's what makes us human. It is also human nature to want to organise everyone else: a phenomenon known, when applied to sheep, as herding; when applied to us, it's called joining clubs. It's likely that humans have clubbed together since the time homo erectus took those first tentative totters on two legs. And while there is no hard evidence to support the speculation, it is possible that the first formalised club took as its motto: Two legs good, four legs bad. (A saying later misquoted by George Orwell in *Animal Farm*...) Many rungs later on the evolutionary ladder came Americans. Compulsive club joiners, those people, perhaps as a result of spending their college years in those huddling pens known as sorority and fraternity houses. As a race they now belong to about 100,000 associations or clubs; seven out of 10... belong to at least one club; a quarter of the population belongs to four or more. The International Association of Bureaucrats, for instance, was founded in 1968 and now boasts 1700 members dedicated to "the art of obfuscation." The club promotes excellence in "dynamic inaction, orbital dialoguing and creative non-responsiveness." Its motto: "When in doubt, mumble." And in Iowa City, the Benevolent and Loyal Order of Pessimists claims several hundred members "from all crawls of life." They'd have more but, as [the person] who founded the order 20 years ago, points out: "Many are too pessimistic to bother." Required reading for prospective members: Orwell's *1984* and Sartre's *Being and Nothingness*. Sports, religion and work are the main talking points of... clubs, while the activities of most are relatively tame: stamp collecting, church going, ball batting. OTHERS, like the Skull and Crossbones, the oldest and most exclusive secret society at Yale University (which claims [the 41st US] president... as a former member) ask rather more of their members. Arcane practices – such as recounting one's sexual history while lying naked in a coffin – are reputed to be a condition of membership. The last survey of N[Z] trends was undertaken by the Department of Statistics in 1980/81. Of those asked, 85[%] said they belonged to at least one type of group which included... those with a purely recreational function... those which protect people's occupational or political interests, [and] those devoted to helping others in the community...

A funding shortfall could put bathers' lives at risk this summer, a lifeguard chief warned yesterday. The Northern Lifeguard Services organisation has decided to reduce paid patrols in Auckland and Waikato to allow Northland beaches to be patrolled for two weeks longer this season. Until this year, paid lifeguards in Auckland and Waikato were funded for seven-week seasons while those in Northland had a four-week season. But because of the shortfall, blamed on certain local authorities shirking their responsibilities, all three regions will have a six-week season this coming summer... [The NLS], which co-ordinates paid and volunteer lifeguards on beaches from Kaitiaia to Raglan, needed a \$197,000 budget to pay its lifeguards over the six-week summer season... Volunteer lifeguards would be on weekend duty from Labour weekend but paid lifeguards would not start patrolling during the week until December 23... Ideally, a nine-week paid lifeguard season should be the minimum... "But... [p]eople are going to swim regardless of whether there are lifeguards there or not."

...The North Shore City Council says it cannot afford to increase its funding of a regional lifeguard service. The N[LS] said on Tuesday that some councils, including North Shore and Manukau City, were contributing "way less than they should" according to their population sizes... [T]he North Shore City Council had given the N[LS] \$10,000 last financial year... The services' operations manager... expressed concern that... lives... could [be] put... at risk, particularly in the first three weeks of December when schools finished for the year... A North Shore City Council spokes[person], who did not want to be named... agreed with [the NLS manager]'s concern... "...and I can emphasise with them because they do provide an excellent service... but I also think that we all take responsibility for our own actions when we are at the beach." [The spokesperson] said it was "an unfortunate thing... that... there is not enough funding available to even meet the needs of our local groups, let alone regional ones." ...45 paid patrollers... and about 900 volunteers would patrol the 16 affiliated surf-club beaches... Based on a head-count made by lifeguards last year, about 158,000 people visited those beaches during a seven-week period last summer. The N[LS] general manager... said the total rescues performed in the area in each of the past two seasons were the highest in 63 years of lifeguarding.

...Lifesavers' warnings about a lack of funding for paid patrols proved tragically prophetic yesterday when a South Auckland schoolgirl drowned at Port Waikato. A member of the public raised the alarm after the 17-year-old... became caught in a rip at Sunset Beach about 4 pm. With no lifeguards on duty the Auckland police helicopter had to be sent to the beach – but the team was too late to save her. The dead girl's name was not available last night. A new member of the Sunset Beach Surf Lifesaving Club... [who] was tidying up the clubhouse... asked to help the helicopter rescue attempt... [T]he 26-year-old jumped from the helicopter into the sea where the schoolgirl was floating face down. A 69-year-old veteran club member... then arrived in an inflatable boat with another club member... "We tried to resuscitate her in the boat and did CPR... on the beach but it was no good..." [The veteran], an active surf club member since 1956, said professional weekday beach patrols should have started with the school holidays, which began yesterday for secondary schools... The president of the Sunset Beach club... had contacted... [NLS when it] heard about... funding cuts last month. "I said to them, 'This is a recipe for disaster...'... They agreed, but said they couldn't force the councils to pay more."

...The... drowning... [of] Mayling Teura, aged 17... at Port Waikato has exposed tensions between the Westpac rescue helicopter and police administrators over surf rescue operations. The Auckland-based police helicopter Eagle was sent to Sunset Beach on Monday... despite having no winch, rudimentary medical supplies, and a crew with little knowledge of local beach conditions. A rookie surf club member, with no training in aircraft rescue work, was dropped from the helicopter into... waist-deep... water, injuring her ankle... There have been suggestions that police administrators preferred to use the Eagle as much as possible to save them money, as they have to pay for the Westpac service... "The only time [Westpac gets] called is when... the police helicopter was not flying or unable to do the job..." ...The better-equipped Westpac helicopter was not contacted until after the student had been brought ashore and an ambulance sent to the beach. Crew members of the two helicopter services work closely together and declined to comment publicly about the matter. But sources said the Westpac helicopter regularly went on "unauthorised" rescue missions when police delays in deciding which aircraft to use were considered unacceptable. One example came 10 days ago when surf lifesavers called the service to winch two surfers off rocks near Bethells Beach. "If we had waited around for the police, they would have been washed off the rocks," said one source... Because it had not been requested by the police, the service had to carry the \$1800-an-hour cost of the rescue... A police spokes[person said their] helicopter was sent [to Sunset Beach] because the Westpac helicopter was at Port Jackson, on the Coromandel Peninsula, at the same time of the callout. However, the general manager of the Westpac helicopter... said the police had not contacted

his operation, which had a back-up helicopter and pilot on standby at the Marine Rescue Centre in Auckland... "A few years back we agreed there would be certain demarcation lines on what we do and what they do. Perhaps we need to sit down and discuss it again."

...The Auckland Services District Commander... said there was no option but to use the police helicopter to search for a... girl who drowned off Sunset Beach... on Monday... [T]he police control room tried to contact the Westpac rescue helicopter base after the alarm was raised, but there was no response. A control room senior sergeant then contacted the police Eagle air support unit, also based at Mechanics Bay, and was told that the Westpac machine was out on a job... A spokes[person] for the Westpac service said another rescue helicopter and pilot were on standby at Mechanics Bay at the time, but [the superintendent] said the spare machine was normally kept at Ardmore... [an]d it would have taken a further 30 minutes to fly the backup helicopter to Mechanics Bay to pick up a crew. "If there was a standby helicopter and crew already down there, I'd want to know why it wasn't used." ...[the superintendent also] took issue with a suggestion that the police preferred to use their helicopter when possible to save money. Although the Eagle was primarily a crime-fighting machine, "it is also a backup for the Westpac helicopter, and there are occasions when the Westpac helicopter helps us out... In an emergency situation, the question of money is something that is decided later,"...

The drowning of... Mayling Teura... on the first day of the school holidays has brought calls for extra [lifesaving] patrols... Councils accept they have a responsibility to keep beaches safe... says... [the] general manager of the N[LS]. They have provided \$161,000 for this season, a shortfall of \$152,000 for what is actually needed... "We have pleaded with local councils for at least five years for fair and equitable funding..." ...Under the present funding system the N[LS] competes with all other community groups for money allocated through the community grants process. [The general manager] would like to see each territorial local authority fund the service directly from rates, with each contributing on a per capita basis. This would see Manukau City paying \$58,266 next year towards a nine-week patrol period rather than their present \$15,000... The N[LS]... would like to see the whole school holiday period covered... Volunteer lifeguards cover the weekends, but are unable to patrol on weekdays or all public holidays... Professional guards and volunteers from the clubs in the northern area made more than 16,000 rescues in the year to April... Last year 20 people drowned off N[Z] beaches – half of them in the northern region. Piha has claimed the most lives in the past 15 years, followed by Muriwai and Karekare... [The general manager] says that the Auckland Regional Council encourages the public to use beaches, providing picnic facilities, car parks and walk ways but no funding for keeping swimmers safe. "What we say is 'let's complete the job...'" ...[However, the ARC chairperson] says the council is not allowed by law to fund lifeguards and that it is the responsibility of [local] councils. Nor... is the Auckland Regional Services Trust responsible – it is "required to operate in a commercial manner." But a new Community Trust which will be set up in the New Year will have \$5 million to give to community groups. Surf Lifesaving Bay of Plenty covers 12 beaches around the Coromandel and Bay of Plenty. "We don't have trouble with funding," says [its] administrator... "We have what we asked for..." ...This is [the administrator's] sixth season in the job. "In the beginning there were lots of problems. Now I go and see the mayors and general managers – we deal with five different councils – and convince them there is a need. That works down here." A lot of the community boards have increased their funding for this season, says [the administrator], and the Thames Coromandel District Council actually approached them to patrol Hot Water Beach, where there have been three drownings in three years. "They asked us if we would do the job if they provided the funds."

...A... personal locator beacon which transmits distress signals directly to satellites is the result of 18 months of design work and testing by a Christchurch developer. In the past signals from such units were detected by ships or aircraft passing within range of the signal... [P]riced from \$475... the Quantum PLB... is set up to be compatible with the Cospas-Sarsat satellite... which relays beacon signals to the rescue co-ordination centre in Lower Hutt. The accuracy of the plotted location grows with each satellite pass, which could be from 10 minutes to three hours apart.

...The green spaces of Auckland have received the thumbs up from a leading American green thumb. Mr G[reen Thumb], an urban forest expert... well known throughout the U[S] for his knowledge on city planning, is the key speaker at a Tree Council seminar in Manukau today... [The American,] who has spent decades advising American city planners on how to blend tree tops with roof tops, says Auckland is on the right track, after... spend[ing] yesterday inspecting the One Tree Hill Domain and selected suburban streets... Auckland had many similarities with U[S] cities in terms of central city parks, but [the expert] was particularly impressed by how tree conscious N[Z]ers were. "People here seem to relate to trees much more than people back home and they also seem to really realise the importance of trees,"... [However,] American developers were becoming more sympathetic to protecting trees... [T]here was a lot of public pressure to maintain trees in tandem with the rapid rise in infill housing... [since a] study of real estate prices showed houses with trees on site commanded markedly higher prices than bare properties... [The] former state forestry worker, was thrown into urban forestry in 1970 when Dutch elm disease caused widespread devastation. "There were cities left with tremendous problems of ripping out and replacing trees. We had to begin a systematic approach to urban forestry since 90[%] of some city tree populations were elms." ...[the expert said] the secret to long-term urban forest design was to... apply a total management approach rather than a single tree approach... [and to] consider all the issues, from tree specimens to the associated bird life.

...a native forest... cannot be both a living forest and a harvest crop at the same time. Our belated understanding of the ecology of native forests shows how... sensitive their make-up really is. Plants, animals, birds and insects all contribute a piece to the jigsaw. Add the interaction with climate, rainfall, soil and altitude and we have a complex pattern that is unique and different for every part of the country. We tamper with it at our peril. Yet we have, especially in the past 100 years, destroyed vast areas of forest, converting hillsides and swamps, valleys and plains into farms or scrublands. The results are clear. [NZ has] the world's worst record in the loss of bird species by extinction and the worst in the number of... species that are on the verge of extinction. Birds are not just some ornamental extra to show the tourists or provide a dawn chorus. Without birds our forests would not survive... We have rivers that are permanently muddied and prone to periodic flooding because the topsoil has been washed off the bared hillslopes. In a native forest there is normally a lot of leaf litter... shrubs and decaying wood to absorb rain, no matter how heavy it is. On forest-covered hills erosion is not a problem: the water runs clear in the rivers, fish thrive, and serious flooding does not occur. In a managed logging programme selected trees are removed and the forest is allowed to regenerate before the next round of cropping. The disturbance... this causes is claimed to be of minor significance. But what in fact happens? First there are the weeds which come into the disturbed area from wind-blown sources or... on machinery. Weeds are already a serious threat in many of our forests and have the potential to destroy vast areas. The damage done in removing even one log makes weed invasion a real concern. Then there is the loss of mature trees. The natural cycles of life and decay provide for the insects which are a vital part of the diet of forest birds. And it is those... processes of decay that enrich the soil and enable it to continue to bear forest trees... Our heritage forests are under threat from a large number of sources, not least from those who see them as potential tree farms. Instead of further degradation we need a planned ongoing programme to extend native forests[– including]... the... 10 million hectares of eroding hill-country pasture waiting for regeneration to indigenous forests... [–] so that their recreational values can be enjoyed, the quality of our rivers... and... air... improved, the severity of floods reduced and threatened plants and birds can look for a better expectation of life.

...WELCOME TO... [NZ – LAND OF] DEAD TRUNKS, DRY BUSH & DRAB PLOTS OF TUSSOCK... Imagine our country without trees, without parks, without forests. Not a leaf in sight, a haven for weeds and pests. It's not a pretty picture but every day it comes closer to reality. While the Government spends millions promoting our clean, green image overseas, noxious pests such as ...possums are destroying it. Forests that have been a proud part of our heritage and our way of life, are no longer safe. The Department of Conservation is fighting a losing battle because like so many of our public services, they suffer from underfunding... One thing you can still do in N[Z] if you are lucky enough to do what I did last summer is to see, within the space of a few days, the range of our biodiversity... A party, predominantly scientists, led by the D[OC], began on the Horowhenua

Plains, an outwash between the Ruahines and the Tasman Sea. Just 110 years ago this was a place of dense lowland forest, extensive wetlands and myriad native wildlife. Today, save for the occasional brave remnant, nearly all of them fenced-off pocket-handkerchiefs of certain species, there is scarcely enough of anything to call it biodiversity. It is wonderful that these samples exist but the rest of the Horowhenua is a grid of farms, towns and roads, harbouring their narrow bands of introduced biodiversity. The party then travelled to Haast, centre for the world heritage Mt Aspiring National Park. Here the natural systems are intact. From the lower Alps to the sea, dynamic processes recharge and renew the soils, rivers, marshes, estuaries and beaches in continuous cycles. Some of these cycles still occur in the Horowhenua. But the difference at Haast is that the native plants and animals there are in natural abundance and are interconnected. Because they hate the wet not even possums disrupt these ties. It is this variety and connectedness that are central to the idea of biodiversity... An expression of its underlying intactness and integrity is its ability to create a capacity for renewal. This is at the root of sustainability, as opposed to our often museum-like notions of preservation. The challenges are great enough in a number of our national parks. Often pestilence, such as introduced pigs, goats, deer... and... stoats... is... stifling native birdsong and native plant life. Outside protected areas the challenges are even more daunting. Today the Horowhenua's alluvial and forest soils carry prosperous farms. Their introduced biodiversity... contribute... not only to the nation's wealth... but also to Government efforts to protect, restore or enhance our indigenous biodiversity... Because of N[Z]'s 130-million-year separation from the supercontinent Gondwana, much of our biodiversity is found nowhere else... and... reflects the longitudinal shading of these islands, from the sub-Antarctic through the temperate to the subtropical – and their interactions. Our biodiversity is significant globally, is intrinsically valuable and is of immense interest to scientists, tourists and many citizens, including Maori. Because of its evolution our biodiversity is the best that nature can provide in being uniquely adapted to, if not creative of, conditions here. (The... plants that can do the job beside our rivers and waterways to hold banks, retain water and enhance water quality are usually native ones.) ...an... argument for keeping... estuaries intact... [is that they] are among the most productive ecosystems on the planet. Their biodiversity produces much of our fresh and saltwater fish. For those who still need convincing, why is it that whitebait still abound in parts of the West Coast, but are gone from so many other places? ...[Incidentally, about 180 scientists are attending a NZ] Maritime Sciences Society conference in Christchurch to discuss the treats to... Fiordland's marine environment from the pressures of growing tourism [or] fishing... and the best methods of protection. [The society's p]resident... said the meeting [i]s one of the first stages towards developing a management plan... "Rather than wait until there are problems to solve, we want to make a pre-emptive strike..." ...The society is looking at a multi-zoned protection scheme, similar to that at A[US]'s Great Barrier Reef. Fishing will not be banned, but it may be moved or restricted in different parts of Fiordland. For the scheme to work it will require the consent of Maori, commercial and recreational fishers, tourist operators and residents... Once parties agree, and that will be a major task in itself, the plan will be put to the Government. Another option being considered is to extend the world heritage area that covers Fiordland National Park only to the high tide mark... [T]his could be achieved by co-ordinating existing legislation and would provide greater recognition for the unique environment. "Fiordland is one of the last wilderness areas in N[Z] and on the planet... Fiordland is incredibly fragile in a lot of ways... It's not a big area and you can't have vast numbers of people going in there." ...a fisheries scientist with the Museum of N[Z], has just written a book on the issues with a fellow biologist and photographer... *Fiordland Underwater – the Hidden Wilderness* is a stocktake of the specimens found during their three years of diving in the fiords and outlines some of the threats as: ● Increased recreational fishing from charter boats as access to the area becomes easier. Up to 2500 tourists visit Milford Sound each day, many to fish and dive. The book suggests daily bag limits for recreational fishers may be too high for the limited fish stocks... ● Growing numbers of tour boats, which have increased the amount of sewerage and rubbish dropped overboard. The number of charter boat operators in the fiords, ranging from sea kayaking to tour launches, is estimated to be around 22 and growing. No environmental impact assessment of the larger cruise vessels has been carried out. ● Divers damaging corals and other fragile specimens on the sheer fiord walls by bouncing off rock ledges and stirring the water with their fins.

...Biodiversity – variety of living species – is lost through four main causes. First, there is destruction of wilderness areas (particularly the rainforests)... and of coral reefs (often simply mined for their limestone). Second, there are the extinctions produced by pollution. Third, there is the way in which modern agriculture concentrates on a strictly limited number of varieties. Growers cultivate just a few plant types which are specially productive, at least when massively fertilized and until new diseases hit them. The others they treat as weeds to be destroyed with pesticides. And for plant and animal breeders to have commercial rights to the varieties they have developed, those varieties must 'breed true', which means they can contain very little genetic diversity. In Britain it is a criminal offence to sell seed varieties which are not registered, each for annual fees in the hundreds of pounds, and registration is possible only for seeds which do breed true. Fourth, there is overfishing, overhunting, overpicking, overgrazing, and the like. The extinction rate is increasing, making it altogether possible that well over half of all the species which still remain will have disappeared by the year 2100 even without global nuclear war or catastrophic destruction of the ozone layer. By the year 2000, it has been suggested, up to 20[%] of the species in existence fifteen years earlier could well have been wiped out. Although figures in this area are highly controversial, the definition of the word 'species' itself leading to disputes, the concentration of perhaps three-fifths of the species in the rapidly disappearing tropical forests may make such suggestions plausible, as may that of so many of the others in coral reefs. In the Philippines nine-tenths of the coral has been destroyed by dynamite, pollution and collecting. The wildlife trade is profitable enough to drive species to extinction – rhinoceros horn is now worth more than its weight in gold and an orchid can change hands for thousands of dollars...

[An AUS]n wildlife expert... is proposing a simple but controversial solution to saving the world's endangered animals – eat them, skin them or sell them... [The] internationally respected Darwin biologist and consultant to governments and corporations, has told leaders in Canberra that the survival of threatened animals depends on making them worth money. By ranching or "harvesting" endangered species, money can be made for conservation projects, and habitats could be preserved because of their economic importance... The project has a long way to go before most A[US]ns would be willing to have national symbols such as cockatoos, koalas and platypus eaten or sold abroad.

...[an e]nvironmentalist... says people should trap and eat feral cats as part of a plan to rid A[US] of its feral cat problem... [The environmentalist], of native wildlife sanctuary company Earth Sanctuaries, said because of the cats, A[US] had half the world's endangered species. His comments come days after [a WA] federal MP... recommended A[US] should eradicate all cats, including pets, by 2020. The controversial environmentalist, who made headlines by wearing a hat made out of cat skin to public events, said... animal liberationists should not be upset by the suggestions, because "people who think cats are more important than wildlife are not liberationists but lunatics. Owning a cat is very antisocial."

...Pussy cat, pussy cat, you number's up... The family cat could end up wearing a registration tag to keep it off the unwanted pest list. Conservation groups are worried about cats killing native birds, lizards and insects... [T]he northern field officer for the Royal Forest and Bird Protection Society, said cats were killers by nature. "No matter how lovely they are or how well fed, they will hunt... We can't have more and more people having more and more cats which are having more and more kittens. It's a recipe for disaster." Veterinarians, the Ministry of Agriculture, local body officials and animal welfare groups met yesterday at the seventh annual Companion Animal Workshop in Auckland... Delegates decided to develop a national survey to assess how large the "problem"... [of r]ising numbers of feral and abandoned cats... [i]s. The executive director of the Society for the Prevention of Cruelty to Animals... said more than 500,000 cats lived in Auckland alone, and the society handled 9000 cats a year. For every cat with an owner, there was one that had been abandoned. Delegates thought registration would promote responsible cat ownership.

...Two rottweiler dogs killed about 100 birds in a private Christchurch aviary last night before being shot by the aviary's owner and police officers. Police are trying to track the dogs' owner... [In related news, b]oaties are flouting the law and letting dogs loose on sensitive Hauraki Gulf

islands. The Kawau Island conservation officer... said yesterday that on nearby Moturekareka Island up to 15 dogs a day were being let ashore from visiting craft. [The officer wants to] remind... owners that the Conservation Act forbade domestic pets on conservation estate islands. Council bylaws could also be breached on other islands. "We try and make people understand why they should not take their dogs with them if they have to go ashore....,"... [The officer] called on boat owners to keep an eye out for people breaking the law... In some cases conservation officers take people's names or vessel names to keep tabs on anybody who continues to flout the law after being warned. Problems have been reported... after boat and yacht owners allowed their pets ashore to relieve themselves. The dogs cause havoc for ground-nesting birds, particularly shore birds such as blue penguins and... dotterels trying to rear young at this time of year. If dogs maraud along the shore near endangered N[Z] dotterel nests the parent birds become stressed and flee, leaving the eggs to overheat in the sun or to become prey for black-backed gulls.

...D[oC] staff on Great Barrier Island are on full alert after the sighting of a stoat there. By last night, within 24 hours of Thursday's sighting, a pest control expert from Northland had been flown to the island to lay traps. A stoat could spell disaster for endangered bird and invertebrate species on the island... Stoats are voracious predators of ground-nesting birds. They also eat their eggs. A DoC spokes[person]... said the stoat was seen by a contractor near rubbish bins next to the Shoal Bay wharf... It was thought the stoat could have arrived on the island by boat or by barge, or as someone's pet... Up to now no stoats have ever been found on Great Barrier, which is free of possums, deer, Norway rats and ferrets.

...["NOTHING IN CONNECTION with the naturalisation of wild animals into NZ has caused so much heartburning and controversy as the introduction of these blood thirsty creatures,"]. So wrote G.M. Thomson in 1922 about the 1890s Government introduction of mustelids (ferrets, stoats and weasels) to control the rabbit nuisance. Even then some Acclimatisation Societies warned of the disastrous consequences, as did many of the senior conservationists of the day. One hundred years on after the release of large numbers of mustelids in Otago, rabbits still threaten farming viability, showing just how ineffective mustelids were. However, mustelids soon found easy pickings among NZ's flightless or ground-dwelling birds – so much so that the predators appeared in Fiordland before rabbits! Fortunately they did not reach everywhere. Most offshore islands are free of mustelids and DSIR reports in the 1940s and 1960s showed large parts of the mainland – such as Northland – to be ferret-free. But in the early 1980s the NZ fitch industry was founded. Environmental concerns were dismissed with the claim that ferrets were so valuable no farmer would allow any to escape but reports of dead kiwis showing all the classic signs of ferret predation started coming from Dargaville. Ferrets were starting to escape. As with any industry it is necessary to supply what the market wants. The fitch industry failed to do this because it was breeding the wrong type of fitch. Anticipated returns were well down. Then the grossly oversupplied market crashed. You couldn't give fitch away in 1987. World production toppled from 600,000 to 200,000 that year and in NZ many farmers went bankrupt. A number simply opened up their doors and let their whole stock loose. Eight hundred from one farm bordering Mamaku Conservation Park, home of the precious kokako, were let go straight into the Park. Nine farms operated in this area, and seven of these folded. What happened to the other animals is speculation. From Wanganui to Warkworth came reports of 11 farms releasing part or all of their stock. *The fine for releasing any number of ferrets into the wild is a farcical \$100* (petty cash for someone with 4,000 plus animals each carrying \$30 pelts). But farmers weren't just releasing stock. Many failed to install even rudimentary security fencing – required by law – and so escapes continue to this day (fitch breeders have asked to bring in mink – identified as the worst ground predator of game known and following releases and escapes in Britain, identical to those of fitch in NZ, they're now causing £millions of damage annually; fitch breeders are bringing from Finland into NZ new types – probably closer to the steppe polecat subspecies – and although each shipment is inspected on the wharf to make sure no mink are included, the possibility of covert introductions by embryonic transplants gives little to be complacent about). Fitch farming regulations need to be tightened up and properly enforced. The DoC has authority to enforce fitch regulations. However, different districts vary in their application, from diligent – giving operators 28 days to install security fencing or face closure – to disinterested. The Auckland office is in press as "having neither the cash nor the priority to monitor ferrets".]

...There is no love lost between conservationists and the ferret Fitzy, who could become the subject of a tug-of-love custody battle... [Fitzy was] found wandering around Eden Park after escaping from the home of its owner... Park staff gave Fitzy to a Mt Eden resident after the ferret's owner failed to claim him despite national publicity. [Now the owner] wants her ferret back but yesterday had not heard from Fitzy's new owner... [However, t]he Royal Forest and Bird Protection Society says it would like to destroy the ferret... "Ferrets are the most blood-thirsty predators of N[Z] wildlife," said a society field officer... [The field officer said Fitzy's original owner] was irresponsible in letting the ferret escape... ['Ferrets may look cute and sure they make cuddly pets but owning one is far different from having a cat or dog. For instance, if ferrets see an open door they are gone and they do not come back. Instead they easily adapt to life in the wild and, like other musteloids, can climb trees, dig into burrows and swim to the nearer outlying islands. They kill far more than they can eat. They simply kill for the fun of it, ripping the throats of their victims and leaving them to rot. These animals should be completely banned.'] Ferrets are a factor in the looming extinction on the mainland of kiwis, wekas and kaka... It was an anomaly in the law that barred people from owning or farming stoats and weasels, but allowed ferrets to be kept as pets. The ferret is listed as a pest in the Auckland regional pest management strategy and is declared a carrier of tuberculosis by the Ministry of Agriculture.

...Kapiti Island's voracious rats, which have waged war on some of the country's rarest animals, will soon be on the receiving end. The D[oC] is set to begin its biggest rat eradication programme, involving a helicopter drop of 26 tonnes of poison bait on the island sanctuary near Wellington. Department officers say the large Norway and smaller Polynesian (kiore) rats threaten the survival of the island's small populations of stitchbirds and saddlebacks, which are extinct on the mainland. Only about 30 to 40 of each species remain on Kapiti, largely because of rats preying on their eggs and young. The rodents, which number tens of thousands after the breeding season, also savage rare lizards, insects and plants. The co-ordinator of the eradication project... said many island species should thrive once the rats disappear. Some species may reappear, such as the giant wetas not seen since the 1930s. The Talon 7-20 rat poison can also harm other vertebrates. More than 250 wekas have been rounded up to re-establish a population with others which survive the poison drop... [I]t would take two years to assess whether the island was rat-free.

...Vandals who set 13 wekas free from their enclosure could have had a grudge against the Karori wildlife sanctuary's use of a recreational area, project officials said yesterday. One of the flightless birds was recovered by volunteer search parties, some using D[oC] pointer dogs. The other 12 remained missing although there had been sightings of several of the small, brown hen-like birds in neighbouring suburbs. Thirty-six of the birds, rescued from Kapiti Island last month because of a rat poison drop, stayed within the fenced area... Police are investigating the incident, which was discovered at 8.30 am. The padlock on the enclosure gate was cut off and the gate had then been propped open and ramps placed to help the birds over the wire. The Karori sanctuary deputy chair[person]... said the deliberate actions pointed to someone who had... an extraordinarily sick mind.

...Eight of 14 wekas set loose from a sanctuary by vandals have been found. Little hope is held for the rest... of the protected, flightless birds...

An economist... of Massey University[, who]... has developed a statistical model designed... to calculate the odds of a species surviving... extinction... without human intervention[, gave the weka just a 6% chance. Other sorry cases are the kokako (3%) and the little spotted kiwi (1%). The economist says these figures]... challenge... conservation efforts to save... endangered native species such as the kakapo. But minders of the kakapo dispute the view... that the large flightless parrot nicknamed "the big red budgie" is a lost cause. The charismatic kakapo is an important focus of wildlife conservation efforts. As one of the few remaining large bodied birds once so common in N[Z] it must be rescued... the minders say... [However, the] economist regards the kakapo... as... ecologically unuseful, a relic and a museum species. "At the moment it has all the attributes of [following the moa, adzebill, NZ quail, Haast's eagle, huia, Chatham Island Kaka and the NZ crow, for example,] to extinction but I would be more than happy to be proved wrong. I am not privy to all the decisions being made about the kakapo. There may be grounds for optimism but I am not aware of any." Only 50 kakapo are known to exist. The flightless parrots have been transferred to offshore islands. Of the 19 [hens] in existence some are getting on in years. The birds are monitored, at breeding time around the clock, in a \$900,000-a-year species recovery programme... [The

economist says that because the kakapo is a member of the parrot family with other species occurring around the world... [then] if the goal is to preserve genetic diversity more effort should be put into saving the kakapo as an example... About 1000 North Island kakapo survive. The species, also the target of a costly recovery programme, is unique to NZ, and one of only three such wattled birds – together with the saddleback and extinct huia – to exist on the planet... His views are tantamount to heresy in conservation-minded NZ where 11% of the world's endangered birds are found...

Although there has been much anecdotal evidence of... ultra-competitive mynas causing native bird numbers to reduce... a year-long study, part of [an] Auckland University biology student... master's thesis, provides the first concrete data... The impact of mynas on native and other resident birds on Moturoa Island in the Bay of Islands was examined from January to December 1995, after... [a] total of 457 mynas were... killed off. The numbers of tuis, fantails, grey warblers, silvereyes and welcome swallows all increased after mynas were removed... Native bird... levels... [were the] highest... recorded on the island in 15 years... Introduced birds such as blackbirds, chaffinches and starlings also increased after mynas left.

...Magpies and mynas have in some cases been treated with blatant cruelty since publicity about the birds destroying native wildlife, say Auckland bird-carers. A young adult magpie delivered to... [a] West Auckland wildlife centre had had its legs burned off and there were signs of burns on its tail and neck. It was picked up on the Coromandel to Auckland highway by travellers who saw it flopping around on the road... [T]he injuries were probably inflicted by a cigarette lighter up to two weeks ago, but the bird had managed to survive and had kept its weight up. "It whimpers like a little baby," [the centre's owner] said before the bird was humanely destroyed. "You wish you could make it right but you can't." [The owner] said there was no excuse for ill-treating magpies and mynas, which in many cases were just filling habitats – wide open spaces and tall trees – created by people... [Someone] who has a bird refuge on the Tamaki River, also said there had been more recent cruelty against magpies and mynas... Yet, [that someone] said: "More damage is done [to wildlife] by stealthy night creatures like possums, rats and cats." Even more native birds were killed at this time of year by people clearing bush. [The refuge owner] had recently seen a hedgehog eating some young fantails, which were still alive. The tree their nest had been in was felled during bush clearance. "It was not the hedgehog's fault... It was the people who had chopped the trees down." ...B[y] the... way... birds... caught in oil slicks [now] stand a better chance of survival thanks to a \$45,000 mobile rescue unit based in Auckland which... can cover oil spills anywhere in the country. It is the brainchild of the Wildlife Rehabilitation Trust – a marriage of Bird Rescue, the Auckland Zoo, SPCA, Maritime Safety Authority, and [DoC] – and the result of more than 10 years planning. A rehabilitation centre – due to be built within the next 18 months on a site at Carrington Unitech – will be the first of its kind in the Southern Hemisphere.

...Hunters at the Auckland Spring Possum Shoot scored a kill-rate second to none, say organisers. Each participant killed [on average] 140 possums at the Franklin district killfest... with a high percentage of the total cull involving [mother] possums and their offspring... Trouble is, only 27 hunters entered the competition. The organiser... was disappointed at the turnout but everyone had enjoyed the occasion. Except the possums... The top three hunters each won a .22 calibre rifle for their accuracy. The winner... also took home a "brick" of ammunition for the 350 "tails" that [it] nailed between 6 pm of Friday and midday yesterday. [Although 'the flesh is edible and resembles that of rabbit', the bodies won't be made into pies.]

...A group of Taranaki farmers plans to lobby the Government to reintroduce a possum bounty... [A spokesperson] for the group, said that the Taranaki Regional Council had budgeted to spend more than \$5 million on possum control over the next five years, but vast areas of Taranaki would not be covered[– while u]sing 1080 poison to kill possums... did little for [NZ]'s clean and green image... "I know of people who are saying they'd give up their jobs if a bounty was brought in." ...while numbers were high the bounty could be set at about \$2.50 per animal, increasing as the numbers fell. While there had been claims in the past a bounty system did not work, it did produce dead possums. The group intended to organise a petition to gauge support for the scheme.

...The Animal Health Board said yesterday that... [p]est destruction authorities have stopped the use of 1080-poisoned carrot baits... – ...[p]ellets will now be used instead... – ...following the death of a number of robins in a Pureora poisoning operation.

...[the NZer] crouched low in the lush tropical undergrowth, staring into a clearing at a small black and white robin. With a high-pitched chirrrp, the bird flitted to the door of a wire cage bolted to a table-top, cocked its head and eyed the contents of a plastic dish. *Here's hoping*, [the NZer] thought, clenching his fists in excitement. The... conservation officer had been camping on Fregate Island, one of the Seychelles in the Indian Ocean, helping to devise techniques and strategies to save the native magpie-robin from extinction. Slow breeders that fed often on the ground, the birds had been decimated by feral cats. By... November, 1992, despite a successful program to eradicate predators, their numbers had dwindled to just 25. [Local c]onservationists had turned to [the NZer], an endangered-bird expert who, they had heard, might help them induce the birds to breed. "Your skills are urgently required," BirdLife International[']s deputy director-general... [and] coordinator of the Seychelles project told him. After closely observing the robins, [the NZer] concurred with BirdLife International researchers: the native vegetation in the birds' habitat had virtually disappeared and the exotic forest did not provide enough safe nesting places or food to sustain the robins along with reptiles and introduced birds. Over several weeks, [the NZer] helped fine-tune the recovery program, suggesting adjustments to supplementary feeding, the position of nesting boxes and how to exclude other species from food and nesting sites. BirdLife International staff and [the NZer] built wooden feeding tables sturdy enough to prevent giant tortoises knocking them over, and wrapped aluminium sheets round their bases to deter climbing reptiles. Wire cages of a mesh size big enough to admit robins but not other birds were built round the feeding dishes... Gradually, the robins ate... [the] meal of cockroaches, cheese and commercial bird food... with increasing vigour and began to nest in the boxes the team had erected. Over three years, the species made a spectacular recovery. Today BirdLife International staff are monitoring a population of around 60 and... have transferred some birds to three other safe islands in the Seychelles. As a senior technical officer with the [NZ DoC, the NZer] roams forests from [NZ and AUS] to the Seychelles, Mauritius and remote South Pacific islands devising plans to improve the survival chances of some of the 1100 bird species facing extinction. [It] has already contributed to the rescue and recovery of more than a dozen, including the gorgeously colourful Mauritian echo parakeet... "No other conservationist in the world has been directly involved in as many bird-rescue programs," says... [the] director-general of BirdLife International in Cambridge, England, the global agency responsible for bird conservation. [The NZer]'s success owes as much to instinct as technique. "[This guy] tries to think like a bird," explains... [a] former assistant director of the NZ Wildlife Service. "When [this guy] takes on a project, [it] lives with the birds, observing, thinking, worrying about their problems until [coming to an understanding of] what must be done." The [predicament of NZ] has helped shape... [his expertise. Since the arrival of humans and] cats, dogs, stoats and... rats... about half of NZ's land bird species... have [been] destroyed... Of the roughly 48 native species that remain, 23 are threatened... [The NZer] can hardly remember a time when [it] wasn't passionate about the islands' birds. As a schoolboy, [it] earned the name "Birdbrain" from classmates in Gisborne. [Birdbrain] raised fowls and pheasants in his family's back yard and often cared for orphan songbirds, hawks and seagulls in his room, rearing the chicks to maturity. One gull became so tame that it occasionally returned to the house years after it had been given its freedom. After his father died, [Birdbrain], at the age of eight, spent much of his time with... an ornithologist friend. [The ornithologist] took him on field trips and to meetings of NZ's Royal Forest and Bird Protection Society and the Ornithological Society. Through these contacts, [Birdbrain], then about 12, was dismayed to learn that the North Island weka, the large flightless, mottled-brown rail that roamed his family's farm, had disappeared from nearly all of its natural range and was in danger of becoming extinct. [The 12-year-old announced it would devote its] life to ensuring the survival of his country's remaining native birds. True to his vow, after finishing high school[it joined NZ's Wildlife Service and specialised in endangered

species management. Seven years later [Birdbrain] faced one of his first real tests as a conservationist. The South Island saddleback, a bird renowned for the glossy chestnut “saddle” across its back and wings, was at risk of extinction. Driven from the mainland by predators, rats had invaded its final refuge, remote Big South Cape Island, plundering eggs and chicks. Some scientists of the day did not believe that rats posed a serious threat to the birds but, with less than 100 saddlebacks left, [Birdbrain and the assistant director of the Wildlife Service] were sure they did and got permission to move the survivors to safer islands. [Their] first hurdle was to capture the agile birds... [but w]ithin a few weeks, 41 saddlebacks had been moved. Within a matter of months, they began breeding. As the world’s first successful relocation of a critically endangered bird, BirdLife International hailed the achievement... Now on 12 islands, saddlebacks number several hundred and [Birdbrain]’s techniques for capturing [birds] have been adopted and refined in many countries. Despite his success, [Birdbrain]’s hands-on approach is controversial. Some conservationists argue... it is wasteful to direct resources and time to bird populations so small that they appear doomed. An article in *N[Z] Science Monthly* even referred to one of [his] operations as “not good science.” Nowhere were [hi]s methods more tested than in a remote South Pacific archipelago, where the world’s rarest bird, the Chatham Islands black robin, was fighting for survival. In the last century, the population of the tiny birds with black plumage had been devastated by rats, feral cats and land clearing. Now only five remained, and only one pair, Old Blue and her mate, Old Yellow, were still producing fertile eggs. Most conservationists thought extinction inevitable. But not [Birdbrain]. “As long as one breeding pair remains, there is a chance,”... One day in the bush, [Birdbrain] was surprised to see Old Blue re-lay immediately after her chick died. It gave him an idea. As a child his most daring experiment had been to capture goldfinch nestlings and foster them to his grandmother’s canary... Cross-fostering, as it is called, had never been tried on an endangered songbird in the wild. If it failed, [Birdbrain] would be condemned for hastening the death of the species. Early the next season [Birdbrain] trained his binoculars on Old Blue, perched on a branch. When the *peep* call of her mate echoed through the bush, [Old Blue] left the nest to join him. As soon as [Old Blue had gone, Birdbrain] crept up to the nest and, using a spoon, gently removed a tiny, warm, fragile egg and put it in an aluminium canister lined with cotton wool. Quickly replacing the stolen egg with a plastic replica, [Birdbrain] hurried back into the bush. Five hundred metres away, his colleague... waited by another nest whose owner, a grey-brown Chatham Islands warbler, had just flown off... A few minutes later the warbler hen flitted back through the trees and burrowed into her dome-shaped home... The pair spent an anxious few minutes waiting to see if the foster mother would toss out the egg, but [the warbler] noticed nothing amiss. The egg hatched 18 days later, but the warbler was a failure as a mother and the chick died. It wasn’t until tom tits were used as foster parents the following season that chicks routinely survived. “We played some tricks on Old Blue,” says [Birdbrain], who fondly remembers the bird that became so famous in N[Z] that her death at the age of 13 was announced in Parliament. At last count, 200 descendants of Old Blue live and breed in the Chathams, and experts agree the black robin has turned the corner... In answer to critics who cite geneticists’ “50-500” theory on extinction – a population of fewer than 50 birds can’t survive, and 500 or less will eventually be doomed by inbreeding – [Birdbrain] points to research published in January 1995. In DNA tests conducted by [a]Massey University ecology professor... blood from the black robin population shows almost no genetic variability among the species. “There has been no indication that the black robin’s fertility, hatchability and chick survival rate has been disadvantaged by close in-breeding... This offers real hope for recovery of other rare and endangered species.” TO WATCH [Birdbrain] at work, I join him at a research site at the foot of an extinct volcano on Little Barrier Island, overlooking Auckland’s Hauraki Gulf... Little Barrier is home to 18 of N[Z]’s 50-odd remaining kakapo parrots... [T]he giant, flightless, nocturnal parrots breed every two to five years, and only when food is plentiful. To increase their breeding frequency, [Birdbrain] and his colleagues are supplementing their diet with nuts, fruit and vegetables. One [hen], Jean, has so far spurned the food, and [Birdbrain fears Jean] will never breed successfully without it. [Birdbrain] aims to teach her to recognise and eat the food... [W]e must catch our kakapo in rugged terrain. [Jean] has a small radio transmitter strapped to her back, and for over an hour we use a receiver to home in on the signal. At last rapid beeps guide us to an outcrop of rocks where Jean huddles in a cleft. The size of a fat rooster, [Jean] has huge claws and a powerful beak... [But when Birdbrain] picks her up [Jean only] burrows her head into his bush shirt. “All right girl,” [Birdbrain says as it] gently... renews a special friendship. In 1981, [Birdbrain was responsible for] transporting Jean and another... kakapo from Steward Island... Such work earns [Birdbrain] increasing worldwide recognition. In 1994, the UK-based Royal Society for the Protection of Birds awarded him a medal for his international contribution to species survival... Every week, letters arrive from around the globe, requesting his advice on bird-rescue and recovery projects. At home, Massey University... awarded him an honorary degree and doctor of science. At 57, [Birdbrain] remains dedicated to his mission. “I believe we have a duty to preserve and respect the unique wildlife of our planet, for its own sake and for the sense of wonder and enjoyment it inspires... We must take opportunities now... For when, through our own actions or indifference, a species is lost forever, we have failed ourselves and future generations.”

...[*Back to Nature is an exciting new feature focusing on the world’s precious wildlife. This month: the grey wolf: The grey wolf – Canis lupus – is the largest member of the dog family. Millions of grey wolves once roamed nearly all of North America. However, earlier this century, a law was passed to exterminate the species. Today their numbers are increasing again – up to 50,000 – although the species is still listed as endangered. Wolves communicate with each other by howling. Biologists have linked whimpers to friendliness and odd chirps to flirtation, while piercing whines mean the conversation is over. Contrary to lore, wolves do not howl more during a full moon. The American Indian reveres the wolf as a symbol of power and freedom.*]

...IF YOU don’t sleep, the wolf will come and get you... Indian mothers tell their children. In Uttar Pradesh, north India, this universal nursery story has become a reality. In the worst case of wolf attacks this century, 50 children under the age of five have been mauled and 31 killed in three districts of this poor, densely-populated region. Ten days ago, the wolves struck again, taking a four-year-old. [The girl] was with her mother in the outskirts of Manjanpur village when a huge tawny wolf leapt from the elephant grass and carried her off into the forest. For two hours villagers, armed with staves and torches, combed the jungle. Eventually they found the barely conscious child by the river bank. [The girl] is now in hospital with deep stomach and head wounds... [Since the] killings... began in March... a massive hunt has been on, codenamed Operation Wolf. Every night, across a 100km area, teams of shikaris, or traditional hunters, backed by police and forest rangers, comb the riverside ravines and grasslands where the wolves live. With 12-bore shotguns at the ready, they listen and watch, waiting for a sound or shadow. Ten wolves have been shot so far. But although rangers have tear-gassed lairs and even tried baiting wolves with a doll dressed in child’s clothes, the killers are still at large. Wildlife officials have stepped up their operation, organising nightly patrols of villages... They have also offered a bounty of 10,000 rupees... a wolf – a large sum in rural India. But the hunters are frustrated by the terrain – wild grasses and crops standing taller than a [hu]man; and the animal’s speed... “The swiftness of wolves makes them even more dangerous than tigers,” said... [the] chief conservator of forests and former director of Project Tiger, who leads the hunt. “They are also clever. A wolf will wait around a village until everyone’s asleep and then strike.” In one incident, a wolf gently lifted a child from beside its sleeping mother... [The chief conservator] believes about 200 wolves inhabit the area, of which one large pack of about 10 wolves has turned [to eating children]. Normally wolves prey on small field animals or domestic livestock. But as villagers protect their animals more carefully... some wolves have discovered that children are easier prey. [The chief conservator] also thinks they communicate this to each other. “It’s one theory for the strange way in which wolves are working in an organised manner in this large area.”... Local officials are fighting not only nature but also deep-rooted superstition. When the killings began, terrified villagers spread fantastic rumours of a supernatural killer or a werewolf. Some believed gangs of kidnappers were snatching children for their internal organs. Angry villagers have beaten to death some 30 people. More than 200 vigilantes are now in prison... facing murder charges... The last large-scale incident of wolf attacks was in 1878 when 624 people were killed in Uttar Pradesh. British Government agents offered a reward of Rs5 (22c) a wolf and 2589 were subsequently killed in nine months but although grey wolves are common around human settlements in vast tracts of north India, there have been

only sporadic attacks since. In 1972 wolves were given protection as an endangered species and a ban was put on wolf hunting... [The chief conservator] believes the latest problem is the inevitable result of conflict between an ever-growing wolf and human population. "We protect these carnivorous animals which are hunters by nature... But part of the work of conservation is to kill aberrant animals to protect the innocent ones." While the hunt continues, a more permanent solution to the larger problem eludes wildlife officials... [■ Researcher]s in the Netherlands[have] announced the development of a unique and humane way to keep elephants from wandering out of nature reserves. Dutch and Cameroonian researchers at Leider University said red pepper bombs were tested successfully on a herd of elephants that often stray out of Cameroon's Waza Park. The pachyderms, which have a keen sense of smell, found the spicy spray so offensive that they retreated to deep within the park. Every June the elephants try to head south in search of water and food, destroying crops along the way, and sometimes injuring people.

...The leader of the Conservatives... does not know whether the initials DOC mean the Department of Conservation or the Department of Culling. Making public his party's 18-page review of the department yesterday... - ...the... party had used some of its limited resources to hire university graduates to undertake the review and two others - ...[the leader of the Conservatives] said its decision to cull... Canada geese in the South Island... and... the wild horse herd in the Kaimanawa Ranges... raised serious questions. [The leader of the Conservatives] did not know who in the department was advocating the shootings, but new legislation was required to remove the department's powerful but totally ineffectual advocacy role. The Conservatives also wanted the department stripped of its policy role, leaving it to manage conservation land.

...A survey of the Kaimanawa horses appears so far to substantiate the D[oC] estimate of the population... By nightfall on Monday, with about 50[%] of the range covered, the total count stood at about 1300. The [DoC] earlier estimated numbers at between 1500 and 1800 and intended reducing the population to 500 in the heavily stocked southern zone and clearing the ecologically sensitive northern zone. A second satellite population of 300 may be started on Defence land in the south. The International League for the Protection of Horses [ILPH] and the Kaimanawa Wild Horse Preservation Society [KWHPs] have challenged DoC's figures... It is understood that once these latest results are compared with the operational plan, they will enable the kill to proceed, subject to the weather. The sparsely populated and difficult-to-muster northern area will be the first sector aimed at... The horses... were in groups of three or four, all kilometres apart within the remote Awapatu catchment. Only a few groups had seven or more. The estimated foal (or yearling) count was about one in seven. Most horses were quite nonchalant as the helicopter passed overhead and all of them seemed to be in good health. Most were seen in open tussock country and some were in the valleys which dissect the rolling plateaus. Twelve horses were counted above 1300m, the present snowline. Only a few were seen on the fringes of the mountain beech remnants which dot the area. Although some animal welfare groups have rejected the [DoC]'s plan for four departmental cullers to fire a volley at each group - saying that wounded animals or those that were not targets could panic and injure themselves - there appeared to be no reason experienced hunters could not be transported by helicopter, then use natural cover to get within .308 range downwind, and shoot them all in one volley. The humane back-up for a wounded animal would be a helicopter shot, but the Government has apparently ruled out that action. As for damage to fragile ecosystems, there was some trampling and pugging around wetlands but it was not possible to put that in a historical context. However, it was obvious that the hard tussock, as the favoured forage, was being eradicated. Although mature red tussock remained - being less palatable - juvenile red tussock was also in decline, and therefore not filling in the gaps. The upshot was that in many areas there were a few clumps of surviving red tussock within a sea of hieracium (hawkweed) - the plant that is now destroying the Mackenzie Country. Evidence of fires could also be seen and many steep slopes are now just bare soil. Yet while tussock damage from horses was obvious, severe damage from the 40 years of Army use could also be seen. The worst damage was close to the Waiouru military camp, where networks of muddy grooves criss-cross the tussock. Further out... deep four-wheel-drive ruts could also be seen in the secondary routes on ridge lines, albeit at a much lower density... Tank track damage is minimal. The Army has introduced a system of retiring training sectors on a rotational basis, and using hard roads for access.

...Kaimanawa feral horse-lovers would have the public believe protected free-range horses are a different proposition to deer or possums which were liberated, protected and left to multiply for over 40 years. No control action was taken until forest undergrowth had been eaten out by deer and possums had set about killing off trees. The Urewera National Park was set aside as a water retention forest but by a combination of feral browsing animals and timber millers, farmers along the Whakatane river had 400-year floods in seven years. The fodder for four deer would be about the equivalent grazing for one brumby and left where they originated wolves hold their numbers in check. No control over horses grazing tall tussock in a high country environment is to repeat the ongoing deer and possum blunder.

...Group fails to get cull ruled unlawful... Up to 300 Kaimanawa wild horses - many of them pregnant - will be shot this month after an 11th-hour bid to stop a... cull of the herd failed. In a closed hearing in Auckland yesterday, the principal planning tribunal judge... ruled out holding an urgent hearing into the cull... A joint statement issued last night by lawyers acting for the Crown and the K[WHPs] said it was "impracticable" to hold a hearing before the... cull... Horse lovers will move on to the Desert Rd, near Waiouru, today and are expected to stage a protest there until tomorrow night... The patron of the... [ILPH] said last night that it would put pressure on the Government to "stop the slaughter." An emotion-charged 90-second television advertisement depicting a horse saved from the cull which went on to become a young girl's championship-winning pet screened on Thursday night... Media and anti-cull organisations have been banned from attending the cull and the exact date has not been released... However, the [DoC] wanted to complete the cull before the end of the month so newborn foals were not left to starve when their mothers were shot... The [DoC] deputy director... said the carcasses would be buried in deep holes on the Kaimanawa Ranges, at least 100 metres from water holes... Last month, the Waitangi Tribunal turned down a request for an urgent hearing into the issue from the Tuwharetoa subtribe Ngati Tama Whiti. It claimed that the cull would violate the right to exercise hapu (sovereignty) over ancestral lands and their products, namely horses.

...The Government's decision yesterday to buckle to public pressure and cancel the Kaimanawa horse cull has tested to breaking point the loyalty of the Minister of Conservation. The... [PM], who announced the u-turn minutes before leaving for South Africa, confirmed that [the minister] had offered to resign, but [the PM] had rejected the offer as "totally unnecessary." It is understood th[e minister]... was furious at comments the Minister of Tourism... made on his radio talkback show on Sunday. [The Tourism Minister] called for a minute's silence "to reflect on the orgy of destruction that's soon to take place on the central plateau." Later, in a clear reference to [the Conservation Minister, the Tourism Minister] said: "I don't profess to be a clever, over-educated Rhodes scholar. All I'm saying to people out there is that there must be a better way than sending in gun freaks with high-powered machines to wipe out these animals." [The Conservation Minister] was entitled to expect the [PM] to rebuke the Tourism Minister for this but that apparently did not happen at yesterday's cabinet meeting. A spokes[person for the PM said the PM] was not ignoring the issue - it was just that [the PM] had not seen a transcript of the programme and was squeezed for time... [The Conservation Minister] was refusing any public comment last night. However, the N[Z] Herald understands that [the minister felt it] had been hung out to dry by the policy reversal, especially as only two weeks ago the cabinet had endorsed the strategy. It was a plan [the minister] inherited, as the cabinet had provisionally approved the cull as early as May 5 - at least three weeks before [the minister] took over the conservation portfolio on the resignation of the [previous Conservation Minister], who stood down in a bid to atone for the Cave Creek tragedy. Responsibility for implementation then fell to [the successor], who argued for the cull publicly and at some political cost. But [the successor] had strong backers as most of N[Z]'s leading environmental groups considered the horses were threatening native grasslands. But a highly emotional campaign fought by the K[WHPs] succeeded in mobilising public opinion... The P[M]'s office... received 500 letters against the cull in yesterday morning's mail alone. However, the Government remains convinced that the wild horse population must be reduced. [The PM] said yesterday that a muster would be ordered for "some time next autumn." ...[the PM] was careful not to say that, once mustered, the horses will have to be disposed of. If they are not sold as pets,

they will be sold as pet food. This will remain the case even if a viable contraception scheme is developed because herd numbers are already at twice the ecologically safe level.

...Public sentiment rather than science may decide whether the size of the Kaimanawa wild horse herd is controlled by contraception, says a Massey University ecologist... [who] told an ecology department seminar that applying contraception to a wild species might be seen as a “God-like act.” Others would think the money should be spent on saving threatened indigenous species. The immuno-contraception being tried... can last up to three years... The contraception [i]s shot into the rumps of... mares using airguns... First results of the trial should be available next April.

...The Government has sacrificed the environment for the sake of votes in abandoning the Kaimanawa wild horse cull, say environmentalists... [The] conservation director of the Royal Forest and Bird Protection Society... said last night that the Government had capitulated to a “hysterical, noisy minority”... However, the... [director] predicted the move would ultimately lose the Government more votes than it gained. And there are doubts that its opting for rounding up and auctioning the horses next autumn instead of shooting them will ultimately prevent the deaths of more than a few yearlings and foals. In 1994 about... 150 younger horses offered at auction were sold, the rest staying on the Poronui Station, near Taupo, or following more than 100 other older animals to a Taumarunui abattoir. At the 1993 auction three-quarters of a mob of 120 sold – a further 100 were slaughtered... Last night representatives from the K[WHPS] and other horse-lovers’ groups were proclaiming the axing of the cull in favour of a muster and horse auction... as a triumph of common sense, and an opportunity to begin the in-depth study of the horses they have been seeking all along. They have also demanded that protection status – lifted from the animals earlier this year – be reinstated... But... a Massey University geneticist, dismissed the genetic uniqueness argument often used by [the KWHPs. The geneticist], who is also the chair[person] of the Rare Breeds International board, said... “Station hacks and Army-derived thoroughbreds, released in the 1940s, have both joined the herd at different times, so the herd’s genetic pool is added to regularly. There has been little time for any natural selection to affect the Kaimanawa herd significantly.”

...As the row over the cancelled... cull continued to simmer yesterday, it was revealed... the Government has been told the delay until next year... “will result in... 240 [to] 290 horses being added to the population which will need to be removed either by culling or mustering to the abattoir[.]” and estimated... costs of mustering horses from the area could be \$200 to \$300 per animal, while sales of the horses previously had been less than \$100 each. Meanwhile, the... [p]atron of the... [ILPH] said the cancellation of the cull and planned muster next year was much more acceptable to his organisation. [Ironically, i]t was the league that had... protested strongly against a muster... [i]n 1993... saying it would be cruel and inhumane... [T]he league had no quarrel with the legitimate and proper slaughter of horses in N[Z]. Between 7000 and 8000 horses a year are slaughtered for export for human consumption, with an estimated additional 600 a week slaughtered and processed for the pet food industry. - 1996

N[Z]ers accept wild deer being shot from a helicopter. But they raise a public furore when the target is wild horses. The country has built industries and a large part of its economy on putting lamb, beef and venison on other countries’ dining tables. Serve up horse meat to the same foreigners, however, and some Kiwis are horror-struck. This recipe for confusion has come to a head in the fierce debate over the Kaimanawa wild horses... When it comes to preserving the horses which have ranged over the North Island’s Central Plateau since the 1870s, one horse-lover’s idea of animal welfare has proved not to be another’s... While the plant-verses-animal, or even native-verses-exotic, conflict remains a subtext of the whole story the most recent chapters have been on animal welfare... Save Animals From Exploitation, Kaimanawa Horse Action Network and... the Wild Horse Trust[(WHT)]... want... the animals to remain on the plateau where, [the groups] believe... their numbers would stabilise because of natural considerations. But the natural way is not necessarily a kind way. As grazing has run out, horses have gone hungry and that has led to deaths, stunted growth and diseases caused by nutritional deficiencies. The Veterinary Association’s equine specialist... was horrified when [it] saw the poor health of many of the horses... [The specialist] said any farmer who caused animals to be in that state would have been prosecuted. The horses [a]re not in a natural environment, they had been put there by people and the only way to protect their welfare was for people to manage them within the environment... said[the specialist, who has drawn] criticism for backing the view that, to reduce their number, the best interests of the horses would be served by shooting them where they were. It [i]s not an isolated opinion. A lawyer specialising in animal welfare... said that four years ago about 40 people from a wide range of animal welfare groups thrashed out the issue during a one-day conference. Their combined opinion was that the most humane way to reduce the number of horses was to shoot them. At that time, [the]Conservation Minister... decided “for political reasons” not to take the advice... Similarly, when a kill planned for last year... raised a storm of protest, it too was shot down for political reasons. [The lawyer] said people’s romantic notions about “noble” horses were “a big factor” in the debate, but animal welfare was a matter of pragmatism. For instance, it may cause lambs pain to be tailed but, considering the horrors of flystrike, it was better to have the tail off... It was quite feasible that the young horses would settle in captivity but older stallions were not suitable for domestication... [The lawyer i]s not happy with the prospect of stallions being gelded. It would be “absolute terror” for the animal... Yet that is the plan of some ardent horse-lovers from the protest groups who see it as being in the best interests of the horses. There may be an explanation for the confusion over what is in animals’ interests. The animals do not get a look in. The laws on animal welfare... are set by people.

...THE WILD HORSES FLASH THROUGH THE foothills of the Kaimanawa mountain range... galloping down hillsides to drink at the streams that wash through the region’s shadowy gorges. The short, pot-bellied horses have roamed the area in groups of four or five for more than a century, feeding on tussock and native grass. But over the past 15 years their numbers have grown tenfold, and the region’s delicate flora are suffering under the impact of some 2,000 sets of hooves. In their search for fodder, the horses churn up the temporary wetlands that support tiny herbs, grasses and sedges – rare plants the D[oC] is anxious to preserve. Says DoC[’s] senior conservation officer...: “If it were rare animals we were talking about, it would be regarded by all as an absolute treasure of an area. But some of these plants are difficult even to find.” DoC is struggling to persuade N[Z]ers that the wetland and sub-alpine plants are as important as the horses[(‘a remarkable 25% of all NZ’s plants can be found above the treeline, and 93% of all the alpine plants are endemic – compared with 80% for the rest of the higher plants; snow tussock herb-fields are one of the most distinctive elements of this cold, windswept environment – they are remarkably long-lived, larger specimens may be several centuries old, and like beech trees seed infrequently but in profusion’)]... Over the past three years 570 wild horses have been mustered and sold, half to private buyers and half to abattoirs, and DoC plans to muster another 1,500 in the coming months... [Afterwards] DoC hopes an immunocontraception program... will hold numbers at about 500. “That will leave the animals and the plants in a situation that is sustainable.” The W[HT] disagrees, saying such a cut in numbers will threaten the entire herd. Thought to be descended from escaped military mounts and a Welsh stallion-Exmoor pony cross that was turned loose in the late 19th century, the horses are genetically close to Thoroughbreds, though they look quite different... “They look like a pregnant mare because they need to eat so much roughage to get even the smallest amount of nutrients[.]” says a spokesperson for the WHT, who] thinks they should be left to graze in peace. “The herd has never really caused a problem... If there are areas that require protecting for plant growth, let’s fence them off and get someone in to manage the horses instead of getting rid of them all.” But DoC says fencing is impractical over such a large area and would in any case require the temporary removal of the herd. Whichever of the other options – capture or culling – the department finally decides to adopt, it looks as if the Kaimanawa horses’ years of free rein are coming to an end.

...The days of the Kaimanawa horses appear to be numbered... The Minister of Conservation... said the numbers were such that “significant control” of the horse population needed to occur this year, most likely between May and July. [The minister] said his strong preference was for a muster, but final decisions would be made after consultation with interest groups... [The minister] said the Government was committed to the

Kaimanawa Wild Horse Management Plan, which sets the maximum sustainable horse population at 500... roaming 70,000ha... Air and ground tallies were carried out by the DoC last month as part of its programme to reduce the number of wild horses and their effect on the area's ecology. About 200 horses were spotted on private land next to the defence area. About 13[%] of the horses seen were foals.

...More than half the Kaimanawa wild horses injected with a contraception vaccine by Massey University scientists... produced foals this summer.

...a Government "Adopt a Kaimanawa Horse" campaign to find homes for mustered wild horses... was... announced yesterday... The horses will be mustered over the next two months... [- at a cost of] \$479,000, compared with \$100,000 to shoot the horses from helicopters... [-] and for \$100 "good owners" with referees can take home a stallion, mare, yearling or foal... The Minister of Conservation... said prospective owners would be warned that the horses needed considerable care. The SPCA would check on the animals' welfare after purchase. Any horses not adopted would be sent to the abattoir, [so the minister] issued a challenge to horse-lovers: "Over 11,000 people signed a petition to Parliament concerned about the welfare of the horses. If at least one in 10 were prepared to adopt a horse, our problem would be solved." ...[but t]he Auckland SPCA director... has scoffed at the plan. "The minister is laying the blame at the feet of the people who want to save the horses, saying 'roll along and buy them' like some cheap auctioneer. It would be very nice if [the minister] was in cuckoo land, and perhaps [the minister] is, to think there would be lots of lovely homes out there." ...the... [director], who opposes any cull... [said p]rospective owners would need a large property and a good knowledge of horses... [The minister says it is] in a no-win situation. "Some people would have me not touch a hair on a horse's head, and others want to see all the horses destroyed to save the plants."

...[a DoC] scientist... stroked the grass-like plant in the small container and spoke glowingly of its ability to survive in its last-known North Island habitat. The red tufted sedge, now found only in dwindling areas of the Central Plateau, once populated at least half the North Island... It is this unprepossessing plant, along with other rare and endangered species like the even smaller Kaimanawa forget-me-not, which is up against the tangled mane, wild running, free spirited Kaimanawa horses in the preservation stakes. "It's native plants versus exotic horses," said [the scientist, for whom] it may not be much of a competition. [The scientist] recalled with excitement his journeys of discovery 10 years ago when plants were found in the... Plateau that no one knew grew there or, in some cases, that they even existed. [The scientist] also noted that in the intervening years some had been lost altogether and others were being severely threatened by the grazing pressure of the horses. As [it] spoke, standing in the Waiouru Primary School car park, nearby horse preservation proponents were making their feelings known about the plants' rivals. "Don't kill the horses," said their placards. The plants' habitat is inland from the State Highway 1 stretch of road known as the Desert Road. The scenery is magnificent – bleak but certainly not desert. The grass and tussock-covered plains and hills are more reminiscent of the South Island... 10 years ago the plains were covered in red tussock... [A] Major... of the Waiouru camp said the tussock was once so thick soldiers on exercise could crawl unseen for hundreds of metres. Now their enemies would have them in their sights in a minute... [and many of the plants] are now grass species like browntop, cocksfoot, chewing fescue and yorkshire fog which can be found all over N[Z]... The land, though, does look made for horses to thunder through in vast herds. The Bonanza boys could come galloping along anytime and no one would be surprised. But, [the] Conservation Minister... said, the land was not made for horses. Private landowners found that out long ago. They got rid of the horses on their land and turned to profitable enterprises. "The only reason the horses are on Crown land is because of the protection given them by the Army... If we do nothing we will have neither horses nor plants,"... Now across the vistas, modern day Bonanza boys whisk along in helicopters herding small bands of the rough-coated, mostly small and hardy horses on to trails familiar to them. That way they travel well, cantering along at a steady pace and joining others which have been driven down from the hills or flushed from the valleys... Lengths of garden-type screening is stretched along two sides of [a] ridge to funnel the horses towards yards set up on a blustery outcrop. The horses end their journey, for the moment, in portable yards constructed of aluminium and covered with scrim. A truck to the rear of the yards, where handlers shelter from biting winds, is also covered in scrim. Anything that glitters would spook the horses on that final run... [T]he horses quickly quieten in the pens. Only the presence of people drives them to the corners... in fright... Up close, horses... [2- and 3]-years-old are seen to be about Shetland pony size – testimony to their hard lives of freedom... The SPCA [supports the muster because it says]... it's cruel to let the horses live in their present condition. Many may have starved to death this winter.

...1075 [Kaimanawa wild horses] were mustered to be auctioned off this month. Many horses showed signs of poor nutrition and were infested with internal parasites. The 517 remaining... horses will be kept in the Argo Valley with a trust set up to manage the herd.

...The cost of reining in the wild Kaimanawa horses has so far amounted to more than half a million dollars... Preparing for the muster, including conducting a census of the horses and then corralling them cost \$356,600. The horses were trucked to Taihape farms for a price of more than \$31,000 while their feed and management until they are sold is estimated at \$123,000. Also in the account, revealed... under the Official Information Act, were fees paid for Ministry of Agriculture and veterinary supervision which came to more than \$21,000. Payments to the SPCA for checking references for prospective horse owners – including the P[M] and the Treasurer – will be more than \$13,000... [T]he account saddles each horse with a bill for more than \$500...

[The PM stepped] in last year to save hundreds of Kaimanawa horses from the abattoirs and yesterday... followed through on [its] promise, becoming the owner of a yearling at the first of [3] auctions of the wild herd. Almost all of the 204 yearling fillies and colts were sold... with the 10 unsold animals to be offered at auction this Saturday. An agent bought a filly on behalf of [the PM]... destined to be ridden by [its] grandchildren... But just how much the P[M] paid for the horse was not being revealed yesterday... The 194 horses sold fetched \$32,720, with the top price of \$620 for a colt. Some animals fetched only the reserve of \$100, with some buyers going home with several horses... 250 people came from all over N[Z] with their chequebooks and credit cards... Many first-time horse buyers attended... Buses transported the buyers to the isolated farm, where they had an hour to view the penned animals... The auction closed after [3] hours of intense bidding. DoC said it was delighted with the auction result.

...More than 100 people [who had] paid \$50 each to register as buyers... did not turn up[at the Kaimanawa wild horse auction]. More than 600 of the... mustered horses remain unsold. Fifty horses have already gone to the abattoir... The former Minister of Conservation... said yesterday that [it] was not surprised the horses had sold poorly and maintained that shooting... [them] in the field... would have been more humane than putting them through a stressful muster and auction... Those who made the most noise, and influenced public opinion most strongly were those who did not understand what humane treatment was, [the former minister] said. Battles between rational and extreme views were commonplace, making management of the conservation estate difficult. Too often the extreme view was given prominence in the media.

...To us Europeans the past three months have been an interesting if depressing lesson in politics and political life in a country which usually sees itself in the role of a world environment protector... [W]e are shocked by the experience. From the moment [our Swiss-based] Foundation made its first offer... to buy "all of the remaining Kaimanawa Horses", in other words all the horses taken from the Kaimanawa mountains that had not found a buyer, we have been astounded to see the presumptuousness and contempt that [NZ] authorities show for their fellow citizens, for the money of their taxpayers and for public opinion. We have seen a Minister of Conservation all but annihilate an internationally registered endangered herd of special genetic value and a national heritage. We have seen him humiliate two important humane organisations of worldwide recognition: your own... [WHT] and ourselves whose total commitment is to the salvation and the welfare of the horses... How can [NZers] stand for something that no citizens in Europe would take from their government? Your government has cheated you out of your Kaimanawa Horses! It has arbitrarily lifted the protected status of the herd. It has culled three quarters of the 1700 horses, in fact all the horses of the northern range against your will. It has destroyed the social structures of the herd... And it has deliberately prevented the sale of the last 400 horses to a national organisation. The [WHT]... has the competence and resources to offer these horses sanctuary and a future and... also has the respect and full

support of the... Foundation[, whose]... 50,000 hectare sanctuary for 700 Brumbies ([AUSn] wild horses) has been successfully in existence for 9 years, attracting tourists from all over the world. In Togo... the Foundation runs the National Park of Fazao-Malfakassa, an elephant and wildlife sanctuary of 200,000 hectares... We absolutely disagree with [the]Assistant Conservator... from... the [DoC, who] said... on TV Channel 3, Sunday night... [that] the remaining Kaimanawa Horses had to go to the meat works as there was no interest in them. The bold untruth of this statement is contradicted by the facts on record. In almost three months of negotiations, the minutes and records of which are filling file after file, it has not been possible to purchase the horses held prisoners on holding farms under the saddest conditions. Despite the seriousness, reasonableness and sincerity of the joint offer... DoC... has been constantly raising new and ludicrous impediments to the conclusion of the sale. The Trust's management proposals were dismissed, land options turned down. Invasive and insulting demands were made on the Trust and the... Foundation to provide evidence, explanations and written proof of their financial resources and long term solvency. At the same time DoC constantly prevented inspection and even viewing of the allegedly remaining 400 horses which it pretended and still pretends to hold for sale, whose welfare it pretends to hold paramount... In fact everything leads us to believe that these horses may not exist. [NZers], your Kaimanawa Horses are gone. And it was all done... [behind] your backs. With... [about] a million dollars of... YOUR money... They were YOUR horses, as the land they once lived on is YOUR land... In Europe... we would ask: "Where are the remaining 400 horses which you [allegedly] still hold as hostages? What... do you have to hide?" And we would keep asking till we knew the answer.

...An organisation campaigning to save Kaimanawa wild horses hopes a \$10,000 newspaper advertisement will motivate others to take horses it refused. About a hundred horses, mainly stallions, remain from the 1060 mustered from land at Waouru in June... Yesterday's one-page ad... in the *N[Z] Herald* was placed out of "sheer frustration"... [says the president of the WHT. The trust], which had hoped to establish a second herd... [-a]bout 530 horses still run wild in the Kaimanawa ranges... [-] has negotiated with the [DoC] for the removed horses since August, when 400 were unsold. The president... said the trust had wanted to have enough horses to establish a viable herd, but as their numbers reduced over the months that became impossible... The trust was acting on behalf of... a Swiss wildlife group which had offered \$100,000 to buy and establish the horses in a new area. Under the headline "Tragedy of the Kaimanawa wild horses," the group castigated the Government, [the Minister of Conservation] and his department... The ad... said the issue would be put before the International Court of Justice for Animal Rights in Geneva. [The minister said it] had never heard of the court but was satisfied the department's standards would stand up in any forum... [The minister], who disputed all the claims made in the ad... said [it] was not satisfied the \$100,000 promised by the [Swiss wildlife group] was sufficient to support nearly 400 horses. "The grazing costs of these horses are costing the Government \$23,000 per month, and so I was concerned that the trust did not have the capacity to care for that number of horses in the long term." The offer remained open for the trust to take the remaining horses, [the minister] said.

...In an operation similar to its plans for the Kaimanawa wild horses, the D[oC] has all but wiped out an ancient herd of cattle on the Auckland Islands. Only last-minute work by the Rare Breeds Conservation Society brought an attempt to preserve the genes of the unique herd, but the success of that is hanging in a balance which seems to be tilting towards extinction of the species. The sole surviving heifer of the seaweed-eating cattle is under intense scientific care at Ruakura research station in Hamilton, where efforts to fertilise her eggs with semen taken post-mortem from Auckland Island bulls are proving frustrating. A second [cow] brought from the Islands died soon after arriving at Ruakura. Some reports say that [it] died of salt deficiency, the species having adapted to a high salt intake from eating kelp. The slaughter of the cattle took place under a new D[oC] policy for the management of the islands, which consist of the large Main Island, and smaller ones named Enderby, Adams, Rose and Disappointment, and a large number of smaller outcrops and large rocks. Cattle had existed on the islands, 400 nautical miles south of N[Z], since 1849, although the founding animals of the slaughtered herd were believed to have been landed there in 1894 in an effort at farming by a... [farmer from] Invercargill. Those who warn against diminishing biodiversity describe the loss of an isolated herd of independently developing animals free of all supplementary chemicals as a tragedy. Scientists with long association with the islands are circumspect in their reaction to the demise of the herd. An ecologist who studied the islands for years... said: "It's a bit sad. They were remnants of an early shorthorn breed, and they had had no management, no drenches or other treatments like modern cows, for 100 years so we could have learned a lot from them. They were, however, like the Kaimanawa horses, the wrong animals in the wrong place at the wrong time when it comes to balancing N[Z]'s truly unique natural environment. The rescue attempt was belated and it would have been nice to have had a bigger gene pool." Apart from the genetic diversity represented by the herd, a quality which is becoming more valued as commercial forces cause specialisation – and thus susceptibility to epidemic disease – in cattle breeding, scientific interest centres on whether natural traits or evolutionary development in the undisturbed animals might have been of benefit in modern farming. An example is sheep rescued from a flock slaughtered on Campbell Island. They had no footrot, which is endemic in mainland sheep... [A] colleague of... th[e ecologist]... in the now defunct Department of Science and Industrial Research, wrote in 1971 in favour of retaining the cattle on Enderby, second biggest of the Auckland Islands group. [The colleague] reported after a study expedition that there seemed to be little effect from the cattle on the natural bush of the island, and wrote: "Thus, unless [people] once more intervene... future environmental trends can be predicted to some extent. One possible, but in my opinion undesirable, disturbance would be control or removal of... [the] cattle in a fumbling attempt to re-establish the natural vegetation and protect the native fauna. On Enderby there are breeding sealions, many native bird species, cattle and rabbits all in an interacting relationship which is not obviously detrimental to any of them or the present vegetation, and existing trends... have positive conservation values and scientific interest... While further deterioration of the group should be prevented, every opportunity should be taken to profit from the natural experiments now taking place." The advice failed to move the D[oC], whose Invercargill branch moved three years ago to try to exterminate all non-native life from N[Z]'s southern islands. Its first action was to set poison baits for rabbits, which have not only successfully exterminated them but also mice which were accidentally introduced from a succession of whaling and sealing ships which visited from 1822. Dogs and pigs were introduced in 1842 when Chatham Island Maori arrived to settle. A scientific expedition under an American, C. Wilkes, in 1845, found cats, mice and pigs well established. In 1849 Charles Enderby, chief commissioner for the Southern Whale Fishery Company, which had obtained a lease on the islands, liberated rabbits, goats, sheep, horses and the first cattle. Declining numbers of whales led to abandonment of whaling by 1852. The Maori settlers left in 1856, having eaten all the larger animals, leaving only rabbits and goats for the survivors of the wreck Invercauld in 1865 and the gold ship General Grant, in 1867. The president of the Rare Breeds Conservation Society... says that obtaining a live specimen of the cattle herd after the D[oC] cull had begun was "sheer luck." [The president] travelled to the islands and found that the initial cull had missed five cows. [The president] caught one and her yearling calf and brought them back to the mainland. "The cattle had lived there a very long time... but it is basically D[oC] policy to clean everything out regardless of whether they have a right to be there. It is a pretty blanket, one-eyed approach. It is a shame that the opportunity to get a herd established away from the islands was missed." [The president] has, however, high hopes for the insemination work at Ruakura. "The people there are the best in the world at this sort of thing, there is the best technology, and they are putting a lot of their own funding into this. What they are doing is a world story." Another authority said, however, that the shorthorn was the most difficult cattle breed to artificially inseminate. There have been several attempts on the cow, but only one egg has fertilised, and it aborted recently after five months... [However,] other cows had been inseminated with Auckland Island semen, and it was hoped that a half breed calf could be delivered within a few months. A breeding improvement programme would follow.

...A planned cull of Canada geese yesterday was abandoned after protesters... clashed with fish and game officers... About a dozen protesters gathered at the Bromley sewage treatment ponds at dawn after word spread that a cull was planned. A North Canterbury Fish and Game Council officer... said the protesters arrived as officers were herding the geese on to the shore. The protesters used smoke bombs, shouted and made noise to

scare the birds away... [T]he cull was called off because the birds had become too distressed by the protesters' actions. "It is an unpleasant task at any time but it has to be done... Our first priority was animal welfare and to do the job as humanely as possible." ...The conflict led the Christchurch City Council to withdraw permission for any further culls on its land... The original council consent was for one cull only, with the geese to be herded into pens and trucked away to be killed elsewhere... "Geese being butchered in public view on council land is not exactly what the council thought it was getting itself into," said... the Christchurch City manager... "It is a very sensitive issue and we are mindful of not wanting to get the community offside." On December 28, [1996,] at Lake Ellesmere, 3600 geese were herded into pens, stunned and beheaded.

...For the past decade, fewer hunters each year have headed to their maimai on river and lake shores to bag ducks, swans, pukeko, geese, quail and pheasants. Thousands had abandoned the sport, said the executive officer of the Auckland and Waikato Fish and Game Council[who believed] competing recreational pursuits and lifestyle changes were taking a toll on hunter numbers. Other factors suggested as contributing to the falling numbers included the number of families without fathers who could pass on the interest to their children, the rise in seven-day retail trading and the greater difficulty in getting firearm licences. There were now about 40,000 licensed hunters nationwide, down 6[%] on three years ago... With licence fees providing the main source of income for the council, the drop is a financial headache... [One hunter] will definitely be out on his beloved Lake Rotokauri, west of Hamilton, for the start of the season... "It's peaceful here and I can unwind. If I see a duck it's a bonus,"... [The hunter] has had many "bonuses" over the... [past] 30 years... and this year... hope[s] to down 300 ducks during the season... [There is a daily limit of] 10 ducks...

Dismembered ducks were dumped on the doorstep of [an] inner-city sports store... yesterday in protest over duck shooting. Members of the group Save Animals From Exploitation displayed ducks which they said had died slowly from gunshot wounds and others which had been blown to pieces. A spokes[person]... said volunteers had collected the ducks from shooting areas near Waiuku. Beer bottles and cans were part of the display because shooters often drank while hunting and left empty containers and spent cartridges behind. The group had targeted [the inner-city sports store] because it believed it was encouraging children to kill animals by selling licences to them for \$1. The lunchtime Queen St protest did not take the [store]'s staff by surprise. The store manager... said they were expecting the demonstration after a tip from a television channel... [The manager] could not understand why [his store] had been the target of the group for the past couple of years, because it did not sell guns. The duck-shooting equipment stocked included ammunition, duck callers and shooting licences... sold... on behalf of the Fish and Game Council at prices set by it[. The store] had yet to sell a children's licence this season... [In related news, b]lack-backed gulls are being culled in Northland to give other birds a better chance at life... 300 gulls nest at a native bird refuge at Mangawhai and are threatening the survival of rare native species such as the... nearly extinct... fairy tern and the dotterel... "There are only 30... fairy tern[s]... at the reserve, and they can't compete with the hundreds of gulls for territory and food[," said a] conservation officer... D[oC] staff are feeding the gulls poisoned bread... [until their numbers] reduce... to about 50.

...There are 30 fairy terns in the world, and right now those birds are nesting on the busy beaches of Auckland and Northland. The D[oC] is pleading for care on the beaches where fairy tern... nests are extremely vulnerable to dogs and vehicles. Department staff found nests on Muriwai and Papakanui beaches last week, well before the usual nesting season... The nests which have been found have been fenced off. People are being asked to steer clear of fenced areas, as the birds are easily scared off their nests.

...Endangered birds who choose a sandy spit on Omaha Beach for breeding this year can count on human help for a safe and undisturbed nesting. Residents are watching over the welfare of the eight pairs of N[Z] dotterels which nest from September through to November at the popular resort near Warkworth. Since July a band of 10 volunteers have been trapping stoats, rats, hedgehogs and feral cats which raid nests. Next month a donated hut will be placed on the spit so that a warden can be on hand... to ensure birds are not bothered by dogs and vehicles. The trapping leader... said the birds were making their simple scrapes in the sand and would soon start laying their camouflaged, mottled eggs. The tip of the spit has been cordoned off with tape and signs ask beach-goers to walk below the high-tide mark instead of through the dune nesting area. [The trapping leader] said the spread of housing to within 50m of the spit had been of concern but the land developer... had supported the protection effort and donated money and materials. A wildlife scientist... said the Omaha community was important because the D[oC] could not manage all the dotterel nesting sites scattered from East Cape to North Cape. Omaha was also important to the survival of the dotterels because it served as a post-breeding flock site for 50 to 60 birds in the Mahurangi-Pakiri area from February through to May, said [the trapping leader].

...NZ's rare kakapo may be hatching a plot to expand their numbers. D[oC] staff, who intensively monitor each of the 50 known birds, say the huge, flightless nocturnal parrots are making all the right mating signs. That may produce successful breeding for the first time in three years. Nesting among the critically endangered birds last occurred two years ago when two [hens] laid eggs. But the eggs proved to be infertile. [However, t]he department's kakapo recovery programme manager... said that this year 13 of the 16 [cocks]... on Codfish Island... were "booming" – a noise they make to attract [mates]. As an attraction to [hens] prior to breeding, [cocks]... mark out a track which leads to a bowl they dig out of the moss and tussock on the ground. They keep the tracks scrupulously clean of twigs and leaves and at night sit in the bowls and make a booming sound... [The hens] were visiting the... "arenas," with some camping for the night... [The manager said it] was "cautiously optimistic" that the birds would breed. "Rimu on Codfish Island are fruiting well, and we believe this stimulates breeding activity,"... The last time rimu fruited heavily on the island was in the 1991-92 breeding season, when four [hens] nested. But the rimu fruit crop later failed. Three chicks were found starving on the island and were removed and hand-reared. Only one... survived, and is now on Maud Island in the Marlborough Sounds. This year conservation staff, with sponsorship from Comalco, have set up a system of remote-controlled cameras and sound devices to monitor the birds if nesting occurs, to ensure they are adequately fed and not attacked by predators... [K]akapo on Maud Island and Little Barrier were showing little sign of breeding activity... It is believed only about 10 [hen] kakapo are now capable of breeding.

...A [hen] kakapo has been found on Stewart Island, giving a major boost to the recovery programme for the endangered bird. The Minister of Conservation... said yesterday that the kakapo had been found at the weekend at the Tin Range on the southern part of the island by D[oC] workers... Of the 50 known adult birds and three chicks, only eight adult [hens] were capable of breeding. "The recruitment of an additional [hen] into the programme is significant." A transmitter was placed on the bird and once checks were made on its health, weight and whether it had nested, it would be moved to a safer location on nearby Codfish Island... [T]he search team would stay in the Tin Range area in case of other stray kakapo. The first [hen] kakapo seen this century was found on Stewart Island in 1980. It had been believed that the kakapo was essentially extinct as only a few solitary [cocks] had been found in Fiordland. In the... early 1990s, conservation staff rescued the small population of... birds from Stewart Island because they were under threat from wild cats. The last kakapo found on Stewart Island was transferred to Codfish Island in 1993.

...SCIENTISTS are delving into kakapo droppings to try to work out how to encourage one of the world's rarest birds to breed more often... [Egg] laying appears to happen when rimu trees seed heavily. But the... kakapo recovery team are not absolutely sure if there is a direct link between rimu trees and the [kakapo's] breeding pattern. "We don't actually know what turns a [hen] kakapo on to start breeding... We're hoping to find the trigger which makes the [hen] kakapo get clucky... then we can maybe get the birds to breed more often through a special feeding programme." Over the next year [a] DoC lab worker... will be closely analysing the contents of kakapo droppings collected from Codfish and Stewart Islands. DoC will also send ripe rimu fruit to A[US] for analysis. It's already known rimu berries are high in estrogen which could stimulate kakapo... It's hoped results will reveal what triggers these mysterious flightless parrots to start breeding before rimu and beech trees have a heavy seeding season. DoC says this is just as important as the rest of the one million dollar a year kakapo recovery project. Up to now the

kakapo teams have concentrated on saving the chicks once they hatched. This year the results have been better than usual with three chicks surviving... But the key is to get kakapo mums working harder. And that means trying to find out how to encourage more kakapo hanky-panky than once every five years.

...While the country holds its breath over whether one of our most endangered birds – the kakapo – will have any [more] chicks this year, nesting is over for many species under threat. It has produced the usual crop of success and disappointment for conservation managers... On[ly on]e takahe chick has survived on Tiritiri Matangi Island in the Hauraki Gulf, where 17 adults now live. The birds were established on the island in 1991. Only 200 of the birds are thought to be left, with the main population in Fiordland's Murchison Mountains. Apart from Tiritiri Matangi they have also been established on three other islands: Maud Island in the Marlborough Sounds, Mana Island and Kapiti Island... [T]he leader of the takahe recovery programme, said that with half the survey work in the mountains completed, eight chicks had been found in the wild and 19 had been produced at the department's Burwood rearing unit near Te Anau. The season had been reasonably good, but in the past 10 years the total population had stayed about the same. Over the past few years record cold winters had made numbers decline. It was likely the islands would reach their capacity for the birds in a few years, although research was now being carried out into takahe productivity on islands. With sponsorship from Flight Centre, a researcher was investigating whether genetic conditioning made takahe more adapted to alpine habitats than islands and whether different nutritional aspects played a role in breeding on islands. "The takahe is still an endangered bird but we are making progress. We would like to be making more progress but our big disappointments have been caused by the extreme weather conditions in the wild,"... Back on Tiritiri Matangi Island, the rare honey-eating stitchbirds or hihi have finished an "incredibly successful" breeding season, according to the Auckland regional conservator... More than 20 chicks have fledged successfully in only the bird's second breeding season on the open sanctuary. One of the rarest coastal birds, the N[Z] dotterel – about 1300 are left – has had a better season than last year in the Auckland region in spite of two cyclones... Of the rarest wild populations in the Auckland region, the kokako in the Hunua Ranges have had perhaps the least successful year. Only 20 of the country's premier songbird are known to exist in the ranges and during the breeding season they are closely monitored in a partnership between the Auckland Regional Council and the D[oC]. This season, in spite of predator control, the two breeding pairs in the 20,000ha of regional council park have not successfully reared any chicks. One pair nested once and raised two chicks, but both were discovered at five to 10 days old with broken necks, the gruesome sign of the presence of a marauding possum. The other pair nested three times but their eggs were eaten, possibly by ship rats, possums, harrier hawks or moreporks. Last season was bad because of poor food availability but at least this year the breeding pairs had increased from one to two, said [an ARC] resource scientist... In the biggest managed population of kokako, at Mapara in the central North Island, around 25 chicks have fledged and about 20 nests are still on the go.

...A KOKAKO recovery programme has broken all breeding records, hatching 23 chicks from the 55 it monitors. The key, according to [one] conservation officer... was brutal pest control and really keen staff. "There's no place here for wimps and people who can't get up in the morning." The team of 22 D[oC]-funded staff has cleared a 1400ha area in the Urewera National park of 98% of its possums, freeing up vast quantities of food and habitat for the endangered kokako and about 50 kiwis which live in the area. Kokako (blue wattle crows) have been steadily declining in number... Nationally, there are now thought to be about 1000 left, with 600 of those in the Urewera area... [Since the cull of possums, which] also caught 75 stoats, a few feral cats, weasels, and... rats, [it]... was obvious that the forest was now growing and producing plentiful fruit. Rata were flowering and the supplejack had heaps of bright red berries, which is crucial food for pigeons and kokako over the winter... [Kokako] are quite large birds which sing haunting... songs and, although poor fliers, leap through the tree canopy in short noisy flights.

...On the world wildlife stage N[Z]'s tui would be close to the top of the bill for the quality of its singing but our most outstanding avian diva must be the kokako. The pure flute-like notes of its calls have a chiming resonance that make them sound like they were being delivered within a vaulted cathedral rather than the open expanse of a forest. Sadly, all too few N[Z]ers have heard these stunning performances for the steady decline in kokako numbers throughout this century has seen them disappear from so much of the country where they were once common... For a bird of the treetops it has quite unusual and engaging behaviour because with small wings it is a weak flyer. Rather than flying from branch to branch in search of food, the long-legged bird mostly runs and leaps about the canopy more like a squirrel. It has a broad diet of insects, fruit and soft foliage and, like a parrot, frequently uses one foot as a hand to hold stems or fruit while it plucks the food from them. The kokako's poor flight was once thought to be its major survival weakness, making adults vulnerable to introduced mammalian predators... [Furthermore, w]hen most of the landscape was covered in trees the birds were able to range far and wide but as farmland has insidiously replaced our forests through slash-and-burn development, kokako territories have been boxed in by pastoral moats that the birds cannot cross. [However, w]ith the aid of better remote monitoring technology, such as time lapse and movement triggered photography, and more intensive study by dedicated researchers, breeding failure has been found to be of greater importance than was previously appreciated... Over the last couple of years the D[oC]'s Kokako Recovery Group has... resulted in a dramatic improvement in breeding success... In the Mapara Wildlife Reserve in the King Country, numbers have increased sufficiently for some birds to be captured for transfer to new refuges. A pair of birds from Mapara and two more bred at the Mt Bruce National Wildlife Centre are to be released on the open sanctuary of Tiritiri Matangi on Sunday. This will give Auckland residents and visitors a golden opportunity to see the kokako, watch its acrobatic rather than aerobic progress through the trees and hear its marvellous calls...

Last breeding season... 140 chicks fledged in forest blocks managed under the D[oC] kokako recovery programme sponsored by State Insurance and the Norwich Union group... [A]t... Mapara... more than 66 chicks fledged, an incredible result from a population which numbered just five [hens] in 1990... Chick production at recovery sites is over three times higher than observed productivity in unmanaged forests[, where cocks outnumber hens]... by as much as 10 to one in some places. The... bird will be taken off the threatened list [when] breeding pairs number about 2500.

...An expedition to find the long-lost South Island kokako has ended in disappointment for searchers who are convinced the bird survives. The seven-week expedition, one of the most intensive searches for the bird, took place in bush country south of Murchison where an ornithologist... discovered a clue to its presence last year. [The ornithologist] noticed a huge area of moss on the forest floor had been grubbed over, heard a kokako-like call and then glimpsed what [it] believed was one of the birds stalking along a branch. But the sighting was not good enough to confirm the bird's existence. So... the... [ornithologist went] back in the area leading the World Wildlife Fund for Nature N[Z] expedition supported by the D[oC], Timberlands West Coast Ltd and the clothing company Earth Sea Sky. Unlike the North Island kokako, which is on the verge of a slow, managed comeback from about 400 breeding pairs, the South Island kokako was last sighted about 50 years ago. But... [the ornithologist believes it] has seen the bird nine times... [o]ver the years... One week into the expedition, those taking part were sure they heard its call. "The liquid, crystal-clear nature of the notes is unmistakable. But... [v]ery rarely does it call..."...the searchers saw no more moss grubbing and there were no more sightings. Nothing turned up on tape from recorders placed in the forest and mainly possums and stoats triggered the expedition's six automatic-surveillance cameras. "I am absolutely positive the bird is there – no question. It's just outwitted us, that's all... It is the most interesting bird we've got in N[Z] for its call and furtive behaviour. Some of its calls are phenomenal. I've been to the Amazon jungle and the Himalayas and I've heard nothing that equals the call of the South Island kokako." [The ornithologist] hopes to resume searching next year. "But even if we do achieve something with this difficult bird can we save it from extinction?"

...DNA taken from fossil bones of the North Island takahe shows it was a different species to the rare South Island birds, of which only about 200 survive. The discovery, described by Otago University researchers as scientifically startling, has thrown new light on the birds' evolution... The surviving South Island species is a fat, heavy bird like an African swamp hen... The extinct North Island species was taller and thinner, and more

closely related to the A[US]n swamp hen. “It appears that the North Island takahe is the more recent of the two takahe species... and its DNA suggests it’s more closely related to the pukeko we know today.” ...The “modern” N[Z] pukeko arrived from A[US] only about 300 years ago, which suggested that separate invasions of N[Z] may have given rise to the different takahe species.

...dinosaurs... died out 65 million years ago. Why is one of the enduring mysteries of science. Many scientists think it was due to a climatic change, perhaps brought on by a meteor striking Earth. Now the puzzle’s been compounded [by]... DNA evidence suggesting many of the birds we see around us today survived through that mass extinction; that their family tree is twice as old as previously thought... If birds are that old... they may have evolved back when the continents were clustered together in the Southern Hemisphere[, which suggests]... scientists should be working down here to solve evolution’s mysteries. “Most geologists through time have been from the Northern Hemisphere, [so] most of them have worked in the Northern Hemisphere. What we’re suggesting, in fact, is that they may have been looking in the wrong place.” ...[Incidentally, DoC] staff have found a new species of snipe on rocky Jacquemart Island... The small, brown, ground-nesting wading bird had eluded scientists for 200 years.

...It was hide-and-seek for 200 years but when searchers finally got on the right trail of a new species of bird it was all over in minutes. A D[OC] field officer... and his bird-tracking gorden setter, Fiddich, were on rugged Jacquemart Island, 700km south of Bluff, for only quarter of an hour on a recent Sunday when the dog flushed a bird from the tussock. [Fiddich’s handler] and two other officers... and their dogs, had just started a grid search for the flightless Campbell Island teal. [The handler thought it] recognised the bird as a snipe. “[One of my colleagues] said snipe weren’t supposed to be on the island so we debated it for a bit,”... When Fiddich showed [that the dog] had the scent of another bird, [her handler] went behind its hiding place before the dog moved in. “The bird popped out and I grabbed it. It was all pretty simple.” They photographed the small... wading bird and released it. For the next 3 1/2 hours the [officers] spotted about 10 snipe on the snow-swept, 19ha subantarctic island last visited 12 years ago. The chance discovery of the new subspecies of N[Z] snipe, the first subspecies of any bird discovered in 100 years, has thrilled bird-lovers and researchers. A DOC scientist... said the find was exciting because so much work was done trying to save species from extinction: “It shows there are still gains to be made and little mysteries to solve.” The insect-eating snipe is common in Europe and used to live on the N[Z] mainland. They spread to outer islands about 20,000 years ago and several distinctive subspecies developed... [S]cientists thought there may have been a species on Campbell Island, 2km north of Jacquemart, but they were killed by rats taken in by whalers in 1810. The find showed that the scientists were right. A DOC snipe expert... said the new bird would be the fifth subspecies of surviving snipe. The others are the Chatham, Snares, Antipodes and Auckland islands snipes. The discovery was like a bolt out of the blue and [the expert] would “cheerfully lose limbs” to get down to the island to see for himself. It might take some time to confirm the find officially because they needed a specimen of the bird and with such a small population, “no-body is going to be doing that,”... The last time a new subspecies was found was in 1897. That was also a snipe, the Stewart Island subspecies, which died out in the 1960s. The Little Barrier snipe is also extinct. The last find of a new bird species was the Stephen’s Island wren, discovered in 1894 but also now extinct, eaten by a lighthouse keeper’s cat. Jacquemart Island, although small and weather-battered, is likely to be able to support a population of 100 snipe sheltering in its thick tussock. DOC will now look at eradicating rats on the nearby islands, benefiting wildlife such as teal and albatross, and also lessening the risk of rats hitching a ride to Jacquemart. The new bird is likely to be called the Campbell Island snipe, though occasionally discoveries have been named after their finder... Fiddich[and her handler], who usually work in Northland hunting for brown teal, are not expecting such immortalisation. Fiddich is not a dog who works for rewards – the [handler]’s excitement over the bird... was enough to encourage her to find more. [The handler] said the two weeks spent on the islands, a 60-hour boat trip from the mainland, was reward enough for him... [□ Scientific excitement over a new bird subspecies being found on a subantarctic island was tempered last night by f]resh concerns... about the future of wildlife at Antarctica after the discovery of a poultry virus among penguins... A[US]n scientists have found that Adele and Emperor penguins are producing antibodies to the infectious bursal disease virus, commonly found in the domestic chicken. The shock discovery will be presented to more than 200 senior officials at the Antarctic Treaty Consultative Meeting... which begins in Christchurch today... [T]he *Nature International Weekly Journal of Science* says... human visitors may be to blame because only colonies in contact with humans show signs of infection. The pathogen could have been spread by careless disposal of poultry products or by contaminated footwear, clothing, equipment or vehicles. Antarctic penguins had been considered relatively safe from disease because of their remote environment.

...It’s five minutes to midnight for penguin colonies from South Muriwai to Manukau Harbour, and drastic action is needed now to save the protected birds, says [a]Piha resident and penguin champion... The Little Blue penguins are being mauled to death at night by roaming dogs, despite the efforts of some locals keeping vigil with torches, blankets and coffee. Numbers were [now]so low the colonies were threatened with extinction... [The resident] began recording penguin numbers at North Piha last year after noticing there were fewer of them around... [L]ast season had been disastrous, with at least 12 breeding birds dying, and no fledglings surviving. And this breeding season had started off badly, with one of the first penguins ashore being killed by a dog. The Little Blue penguins come ashore after dark and breed and nest from July to January. They are the world’s smallest at an average height of 25cm and live for about 20 years... [The resident] said the council needed to ban off-leash dogs from beaches between sunset and sunrise, and to enforce stricter dog controls during the day if the penguins were to have a chance. People had to be educated, and more signs were required... “With a bit of care and respect, people, dogs and penguins can all live in safety.” ...A Waitakere City Councillor... said yesterday that the birds’ plight would be discussed immediately. “We have emergency powers in the bylaws to do something within two weeks. We are very keen to protect the remaining birds as soon as possible. Lots of people thought the last of the penguins were gone, but this clearly isn’t the case.” ...a D[OC] regional conservator... said yesterday that the penguins were not a priority because they were not on the list of rare and endangered species. But the department would be happy to support community initiatives.

...Alarm at the death rate of little blue penguins on the west coast of Auckland has prompted the Waitakere branch of the Royal Forest and Bird Protection Society to fund the building of 50 breeding boxes.

...Dogs will be banned from key wildlife areas on several west coast beaches in a bid to stop them attacking native species... [like] the little blue penguin, pukeko, teal ducks and dotterel... The Waitakere City Council has designated special dog-exercise areas at Piha and Bethells Beach.

...A Japanese [perso]n facing three charges involving a blue penguin and other Otago Peninsula wildlife was remanded in custody when [it] appeared in the Dunedin District Court yesterday... The... 30[-year-old]... was remanded without plea... [after being] charged with disturbing absolutely protected marine wildlife, namely nesting albatross, without lawful authority, and having in his possession absolutely protected marine wildlife, namely a live blue penguin, without lawful authority. Both charges were laid under the Wildlife Act. [The suspect] was also charged under the Summary Offences Act with being found without reasonable excuse in an enclosed area at Taiaroa Head... The charges were laid after [the suspect] was seen inside a fence at the royal albatross colony on Sunday morning. Police said a blue penguin in a bag was found in a nearby car.

...The Mayor of Auckland... has won praise from a Japanese environmental group for supporting protection of a threatened tidal flat in Nagoya that is used by migratory birds. [The mayor], however, has remained guarded about supporting preservation of the Fujimae tidal flats, which are threatened with destruction by Nagoya authorities for a rubbish dump or port development. The Japanese environmental agency recently classed the 112ha area surrounded by industry as the second most important tidal site for shore birds in Japan. The Save Fujimae Association, which has won international backing from conservation groups, wrote to [the mayor] last year seeking Auckland’s support. [The mayor wrote to his counterpart in] Nagoya but refused to release a copy to the association and would not respond to requests for the letter from the N[Z] *Herald*... Getting a copy of the letter involved a request by the *Herald* under the Local Government Official Information and Meetings Act, the intervention of an ombuds[person]... and seven months. In its dealings with [the ombudsperson] the council said the ability of [the mayor] to express his free and frank

opinions for the effective conduct of public affairs was at stake. That ability should not be jeopardised by the release of the letter. The... [ombudsperson upheld the council's] view, but, given the widespread support for environmental protection and habitat preservation... considered it to be in the public interest for [the mayor] to indicate the nature of his letter. The council agreed... [The mayor has said it] does not share environmentalists' concerns for migratory birds affected by a huge reclamation in Hakata Bay by Auckland's sister city, Fukuoka. Both cities share 15 species of birds including the bar-tailed godwit or kuaka. Fukuoka is a feeding and stopover site on the birds' migrations and Auckland is their retreat from the Northern winter. The council has been frequently criticised for not doing more to persuade Fukuoka to provide havens for migratory birds. A year ago, to the dismay of conservationists, the council did not show the Fukuoka mayor and councillors visiting Auckland the region's spectacular flocks of migratory birds. A spokes[person] for the Save Fujimae Association... say[s] the destruction of the Fujimae tidal flats posed a far more serious threat to migratory birds than the Hakata Bay reclamation. "Fujimae for Japanese environmentalists is a very big symbol. If they cannot save Fujimae they are not going to save anything." [■ '90% of Japan's migratory bird wetland areas have been developed.']

...Many Rarotongans are superstitious about the dense bush-covered hills in the centre of the lush island, believing that is where spirits and spooks lurk. So getting locals to work in the unexplored forests to help save one of the world's rarest birds... was difficult, said... [a member of the] small group of passionate environmentalists who have brought the tiny kakerori back from the brink of extinction. Although still endangered, the kakerori, or Rarotongan flycatcher, has been off the critical list for... a year. The bird is found only in the inland Takitumu district of Rarotonga. A missionary... discovered as far back as 1885 that its numbers were declining, a pattern that continued until 1989 when it was estimated that only 29 birds were left. The decline was blamed mainly on the ship rat, introduced by accident more than 100 years ago. So saving the birds meant eliminating the ship rat... The kakerori recovery programme got under way in 1987 after it was taken out of the Government's hands. Funding of \$300,000 for a five-year period came from the South Pacific Regional Environmental Programme. Getting rid of the main predator involved the laborious task of laying poisoned bait at various stations covering the entire 155ha area in which the bird is known to exist... Nesting trees were also banded with aluminium strips to prevent rats from climbing them. Thanks to the recovery programme, the kakerori population had reached 134 by 1996, an achievement which has put the Cook Islands "on the conservation map,"... The kakerori habitat has now become a reserve called the Takitumu Conservation Area. It was established last year... [T]he conservation area's support officer... is organising guided nature walks through the area for a small fee which helps the recovery programme. [The support officer] said that because the bird had almost totally disappeared, very few Cook Islanders knew of its existence. And there were those who could not understand what all the fuss was about. "The locals say the bird has no economic value, it's not dramatic nor does it have an attractive call." To which [the support officer] replies: "Once it's gone, it's gone and we don't want our children knowing about the birds just from picture books." ...[In local news, an area] of land on the Coromandel Peninsula is being cleared of predators to create a new sanctuary for kiwi. The sanctuary will cover about 5000ha of state-owned and private land on the Kuaotunu Peninsula on Coromandel's east coast. The land[– which] includes forests, farmland, regenerating forests and spectacular coastlines... [–] is geographically suited to the sanctuary concept; it is bounded on three sides by the Pacific Ocean and on the fourth by a public highway. A buffer zone will be created around the "prime sanctuary" where invading animals can be stopped by trapping and poisoning. The Kuaotuna Kiwi Sanctuary Committee has applied for funding to kill predators... [The c]ommittee secretary... said the exact number of North Island brown kiwi in the sanctuary was unknown but there was anecdotal evidence that kiwi calls in the area were becoming less common. The sanctuary is not a registered reserve, as negotiations with landowners would have taken years, but an area of special interest where a wide variety of groups can work together to prevent the kiwi's extinction... DoC[']s kiwi recovery programme co-ordinator... said the mainland population of kiwi was declining by 6% a year with 95% of chicks killed by stoats or cats. Eggs were also eaten by stoats and possums, and mature birds fell victim to dogs and ferrets.

...Once kiwi were numerous, now they're a threatened species – so conservation workers treat every single chick as important... "[At the present rate of decline, by the year 2005 or 2007 they'll have] had it." "The time has come to stop hiding the truth, [to] stop telling lies. Let's show everybody what really happens out there." N[Z]ers call themselves Kiwis whether it's [for] business, politics or sport. It's the... [name of] a biological oddity, found nowhere else in the world. It feeds at night, it can't fly, it mates for life, it lays huge eggs... chicks are born fully clothed... and there are 6 distinct varieties. Although it has feathers, in many ways it's not like a bird. With a strong sense of smell and a lower body temperature it's more like a mammal... Kiwis [also] have sharp hearing to locate food underground... They're very efficient hunters but despite this the kiwi population is declining rapidly. DoC figures paint a miserable picture. Kiwi numbers have dropped dramatically and some regions have lost the kiwi for good... So who, or what, is killing the kiwi? Researchers need more information, so under the Kiwi Recovery Plan a small team of scientists and volunteers around the country have been studying the life and death of our national icon. Their conclusions are disturbing. One of the kiwi's main enemies is '[humanity's] best friend'. Kiwi have a distinctive smell which will lead a dog straight to the burrow. A few years ago one dog – a german shepherd – ran amok in the Waitangi State Forest in the Bay of Islands. It's reputed to have killed 500 kiwi. The bird doesn't have a breast-bone so its ribs shatter at the slightest pressure from a dog's jaws. It doesn't stand a chance. Pig-hunters are one group of dog-owners who've come under fire. Some of them have been accused of allowing their dogs to run unchecked... Pig-hunters, though, insist their dogs are trained to attack only pigs... "We spend... years training our dogs... [for that purpose, whereas] a dog in town... doesn't have a purpose, it's tied up all day, [the owners] come home from work, they let the damn thing go and they're living on... the verges of all this... bush country... and the dog's gone. What's the dog doing?" "...It's not just... any dog... it's... pig dogs[, too]... People too easily say, 'Well my children never steal the neighbours' apples,' but... it's not always the fact, is it?" But dogs can be the good guys too. The Kiwi Recovery Team uses [dogs] to locate kiwi for research. "In the late 1980s the DoC got quite concerned about the decline of the kiwi... [T]he problem is most of the deaths are young kiwi and that means the population isn't being replaced." "Waikaremoana is part of the largest [native] forest patch in the North Island. It's the single biggest bit of [kiwi] habitat left and in places like this we'd expect kiwi to be hanging on well, but that's not happening... [–] in places like this we now have about one kiwi per 100 hectares... [I]f a kiwi is lucky enough to become an adult its got every chance of living for quite a long time, maybe up to 40 years. The problem is that so very few kiwi actually get that chance, most of them being killed in their first few weeks of life. If you had to identify the single animal that you [nee]d to control or take out of the system to make a difference for kiwi its got to be the stoat... That is the villain above all villains." Ironically, European settlers introduced the stoat to control the rabbit they'd introduced earlier, but the stoat found native birds more to its liking, and so did the stoat's cousins – the ferret and the weasel, [which] were also introduced to control rabbits. All of them are prolific breeders. Young... stoats are pregnant when they leave the nest and they're superior hunters... Once, N[Z] was 'Birdland', but that changed when the humans arrived. Now, behind the picture postcard images there are grim statistics. One third of the world's endangered birds are in N[Z] with another 40 birds already extinct... It was in 1991 that the alarm was raised [to] the plight of the kiwi. The Kiwi Recovery Team was formed... Because the kiwi is nocturnal most of the [team's] work... is done at night... [While they work, t]here are few bird calls of any sort. It's a reminder [of] just how bad things have become in Birdland. "...some nights are deathly silent. There's almost a conspiracy of silence among the nocturnal animals. But once there were seabirds flying in, crashing through the forests, breeding in burrows on the forest floor; there were kakapo calling; there were heaps of bats[– 'the only native NZ land mammal (there are two distinct types: the long-tailed and the short-tailed') –] on the wing; there were kiwis... there was noise in a way that we just can't imagine. We can only glimpse it occasionally by going to an off-shore island now and so the silence is a true silence because the things that were making those noises are... either in greatly reduced numbers or they've disappeared altogether." ...Kiwi are not defenceless, of course. The adults are strong and sometimes fierce, especially if some other bird strays onto their territory – and they'll fight each other, sometimes

to the death. Even humans can expect to be challenged. A kiwi's territory can cover over 40 hectares and trespassers are not welcome. If it comes to a fight the kiwi can use its claws and they can inflict a nasty injury, so the adult has a reasonable chance against a cat or a stoat – but young kiwis are helpless. They need to grow a lot bigger before they can stand a chance of fighting off a predator... Researchers have identified another enemy... the possum[... which]... affects the kiwi in several ways. It's eating through thousands of hectares of kiwi habitat each year, it'll often take over a kiwi nest and sometimes... eat a kiwi's egg, but worst of all the [people] who hunt the possum use gin traps and they can rip off a kiwi's toes or leg. "[If that happens] the bird staggers back to its burrow. If its an older bird and a [cock] it could be sitting on eggs, so [when] the bird... dies... the eggs... die as well. So... that one strike of a gin trap can actually kill three kiwi." ...Their eggs... can be hatched away from the nest, so in several parts of N[Z] DoC... scientists now take some eggs away from the nest and raise the chicks in captivity till they're big enough to fend for themselves in the wild... [(began last year, the programme is called *Operation Nest Egg*). A kiwi] usually only lays one or two clutches a year, so any encouragement can help boost the population... Taking the first clutch will often encourage the kiwi pair to lay another one... [However, the Kiwi Recovery Team] has limited resources. Only one truck, for instance, and the whole country to cover. It has to make every dollar count and relies on help from the Bank of N[Z] and the Royal Forest and Bird Protection Society... They have to leave most eggs to face the possums and the stoats. Rescuing even one is quite an undertaking. It often involves a long journey by road or air to the nearest incubator, and a personal commitment by team members... The battle continues to save this unique bird but success is not guaranteed... Some 250 years ago... Maori leaders placed a... ban on the hunting of kiwi... [yet a]t the end of the day it's humans who've had the greatest impact on the... [population. What the Kiwi Recovery Team] most needs is for more N[Z]ers to become passionate about saving their national symbol; to heed the call of the kiwi... before the kiwi disappears... altogether... [But it's easy for members of the public who are c]aught up in the so-called rat-race... to ignore what's happening in the countryside.

...The little spotted kiwi population is thought to number about 1500 birds and growing... The populations of the great spotted kiwi and the southern brown kiwi are thought to be stable though their ranges have diminished... But... numbers... [of] the... bird that symbolises N[Z] around the world, the North Island brown kiwi... have plummeted from about 70,000 to 30,000 in the past 15 years... The North Island brown is most threatened by predators, habitat loss and insufficient funding to ensure its survival... Stoats head the list of predators... [However, o]n the 750ha... Puketukutuku Peninsula jutting into Lake Waikaremoana... 500 stoat traps... had... [created a 75%] survival rate among chicks, for the past two years. "Last year we caught 65 stoats, 14 weasels, three ferrets and two wild cats, and we successfully raised 10 out of 11 chicks. This year, for some reason we don't understand, the trap baits were not attractive to the stoats, and we have lost nine out of our 10 chicks so far... We have caught only eight stoats." ...stoats... are [also] [threatening to drive native kaka parrots in northern South Island beech forests to extinction. The grey-crowned flame orange under-wing parrot, which is as big as a sulphur-crested A[US]n cockatoo, is in serious trouble in the Lake Rotoiti area of the Nelson Bays District... [Since last] November only 14 kaka had been captured [by DoC staff] in the 800ha research area on the eastern shore above Lake Rotoiti and only one of these was [a hen]... At one time... there were ma[n]y kaka in the area and tens of thousands of them throughout the country. [One 74]-year-old gold-miner... who lives in the New Creek area above the Howard River, has trapped 107 stoats in a single trap, in his own personal campaign to save the lives of native birds... [Other p]eople use... eggs... [laced with] poison such as 1080...

The North Island kaka has been heard in Egmont National Park, Taranaki, for the first time since the 1960s. The D[oC] believes its possum control work has helped the forest regenerate and encouraged the kaka to stay.

...Ministry of Health officials say they may have to investigate whether the virus which kills up to 95[%] of the possums it infects has any potential implications for human health... [O]fficials announced yesterday that the virus that causes "wobbly possum disease" had been isolated sufficiently to show it is similar to borna disease virus, not previously reported in N[Z]. Borna disease virus is known to cause neurological disorders in horses, sheep, cattle, ostriches and cats – for which there is no vaccine or effective treatment. But the virus has also been linked with illnesses in people such as some cases of schizophrenia, manic depression and chronic fatigue syndrome... [I]t will take animal scientists... 12 months... to check whether the wobbly possum disease is caused by the borna disease virus. The [scientist]s... hope the disease will be specific to possums, which would make it useful to develop as a biological control for the pests destroying native forests.

...The exciting possibilities of possum... LIVE possums from N[Z] are winning the hearts of exotic animal fanciers overseas. And traders who supply the animals... say that farming [possum]s could be more lucrative than cattle... There have been reports of live N[Z] possums for sale in the Bangkok markets, but those involved in the trade here say they were more likely to have come from A[US], the local retailer trying to conceal the source because of questionable importing in Thailand. The trade here, which has included pups and kittens destined for pet markets overseas, is closely monitored by the D[oC], the Ministry of Agriculture and airlines that carry the animals... Small but regular shipments take live non-native, N[Z]-bred animals and birds to Denmark, Germany, Indonesia, Japan and Malaysia. As well as possums and wallabies these have included hedgehogs, which are widely sought as pets in the U[S]... Welfare of the animals is a high priority, says one of the exporters. The incentive is that high prices are paid for good specimens in excellent condition. In any other condition the animal is rejected, cannot be returned to N[Z], and the high cost of the export is lost... Although the Government agencies involved in monitoring the exports say the trade is perfectly legal – and when it comes to possums and other pests, ought to be encouraged – there have been reactions. One... export[er]... was asked by the Society for the Protection of Animals what right [it] had to export live animals. "This is the business I have chosen to do. I have been doing it for years quite successfully and... I intend to keep[doing it," was his reply]... "In the U[S] particularly, exotic animals are very big business. It seems to be a status symbol for people with large acreages to establish animal parks, and they even stock them with giraffes and zebras and the like. There are regular exotic animal auctions where an amazing variety of animals is for sale. There seems to be everything but elephants." When the N[Z] exporters receive an order from overseas clients and agencies, they put the word out to hunters. The animals are caught in the bush by hand, "Which is not as difficult as it sounds... The aim is to avoid any injury or harm to the animal – its health and appearance must be as perfect as possible." Possums, being nocturnal animals, are easily dazzled by bright lights and are then able to be picked up by hand by someone dexterous enough to avoid their scrabbling claws. The going rate paid to hunters is \$15 for a good specimen. Before shipment the animal must be given export permits and health certification by the D[oC] and the M[AF]. The cases in which the animals are exported are made on the exporter's premises to airline specifications designed by veterinarians... Each case costs about \$100. The airfreight rate is \$25 a kilogram. Healthy young animals weigh between 2kg and 3kg, and the cases 5kg, so more than \$300 an animal, in addition to on-farm costs, is invested before it leaves N[Z]... The agencies ridicule suggestions that the live animals are exported for food... [but one exporter admits that t]he real future of exploiting possums as a resource is in possum meat for Asia... "We have been involved in trials, but these have shown that to be economical you need to be able to ship it in container loads, and that means 8000 to 10,000 carcasses at a time, all processed with the proper hygiene. That is possible, and I believe people are working on it, but another high cost is the requirement that the animals have to be kept in controlled conditions on[a] farm for a month before slaughter."

...An A[US]n plot to put Tasmanian possum meat on N[Z] tables has upset local entrepreneurs who want to establish their own market in Asia. A Brisbane-based firm, Otec Pacific Pty, plans to corner the growing Asian market for possum meat in this country. The move has not been welcomed by the Possum Product Marketing Council, which says overly strict Ministry of Agriculture regulations have stalled proposals to export N[Z] possum meat overseas. The council... said a N[Z] possum meat industry had the potential to earn the country millions of dollars a year in Asia, where the much-maligned bush pest was considered a delicacy. But ministry concerns about widespread tuberculosis among N[Z]'s 70 million possums were making it difficult to get meat exports up and running, although a market for possum fibre had already been established in China.

...A... list MP... has found a way to help reduce the possum problem while ensuring that his first-term seat in Parliament is comfortable. [The MP] is using a possum fur seat-cover made by the Nelson business... wh[ich] aims to lower the... possum population... by turning pelts into products.

...International golfers could soon be wearing gloves with a distinct N[Z] feel, if work at a Wanganui fellmongery proves successful. The Hollander Waitotara general manager... is experimenting with possum skins, with the intention of turning them into valuable leather. Until now, possum pelts were just “something that was thrown away” but trials had shown the leather was soft yet strong. The idea for the leather came after a Wanganui [resident who]... did not want to see the pelts go to waste... successfully blended possum fur to create a wool that could be used for clothing and blankets... The company is now setting up suppliers and examining overseas markets. Contracts are pending. [The general manager] had attempted in the past to turn the pelts into leather, but failed because [the fellmongery] did not have a suitable processing vessel. The Wanganui Business Development Board helped pay for the installation of two processing vessels, and the company started processing pelts last March... [The general manager]’s greatest concern was the supply of pelts. Between 200 and 300 pelts, mainly from the lower North Island, arrived at the fellmongery every day – not quite enough to meet needs. [The general manager] was also having to rely on lower grade pelts, because the top grades were retained for export as fur... To produce a pallet of goods for export, 10,000 pelts needed to be processed, compared with just 1080 lamb skins.

...A group angered by D[oC] plans to spread 1080 poison by air over about 6000ha of the... Urewera National Park, [which] has the last remaining population of kokako... took their protest to Parliament yesterday. The Te Turuki Action Committee, formed at Ruatahuna early this month, said many Tuhoe people were totally opposed to the poison being dropped in the central Kawhenua section of the vast park. They wanted a bounty system reintroduced so unemployed residents could trap, shoot or poison possums... The Conservation Minister... refused to meet the 10-member committee[, perhaps because]... anonymous threats had been made to burn down [DoC] huts if the poison drop went ahead... [By the way, t]he possums of South Kaipara peninsula can stay out until dawn today – in safety. The nine [workers] who have hunted them since the peninsula’s bovine TB scare of 1988 will not be on the job. On Friday the Rodney District Council’s crack possum control team had their last day at work, ending an era for the council and for team members such as [one who has been] a council hunter for 36 years... The team has taken redundancy now that Rodney has lost the pest control contract for the A[RC], which took over responsibility for pest control from local authorities in 1989. Most of the [hunters] have found new jobs. The... team was proud that the number of peninsula herds with TB reactors had reduced from 27 in 1988 to one last year. Apart from TB-free cattle and deer, the Rodney possum kill had brought about a significant regeneration of bush around the Kaipara Harbour. The coastal bush from Waiwera to Pakiri had also shown regrowth and a lot of work had been done in 50,000ha of bush designated for conservation. The [ARC’s] biosecurity manager... said the council had chosen an experienced private contractor to take over the South Kaipara TB-control work – Feral Strategies, of Silverdale. The company hoped to begin work in a fortnight. [The manager] said the regional council believed it could do a better job... The contract for pest control in the rest of Rodney, North Shore and Waitakere would be let in a few weeks.

...A war is about to be waged on possums ravaging forest in the Waitakere Ranges. The Auckland Regional Council will launch a... cull early next year. The ground-based operation involves traps in the urban areas of Titirangi and Laingholm, and 5600 bait stations in the regional park.

...Authorities are courting public support for a \$1.3 million possum control programme planned for the Waitakere Ranges next year. A growing possum population is taking its toll on the native bush that covers... 50,000ha of the Auckland western frontier... Each possum eats... 400kg a year[, and] reproduces twice a year... Preparatory work would begin next month in readiness for a blitz on the possums in February... That preparation would include securing the crucial... support of residents living among or alongside Waitakere bush... “We need to get public involvement because we are going to be on their land and quite often they know the area better than we do...” ...The programme was designed to dramatically reduce possum numbers over six months and then keep numbers down with regular maintenance drives. A similar operation in the Hunua Ranges three years ago achieved a 94[%] kill rate and numbers had since been successfully contained... The Waitakere programme would encompass areas of Titirangi, Glen Eden, Oratia and Henderson Valley, and stretch towards Muriwai Regional Park. “It’s a big operation. It ranges from real tiger country in the middle to open pastureland in Henderson Valley...”... [● The DoC] has backed off plans to use... 1080 possum poison in a Northland forest... The [DoC] had planned a trial of bait stations using 1080 pellets in a small area of... Raetea forest... but decided it could not risk sabotage by... protesters... Papa Atawhai O Maungataniwha me Raetea (Guardians of the Forest) said it had to resort to a threat of “active protest”...

The ban on dropping 1080 poisoned carrots on possum-infested bush and forest in the Waikato was lifted yesterday. It was banned after a string of native bird, dog and cattle deaths in the Rangitoto Ranges, South Waikato, last year.

...Environment Waikato has approved a rate of 44c a hectare for animal and plant pest control. It will apply to rural properties over 2ha and provide... nearly 9[%] of the biosecurity budget of \$7.4 million. All ratepayers will pay 20[%] of control costs... through the general rate. More than \$4 million will come from the Animal Health Board... [The announcement comes as t]he biggest possum control exercise undertaken by Environment Waikato since two operations were botched last year... beg[a]n around Maungatautari Mountain, near Cambridge. The \$279,100 operation covering 13,700ha will... mostly... [use t]he poison, 1080, on carrot baits...

Without the use of 1080 poison and similar pest-control chemicals, a large patch of bush in the... central North Island would have become “an ecological desert” within the next few years, says... [someone] who works in that patch of bush most days of the year. [The worker says it] has more chance of seeing a flock of moa in the forest than... of being poisoned by 1080 from the water there. “I’ve drunk from the streams here every day when the 1080 drops have been done and I’ve never been crook,”... [The] robust, free-spirited 37-year-old... [– who gains] most of his funding from a \$36,000 State Insurance grant, with an additional \$7000 from the Lotteries Commission specifically to pay for poisoned baits... – ...has been working in the Mangatutu Ecological Reserve for the past two years, living mainly alone in a sparse lodge on the former Rangitoto Station... spending long hours each day covering a network of tracks [it] has hacked through more than 500ha of dense, rugged bush country. Usually [the 37-year-old] carries a hefty pack, crammed with bags of Talon poison, from which [it] continually replenishes the 450 bait stations through the area. The poison... has greatly reduced the possum and rat populations in the bush, allowing the plant and bird life to return. The bush is blooming with new growth... [A]lthough some insects are lost in the immediate vicinity of 1080 baits... this is countered by a substantial general increase in insects after the predators have been removed.

...No possums... are thought to remain on Rangitoto Island after a seven-year, \$1 million programme to rid the scenic reserve of... the pests. A helicopter equipped with an infrared heat-seeking device has finished a series of flights over the island in a bid to detect possum or wallaby survivors of the D[oC] eradication programme. Conducted in the cold hours just before and after dawn the infrared device detected no heat sources which could be attributed to possums and only three sources identified as wallabies. Their locations were fixed by satellite global positioning and their days are numbered... The eradication programme began... with a 1080 poison drop which killed off about 90[%] of the animals. Hunters have for the past few years been systematically wiping out the stragglers through tracking by dogs, shooting and humane trapping. Before the eradication programme up to 10,000 wallabies were chewing through ground vegetation and up to 14,000 possums were eating the canopy vegetation of the island’s pohutukawa. With Rangitoto home to the world’s largest pohutukawa forest the impact of possums on the trees was causing serious concern in 1990 with 30 to 40[%] of inland trees and about 10[%] of coastal trees dying off through browsing... “We are enormously satisfied and the great thing is that with an island like this, provided we can make sure people keep them off, we don’t have to keep the effort going. With the mainland you have always got that problem of re-invasion... We will not rest until we think we have got the last one,” said the D[oC] ranger on Motutapu[Island. Meanwhile, on the twin islands’ much larger neighbour, Waiheke Island, conservationists]... fear that locals

[are raising ferrets]... Ferrets are on the most-wanted list of pests on the Hauraki Gulf islands... Under the Auckland City Council district plan for the Hauraki Gulf, islanders are banned from keeping or breeding them. But Royal Forest and Bird Protection Society members... recently received reports that someone was breeding ferrets for sale. "There was even a young child on the island who was parading around Oneroa with a ferret on a lead," said... [t]he society's Hauraki branch chair[person, who]... has called on the council to declare an amnesty, believing that people are probably not aware of the regulations. "I'm hoping that people will realise their error and hand in their ferrets." The acting manager of the Waiheke community board... said the council would offer people several months' grace and then begin an enforcement programme.

...Rat eradication on one of the most popular islands in Northland should be funded to protect public enjoyment, says the regional conservator... The growing rodent problem... on Urupukapuka Island... has distressed campers and... "revolting rats" drove one disgusted mother home early from a school trip. [The conservator] said if the island was not rid of rats the D[oC] might have to consider closing down its two camp grounds.

...The Marlborough Sounds' reputation as a prime conservation area received a boost yesterday when the D[oC] unveiled plans for a new predator-free sanctuary on Long Island. The project will provide a home for tuatara, native frogs and saddlebacks by eradicating resident rats. Conservationists [welcomed the proposed addition to the] chain of wildlife sanctuaries in the outer Queen Charlotte Sound...

THE D[oC] is about to launch a Noah's Ark project to ensure the survival of one of the world's rarest and most primitive frogs. About 300 native Maud Island frogs will next month be transferred to a new island home in Queen Charlotte Sound. The frogs are found only on the 309ha Maud Island in Pelorus Sound, but will be transported the 25km to their new home on Motuara Island by road and boat. The DoC is making the move to protect the species after concerns the entire population... of... 19,000... could too easily be ravaged, or wiped out, by fire, disease or predators making it to Maud Island... [S]toats had swum to Maud Island at least twice in the last 10 years, but fortunately had been eradicated. The rare native frog was discovered only in the 1930s and has features in common with fossil frogs from South America, which have long been extinct... There are three other surviving native frog species in N[Z]: Hochstetters, Archey's and Hamilton's... Ten people are involved in the transfer... [The] leader of the project... was hoping for light rain, calm weather and warm temperatures to catch the frogs. "They are most active in those conditions,"... [C]aught... frogs will be put into sealed plastic containers and kept in a cool, dark environment. If they are exposed to wind, dry air or sun their skins dry rapidly and they will die... Once they are successfully transferred, DoC staff will regularly monitor the... nocturnal frogs... which... can live as long as 20 years... The planned site for the frogs is well away from walking tracks. "It's important they settle with the minimum of disturbance. They are small, secretive and pretty silent except for faint chirps... If they take to their transfer it will be groundbreaking."

...BUYERS of lifestyle blocks on the upper reaches of Whangaroa Harbour, in Northland, will have to agree to a ban on cats and dogs because of the birdlife on the subdivision. The farmland has a population of kiwi on a headland, and bittern, banded rail, fernbird, tern and reef heron along its salt marsh and mangrove shores. About 10ha of reserve has been set aside for them, and there is an existing esplanade of about 10ha. A D[oC] spokesperson at Kerikeri says it is rare for kiwi to be so close to the harbour. The landowner, whose house is about 400m from the headland, can hear their calls at night. Buyers will also have to agree to control pests: rats... possum[s]... stoats and ferrets... H[owever, the]... chairperson of the Far North branch of the Royal Forest and Bird Protection Society, who lives at the harbour, is sure that... dog[s are] the main predator of kiwi... Without the cat and dog ban on the Lindsay Park subdivision, bird numbers on its fringes would inevitably decline. "The idea of banning pets as farmland is settled is catching on: people are starting to appreciate the kiwi calling out at night and are coming to value their presence. Birds can be pets." At Kerikeri, just over 30km south-east of Whangaroa... the branch manager of [a real estate agency], agrees: "The kiwi is a selling point..."

...[the] day of the eco-subdivision has come, even if property buyers have been slow to see the light, says a Royal Forest and Bird Protection Society... [field officer who] has been involved in promoting cat-free and dog-free subdivisions to protect wildlife near Tauranga and on the Coromandel... In the Far North, the district council has recently given the go-ahead for a similar lifestyle settlement near Kerikeri, where pets such as dogs, cats and mustelids... are banned... But since... [the] 24... Mahakirau Forest Estate... blocks – averaging 20ha and costing about \$150,000 – ...on the spine of the Coromandel Peninsula... went on the market nearly a year ago, only three have been sold... One of the developers... yesterday blamed slow sales on financiers and lawyers putting off buyers... [B]anks and legal advisers were warning would-be buyers that they might have difficulty reselling in the future because of the covenant... The company must sell seven more lots to secure finance to provide roading and other services to the subdivision... [■ The requirement that the] coastal subdivision near Tauranga be closed to domestic animals is under appeal by the developers. The Western Bay of Plenty Council gave approval last November for a 30-lot subdivision on the Athenree Peninsula... with one of the conditions being a ban on cats and dogs. The Five Jems Company planning the project has challenged the decision and is awaiting an Environment Court hearing. Both [the RFBPS and the DoC] objected to the subdivision application, fearing it would threaten a neighbouring wildlife refuge reserve which is also a nationally significant habitat of indigenous fauna. In the Coromandel case, Mahakirau Investments Ltd agreed to a covenant banning... any introduced species... [including fish] plus a list of about 200 garden plants which have the potential to become pests.

...The Western Bay of Plenty District Council has backed away from a total ban on cats and dogs in a coastal subdivision... on the Athenree Peninsula. Its lawyer... told an Environment Court hearing... yesterday there was doubt over whether the council could legally apply such a stipulation. Rather than argue the case in court, the council had reached a settlement, allowing one dog and one neutered cat to each property.

...A two-month tour of duty in Western Samoa proved a powerful eye-opener for... [a] Kiwi vet... Makeshift operating tables in backyards and a mobile clinic on the back of a ute substituted for sterile surgeries during his volunteer stint with an animal welfare agency set up by expatriate N[Z]ers... A lack of animal control laws and the almost complete absence of veterinary services in Samoa made for a staggering proliferation of pets... [the] Auckland... said. "Most of the animals weren't desexed. One family would end up with 10 or 20 cats and four or five dogs with puppies on the way." Many animals scavenged for meals and some were so wary of people they had to be shot with anaesthetic darts before [the Kiwi vet] could get close. "Sometimes you would go to help them and they would try to take your arm off or they would hightail it over the back fence." ...[the Kiwi vet, who] was heartily welcomed by grateful families and, despite the challenges... averaged three desexing operations a day... said the Animal Protection Society in Apia was the only veterinary service available to residents. There were one or two Government vets who specialised in caring for livestock such as pigs and cattle but few people knew of them. The society began three years ago... Fundraising dinners and grants from international philanthropic organisations had bankrolled the mobile service so far... It also relied on donations and the efforts of unpaid helpers. A Japanese vet associated with a volunteer agency had replaced... [the Kiwi vet, who is now] back at his Pt Chevalier clinic.

...[every community has its share of pet owners who allow their pets to breed at will and "dispose" of the young animals cheaply. These irresponsible owners continue to create a major expense for responsible pet owners, through dog registration fees for animal control, sheltering and euthanasia. While most owners understand the cost to them of other people's unwanted pets, few are fully aware of the benefits of neutering at an early age. Desexing reduces the risk of uterine problems, mammary, testicular and prostate cancers. And these are just the health benefits. The wider benefits of neutering and spaying include a reduced risk of roaming (de-sexed pets may in fact never develop the desire to roam), less fighting and marking of territory with urine, no risk of an unplanned litter, and behaviour which is generally more socially acceptable. Overall the benefits of neutering a pet are significant. If you are in any doubt, talk to your veterinarian for advice.' Incidentally, AUSn vets have developed a 'pellet that can be inserted behind Koala necks, sterilising them for two years.' Speaking of Koalas, one 'has survived being hit by a car which then carried it for 12km after a paw got stuck in the car's front grille'!

...Just over a year ago, an AUSn was driving to Wauchope, in northern NSW, when it stopped to investigate a grey bundle lying by the roadside. It turned out to be a badly injured koala. Her urgent call to the Koala Hospital at Port Macquarie undoubtedly saved the animal's life, and that plucky young koala was to amaze everyone with her extraordinary determination to survive. At the surgery, two veterinarians experienced in treating the hospital's

koalas, estimated the young koala had lain by the roadside for three days. Her right arm was fractured in two places, one leg was dislocated, her lip was torn, and it was suffering from dehydration and malnutrition, made worse by a tick infection. To cap it all, the young koala was a mum, with a tiny baby hidden in her pouch. Incredibly, the joey was alive. The young mum – named Rita, in honour of the person who rescued her – was in a lot of pain and needed 24-hour care. A hospital volunteer skilled in the intensive care of highly stressed koalas offered to take on the job, supported by her husband. Rita learned to suck formula from a bottle within 10 minutes, although her mouth was still sore, and was a dream to toilet train. Once shown a drainage area it could use on her daily visit to urinate, Rita always returned to the same place, despite her pain. Rita was recovering well. Then disaster struck. Despite the long hours of care, Rita had somehow managed to position her plastered arm in such a way it had cut off the circulation. Every attempt was made to save her arm, but it became clear it would have to be amputated if Rita was to survive. The hospital's vets knew of no precedent for the operation. They sought guidance by phone from a leading Sydney veterinarian and also the hospital's Sydney University adviser. The one-and-a-half-hour operation was a brilliant success. Rita thrived – the young koala learnt to pull doors open, curled herself up into a ball and covered her face with her paw when it was raining, and rubbed noses with the volunteer's two cats. All seemed well when, sadly, about a month later, Rita's joey died. Her only visible reaction was to eat voraciously all night long. Rita has now fully recovered and is in good health. The wound arising from the amputation is completely covered with fur. Rita has overcome her initial problems with balance, and has learnt to climb with only one arm. In the process, her left arm has become very strong. Rita can now initiate her climbs by first jumping from the ground onto the tree trunk, like a koala with two arms. Once established, Rita has discovered how to maintain a firm hold, mostly with her feet, grabbing for the leaves it fancies with her hand. Rita obviously feels well, as it has taken to calling out to guy koalas in neighbouring trees, under the watchful eye of her guardians. Plans are afoot to set her free among the trees at the Koala Hospital in the beautiful Macquarie Nature reserve.']

...AN ENGLISH... pe[rso]n... is taking legal action... to get maintenance for 29 hedgehogs... her former lover... left her with. [The complainant] (48), of Shrewsbury, Shropshire, is prickly with [her ex, after it] left the hedgehog sanctuary they set up in their three-bedroomed home a year ago. "It's not just me and him this is about. [My ex]'s playing with the animals' lives as well," said [the jilted lover], who blamed the split on the pressures of looking after the hedgehogs. □ [*'Except for garden birds there is probably no wild animal so regularly fed and so popularly "adopted" as the hedgehog, hedgepig, or urchin, an animal remarkable for its coat of spines and its habit of rolling defensively into a ball. The boar grows to 10 1/4 in. long, with an inch tail, the sow is on average 3/4 in. shorter. The weight is up to 2 2/3 lb. The back and top of the head are coated with sharply-pointed spines, 3/4 in. long, with each spine set at an angle to the skin. The rest of the body is clothed in coarse hair. Besides the European hedgehog (so called although it ranges across Asia as well) there are 14 other species in south-west Europe, Asia and Africa. All are alike in habits and differ in appearance in small details only. Snails, slugs, insects and worms form their normal diet. Mice, rats, frogs, lizards and snakes may be eaten at times. It has sometimes been said that hedgehogs eat no plant material, but they have been seen to eat acorns and berries and tame hedgehogs have been known to eat either apple, pear, orange or some other fruit. One of the most persistent legends is that hedgehogs will impale fruit such as apples, pears and strawberries on their spines and carry it away. There have been representations in pottery, in illuminated manuscripts as well as in the written record for at least 2000 years yet very few scientists are prepared to give credence to this in spite of at least two photographs taken of it happening. Foxes and badgers are the principal enemies apart from human beings. Rats sometimes kill them but in a straight fight a hedgehog and a rat are fairly evenly matched. A hedgehog is a match for an adder also, being immune to its poison. Hedgehogs are immune to all but a few poisons and even for these abnormally large doses are needed to kill them.'*]

...Deadly snakes and other venomous creatures are increasingly adapting to life in concrete jungles and threatening the lives of city dwellers, a leading toxicologist warned yesterday. South A[US]'s state toxicologist... said venomous animals in South America, Africa and Asia had shown an ability to adapt to the urban environment by changing their dietary habits. While the trend was not so obvious in A[US]... the dangerous brown snake had also adjusted well to city living and was now found in the suburbs of major cities. [The toxicologist] told the Australasian College for Emergency Medicine's scientific meeting that two people had already died in the eastern states after being bitten by brown snakes this season... [The] adviser to the W[HO] on AUS'n snake bites, used the A[US]n redback spider as an example of venomous creatures which had adapted to their surroundings... [T]he redback had been accidentally introduced to... Osaka. "It's taken a strong hold despite the predictions from some that it wouldn't survive the Japanese winter... There's now evidence that the spider has spread at least... 250km out from Osaka." And [the toxicologist] predicted a lethal Brazilian scorpion which reproduced asexually and which had shown a great ability to adapt could also be accidentally spread around the world within the next 50 years... [Speaking of adaptable creatures, a] chemical developed by Massey University to help control feral cats has sparked interest from a French maker of cat litter. It was hoped the amino acid in cats' urine might result in a cat box no moggy could resist.

...Feral cats in the Waikato town of Morrinsville are the country's first targets for an experimental poison. The diseased cats, said to number about 50, are pests near the town centre but some residents are unhappy with the poisoning programme... The Ministry of Agriculture pesticides board... said [because] Pest-Off feral cat paste, made by Wanganui-based Animal Control Products from an anticoagulant called diphacinone, was classified as experimental[, t]he council could use it for free, in return for information about its effectiveness... Similar products had been used on cats overseas... [T]he paste thinned the blood and caused death by internal bleeding... The poisoned cats will take several days to die... The Matamata-Piako District Council's Morrinsville area manager... said residents near the poisoning area have been personally informed... to prevent pets being killed by the bait... [In related news, t]he first shots have been fired in a battle to eradicate five emerging feral deer herds in Northland which threaten the region's forests. The campaign was launched late last month. More than 15 deer have been killed over the past few weeks.

...Commercial deer culling will begin in the Kaweka Forest Park in... Hawkes Bay next year to reduce deer numbers in the range's beech forests.

...Goat-cull collars Two [nanny] goats in the Ruahine Range, north of Palmerston North, have been fitted with tracking devices to help hunters to find herds of goats to cull. The Department of Conservation says hunters will destroy all of the goats, except the collared nannies.

...A... professional goat-hunter... [who] is managing goat control work in the central North Island for the D[oC]... has been called in to help rid the Galapagos Islands of thousands of goats, which [were introduced as a food source for sailors ('James Cook introduced goats into NZ as a food source for visiting sailors in 1773'), but are now] decimating natural bush on the tiny Pacific Ocean islands. Up to 100,000 goats and several thousand donkeys now run wild on Isabella Island, the largest in the group, and threaten the existence of the... native wildlife. The island, only 13km long and made up of five volcanic cones, covers about 200,000ha. It is almost all a national park, run by the Charles Darwin Foundation and the Galapagos Conservation Trust... [G]oat and donkey populations on the island began to burgeon only within the past decade, although goats have been known there for more than 20 years. "One of the problems is that the local national parks people know very little about goat control work. There is also a major problem just getting to the place,"... says... [the person who heads NZ]'s only full-time professional goat-culling organisation... Over the past two years [himself] and five hunters shot more than 2000 goats out of the Hunua Ranges near Auckland... Together with a team of scientists from around the world – including several from N[Z] – the goat-hunter spent some days on the island... looking at the bush destruction and working out how to eradicate the pests... [The goat-]hunter... says national parks staff in the Galapagos have little in the way of money or equipment to cope with such a problem, and if it is to be properly handled more than \$7 million will be needed... Isabella Island has many flat or gently sloping areas, often covered in rough grass or volcanic scoria, but with large areas of thick bush similar to that in N[Z]. Goats and donkeys had browsed ma[n]y of the trees to death, with most others chewed off as far as the animals could reach. There was little or no regeneration. "There is very little water on the island, and the trees catch water from fog and heavy dews and have drip-lines round them which create small pools... With the trees and driplines gone, there are no pools, and there is no water for new growth to start." Within a few years the

goats could destroy the habitat of the world's last great population of giant tortoises... [P]robable methods of getting rid of the pests would initially involve the use of helicopters... to shoot from... "...and high-powered rifles mean we can clean up a mob of goats without any escaping. They learn fast, and if one or two get away from a mob that has been shot up, they are very difficult to get on to again." ...[helicopters] would... be followed by teams of hunters on the ground, possibly with specially trained dogs to sniff out goats that may go into hiding. The operation may take three years... Access to Isabella is by launch only, and because of the lack of fresh water in the areas to be hunted, hunters may have to be ferried in each day. Hunting will probably only take place in the mornings and afternoons – the Galapagos are right on the Equator which means midday temperatures would make such strenuous work impossible. [The goat-hunter] is now waiting for decisions to be made by the Galapagos authorities. In the meantime two senior Galapagos National Park Service hunters may visit N[Z] to see methods used here for goat control and how N[Z] hunters work with dogs in the bush.

...Mexico, the U[S] and Canada have vowed to increase efforts to protect a spectacular natural oddity linking all three – the 4800km migration of the monarch butterfly. The Governments also promise to help 54 small farming communities whose impoverished economies were badly hurt by a 1986 decree meant to help the butterfly by sharply restricting the use of forestry land... [T]he creation of the butterfly preserves stripped some communities of legal use of almost half their land – driving many residents to illegally use the forests and encouraging others to migrate to... large cities... Monarch butterflies from the central U[S] and Canada migrate en masse in the autumn, reaching a few mountainous spots of central Mexico where they spend the winter. The migration is genetic, not learned. The butterflies who make the migration are descendants of those who made the journey the year before. Nobody is sure how they find their way back. While the butterflies themselves are not an endangered species, the migration itself is "an endangered natural phenomenon," said [a researcher from] the University of Florida, who has studied monarchs since 1958. The... first priority... said the... head of Mexico's National Institute of Ecology... at a five-day conference on the butterfly... attended... [by m]ore than 300 biologists, social scientists, officials and farmers from the three countries... "is the need to intensify efforts to overcome poverty in the monarch zone." ...In the past, advocates for the monarchs and the farmers have clashed over protection efforts. But the two sides came to wide-ranging agreements in last month's meetings... [By the way, t]omorrow marks the first anniversary of the start of the aerial spraying of Auckland eastern suburbs to combat the white-spotted tussock moth caterpillar. By this time last year caterpillars had been hatching in the Kohimarama area since September 20, prompting the dawn spraying by a Canadian DC6 aircraft for two months followed by ground and helicopter spraying. This ended in April amid health concerns. Yesterday, however, Operation Ever Green officials reported that no caterpillars had been observed hatching in the Kohimarama hot zone this spring. This followed a winter when no viable egg masses were found. The Ministry of Forestry chief technical officer... said no intensive searches for caterpillars would be organised... because the chance of finding any was considered remote.

...A synthetic version of the pheromone released by the... white-spotted tussock moth... to attract a mate... has been cleared for use in the Ministry of Forestry's programme to wipe out the insect in Auckland... 20,000 traps could be placed across the eastern suburbs areas from December, when the first of the small number of surviving moths would emerge. Last season's monitoring was hampered by the need to use live... moths[in traps.

...residents of Auckland's eastern] suburbs have been spared a spring tussock moth spraying – and may yet say goodbye forever to air and ground insecticide assaults on the pest. The Ministry of Forestry said yesterday that... it appeared the insect menace had been severely knocked back after [the]last... massive – and contentious – spray programme. But one residents' group last night claimed the spraying had been called off because it was illegal and likely to be stopped by the courts – a view later dismissed by officials who said the operation had... sweeping powers granted by the Biosecurity Act... [However, two] lawyers retained by the group... STOP (Society Targeting Overuse of Pesticides)... had produced opinions which concluded no legal powers existed to permit spraying... With spraying off the immediate agenda, the ministry is gearing up for [the]\$4 million trapping programme using a new synthesised pheromone... The traps will be set 10m apart across 2000 properties... Previous traps were set 100m apart... Any spraying is unlikely before January, when information from the trapping will be known... Even if no moths are caught, trap surveillance is likely to continue on a reduced scale for at least two years.

...50 scholarship holders and supporters of the Selwyn College basketball academy... yesterday assembled 20,000 tussock moth traps for the eastern suburbs. The academy is raising funds by helping the Ministry of Forestry to assemble the cardboard traps in what it says is the country's largest pest-trapping programme. On Monday, ministry staff will begin placing and baiting the traps within the 1.5 sq km infested area... [While on the topic of the tussock moth, health] officials have again cleared the spray... [used earlier this year] after renewed community concerns over its use.

...Government officials are laying the groundwork for yet another health survey into the effects of tussock moth spraying in east Auckland. The Ministry of Forestry wants to set up a register using information collected from 2300 households in the eastern suburbs. The decision was welcomed last night by the anti-spray lobby group, Society Targeting the Overuse of Spraying, which said the plans signalled the ministry was finally taking the health issues seriously. However, the society's president... criticised the ministry for waiting until seven months after spraying had ended and said many people had already moved from the area... Health officials released a report last month which found no evidence linking significant health problems to the Btk spray used in Operation Ever Green... [● A] home-grown parasite... which may save the Devonport ash trees from a destructive insect has surfaced while a relative imported for the job is in quarantine. Ash whitefly, a tiny insect which coats leaves in a sticky mould and causes them to drop early, was found in the Devonport trees two years ago. Hort Research imported a Californian parasite but before it could be released... a Ministry of Agriculture entomologist... noticed an improvement in the health of the trees. Her follow-up monitoring of five sites in the suburb confirmed that although 30[%] of ash leaves were affected last summer only 2[%] were affected this year. Further investigations found... the parasite was laying eggs inside whitefly larvae and killing off the next generation.

...Scientists are looking for a wasp version of the deadly Ebola virus to strike a blow against the pests. Larvae-eating parasitic insects have already been introduced to some parts of the country, but researchers are now... scrutinising fungi, bacteria and viruses as a means of destroying the wasps, which threaten native caterpillars and spiders. Christchurch scientists carrying out the work discovered that wasps were susceptible to a disease introduced to larvae, but the wasps also became wise to the introduced sickness and ejected infected larvae. Now the team from AgResearch and Landcare Research at Lincoln wants a disease too potent for the wasps to deal with, or a way of disguising diseases so they can strike without early detection... [I]t could take two years' research to come up with something people could spray on nests in their back yards, and it could be five to 10 years before an agent that the wasps could take into their population in the form of a bait is available... [The] wasp research team leader at Landcare's Nelson base, said wasp numbers had to be cut by 80 to 90[%]... Scientists are predicting that wasp numbers will be down over the summer because of the cool spring, but say it is still early days.

...The wasp menace should be low... this summer in the Auckland region but wherever spring has been dry wasps could be a problem. In the country's worst region for wasps, the beech forests of Nelson, numbers are expected to increase for the second year in succession... After annoying numbers of wasps in the summer of 1994-1995, the pests have been barely noticeable for the past two years in many parts of the North Island... ['numbers have been so low, researchers haven't had enough wasps on which to test control measures.'] Wet weather at the critical time queens were establishing nests[, which prevents] wasps' collecting nectar or honeydew for successful breeding... was one of three factors affecting wasp densities... Competition and fighting between queens trying to start nests was another... The predator-prey relationship between wasps and insects was thought to be the third factor... "Less food means fewer wasps..." [Editor's note: 'Researchers say blue clothing can attract wasps. When a nest is disturbed the wasps will fly out with a wing-beat frequency that stimulates others to attack. Wasps will attack an intruder within 7m of a nest, and pay special attention to moving targets.' In comparison, 'mosquitoes choose their victims selectively, searching for the most aromatically appealing humans. A

University of Florida study has found they use odour to sort attractive people from unattractive and go for humans who provide the richest source of cholesterol and B vitamins, which the insects do not produce themselves. One way to stop attracting them is to stop breathing as they can sniff exhaled CO₂ from as far away as 64.3km.’]

...Nothing is more irritating at night as you’re just dropping off to sleep than the drone of a mosquito buzzing around your ear. Pests that we may choose to ignore – but perhaps at our peril? Malaria, Ross river fever and Dengue fever are serious debilitating diseases carried by exotic types of mosquitoes which if imported into N[Z] could cause a major health problem for the people of this country. According to Auckland Healthcare Services, in the past few years several mosquitoes capable of carrying disease have been discovered in the... region. On each occasion the species was destroyed. But there is a chance of it happening again, especially as global warming takes effect and resistance to anti-malaria drugs grows.

...A new winged terror is striking fear into the heart of the Minister of Biosecurity. Having fended off tussock moths and diseased rabbits, a hitherto unheralded threat – the mosquito – is poised to plague the minister... But [the minister believes it] has the bloodsucker’s number... [It] trumpeted a raft of measures yesterday to meet the deadly peril posed by exotic mosquitoes. A “Mosquito Surveillance Plan” is on the cards, while health officials are being primed to cope with outbreaks of dengue fever, Ross River fever and Japanese encephalitis. But it’s not enough. An outbreak of dengue fever would cost[NZ] about \$250 million, and the loss of foreign earnings, from tourists would be even more... The Biosecurity Council will review recommendations in a new report calling for a mosquito eradication strategy and special mosquito security checkpoints.

...Fish with a taste for mozzies may be the answer... Mosquitofish are to be used to battle insects plaguing a subdivision near Tauranga. The small fish is an exotic which some conservationists believe should not be allowed into waterways... but [DoC] officers considered the effects on conservation values would be insignificant. That was because the[y]... will be released into a... wetland... created artificially for wastewater treatment, there were currently no fish species present, the wetlands had no hydrological link with any other body of water, and mosquitofish were already present in stormdrains 15m away... Last summer... mosquitoes... seemed to find the newly created wetlands an ideal breeding ground. The... Tauranga District Council[’s]... wastewater engineer... said 1000 larvae-eating *Gambusia affinis* (mosquitofish) from a Warkworth fish farm would go into only one wetland. Their release... would be closely monitored... The... council... has also applied to release several species of indigenous fish in the wetlands and a decision by... the Minister of Conservation... is expected soon.

...D[oC] staff have found 48 short-jawed kokopu, one of N[Z]’s threatened native fish, in a small mountain stream outside Egmont National Park.

...A strange fish – the body 10 feet long, the tentacles extending irregularly from the head only – has been found washed ashore at the Waipapa boatshed. The body is massive and is estimated to weigh about a ton and a half... [In international news, a] youth aged 15 has caught a 1.1kg piranha fish in a pond in central Madrid... The newspaper speculated that the piranha had been released into the pond by a hobby aquarium owner.

...Who are you going to call if your pond is plugged, your lake clogged or your canal choked? For a growing number of local authorities the answer is grassbusters – a team of highly specialised, silver-suited, weed-eating fish. So far the herbivorous Chinese grass carp have cleaned up such weed-infested waters as Western Springs, Lake Tahuna Torea in West Tamaki, four ponds at the Chelsea sugar works in Birkenhead, and waterways at the NZ Steel mill at Glenbrook. They are also on trial in one drain on the Hauraki Plains, consents are being sought for another, and councils in the Bay of Plenty, Northland, Hawkes Bay, Manawatu and Masterton are investigating their use. For [the owner] of NZ Water Management the rising interest in... the carp as an environmentally friendly alternative to herbicides and mechanical excavators is gratifying. [The owner] was badly stung in another aquaculture venture when... forced to abandon a marron farming operation at Warkworth in 1992. Now the Warkworth ponds are full of the weed-eating grass carp and the filter-feeding silver carp that clean up after them. The grass carp’s appetite is obvious at feeding time at Warkworth when... fed... cut pasture grass... “When they are hungry they are like piranha, the water boils,”... In water temperatures that suit them the carp grow well and can reach 18kg in N[Z]. The natural environment here, however, is not suitable for them to breed. Their inability to reproduce in the wild makes the fish used as biological weed controls very valuable. [Their owner] and councils, which lease the fish from him, do not want them to become targets for anglers. Like other councils, the Hauraki District Council is hoping the fish will save it money. The drainage manager... said a 5km section of drain would normally cost \$3100 a year to clean but grass carp should halve that figure.

...As vegetarians, manatees spend much of their time grazing on grasses and plants found underwater or floating on the surface... MANATEES AND their ancient predecessors have navigated Florida’s rivers, springs and coastal waters for at least 50 million years. While these gentle giants may resemble walruses, they are most closely related to elephants. Manatees are part of an order of marine mammals called Sirenia, named after the sirens, the mythical mermaids who tried to lure the ancient Greek hero Odysseus to wreck his ship on jagged rocks. Over the centuries mariners possibly dazed by too much time at sea, have mistaken manatees for the mermaids of legend. Christopher Columbus presumably sighted manatees in 1493 and recorded them in his log as “mermaids,” noting that stories of their beauty had been exaggerated. The Florida manatee is a sub-species of the West Indian manatee, which is found throughout the Caribbean islands, eastern Central America, Colombia, Venezuela and Brazil’s northeast coast. One relative of the manatee, the eight-metre long Steller’s sea cow, was hunted to extinction by 1768, just 27 years after its discovery... 1996 [was]... a cataclysmic year for the endangered animals. Within the first five months... at least 276 manatees had died statewide. That’s a devastating toll – over [10%] of the 2639 Florida manatees counted during a recent survey. Something new was killing manatees. Was it a virus? A toxin? Environmental contamination? Some of the world’s leading experts were studying the situation, but they still had more questions than answers... [A] veterinarian at Miami Seaquarium... [thinks it knows what poses] a threat to the manatees. Approximately 30[%] of manatee deaths result directly from encounters with humans. Almost all adult manatees bear the scars of boat propellers. “I don’t think people want to go out and kill manatees... We just need to change our lifestyles.” That means observing boat speeds where manatees are likely to graze. But it also means balancing the ever-increasing demand for new development along Florida’s waterways with the need to preserve wilderness habitat... [Manatee cows] don’t reach sexual maturity until they are four to six years old, and then will have a calf only every two to five years. The calves stay with their mothers for about two years. Because manatees are so slow to reproduce, scientists speculate that they may never have been abundant in Florida. Under the best circumstances, the estimated increase in the manatee population from births would be about [5 to 8%] a year. That’s why the mysterious plague was so threatening... Tampa’s Lowry Park Zoo... runs one of Florida’s three critical-care hospitals for manatees. The zoo has three 62,500-litre concrete rehabilitation tanks that can hold up to 17 manatees. An operating theatre is in a building nearby. The goal of this hospital, and those run by Miami Seaquarium and Orlando’s Sea World of Florida, is to treat a manatee’s medical problem, allow it time to recuperate and then return it to the wild... AT THE Lowry Park Zoo, [a] sick manatee from Lemon Bay... [– which] was in the heart of what was being referred to as the “Hot Zone,” an area of water around Fort Myers where the mysterious manatee deaths were happening... [–] joined several others in the holding tanks. Two of them were also found in the Hot Zone, barely able to breathe. Because the two couldn’t lift their heads out of the water, life jackets were wrapped round them.... [T]he diagnosis turned out to be toxicosis from eating or breathing red tide, a microorganism that can cause paralysis. [So r]ed tide was... the culprit behind the mysterious deaths which finally stopped last May. The good news is scientists now have a test to diagnose red-tide poisoning and have more experience treating it... [S]o few manatees exist that each one saved... has an important impact on the survival of the species... Last June, [the three manatees from Lemon Bay] were transported by crane and truck to a state park in Englewood, where they were... fitted with satellite tracking belt[s and]... released into the wild... [One] is now believed to be pregnant. Such success stories cause naturalists to be cautiously optimistic. Between education and rescue efforts there is hope for the manatee’s future.

...More than 60 monk seals, one of the world's most endangered species, were killed by a bloom of toxic algae off Mauritania's Atlantic coast. Government scientists said the marine mammals had been poisoned by eating fish that had swallowed the algae. The seals were part of a colony estimated to number 150, and it is believed that no more than 350 of the animals exist worldwide.

...Hooker's sea lion has been classified a threatened species. The Minister of Conservation... said yesterday that the animal, found only in N[Z], was probably the world's rarest sea lion and deserved protection under the Marine Mammals Protection Act... [O]nce found on both the North and South Islands... they were taken to the brink of extinction last century by European sealers. Estimates of the population now vary from 11,000 to 15,000. That they now breed only in colonies on the sub-Antarctic Campbell and Auckland Islands made the species more fragile to disease and accidental bycatch... "The impact of [people] continues with about 100 sea lions being drowned accidentally by squid trawlers every year..."

...[t]he effect of an exploding seal population on NZ's lucrative fishing industry needs to be examined in a scientific way, a fishing company executive says. The director was one of a four-member panel debating a South Island seal cull at the Recreational Fishing Council conference in Nelson. The director said fur seals were ransacking commercial fishing grounds – seals took about 8400 tonnes of hoki off the West Coast each year, worth about \$20 million to the industry, and it is estimated NZ's fur seal population of 60,000 annually ate 300,000 tonnes of fish more than the commercial domestic catch of 270,000 tonnes. The panel agreed that indiscriminate culling would not be accepted by the commercial fishing industry, politicians or the public, but it expressed frustration that an expanding fur seal population would result in a marine imbalance. "Seals are increasing in numbers and breeding range and are now as far north as Ninety Mile Beach. No one is saying we wipe them out, all we are asking for is moderation." The problem would continue until the public woke up to the facts, the director said. "We have definitely reached pest proportions in some areas." However, conservationists point out that NZ's 50-boat hoki industry is incredibly wasteful: "If we tighten up wastage in the way we handle hoki stocks we could share some of those stocks with the seals".]

...The Minister of Conservation... has decided all fishing in the Poor Knights Marine Reserve should cease but will phase in most of the ban to take effect in October next year. [The minister] said in Auckland last night that [it] believed there was a negative impact on marine life from recreational fishing within the reserve. At present fishing is allowed in areas of the reserve under certain conditions. It is the only marine reserve in the country where fishing can take place. Recreational fisher[s] and charter operators have vigorously opposed a blanket ban[, which may be why the minister] announced his decision among friends – a conference of the Underwater Association which has called for the ban. [The minister pointed out] that although 30[% of NZ]'s land area had been set aside for conservation less than 1[%] of its sea was similarly set aside. And while N[Z] had the greatest diversity of seabird species in the world life below the water was equally dramatic with many molluscs, seaweeds, rock fish and other fish occurring nowhere else on the planet. [The minister] said recreational fisher[s] believed the impact of fishing in the reserve could not be accurately measured and so fishing should continue until the data existed. "The great difficulty with this argument is that... [h]istory is littered with decision-makers who have put off making hard decisions on the basis of needing still more data. I tend to favour the precautionary approach. If we are uncertain about the outcome we should err on the side of nature..."

...Most of N[Z]'s landscape is now hostile to many native species... [In addition to] our threatened birds[, there is also] concern for species ranging from native bacteria... to... reptiles and even rockpool fish... [T]he new State of N[Z]'s environment report... says that although N[Z] has only 300 described species of bacteria, the number present in the country is probably higher than 80,000. But more than 1000 species... live in association with threatened plants, animals and fungi or in geothermal areas threatened with development. Recent advances in technology make bacteria potentially valuable resources... The number of N[Z] fungi has been estimated at 20,000 although only 4500 are known. Scientists put 200 identified forest-dwelling species at risk from habitat destruction. Many edible species exist but, the report warned, "even collecting a fungus to study it professionally or as a hobby could unwittingly place a species under threat." Not all indigenous invertebrates have suffered as a result of human settlement. About 40 species of native bees have adapted well to pastures, having lost beech forest habitats to introduced wasps and in spite of needing to compete with introduced bees. But many invertebrates, including all 178 native earthworms and many snails, have disappeared. Some of the 30 species of unique native slugs are believed to be threatened. But because information on the distinctive two-tentacled slugs is so scant, none has been listed as threatened. "The N[Z] slugs are unique in having a tiny pinhole on their backs which, like a whale's blowhole, leads to the slugs' most distinctive feature – a highly developed lung found in no other mollusc," says the report. About 110 fish are endemic to N[Z] waters but fewer than half live in the open sea. Little is known of the status of most fish in N[Z] waters but rockpool fish have been assessed and 11 out of the 61 species, many of them cockabullies, are considered threatened, being rare and vulnerable to habitat disturbance. The report concludes: "The main responses to biodiversity decline have focused on ecosystem and species recovery programmes on offshore islands and extensive pest control operations on the mainland, but the needs for partial restoration of representative indigenous lowland and coastal ecosystems, and for wider protection of marine ecosystems, has yet to be addressed." The Government has called for a biodiversity strategy to be drawn up...

What was the N[Z] landscape and animal life once like? ...Look no further than the Trounson Kauri Park, the shining example of a conservation strategy to give us a glimpse of what the... environment once was before the arrival of humans. Located off State Highway 12, about 36km north-west of Dargaville, the 450ha reserve is an oasis of native species and plants surrounded by a vast buffer zone of pasture to create a mainland "island," one of five such the D[oC] is hoping to establish. The well-fenced reserve is free from large browsing animals, and its gentle terrain allows easy access. Size is important. The reserve is large enough to let populations of territorial birds have sufficient space to roam and small enough to manage. Neighbours and local iwi are supportive of the forest's intensive management and 20,000 visitors a year come to see the results. The high-quality forest with its diverse undergrowth and a large number of fruiting trees like taraire and tawa, is home to several threatened species: the North Island brown kiwi, kukupa (wood pigeon... or kereru[– upon which]... a... rahui... or... ban... on killing... was placed... [l]ast August... but the[se]... big beautiful bird[s, which]... are the only large birds able to eat the big seeds of species like miro, puriri and taraire... are still in danger from poachers...), long-tail bats, banded kokopu... and kauri snails. In this haven from the 20th century, the department hopes species can recover their numbers and is reintroducing regionally extinct or threatened flora and fauna to restore a true kauri forest ecosystem. This year, 21 North Island robins from the Mamaku Plateau were transferred to Trounson to establish the first mainland population in Northland for decades... An estimated population of more than 200 brown kiwi is the best tally in Northland... Surveys of long-tailed bats will determine their range and estimate their numbers, and the giant kauri snail is being studied to see how it can be protected... Preliminary findings by an Auckland University masters student show that the shore rat is the main predator of the snail. Tracking devices called transponders – glued to the snails' shells – keep and eye on their nocturnal wanderings. Trounson Kauri Park is the only mainland island which represents a kauri megasystem... If the threatened species are to have a chance to recover, the introduced predators that prey on them must be controlled, so conservation staff wage an unrelenting and constant battle, patrolling the precious "island." ...The hard work has had a pay-off. Less than 17[%] of the forest's trees are browsed by possums, compared to 85[%] of trees at the Katui Forest, 5km west... [Incidentally,] Wellington City Council parks staff have made it into the *Guinness Book of Records* by planting 25,250 native trees on the town belt in less than eight hours – an average of one every two minutes. The former record was held by 100 [RFBPS] volunteers who planted 6000 trees over two days on Tiri Tiri Matangi Island in the Hauraki Gulf last year.

...Project Crimson... [uses a] water-retaining gel to help... [newly] planted... pohutukawa... trees grow... on [the Hauraki Gulf's] Browns Island...

An Auckland tree expert says a city council's decision to axe protection for some native trees is contemptuous and short-sighted. [The expert], of Lifestyle Tree Care and Consultants, wrote to the N[Z] *Herald* angry at the felling this month of a 100-year-old pohutukawa in Takapuna. A Pine

Ridge Tee property owner originally asked... [the] Grey Lynn company to cut down the tree to make way for a new house. [The company refused when it] realised the tree was no longer protected. The North Shore City Council scrapped automatic protection for native trees over 8m high on private property [last]October. It said residents were responsible and had a sensible record towards trees. The decision allowed property-owners to prune or fell any trees on their own sections, except those on the “notable trees” list, coastal and lakeside pohutukawa over 3m, or those within coastal protection or rural zones. The move sparked outrage from environmentalists, including the Auckland Tree Council and Auckland Conservation Board who are appealing against the decision in the Environment Court. A date has not yet been set for the case. [The expert] said yesterday that [it] told the property owner the tree could be trimmed to accommodate the house, but it was cut down on February 5. “The council decided the city could look after our trees. It doesn’t appear we are able to.”

...Auckland developers and councils were lukewarm yesterday about a bill which would make tree conservation a matter of national importance. The Urban Trees Bill... was too vague and wide-ranging, they told a select committee hearing in Auckland. Designed to protect and conserve tree cover in urban areas, the bill defines “tree” as including any shrub and plant and the root of any tree. It would make it compulsory for a territorial authority to protect, maintain and conserve, as far as practicable, existing tree cover in every urban area... The Manukau City Council said tree protection in urban areas was adequately covered by the Resource Management Act. The Auckland City Council supported the intent of the bill, but urged that local authorities be allowed to be responsive to local circumstances. However, a longtime advocate of saving trees, [who is an Auckland University]Professor... praised the bill... [Meanwhile, s]lippy autumn leaves in... central [Auckland] are causing headaches for an elderly pensioner, who fears they will cause an accident. [The]Greys Ave resident[, who is] aged 87, is calling on the Auckland City Council to clean up the leaves before someone slips and breaks an ankle. [The pensioner], who has lived in the inner-city street for 51 years, said that in previous years, wet, slippery leaves had been regularly cleaned up. But this year they had been piling up on the footpath, grass verge and road for weeks. The council’s marketing manager... did not know why the leaves had not been cleaned up this year, but would make sure it was done as soon as possible.

...Strange skeleton forests dot Chatham Island, like something out of a science-fiction movie. But there is a very down-to-earth explanation for the bare tree[s]... which have replaced once lush forests. Most of it is to do with humans. Much of the land was cleared for stock. The remainder has fallen prey to stock anyway. Constant grazing of the forest floor stopped trees like the indigenous kopu regenerating. Stock also opened up gaps in the bush, allowing in the wind which put paid to any hope of growth. Most of the surviving trees... have been so battered by the prevailing westerly that they are permanently bowed over. But not all of them. A stand of regenerating bush at Hapupu, at the north-eastern end of the island, shows that when stock are fenced out the trees will come back. The bush is similar to, but not quite the same as, bush on the mainland. Made up of kopu and a native karaka, the stand was saved because of the historic Moriori dendroglyphs, or tree carvings, it contains. Local support for saving the bush is growing, and farmers are fencing off forested parts of their land.

...In many parts of N[Z], rural landowners are in uproar over district plans which impose rules to protect native forests and landscape values on private land. The most important area caught up in this debate is the Far North. This district is a biodiversity treasure house, containing the most important collection of threatened and vulnerable native plants and animals on private lands anywhere in N[Z]. Yet tomorrow the Far North District Council will consider a motion to withdraw rules designed to protect native forests, wildlife habitat and landscape. Attempts to preserve natural habitats by regulation have repeatedly generated controversy over the past decade. Similar planning rules have had to be withdrawn in several other districts. Conservationists and planners need to learn from these events and develop new strategies. The ill-will which district councils have created among rural landowners is a real problem for conservationists... This is because protecting a habitat is not simply a matter of refraining from destructive actions. In typical Far North habitats consisting of teatrees, regenerating tree species and kiwis there is a need for positive acts of care and stewardship. Possums have to be controlled, the incursion of weeds nipped in the bud, farm dogs kept out of range of the kiwis and the regenerating bush protected from accidental fire. Stock must usually be [kept] out if scrub is to progress to diverse native forest. Fencing off small remnant stands of mature forest is essential if the trees are to replace themselves before the end of their lives. Such tasks can be postponed, but not forever. All of this adds up to a sizeable management responsibility, which depends in large measure on the goodwill and conservation commitment of landowners. The state cannot realistically take over the task, nor will it adequately be performed if landowners are fired with a sense of injustice and bitter resentment. A pragmatic view would therefore acknowledge that imposing rules in district plans is not sufficient in itself. Indeed, done in isolation from other actions, it can be counterproductive. Farmers deeply value the freedom and responsibility that goes with owning your own land and running your own business. In my experience, farmers’ defence of traditional property rights should not in itself be interpreted as anti-conservationist. Yet there is no dodging the fact that achieving sustainable management of resources – the purpose of the Resource Management Act – does involve a change to traditional property rights... Among the often-struggling hill country farms of the Far North undeveloped or reverting land is extensive. The district council’s protective rules might be restricting not just 10[%] of a property, as in lowland farmland or towns, but 40[%] or even more. The cost to a landowner of being prevented from subdividing that land or putting it into commercial forestry can be considerable. Experience in Europe – even in countries with strong planning traditions – confirms that land preservation on private land needs to be eased into community acceptance using financial incentives. The interactive process of offering, negotiating and accepting incentives for conservation is respectful of landowners. It contrasts with the one-sided process of councils imposing rules... The implicit idea that the... Far North district plan... could be used to declare a national park over a huge area of private land, without any payment, was always a greedy dream. Predictably, it provoked outrage. Sensibly, the council has scaled back the plan’s ambitions by introducing a variation... the effect [of which i]s to narrow the focus of the rules on... protecting priority sites called special natural areas (SNAs). Even so, many perceived injustices would remain if the SNAs were simply implemented through imposed rules. Financial incentives... are needed to help smooth the path to sustainability. The council already offers an incentive scheme for native forests under which rates are postponed as long as the forest remains untouched. This costs about \$100,000 a year. To supplement the council’s resources, central Government funds could be sought. The Forest Heritage Fund has protected 100,000ha of native forest since 1990 at an average cost of \$200 a hectare. A parallel fund for conservation on Maori land... has protected 75,000ha for \$120 a hectare. The cost-effective performance of these two funds suggests Far North SNAs could be fully protected over a number of years for a sum not too much greater than the council is already spending on temporary protection. Handled well, a proper landowner incentive programme could also save the council the huge costs it must be anticipating for litigation over its plan.

...A fragment of what was once a huge and productive wetland... that... covered the Wairau Plains... has been saved. The Nelson-Marlborough Fish and Game Council has bought part of Para Swamp, which it believes is the most significant freshwater wetland system in Marlborough.

...“Save the thousand acres” is the battlecry of a group that wants private farmland at Long Bay and Okura acquired to extend the A[RC]’s most-used park. The... Long Bay-Okura Great Park Society... convened... said the paddocks rolling the length of the present park to the Okura River were the only place left on the North Shore where a park of 400ha... could be created. Urban sprawl had already reached the park gates. Incorporating some of the neighbouring farmland to form the Great Park would also protect the adjacent marine reserve from water run-off and other harmful effects of any building in the Long Bay catchment... The society has 100 members and is now raising funds for a campaign to persuade local authorities and the Government to buy the land, which offers sweeping views of Hauraki Gulf and Rangitoto islands. The society describes its task as formidable, partly because of the row over the setting of Auckland’s northern urban limits. The... Environment Court r[ecently] ruled that... land on the southern side to the Vaughan Rd ridge, sloping towards Long Bay, would be included in the metropolitan area[, while t]he land on the northern side of the ridge... sloping towards Okura, should be kept free of housing... Okura-side landowners are appealing to the High

Court so that their land is not shut out of urban development forever. Planners say it would be difficult to take [the southern] land into the park now that it has been put within metropolitan limits... [because the new] zoning has increased its value significantly. The general manager of regional parks... said protection of the Long Bay backdrop was on the park's management plan and was an issue of concern. But the council had given no direction to either buy land or to look at the Long Bay-Okura Great Park concept... A subcommittee of the [ARC] and North Shore City Council is examining issues about regional parks in North Shore City generally... A North Shore city councillor... said the... North Shore has only about 53ha of regional park land...

It... seem[s] that as Auckland looks to double its population in less than 50 years we should not be too hopeful that the open space which we take for granted around Auckland will be added to our existing quota of parkland. Recently we have seen ample evidence of politicians citing the high cost of land to sit on their hands and watch remaining outstanding examples of potential parkland, such as the defence land on Takapuna Head or the McElroy Peninsula in Mahurangi Harbour, slip towards subdivision. They are not making any more land, it's not getting any cheaper and the lots are fast becoming smaller and less viable as parkland. So it would appear that once again Aucklanders must remind the Crown that, as with Hamlin's Hill, they have already paid for the Takapuna defence land and even if it's surplus to the Navy, it certainly isn't surplus to Auckland. Sadly it... required public pressure to remind the A[RC] to exercise its responsibility to protect prime regional open space in the Mahurangi. After all, if the ARC is not prepared to purchase, at rural coastal prices, land it has rated as a top priority, then just what can we expect from it...?

...The Alliance and some conservation groups say a \$550-a-head Auckland conference next week on parks is a renewed bid to corporatise the region's public open spaces. But the A[RC], which is hosting the three-day conference, says the aim is improving parks management. The Alliance is suspicious of session titles such as "Parks as a business" and "Leveraging resources from communities,"... Some [RFBPS] members – whose organisation has been invited to attend – also believe the agenda has a strong business focus... "In this thinking parks are just another business where users are seen simply as customers to be sold a product. The user-pays goal of some regional councillors is definitely on the agenda." ...the biennial conference was organised by regional parks services from around the Pacific rim working under the name Strategic Partners. Park managers from A[US] and North America attended, with the aim of evaluating and improving the way they ran parks... [The ARC]'s parks committee... said the region's 21 parks cost \$12 million a year to operate and generated \$3.8 m... in revenue, with Mt Smart the chief contributor.

...The cost of restructuring the D[oC] was expected to result in cuts of \$718,000 a year from its operating budget, the Alliance said yesterday... [T]he Minister of Conservation... told Parliament earlier that the cabinet had budgeted \$6,247,000 for the restructuring this financial year. The changes were expected to save \$1.2 m... in the financial year ahead and \$1.65 m... in 1998-1999... The Alliance conservation spokes[person]... said... "At this rate so much will be spent on restructuring that the department will not have the resources left to operate effectively." ...The minister said restructuring was resulting in some redundancies, mainly at head office, but... at field centres there were more resources and more staff than ever before... [H]owever... a... Labour MP... predict[s]... some visitor centres w[ill]... close, area offices... reduce and funding would be trimmed in the Canterbury conservancy... One of the only development works to be approved next year would be at Cave Creek, where special funding had been approved for new safety steps... to the chasm where... [14] people died when a platform collapsed... in the West Coast national park two years ago.

...A year of checks on D[oC] structures shows many have fallen below standards set following the 1995 Cave Creek tragedy. A department project manager... said that about 70[%] of 3000 top priority structures examined so far needed maintenance. This ranged from replacing chicken wire that provided underfoot grip, to repairing undermined bridge abutments and smashed decking. Nationwide, 3500 structures were rated top priority because of risk to users, including their height above the ground. A national asset management programme had revealed the department had 16,500 structures such as bridges, platforms and walkways, and 3500 huts and toilets. While the inspections, which began in November last year, showed some structures needed urgent work, damage was most likely to have been caused by the "violent environment" rather than inadequate maintenance... [The] inspection programme involv[es] 26 engineers and 120 field staff... The department was also working with the Building Council to adapt a building code for its structures. "The [existing] building code is fine in the urban and rural environment but not for the back country. We don't want handrails up a mountain. People accept the risks in that environment..."

...The D[oC] has denied suggestions it has gone over the top with its safety standards for back-country structures... The Director-General of the department... told a meeting of the Conservation Authority... it was ensuring they met legal... requirements... Authority members had criticised the lengths the department was going to. [Incidentally, 'each year 8000 volunteers provide 20,000 hours of help with DoC projects'.]

...Seven conservation workers... under contract to the D[oC] have the job of... eliminating every weed they see... on Little Barrier Island... in a bid to protect the forest environment of one of N[Z]'s foremost scientific reserves. The team's main task is to eradicate climbing asparagus, which is a serious threat to the largest remaining relatively unmodified northern N[Z] forest on the rugged 2800ha volcanic island, a reserve since 1896. The workers search every square inch of the area they are targeting for the invasive weed, which was once sold in garden centres but is now a big problem on Waiheke Island and almost everywhere else in Auckland, including the Waitakere Ranges. The South African sub-canopy vine – often overlooked until it takes hold – was first recorded on Little Barrier... in 1978. It smothers trees and can strangle young native plants. Unchecked, it would modify the island environment in 20... years. Since... the workers began the \$62,000 project, which is financed by the Government... they have eradicated 10,000 climbing asparagus plants, 4500 mint, 4000 billies and about 1000 other weeds... They are eradicating all weeds up to 100m above sea level in the south-western corner of the island closest to the mainland, from where the weeds have arrived either by humans, birds or the wind... [The] parks and recreation management graduate from... Lincoln University... [who is the] team leader... says a solution of two plant pesticides is used to kill above ground growth as well as underground root systems. Although it is not ideal to spot-spray poisons in a reserve such as Little Barrier, [the team leader] says there is no alternative.

...*Spray and pray*... Only a few N[Z] local authorities have developed real commitment to the principles of the Resource Management Act in their use of pesticides. An independent research project has looked into what councils spend on pesticides, whether they analyse alternatives to pesticides, public opinion on the issue and trends in pest control overseas and in N[Z]. It finds that councils put a cost on the purchase and application of pesticides but they appear unable or unwilling to take account of the hidden costs... [–] the unpriced environmental effects... They include loss of biodiversity, pollution of surface and ground water as well as the marine environment, risks to wildlife and human health and the development of pesticide-resistant strains which have to be combated with new compounds of increased toxicity. The author of the report... aims to show why such costs should no longer be hidden but that accounting practices should change to take full account of the costs associated with pesticide production and use. The changes to accounting would be in line with principles of the R[MA] relating to the need for policymakers such as councillors to achieve such objectives as managing the use, development and protection of natural and physical resources in a way to meet the needs of future generations... [The] survey found that Wellington, Dunedin, the Hobson and Eastern Bays wards of Auckland City, Hamilton, North Shore City and Tauranga were the councils with the most commitment to the R[MA]. They were actively seeking, testing or using alternatives to chemical pesticides... [The author], a former town planner and highway engineer[who]... paid for the project himself... surveyed 11 councils, asking chief executives to provide information on how much their councils spent on pesticides and councillors for their opinions as well as the views of their communities on pesticides. Only the chief executives of Christchurch City and Rodney District responded in full and 33[%] of councillors replied to... [the] questionnaire, sent out immediately before the October 1995 local body elections... The responses indicated that councillors going about council business now only gave a small amount of attention to the pesticide issue following its high profile in the late 1980s and early 1990s. But the survey revealed that when ratepayers contacted councillors on the issue, personal health and pesticide spray drift were

their major complaints. [60%] of the responding councillors considered pesticides did generate undesirable hidden costs. [The author] used surveys carried out for the Auckland and Wellington city councils to conclude that there was a lack of awareness among the public on weed control. An Auckland survey revealed that 84[%] of residents believed that public health was the most important factor when councils controlled weeds in parks and reserves. But given the high degree of public concern at the impact on health of pesticides, [the author] could give no explanation why only 800 households in Auckland City, less than 1[%] of all properties, had registered on a council list to prevent their grass verge from being sprayed with chemicals.

...*Weed-control issue on the boil in city*... Looking forward sometimes requires looking back, as a number of city and district councils have done in positioning themselves at the cutting edge of weed control and replacing chemicals with steam spraying. Now the Auckland City Council is considering abandoning non-toxic weed control in several Auckland suburbs, opting instead for a return to toxic chemicals. In doing so, the council will buy a fight with the anti-chemical lobby and risks putting itself off-side with a growing number of local authorities adopting non-toxic control methods. The Auckland City Council is not a leader in non-toxic weed control, using chemicals in all but the Eden and Ellerslie boroughs... While no firm decision has been reached, the recommendation for a return to herbicides stems from the council's desire to save money. Council managers were yesterday reluctant to discuss the issue, saying only that it was a budgetary recommendation and one that affected residents would be invited to comment on. Residents believe, however, that the savings in question amount to less than \$50,000 a year and say they will fight it with vigour. Council contractors in the Eden and Ellerslie boroughs use the Waipuna method which... involves spraying with boiling water, a traditional technique commercially developed by Auckland company Waipuna International. As simple as it sounds, hot water has been proven to work as well as chemicals on soft weeds and is now the principal method of control in the North Shore, Wellington, Dunedin and Rodney City Council districts. Waipuna International's spokesperson... says the... company has contracts with authorities in Holland, Britain, A[US] and the U[S]. "While the application and machinery are new, the method of weed control has been around for years..." ...Criticism that the method required spraying at more regular intervals and therefore cost more in labour had little merit given that councils had to advertise when they were spraying[chemicals] and also had to administer no-spray addresses. "We know from... experience that effective weed control required four or five sprayings a year. The Waipuna method requires one or two more sprayings but has distinct advantages. These include the ability to spray in wind and drizzle and removing the requirement on councils to advertise chemical-spraying days." It is a burden that Waitakere City Council is prepared to shoulder. It is the only council in Auckland persisting with chemical-only control methods. A spokes[person] said that despite its clean green image, the council had decided to stay with chemicals as the most cost-effective method, having trialled the Waipuna method several years ago. "We found it cost between two and seven times more and had to be applied six times a year as opposed to two. Equally, it didn't kill the roots of gorse or ginger. For those reasons we stuck with herbicides." [But the spokesperson] said there was increasing pressure for environmentally friendly control and new techniques may allow the council to consider changes. Tauranga has gained a reputation as one of the most eco-friendly districts in N[Z]. A citizens-initiated referendum banning chemical spraying presented a challenge to the Tauranga District Council, which farmed out the challenge to contractors... Their answer: a [4-wheeled] motorcycle, a length of number 8 wire, a scaffold, a weed-eater, and a healthy dose of Kiwi ingenuity. A... spokes[person for the contractors] said two prototype motorcycle-cum-weed-eaters were being trialled with impressive results and could... provide the simplest solution to a growing dilemma.

...The dream of many city people is to own a small piece of land in the country, frequently referred to these days as "a lifestyle block." Unfortunately part of the life style that many never bargained for is the constant effort required to control thistles, ragwort, gorse and a long list of other noxious weeds. Some small landholders will therefore be... spot spraying or swinging a grubber... [during summer holiday] hours that would otherwise have been spent at the beach... One of the best [pieces of advice I] could give these depressed souls would be [to purchase] a weed-control agent that finds the weeds by itself, steadily attacks them and requires little human effort to maintain its effectiveness. For controlling gorse I have noticed that one such agent is becoming increasingly common. Around the country many more gorse bushes are being covered in shrouds of extremely fine gossamer produced by colonies of a minute spider mite which was released in N[Z] a few years ago specifically to reduce the vigour of this prickly menace... The tiny red mites... were introduced by Landcare Research from Europe, the home of gorse, but only after it was established that they would not eat anything else... There have been too many instances in the past of control organisms becoming new pests when they had locally killed all of their target species or found some of the native wildlife easier or more palatable to feed on. It is remarkable that a creature as small as a spider mite can be effective against such a robust plant but with mouth parts like a hypodermic needle, the gorse spider mite is able to penetrate the tough spiny stems and suck out the living tissue inside. The dark green stems are eventually reduced to pale yellow by the massed attacks of tens of thousands of the suctorial feeders... The spider mites mature very rapidly, completing the cycle from egg to adult through three nymphal stages in just a few weeks. As about 20 times more [gal-mites than guy-mites] are produced and each one lays between one and four eggs every day, population numbers can expand very rapidly. One introduction that I have observed this year used just two finger-sized springs of infected gorse tied on to a couple of large bushes in a new area. Within six months the mites had spread over a hectare of land heavily infesting dozens of mature plants. They travel by walking from bush to bush where branches touch and although they have no wings they are also able to fly to reach isolated plants. This is achieved by the technique known as ballooning in which the mites cluster at the tips of exposed branches where they can easily be swept up by wind gusts. Supported by long threads of secreted gossamer they are then... carried far and wide on the wind to infest distant thickets of... gorse and eventually reduce the need for grubbing and spraying.

...the orange psyllid, or jumping plant louse, that has quickly established itself in Auckland[could save councils the huge cost of controlling] acmenas, which are regarded as a threat to forest and native shrubland... The psyllids have been found only on... acmena (monkey apple) tree[s, and a]... HortResearch scientist... says the insects seem to feed on new leaf and flower shoots. Scientists do not know how much damage they will do [but] hope... they will be a useful tool in cutting the spread of acmenas... Officials are baffled how the insects got here or where they came from.

...Two Auckland scientists... are researching the extent to which foreign fungi are slipping through border "quarantine" on the roots of imported plants and agricultural equipment. In other cases, spores... of fungi, are carried in by wind. "No one knows what impact this invasion of foreign fungi will have on our native forests but it may be devastating... [Yet w]hile the invasion of our native forests by introduced animals and plants has met with a vocal response, the impacts of introduced fungi have been quietly ignored," [one of the scientists] said. In the first study of foreign fungi in N[Z]'s native forests, the pair hope to discover the extent to which foreign fungi have invaded, and then to understand what effect these fungi would have, and why some foreign fungi were so successful. The pair were initially focusing on two fungi: the orange pore fungus (*favolaschia calocera*) and the poisonous fly agaric mushroom (*amanita muscaria*). These species had the potential to displace native fungi, disrupting the food chains of native insects and birds... To survey the spread of the fungi, the two researchers had asked members of the public to report finds to "Fungal Invaders" at Private Bag 92170, Auckland. They had also set up an e-mail address... and had asked for details of the location, habitat, nearby tree species, date and finder's name and address. The species were easy to identify... Both were fruiting now, which meant their "mushrooms" were visible... The fly agaric arrived on the roots of its usual host trees, oaks and pines, but could now be found under most species of introduced conifers, and was also common under eucalyptus... birch, European beech and chestnuts... The orange pore fungus was often seen on the fallen wood of many native and introduced trees, especially in the north of the country. It was common in forest remnants but could even be found on fallen wood in gardens. A native of Madagascar, the orange pore fungus was first found in Auckland and the Waikato in 1969, suggesting that it arrived sometime during the 1960s. Since then it had spread as far south as Nelson, Paparoa National Park... and the Chatham Islands.

...Ministry of Agriculture officials say they are developing thousands of new import health standards in an effort to prevent the introduction of unwanted pests... Part of the work will be funded by plant propagators and other importers being charged more than \$1000 each... [A]n official... of the ministry's regulatory authority... told N[Z] members of the International Plant Propagators' Society at their conference in Nelson recently that the charges would be made under the Biosecurity Act. Computer software for a plant and animal quarantine information system was being developed which would contain health standards for all plant material and animals coming into N[Z]. Although the software would be accessible to the public in several months, thousands of import health standards still required development and[may] take years to complete. Material... imported previously but... not yet in the system could be imported under the regime used in the past, but to import new material the importer would have to pay for the standard to be developed... Importers also had to pay for a... permit to bring each consignment of propagation material into the country, which... could also become costly... Some importers had been put off trying to import materials after learning of the procedure.

...N[Z] now has more naturalised introduced plant species than native plants. The latest count of naturalised plants – those that have survived and reproduced in the wild – included in a Landcare Research database... is 2064 compared with 2039 native species... [(although it] has been estimated that up to 20[%] of the country's native plants have yet to be found – let alone named[)]... The database records the species total and not the number of individual plants and the count does not mean that naturalised plants are overrunning... [NZ. T]here was a tendency for naturalisation to occur in the northern part of N[Z] where the main ports of entry were located and where it was warmer. But even when species naturalised some remained in small populations... [T]he number of naturalised plants was still small compared with the 15,000 or so plants cultivated in... [NZ. A]n unknown number of those had the potential to naturalise but many such as common crops and herbaceous annuals and perennials had not shown an inclination to do so... [P]lants were now screened before they came into the country to limit the number that might become invasive[, said a botanist who] has used the... database to produce a book on the common and Maori names of N[Z] plants to help people who struggle with the Latin versions.

...When Joseph Banks... stepped ashore at Anaura Bay north of Gisborne in 1769, one of the first plants... the botanist on Captain Cook's ship Endeavour... noticed and collected was the kaka beak, *Clianthus puniceus*. It is not surprising that this native legume, also known as kowhai ngutukaka, caught his eye. For its clusters of finger-length, hook-shaped, scarlet flowers make it one of our most showy native shrubs. Arriving in October, Banks would have missed the best of the blossom by about a month. But as the plant was then fairly common, the late flowers would still have been making a bright splash of colour along the edge of the bush. Later records by other explorers showed it was widely distributed all along the coast through the Coromandel and Auckland regions up to at least the Bay of Islands. It was also found inland in open bush and around the shores of lakes such as Rotorua and Waikaremoana. Today its glorious spring-time floral displays are almost a thing of the past. Browsing mammals... introduced by European settlers found the kaka beak's soft foliage so palatable that they have almost eliminated all natural populations of the plant... In an attempt to reverse the decline of this lovely native shrub, hundreds of plants are being cultivated in a cooperative programme between the D[oC] and the A[RC]'s Botanic Gardens in Manurewa. Eventually they will be... reintroduced into selected natural habitats, mainly off-shore islands, which are no longer threatened by browsers. Many of the plants have been propagated from seed stock that originated from a few wild plants on Moturemu Island in the Kaipara Harbour. It is feared that the last survivors there may now have been shaded out and smothered by both native and exotic plants. The cultivated progeny are therefore doubly valuable in preserving some wild genetic material that might otherwise have been lost and in providing a resource to restock Moturemu... It has been fortunate for the kaka beak's survival that it can be grown easily from seed and its cultivation as an ornamental garden shrub... [– it became a] popular flowering shrub... in England[(b]y the early 1800s it was already listed in the garden catalogues of English nurseries[)]... – ...will... help... preserve some of the genetic diversity. [Editor's note: 'gardening is Britain's leading pastime – Brits spend £3 billion a year on their gardens'.]

...Instant colour is the new-age way to gardening, whether it is a full-on bedding scheme, enhancing... those perennial beds which are past their flowering peak... an entrance, edging... border... patio, poolside or deck... filling a container or hanging basket... These days, with lifestyles placing more and more demands on time, the benefit of instant colour... has become appreciated by many gardeners with busy schedules... Now it's all been made easy because, in any season, you can get a ready-made garden colour scheme in pots. All the work has been done: seed selection, sowing, pricking-out, growing-on, flowering. There are no... disappointments, and the effect is immediate... When planting hanging baskets to provide instant colour it is important to be able to select plants with similar flowering times, thus avoiding empty spaces. Retailers should be able to provide this information... The field days associated with seed company trials, and those conducted by the Auckland Botanic Gardens, allow a check on the performance of proven cultivars as well as the chance to find something new and interesting... [■ G]reen-fingered... thieves have struck again at Eden Garden, forcing the historic public attraction to review its security. Camellias, azaleas, pongas and king ferns were removed... [The person] who manages the garden, said the weekend discovery meant upgraded security measures – possibly cameras – would be installed soon.

...*Garden of Eden revisited* OUT of the dirt-poor, half-dead moonscape that is Cornish clay country, an enchanted garden is coming to life. It will house desert and rainforest all under one colossal roof and more than 10,000 species of plants will bury their roots into Britain to form a unique botanical garden... [A] fabulous, modernistic greenhouse... will rise out of a dying clay pit at Bodvelva by the sea, bringing new life to a landscape that [humanity] has all but sucked dry. "Pure and simple, this is a production dreamed up by a few eccentrics who decided to have a go," said... one of the project's founders[– who] compares the Eden Project to an Eiffel Tower or a Sydney Opera House and conjures up exotic visions of the world's plants, be they Malaysian mango or Cuban palm, jostling for space in sleepy south-west England. "Our generation did a lot to screw up the planet and we wanted, in a small way, to turn it around. So one night we dreamed up the biggest greenhouse in the world and decided to make it an icon... This little institution isn't going to change the world but it can perhaps be a catalyst." Others go even further... a former record producer and song-writer who is heading the \$265.8 million Eden Project, calls it "the eighth wonder of the world". His "wonder" is a spectacular 14ha effort to map [humanity]'s relationship with plants and the way [humanity] has built civilisations on the back of things that grow. Part government-funded, construction starts early next year and is due to take two years. Some 750,000 visitors are expected annually in a region with crippling unemployment and scant hope for new beginnings, let alone "green" ones, as coal pits shut. Soaring 70m high and stretching 4ha across, Eden will contain distinct biomes, or climatic zones, all joined by aerial walkways so visitors can survey the world's bio-diversity from on high... Four geographical zones are planned: Amazonian, south-east Asian, West African and Australasian.

...FRENCH presidents are renowned for their love of "grands travaux" – grandiose building projects... [One] is remembered for the futuristic arts centre that bears his name... [Another] erected the glass Louvre pyramid. But [the former president] who left office under a cloud of scandal in 1981, plans to outdo them all... Not everyone in the Auvergne, where [the former president] leads the regional council and is a local MP, shares his enthusiasm for the expensive project, a theme park called Vulcania complete with a giant concrete model of a volcano that can simulate eruptions. The intrusion of bulldozers to start scouring out a volcano "crater" has caused fierce criticism. The Auvergne National Park boasts a chain of real but, mercifully, dormant volcanoes known as the Puy-du-Dome and critics wonder why... [anyone] should want to build a model one. Environmentalists say the theme park, expected to cost about \$NZ105 million provided mostly from public funds, will wreck a pristine region popular with ramblers drawn to its magnificent scenery. But [the former president] (71) sees in Vulcania a magnet for more tourists... Most of the park will be underground. A vast auditorium will recreate volcanic explosions through sound, vision and smell. Infrared lights will drive up the temperature and tourists will feel the earth move under their feet... [One critic] is unimpressed. "Even if most of the exhibits are underground, Vulcania will still mean more car parks, new roads and new hotels. Look how we've destroyed other areas of natural beauty in France, like the

Cote d'Azur..." [The critic] and fellow activists managed to delay the project for two years by arguing in court that under the local planning laws the area was a protected zone. But the court has ruled in the council's favour. [The former president], having secured a grant of \$NZ17.5 m... from the European Union, has not wasted any time calling in the bulldozers. [The]Environment Minister... a member of the Green Party, had asked for the project to be reviewed. [The minister] wanted a report from a hydrologist, arguing subterranean building work could affect the water table – the Auvergne boasts dozens of underground thermal springs which produce natural spas and mineral water that is bottled and sold. However, the local council is dismissive of such risks. It believes now is the time to market the region's volcanic landscape and cash in on an increase in public interest after the release of two Hollywood volcano disaster films. What angers protesters is a suspicion the project has more to do with promoting [the former president]'s glory than boosting regional tourism. [The former president] has long feared his legacy will be overshadowed by that of [his successor], who ended up inaugurating a number of "grands travaux" initiated under [his presidency] in the late 1970s.

...A book promoting the protection of natural landforms was launched yesterday against the ominous noise of an earth-mover working above one of Auckland's most important cliffs... [The] author of *Precious Land*, spoke over the growl of the machine at the launch held in front of the Eastern Beach anticline. The anticline, a giant fold formed 15 to 17 million years ago when the Auckland region was uplifted from the sea, is visible in the 20-million-year-old layered rocks in the cliff face at the northern end of Eastern Beach... Geologists regard it as the best example of its kind in Auckland visible in three dimensions... The earth-mover's presence was coincidental but a reminder... that the anticline is not protected... [The author] told the... 30 or so at the launch... that to many N[Z]ers conservation meant protecting remaining forests and endangered birds. But conservation included all aspects of preserving natural and human heritage... Although many spectacular landforms were protected in national parks and scenic reserves, and areas such as Auckland's volcanic field and Rotorua's geothermal field appeared on international lists of important earth science sites... protection... of natural landforms and geological features was a neglected area of conservation... Geysers and mud pools were under threat of geothermal exploitation, exotic forests threatened sand dune systems and landscapes were being flattened for subdivision... Their preservation was desirable for research and education, for their aesthetic values and for recreational and tourism benefits. "It is often claimed that it is N[Z]'s clean green image that attracts more than a million tourists to our shores each year... This is not true. In reality it is our rich heritage of spectacular and diverse landforms that attract them for we have without doubt the most varied and inspiring landscape of any place of similar size in the world." ...[the author] said it was fortunate that the... anticline had not been ruined by erosion protection barriers[and the author hoped it] would gain protection in the Manukau City Council district plan. Through Lottery Grants Board funding, copies of *Precious Land* have been sent to every secondary school to foster an awareness of how unique Earth is...

[Its] tiny inhabitants... make a bushy enclave in West Auckland unique. A staggering 120 native snail species live in the Atkinson Reserve near Titirangi Beach. A snail enthusiast and specialist... says up to 30 species a square foot are found in the bush-clad gully, making it an ecological gem. "People overseas just can't believe it – there's nowhere in the world that has so many species in such a small area,"... But the remarkable, and so far unexplained, preponderance of snails was under threat from exotic plants migrating from neighbouring gardens. Hydrangeas, honeysuckle and agapanthas bloomed on the forest fringe and wild ginger was taking hold further in. The greatest threat came from the wandering jew creeper as it spread like a thick carpet across the forest floor smothering all life beneath it. The dank, mulch-rich floor [is what supports] the vast majority of the native snails, many of which were no more than 1mm... long. [The enthusiast] said it was imperative that the reserve be conserved intact. "It's just the sort of reserve that could disappear through neglect. It has deteriorated a lot in the years I've been coming here. These little snails don't adapt to gardens – once the bush is gone, they're gone." The Waitakere Ranges Protection Society shares... [his] view and is moving to have the reserve surveyed, monitored and properly managed... [In international news, t]housands of monkeys forced out of forest near the Indian capital have swamped the city. Large groups of monkeys have invaded New Delhi's residential and work areas... [The m]onkeys run riot... officials say.

...A new \$3 million enclosure at Auckland Zoo could open minus many of its promised star attractions... The 6ha Pridelands enclosure – billed as a no-bars compound closely resembling natural habitats – was to feature a wide range of African species when it opened at the end of this year. But a Ministry of Agriculture ban on exotic animals coming into the country while import health standards are reviewed has hindered the zoo's plans to import three lions, two rhinoceroses and a flock of flamingos. The snag follows a \$600,000 shortfall in funds which has delayed work on the baboon and hippopotamus sections of the... enclosure until next year. A director... said the shortfall was the result of the zoo's being too ambitious as to how much of the project – a major redevelopment of a third of the zoo's area – could be completed in one year. On top of the embarrassing gaps in the enclosure, the ministry decision had the potential to damage the zoo's international reputation by jeopardising conservation projects, [the director] said. Such breeding programmes depended for their success on the zoo's being able to import and export animals to ensure genetic diversity. The ministry yesterday defended the move... [but] would try to make the zoo's applications a top priority. However, the process could be long because it included public consultation and compliance checks with countries of origin. Pridelands was to have as its centrepiece the country's only breeding lions, imported from South Africa. The zoo's own lions could not be used for breeding and were not destined for the enclosure. [The director] said that... Pridelands would open as planned... [but just] feature... tortoise displays... giraffes, zebra, springbok... and... one rhinoceros...

Save the rhino, kill the people WE found them deep in the Burmese jungle, east of the Tenasserim River. About 2000 of them, hungry, exhausted and fearing for their lives. They have no money, no change of clothes and they eat what food they find. They sleep under palm leaves propped teepee-style against the trees... [One of them knows they] will not be going home. [The 56-year-old] and thousands of the Karen ethnic group, a gentle, cultured and religious people, have been driven out of their homes by the Burmese Army. [The 56-year-old] also knows that in a strange way [they are lucky because they] made it to the jungle, starving and homeless but alive. Some 2000 people, including [the 56-year-old]'s brother, a father-of-six, have been murdered in the two months since the Army launched its offensive to crush the Karen, according to human rights groups which base their evidence on independent research, including hundreds of eye-witness accounts. Tens of thousands have been forced to work, unpaid and unfed, building roads and railways, and 30,000 have fled into the jungle or across the border to Thailand. Why? Because the Burmese Army is clearing the... area... [of] villages... to make way for the biggest nature reserve of its kind in the world. Dwarfing the Masai Mara and the Serengeti, it is home to rare flora and fauna, tigers, elephants and the Sumatran rhinoceros. It will attract millions of tourists. Most importantly, it will be a sign to the world that Burma, shunned because of its appalling human rights record, cares about endangered wildlife and the environment. All the Rangoon government needed was a few major international conservation organisations to turn a blind eye to atrocities committed against an irksome ethnic minority. It got them from the top drawer of wildlife protection: the New York-based World Conservation Society and the Smithsonian Institution in Washington. It also claimed to have "an open channel of communication with the World Wide Fund for Nature International... [A]fter our dispiriting trek into the jungle, we made for Rangoon to see if a minister would talk about the project and the role of those conservation giants... [We were u]shered into a spartan office... [in t]he two-storey Forestry Ministry[, which] is part of a complex of ministries run by the State Law and Order Restoration Council... where two senior Ministry figures received us with a mixture of scepticism and delight that respectable British scientists were interested in their "big idea." ...[the] adviser to the Forestry Minister, boasted of Slorc's plans to establish a "unique" million-hectare "biosphere," the Myinmoletkat Nature Reserve, in the Karen area, one of the semi-independent regions set up just before Britain pulled out of Burma in 1948. "We hope the reserve will win world heritage status," [the adviser] enthuses. The reserve would also encompass a section of a gas pipeline being constructed by... forced labour... [for] Total and Unocal, the French and American oil companies, which signed deals with the Burmese to pump gas from the Andaman Sea in the west to Thailand, in the east... [The adviser] tells us of another project, the Lanbi Island Marine National Park, off the southern Burmese coast. Coral islands would be transformed into an "eco-tourism

venture” in the first stage of a grand plan to open the 320km Mergui archipelago to mass tourism and scientific study. The... WCS... and the Smithsonian... are helping to run both projects, says his colleague... The WCS and the Smithsonian are the first non-governmental groups to have worked with the SLORC since the Rangoon massacre of 1988, when 3000 demonstrators were killed by police and troops during riots which led to the ousting of [the then] President... Later that day we... asked if we could visit the new sites, [but] were told: “I’m afraid that will not be possible at the moment. You must be aware we have problems in this area. There is a large security operation going on. Mopping up must finish before anything else can begin.” Mopping up. That phrase appears frequently in Burma’s state-controlled press. It refers to the forced removal of “troublesome elements.” ...This contempt for human life was not evident last September at the launch ceremony for the Myinmoletkat Nature Reserve, held in Rangoon... [The] Director-General of Forestry, assured guests that the welfare of local inhabitants would be paramount. Not only would rare species be protected but the lives of the rural poor would be improved... [One of the rural poor was] taken from his village near the coastal town of Tavoy and sent to a labour camp where conscripts were forced to build a railway running north to the town of Ye. After 17 people died from malaria, three of his friends tried to escape. They were caught, forced to dig their own graves and then executed. “The soldiers buried the dead bodies but left the legs and hands exposed; nobody tried to escape after that,”... In a village south of the Total pipeline... a... 34[-year-old]... mother of seven, told how [girls] were raped by soldiers guarding forced labour projects. “...one of the girls[... who] was just 15 years old... was raped so many times [it] died...” ...The slaughter of the innocents goes on, but the conservation groups are winning the battle with their conscience... [The] science director at the WCS... says: “We do not sanction forced relocation, torture or killings. But we have no control over the government. We are in Burma because it is one of the highest biodiversity countries in Asia... [and we] are focused on... conservation... We can walk away from it, but that wouldn’t do any good for anybody...” A spokes[person] for the Smithsonian... says: “We are there to do important conservation work. We may disagree with a regime but it is not our place to challenge it.” ...[the] director of WWF in Britain, says... “Sometimes we have to deal with repulsive regimes... We have to weigh up whether the conservation benefit is worth the risk of being seen, directly or indirectly, to be supporting those regimes.”

...[the] mountain gorilla – once there were thousands, now perhaps some 350 survive. In their tropical Eden gorillas lead a carefree, unhurried life, with alternating periods of feeding and rest. They live in remarkably stable family groups ranging from 5 to as many as 30 individuals. All follow the undisputed leadership of the dominant silverback, so named because his back has turned white with age. We’re at once attracted and repelled by the great beast which is so like ourselves. Yet, after untold centuries as master of his domain, today the gorilla may be doomed. In the most densely populated country on the African continent, the farmer’s hoe may prove as lethal as the poacher’s gun. Farms already stretch to the very edge of the park and the pressure of human population steadily grows. Tourist dollars may help. But, although tourism has increased park revenues more than 100% in one year alone, the future of the mountain gorilla is by no means secure. “Their future will probably be decided within the next 10 years, but much of the future of the gorillas will depend on Rwandans. It’s their treasure, their park, their land.” “By knowing more about gorillas, about their intelligence, how sensitive they are, how perceptive they are, we can hope to convey the importance of saving gorillas as a species to people who are living with them and are competing with them. If they realise how similar to humans they are perhaps conservation efforts will be enhanced.” For many Rwandans, the first step towards caring is learning that the gorilla exists at all. “Hopefully through education that will change, but for the moment saving the gorilla is not a driving concern for the average Rwandan.” Awareness and understanding – will they be enough to stem the tide, or is the gorilla, like so many species before him, destined to vanish from Earth for all time? “It’s hard to imagine what Rwandans are going to do. We’d like to be able to convince them these animals are extraordinary and it’s such a unique treasure they have here that they also should value them – but that’s going to take a long time.” “The sad point is that there is no guarantee the wild population has any future at all. They’re totally at the political whims of whatever country they’re in.” “I’m alarmed, but it’s not contagious. I wish I had a greater gift so I could alarm millions of people, but they sail on unconcerned. What can you do with such apathy, such lack of imagination?” “If there is political stability in west Africa then we could siphon zoo gorillas back to the land we stole from them. That is the dream of every responsible zoo director or owner – who must dream that his human descendants will one day organise the rehabilitation of gorillas, or any other animal, to their own land. So there is a grand design, a purpose. I hope it isn’t a romantic dream. I think it might happen. It’s a long shot, and a long shot is better than no shot.”]

...It’s time we ended zoos, says Kiwi bear campaigner... Zoos have served an excellent purpose but their time is up, says a Hunterville farmer about to embark on another mission to help make better lives for endangered animals... “In my mother’s time it would have been impossible for her to see an elephant, for instance, and to appreciate them, if it were not for zoos or circuses. Nowadays, with so much excellent natural history on television and available on video, there is just no excuse for keeping animals in zoos...” ...[However, the farmer] accepts that some good work is being done in preserving endangered birds by having eggs laid in captivity hatched in the wild... [The farmer says it] is not an animal idealist, just a hands-on worker who [occasionally] gets called in... to help the World Society for the Protection of Animals. One of its projects is to get captive bears back into something that resembles their natural habitat, and [the farmer] is the society’s expert in building semi-wild sanctuaries for them... [The farmer] left last night for Ecuador where [it] will build a sanctuary for native spectacle bears confiscated from or handed over by owners who have kept them as pets. Spectacle bears are an endangered species which... is further threatened by a rapidly increasing demand by Asians for... so-called ma[sculine] potency “medicines.” ...the demand is driven by increasing wealth in Asian countries, and supported by the ease of international communications. While [the farmer] was in Ecuador recently on a pilot project for the sanctuary, some of the local people who worked with him received offers from Asian traders for live bears... [The farmer] has had to negotiate with Government agencies – and may have to do that again since the Government in Ecuador has changed – and learn to deal with local bureaucracies and people with difficult work ethics. [The farmer says it] is getting used to that after having built sanctuaries in Turkey and Thailand, the first to liberate dancing bears, and the second to liberate pets and bears headed for restaurants... There is a lot more work ahead of him. The society has had requests for bear sanctuaries in India, Pakistan, Bulgaria, Romania, and Georgia... The society sees the sanctuaries as halfway houses for formerly captive animals. If they adapt to life in the semi-wild they may be released into their native wilderness, and certainly all offspring will be... [By the way, s]cientists have hailed the birth of [a] baby panda as a sign of progress towards saving the endangered species, but warn that the animal could still be extinct in 100 years. “Bringing up pandas in captivity is very difficult,” said... [the] director of the Chengdu Research Base where the panda, whose twin died on delivery, was born as the result of artificial insemination. Rearing a cub is a constant battle because its dependence on its mother’s milk means it cannot be hand-reared.

...Let’s suppose a private company decided to get into the business of species conservation. It would need a suitable habitat[... so efforts]... would be made to acquire only that habitat crucial to the species’ survival... Simply buying the land is not sufficient. For one thing, exotic pests may invade the sanctuary and threaten the wildlife. So the firm would develop a barrier to keep the vermin out. The wildlife within the sanctuary are, after all, an important economic asset. To enhance the build-up of numbers, the sanctuary would be rehabilitated. Exotic pests would be gradually eliminated. Native plants would be planted and rare wildlife reintroduced. Captive breeding programmes to accelerate growth in wildlife numbers would be implemented... As the populations in the sanctuary build up, the surplus is removed for introduction into other reserves or facilities overseas. Faced with mounting success, the firm eventually becomes publicly listed. It raises capital for further sanctuaries through share offers. This in fact is no hypothetical firm. It exists: it is Earth Sanctuaries Ltd and is based in A[US]. The economic value of the wildlife it protects in turn spurs it to invest in those species’ survival. Earth Sanctuaries is the most successful breeder of platypus in A[US]. To protect its investment in wildlife hundreds of kilometres of fox and cat-proof fence are built around their sanctuaries. Rare A[US]n species are making a comeback within these sanctuaries at a rate not matched in national parks or zoos.

...*Global zoo getting fuller all the time...* More new species of mammal are being discovered than ever before, according to the latest edition of the definitive *Mammal Species of the World*. That's partly because more resources, and more effort, are being put into finding them, and partly because the introduction of improved techniques means classification has become more refined. Since 1758 when the biologist Linnaeus established a classification system, about 1.4 million living species have been discovered and described. Until recently it was held that most mammals were already known, but over the past decade more than 450 new species have been recognised, bringing the total to around 4600. Considering that 15 new mammals have been found in the Philippines alone in the last 15 years, biologists now estimate that the total could run to 8000. Among the discoveries is the Panay cloudrunner, a grey rodent that resembles a fox squirrel... the extraordinary looking soala... and... a deer... that barks when it gets excited... Scientists believe that a large ox discovered... in the Anamites, a mountainous area on the border between Laos and Vietnam... may be a primitive link to today's cattle... Since most mammals are rodents or bats they make up the majority of new discoveries, but new primates have also been found. A dwarf marmoset with a koala-like face is one of seven small primates discovered since 1990 in Brazil... Not a year goes by without the discovery of thousands of new species, whether in remote jungle or in the potted plant of a Washington DC office – where a new species of ant was discovered a few years ago. The discoveries are important beyond the study of mammology. A creature may host a community of parasites unknown to science... But many of the new species are under threat of extinction. Last year a U[N] report classed one-quarter of the planet's mammals as critically endangered or vulnerable. In some cases, the publicity that new discoveries generate has increased awareness of the need for conserving natural habitats. Both Laos and Vietnam set aside precious tracts of forest in the Anamites after the soala and barking deer were found, but they still may not survive hunting by locals. The worry for biologists is that the rate of extinction of even known species far exceeds the pace of their discoveries, and whatever benefits they bring to conservation cannot come fast enough. And the allocation of scarce conservation resources is a source of frustration... [A] mammologist at the W[CS] in New York who co-discovered the soala, notes that America is spending billions of dollars in the search for extraterrestrial life. "I'm surprised to see people get so wildly excited about a possible bacterium on Mars when our own planet is crawling with undiscovered species."

...[*You can own a species* BOFFINS are offering an ultimate ego-trip – to name a species after you. Biopat, a conservation charity, will put your name on a newly discovered species for \$5000. Frogs, insects, plants and marine animals are all up for grabs and donors will get a certificate and a photo of their species. Biopat is offering the service on its website and the money is being used to help biologists find more species and protect them. Only about 10% of the species on earth have been identified. While about 10,000 a year are found, 15,000 a year are wiped out.' ● A sausage-sized stick insect believed to have died out 83 years ago has been rediscovered living on a rock in the Pacific Ocean. Scientists found three Lord Howe stick insects, which they likened to "walking sausages", after scrambling up a cliff in the dark on Balls Pyramid, a volcanic rock 23km from Lord Howe Island. For thousands of years, the remote island was home to only one mammal species – a bat – and two species of reptile. The nocturnal insect evolved into a 15cm-long, 1.5cm thick wingless giant because it had no predators. But the insect known locally as the "land lobster" became extinct after rats colonised the island from a shipwreck in 1918. Rumoured sightings of sausage-shaped carcasses by rock climbers on Balls Pyramid in the 1960s encouraged the latest expedition by AUSn scientists, who found the three specimens of Phasmid dryococelus australis feasting on tea-tree leaves. The scientists, who also found a number of eggs, believe there could be just 10 adults surviving on the desolate rock. They hope to re-establish a breeding colony on Lord Howe Island. The island, home to dozens of unique species, is thought to have been untouched by humankind until European navigators settled there in 1834. The invasion of rats in 1918 led to the disappearance of five endemic bird species. A bounty of 6d per rat was introduced to encourage residents to kill them. After 20,000 corpses were collected, it was discovered that locals had been breeding rats to earn themselves a steady income. Today, the fragile island is home to 300 permanent residents, while only 400 visitors are allowed at a time. The island's Lord Howe woodhen was recently saved from near extinction by a captive breeding programme.']

...*Eye in the sky watches out for wildlife...* Peregrine falcons in Greenland, Oryx antelopes in New Mexico and white-faced ibis in Nevada have found a new friend and protector. Under a programme that says as much about the changing role of the military as about public pressure to defend wildlife as vigorously as humankind, the U[S] Department of Defence is using its web of orbiting satellites to track endangered species. Using a new generation of miniature transmitters, [US] conservationists can shadow migrating animals wherever they go. They have welcomed the Pentagon's eagerness to adapt military technology to assist their studies. Controlling nearly 10 million hectares of fish and wildlife habitat, the U[S] military oversees the homes of 100 threatened species and is establishing natural resource programmes at all of its domestic bases, many of which are in national conservation areas... [The US] Army scientist overseeing the project, says: "This system serves as a crystal ball that allows you to peer into remote places and the hidden behaviours of virtually any creature in the wild." By tracking a single peregrine, researchers can also keep track of the bird's prey. That information can be passed on to military aviators so they have a better chance of avoiding collisions with birds. The programme has not only introduced an element of concern for wildlife when and where the military conduct training manoeuvres – earlier this year a Navy gunnery range in the Atlantic was moved when... found to be in the path of migrating whales – but has helped biologists to explain a decline in wildlife populations. In 1995, for instance, researchers tracked 12 Swainson's hawks from their roosts in California to the Pampas of Argentina. When they visited the nesting areas pinpointed by the satellite data, they found thousands of dead birds, all poisoned by eating pesticides used to kill grasshoppers[('British wildlife experts are mourning the loss of Kerry the goose after tracking him by satellite all the way from Ireland to an Eskimo's kitchen in Arctic Canada – Kerry had safely completed the arduous 7240km journey, only to be shot by a hunter; Kerry was found by researchers who tracked the beeps from a transmitter on his back to the Eskimo's home – they were led to a freezer, where Kerry lay, still wearing his \$10,000 electronic tracker')]. Since then, an international rescue effort has helped the hawks recover their numbers. "The technology really saved that species,"...

FOR THE SO-CALLED "LOST" TRIBES WHO LIVE DEEP IN THE world's rain forests, it's better to be lost and alive than found and decimated by outsiders bent on exploiting the forest – and destroying their homes and way of life in the process. But such is the fate of many forest-dwellers in the Amazon region, Malaysia, Indonesia and elsewhere. There are few, if any, truly lost tribes anymore, says [a spokesper]son of the London office of Survival, which campaigns for tribal people's rights around the world. Acknowledging that there could be as-yet-undiscovered groups in extremely remote areas like western Papua-New Guinea, [the spokesper]son says most tribes today know about the wider world, even if they want nothing to do with it. S[urvival] favors the terms "isolated" and "uncontacted" for these groups because "their whereabouts, or their existence, is known, but... they have no sustained contact with the outside world." In such cases... "the only means of knowing about them is through reports" from people who may trade with them. One of these isolated tribes, and the latest to be "contacted"... is the Korubo, who live in the remote Javari Valley in western Brazil, close to the Peruvian and Colombian borders. Although the Korubo's existence has been known since 1973, it was only in October 1996 that representatives of the Brazilian government's National Indian Foundation (FUNAI) made contact with perhaps 20 of an estimated 200 to 300 Korubo people. Several previous attempts to contact these semi-nomadic hunter-gatherers, who live along the Itacoai River in Amazonas state, resulted in clashes in which nine FUNAI agents and an unknown number of Korubo were killed. "It became apparent... that there would be more and more conflict between the Korubo and loggers" who were moving closer to their territory. That situation, regarded by FUNAI as a serious threat to an isolated people, prompted officials to again seek to make contact, and to set up a post at the confluence of the Itacoai and Itui Rivers, where the Korubo could go for assistance and medical care... [Survival and] FUNAI's Department of Isolated Indians, speculate that the contact attempt worked this time because illegal mahogany loggers had probably killed some Korubo, who realized they needed allies. The keys to the contact were shiny and made of metal: machetes and aluminium cooking pots... While [Survival] regards the pots-and-

machetes approach as “paternalistic” and fostering dependence, [its spokesperson] acknowledges that the Korubo case is complicated. “It is certainly true that these people are under threat... If you look at the catalogue of encounters, the Indians don’t really stand a chance against guns and the people coming in from the outside... They know that in the past white people have killed them. So they’re very much on the defensive.” The future of the Korubo and other tribes – like that of the rain forests themselves... [(r)ain forests account for 6% of Earth’s land area – and 1% of that is lost every year[])]... – remains precarious. For the people and the forests alike, the message seems to be the same: adapt or die.

...no fish were lost... – but... six visitors... suffered cuts from the glass and shock... wh[en a]... glass tank full of marine life cracked open at Sydney Aquarium yesterday, spilling 12,000 litres of seawater... An ambulance spokes[person] said two of the injured were taken to Royal Prince Alfred Hospital, while a third went to Sydney Hospital. The others were treated at the scene. Sydney Aquarium did not say what type of marine life inhabited the tank, which... was specially armoured. “This tank has been in place and working successfully since it was installed over six years ago,” it said in a statement. The aquarium was investigating the cause of the fracture and said the complex would be open for business as usual today.

...*Scuba shops warned after faulty tank tragedy*... Dive shops have been issued a shuddering warning after a police probe into the death of a young scuba diver. Police began investigations when scientists pinpointed a corrosion build-up as the reason the 24-year-old was starved of oxygen during his fatal underwater hunt for crayfish. Inquiries failed to identify who was responsible for the mistake which resulted in 2.4 litres of sea water seeping into the [24-year-old]’s dive tank, leading to a fatal chemical reaction... [while the 24-year-old was] diving in the Manukau Harbour with a friend on December 27 last year... [Peter] Massey had bought the aluminium cylinder from a dive shop three weeks earlier. It had undergone a full commercial test and was passed... Following Mr Massey’s inquest, the Underwater Association... [said it conducted] regular safety audits of filling and testing stations... The only wish of the grieving parents... is that other families be saved the trauma they have been through... ● A... first-time [skydiver] died after his... parachute... failed to open during a jump at Parakai, north-west of Auckland, yesterday. A N[Z] Parachuting Federation investigator... said the 22-year-old... was making his first static line jump from 3000ft when his main chute failed to open correctly. The [22-year-old] activated his reserve chute, but... was at too low an altitude for it to fully inflate. His name was being withheld by the police until relatives could be contacted... [I]nquiries would focus on why the [22-year-old] failed to follow the safety procedures taught on the Parakai Parachute Centre course [it had] attended with 12 other novice jumpers. Three of his fellow learners who jumped from the same flight landed safely... The [22-year-old] was the third parachutist to die [in NZ] this year. Two [guys] were killed in a tandem parachute accident at Taupo [last month]...

Skydivers defend sport’s safety... The N[Z] Parachuting Federation is confident that safety standards in the parachuting industry are sufficient, despite three deaths in almost as many weeks... [The federation’s] technical director, said the deaths... [– t]he first since 1991... [–] were a coincidence... “The whole thing has to be put into perspective... It’s too short a time to see this as a trend...” Operators had to join the federation, a self-governing body, before they could practice, and had to be fully qualified and equipped... “It’s quite a detailed process. You can’t simply go out and buy a plane and take people up and push them out.” Parachute jump operators must have an instructor’s qualification as a minimum. Each parachuting company has a qualified chief safety officer, who is ultimately responsible for the equipment. The reserve parachute must be packed by a qualified technician and the main parachute must be packed by someone who has the approval of the chief safety officer. The companies have to conform to federation-approved operations manuals and to Occupational Safety and Health regulations. Novices doing a static jump get an average of four to six hours of training, and must be certified as competent and capable by an instructor before they jump... [The] owner-operator of the Wairarapa Parachute Centre in Masterton, said it was safer to jump out of a plane in a parachute than to drive a car. “We have had a bad run, but... [p]eople die on the roads every day. I’d rather be strapped to a parachute than sitting in my van right now.” But an Auckland[er]... who worked in the industry for six years claims the parachuting industry is not as safe as it is made out to be. The [Auckland]er, who did not want to be named... left the industry in part because [it] was concerned at unsafe practices. Jumpers were given a pat on the back and told, “You’ll be right,” but a lot of people went vacant when they jumped... “Six hours training is not actually that much. For some people it’s adequate, for others it’s not enough.” ...[yet] it was very rare that someone was refused a jump after the training session. [Furthermore, the federation] was a close circle of people “who fairly well all scratch each other’s backs.” [The Auckland]er suggested an independent body such as the Civil Aviation Authority should have jurisdiction over the industry. [The technical director], however, said that clubs belonging to the federation could not afford to have improper practices. “Otherwise they wouldn’t get many customers.” ...[the 22-year-old who] died on Sunday... [was Takanini resident] Gareth Norman Dunn...

[THE] NEW Sport and Recreation Minister... might think [it]’s on to a good number with his ministerial appointment. His predecessor... certainly enjoyed his time in the job. But [the new minister] should be warned there is growing anger in N[Z] that sport is not getting a fair deal from the Government. The Government’s vote for sport, fitness and leisure is \$4.8 million annually, according to a... briefing paper prepared for [the new minister] by the Department of Internal Affairs. That’s little more than Norman Kirk’s Labour Government gave to sport and recreation when it came into power 25 years ago. And back then the... dollar would buy 10 times what it does today. Admittedly, sport and recreation now benefits from the Lottery Grants Board. But this has nothing to do with money from the Government’s coffers. The... briefing paper... makes interesting reading. Here are some... facts from it: ● Sport and leisure in N[Z] pays \$300 million a year in taxes. ● Sport and leisure directly and indirectly contributes \$1648 million to N[Z]’s GDP. ● NZ’s... sport and leisure industry supports 22,745 jobs... When you consider [what] sport and leisure pays... in taxes... a year... the Government’s pay-back... is pathetic... [The consequence is that many of NZ]’s sports clubs are finding it more and more difficult to survive[, and]... sports’ coaches... are becoming a dying breed.

...*Reward for island coach with a mission*... 15 years ago [an Auckland]er opted for the laid-back lifestyle of Waiheke Island. It was an idyllic setting. But the sport... was purely social. “I was playing netball but wanted more than just a friendly game, so I pushed to get teams affiliated to the Auckland competition... I also started coaching, and things took off.” [The Auckland]er pitched in, at times coaching up to four netball teams and later, as it became fashionable, touch football. [The Auckland]er also finds time to play soccer and rugby league. As [the Auckland]er became more involved, [it] cajoled some of her senior netballers into coaching. “They are loving it. They really enjoy spending their time with the little [eight to 10-year-old] ones. In the past we had to rely on parents. Others were happy just to drop the kids off;”... Yesterday, the 34-year-old mother of three-year-old and 10-year-old sons had her part in the great Waiheke Island sporting revolution recognised at the launch of the Hillary Commission’s “Coaches Count” campaign at North Harbour Stadium. As part of a “thanks coach” message, [the 34-year-old and three others]... received plaques acknowledging their contributions to coaching – all in more than one sport... [The 34-year-old] also works part-time as the Auckland City Council’s events co-ordinator on the island... [where it] used to spend her school holidays... “When I returned to live here, crime was a problem... Kids had no direction when they were little... There are no gymnasiums, no malls, no McDonalds... [– so s]port is all young people have on Waiheke... Now we are finding more and more are involved in sport and want to stay involved.” The [Coaches Count campaign is] aimed at recruiting what the commission sees as an 80,000 shortfall in coaches in N[Z]... “There are more kids playing sport than we can cope with at the moment,” said [the commission’s] chief executive... “We need coaches to be there for them or we risk losing them.”

...The latest Sports Medicine NZ survey, which has not yet been released, shows the further down the ranks you go, the lower quality of your medical care... “Most of the medical and physiotherapy support is directed at the top teams. If you’ve got a top player worth \$1.5 million, they’ll get the medical book thrown at them. But a third-grade social player can be injured just as badly, and needs just as much support as the top

players.” ...ACC[’s] injury prevention programme manager... said the lack of medical advice for lower grades means there’s a higher chance players will take the field when they’re carrying injuries. “There’s always pressure to play. It’s the way N[Zer]s are brought up. It’s considered brave to play on an injury regardless, and the more serious the injury, the more you play on, the more highly you’re regarded.” [The manager] said the survey highlights the need for more qualified sports first-aiders on the sports fields. [The manager]’d like to see coaches trained in the basics, so they know how to recognise common injuries and know when a player should be sidelined to prevent worse injuries. “ACC hopes to work with the rugby union, Sports Medicine N[Z], St John and the Red Cross to develop a recognised sports first aid course for coaches and club officials.”

...SUPER 12 rugby coaches can be forgiven for feeling a bit miffed as they watch their star players forced out for three weeks after taking a knock on the head. If they were coaching top soccer players, equestrians or cricketers there would be much more leeway over an early return to competition. In the past fortnight, three Super 12 stars have been sidelined with concussion... Rugby union, rugby league and amateur boxing are the only sports in N[Z] with hard and fast rules about concussion... So are [those three sports] being too inflexible? Or are the other sports not quite up with the play? Concussion, medical experts say, has to be taken seriously. If you’ve had a knock on the head, that means your brain has been bashed against the inside of your skull and you’ve already done at least minor damage. Get another knock, especially before you’ve recovered from the first, and you could be in real trouble. “A second concussion within one or two weeks of the first can damage the brain out of all proportion to the violence of the injury, so a severe head injury with permanent disability or even death can result from even a minor blow,” says... an international authority on the subject[, who] cites the case of Kevin Sharkey, an A[US]n league player who played in a major game 12 days after being mildly concussed. [Kevin] received a second knock, and although [Kevin] was unconscious for only seconds, after half an hour [Kevin] lapsed into a deep coma and died 22 hours later. That’s the sort of risk that sets the three-week rule, says [a]sports medicine senior lecturer and Olympic team manager... And although it’s frustrating for coaches and players, medical experts still can’t make general statements about how long it takes an individual to recover, because reactions to concussion vary so much... “There are times when people might not be normal after three weeks, even though there’s an expectation that after that period you’re back playing... Most young people recover fully six weeks after...” ...[the lecturer] believes soccer, and other sports like cricket, horse racing and equestrian events, should take the dangers of concussion more seriously. “There’s no difference between being hit by a high-speed cricket ball or falling off a horse, than being hit by someone’s knee or a head-high tackle... In fact, with cross-country events, in particular, I often think we look after the animals better than the athletes. We have vets there to make sure the horses are OK... – and if they’re in distress they’re off. But for the athletes, there’s quite a bit of anecdotal evidence of people having falls and being allowed to remount later in the day and compete.” ...Rugby union’s policy of a three-week stand-down after concussion has been in place since 1982. Even after three weeks, the player has to have a doctor’s clearance before returning to the field. Rugby league[’s]... policy on players who have been concussed more than once are... tighter than rugby’s, including a three strikes and... the player is out of the sport for good, unless they’re cleared by a neurologist or neurosurgeon.

...IT SOUNDS such an easy question: Which gives the best protection against concussion – headgear or a mouthguard? The somewhat surprising answer – a mouthguard – is backed by medical research and hard facts... NZ Rugby League[’s] medical panel chair[perso]n... says some of the proof came from the experiences of US gridiron players. “They tried everything inside their helmets – air bags, water bottles, gels – to try to cut the rate of concussion injuries. Nothing seemed to work. Then they brought in mouthguards and the number of cases reduced at once.” Mouthguards are now compulsory for league and union players aged 19 and under and next year they’ll be compulsory for all. Referees check boots. Now, there’s a mouthguard check as well. No guard, no play. ACC is helping league clubs buy mouthguards at a reasonable cost of around \$1.30. Union has also made bulk buying arrangements for its clubs. ACC[’s] injury prevention programme manager... says in rugby... many blows to the head come on the chin. “A mouthguard acts as a shock absorber. It dissipates the shock – actually breaks up the direct transmission – and significantly reduces the risk.” Mouthguards, however, are not a magic protector against concussion. Reducing the risk is not the same as removing it... Otago[’s] All Black winger... is a well-known mouthguard wearer, but [i]s still out of Super 12 rugby for the next fortnight after being concussed last weekend.

...THIRTY years ago, few would have thought that rugby could ever have striking similarities to American football[, but]... since turning professional, [rugby] has experienced a face change that few can deny. Its evolution is not dissimilar to that of gridiron... In the early days of ...[gridiron], players were dressed like today’s Super 12 and All Black players. Scantily padded, and with token head gear usually made only of leather, the gridiron players of the early century were hard [guys] whose more passive involvement in the sport meant the chances of injury were far less than today. Mind you, those early 1920s, ’30s and ’40s gridiron players participated in a milder, tamer version than today. But as gridiron grew into a full scale collision sport, where the hits were more frequent and much harsher, protective equipment for players improved to where now we see NFL players wearing shoulder, knee, hip, rib and elbow pads, neck braces, face masks and shock-absorbing helmets... Rugby today is a considerably faster, harder, tougher game played by [people] who, with few exceptions, are bigger, faster, stronger and more aggressive than at any time in the past. The result is that it now is potentially more dangerous... So what that rugby has... evol[ed] from a contact sport to... a collision sport, some... say? ...But unless the safety standards for players evolve to suit the speed and increased physical nature of the modern game, the attrition rate among players will escalate to alarming levels. It is noteworthy that players themselves are taking more care with their bodies than ever before. Many more today wear head gear than 10 or 20 years ago... Shoulder pads are increasingly popular too... It is not unrealistic to project that within five years, most players will be wearing head gear and shoulder pads as part of compulsory protective equipment standards... Some would have it that the more rugby players pad up to protect themselves, the more brutish and violent the sport will become. There is truth in that, but the incidence of injuries today suggests the sport has gone past the point of no return in terms of protection against potential injury.

...At least eight people died and three were left fighting for their lives after a light plane mounting an aerobatics display crashed into a Red Cross tent at an air show in the Belgian coastal town of Ostend yesterday. The pilot, named... as Captain Amr Hani Bilal of Jordan’s Royal Falcons aerobatics display team, was among those who died in the crash. The dead also included a French father and his 22-month-old daughter... All the others were Belgians... The victims died on impact, [the]... head of the special Disaster Victim Identification unit, said... Burning fuel from the plane then heavily charred their bodies, hampering identification... Scores of spectators were badly hurt when the Jordanian air force plane crashed during a solo display, raining debris on to the crowd and spraying people with burning kerosene. Th[e]... Belgian Interior Minister... who rushed to the scene, said the pilot appeared to have lost control of his plane... A Belgian aviation expert told Belgian BRTN radio the German-made Falcon Extra Type 300, purpose-built for aerobatics, had failed to pull out of a loop, which could point to mechanical failure. Alternatively, the pilot could have passed out during the series of loop manoeuvres which involve great strain on plane and pilot from the forces of gravity.

...A WHEELCHAIR-BOUND [perso]n has taken an amusement park to the Human Rights Commission after being stopped from riding on the corkscrew rollercoaster because of safety regulations. The management of Rainbows End, in south Auckland, said if the [disabled person] had been allowed on the ride, it would have risked a hefty fine from Occupational Safety and Health... Human Rights staff have interviewed park management and OSH[’s] amusement device registrar... to determine if the Human Rights Act has been breached. [A Human Rights Commission spokesperson]n... said a decision would not be known for some time. [The amusement park’s manag]er hoped a solution could be found soon, preferably allowing disabled people to enjoy the rides. OSH was concerned disabled people could be difficult to evacuate if the ride malfunctioned.

...At the tender age of four, [an Auckland]er “is sad with the whole wide world.” It has nothing to do with the death of a Princess on the other side of the globe – it is because his kindergarten’s slide was pulled down on Saturday morning. Asked yesterday why the play equipment at

Morningside Kindergarten... was so special, [the four-year-old] simply said: "I liked sliding on it." The kindergarten playground is one of dozens round the country that are deemed unsafe under new Ministry of Education regulations. Northland kindergartens report financial problems caused by having to remove some play equipment and build new structures that comply with the guidelines... The Waikato Free Kindergarten Association says that its financial resources are under strain because of constant safety checks. And the Auckland Kindergarten Association, which ordered the removal of the Morningside Kindergarten slide, may exceed its budget by \$300,000 because of the need to improve playgrounds. That does not appease Morningside's head teacher... who was given just 24 hours' notice about the removal of the slide[, which u]nder the new regulations... was too high... [The head teacher] was also angry that the association did not give parents a chance to lower the slide. The association president... defended the quick action, saying safety was paramount. "If there's a danger to our children, under the Health and Safety Act we must eliminate, minimise and isolate those dangers." ...But [the head teacher] said children had played safely on [the slide] for years... A member of the Devonport Kindergarten committee... said safety guidelines did not take into account that children at kindergartens were always supervised by qualified staff. In the meantime, the preschoolers at Morningside Kindergarten will be without a slide – until their parents can raise funds for a new one.

...The Auckland Kindergarten Association wants more of a say in the development of playground safety standards. The association... was holding discussions with the Minister of Education on the issue... [F]eedback from teachers and parents showed they were frustrated about ever-changing safety standards. "The long-term process is trying to influence the making of those regulations if they are not right for our circumstances,"... [The swings at] St James Kindergarten in Grey Lynn... were no longer in use... because the new standards required too much clear space... [P]arents raised \$10,000 for play equipment... "It is ridiculous that within two years of it being finished completely we are not allowed to use the swings."

...20 years ago [a NZer joined] his uncle's business which supplied children's rides. Over a span of two decades, [the nephew] has completely transformed the business, [turning it into] a world player in the design and manufacturing of plastic playground structures... [which] cost between \$US8000 and \$90,000... The huge sliding loops, tubular structures or roundish objects that look like they are meant for Mars may be child's play – but they have returned some \$2 million in export earnings... [The business] owes a lot of success to this – the ability to observe the safety standards applied to N[Z] playgrounds which laid the foundation for [it] to bring the same standard to the world. During his early years in business, [the nephew] quickly realised that the playgrounds at fastfood areas weren't ideal. In 1993, McDonald's was looking to upgrade its playgrounds. "We came up with the concept of Future Space. The objective was to have a safe, educationally challenging play structure that children can play in rather than play on,"... It was a... [deal] with Canadian plastic company SPI that enabled the [business] to realistically aim to supply an international fastfood company such as McDonalds. The Future Space – now a trademark – design went down well. In 1994, [the business] won the Creative Development Award from McDonald's International... [and] was the only non-American company recognised as a worldwide supplier for the fastfood chain. By year's end, [the business] will be the second-largest international supplier of McDonald's playgrounds. The company has quadrupled in size since 1993 and supplies its products to more than 28 different countries... This week, it won the Best Small Business Exporter of the Year award, organised by Tradenz... [S]ome of the basics guiding the manufacturing of these playgrounds do not... change... "The playgrounds have to be... cost-competitive, structurally sound... meet international safety standards worldwide... and... be... aesthetically inviting... for... children..."... [The nephew] takes great satisfaction in watching... children in Korea queue up to play in the playgrounds that... his team have developed... One of the key things which [the nephew] has learnt over the past five years is the necessity to be adaptable and to change. This is critical in helping him to deal with the idiosyncrasies within... other world markets. "The areas for the playgrounds [in many... Asian markets] are very restricted; we are having to design and build structures and develop space,"... In some parts of the world, the structural-soundness is more important than usual. [The business] has to ensure that the play structures can withstand the test of hurricanes and cyclones, among others. Attention to detail is another. In many of these playgrounds, it becomes too hot to play in, so some incorporate airconditioners as an integral part... N[Z] was a good place to manufacture plastic products as the industry did not have a high labour component[, but one]... challenge facing his company is making play structures so that they can be easily freighted around the world. Because of the unique nature of the playgrounds, the company has also, in a way, shaped the development of its suppliers' business. An example is to be found in the large pieces of plastic that are being churned out for the company to make its play structures. They require rotary moulding rather than the injection moulding process which is normally used for smaller products... One of his suppliers has built what [the nephew] believes is among the world's largest aluminium-cast moulds... In a pioneering effort, the company also worked with a supplier to produce plastic which is iridescent in colour... [The business] is already a main supplier of plastic components and parts to other plastic playground manufacturers. And... [it] is not about to stop there.

...there is increasing evidence of a link between a reduction in crime and participation in physical activity... [T]he University of Sheffield, England, ran a sports counselling course for young offenders and found the re-conviction rate was 56 percent. The rate for those who did not attend was 92 percent.

...*Sporting goods*... [accounted for just under a 10]%... share of recreational spending... [in the US in 1935 – a share that remained constant until 1972, when it began a gradual slide to be approximately 6% by 1991 (in comparison, spending on *films and light entertainment*... ha[s] gone from a peak of just under a 25% share of recreational spending in 1935 to be level with sporting goods spending by 1991; during the same period spending on *reading* has fallen from just under a 30% share to almost half that figure, while spending on *home entertainment* has risen from just over a 20% share to over 35%...]

USer[s] worry that the distribution of income is increasingly unequal... [and whether they're] better off than [they] used to be... Economists who plumb Government income statistics agree that [USer[s]'] incomes, as measured in inflation-adjusted dollars, have risen more slowly in the past two decades than in earlier times, and that some workers' real incomes have actually fallen. They also agree that, by almost any measure, income is distributed less equally than it used to be. Neither of those claims, however, sheds much light on whether living standards are rising or falling. This is because living standard is a highly amorphous concept... Less of a Luxury: The Rise of Recreation, is a recent paper by... an economist at the Massachusetts Institute of Technology, which looks at the living-standards debate from an unusual direction. Rather than worrying about cash incomes, [it investigates USer[s]'] recreational habits over the past century. [Her research] finds that... the... distribution of dollar incomes may have become more skewed in recent years, but leisure is more evenly spread than ever. [The economist] based her research on consumption surveys dating back as far as 1888. The industrial workers surveyed in that year spent, on average, [75%] of their incomes on food, shelter and clothing. Less than 2[%] of the average family's income was spent on leisure... Only the... [high]est-income families... could afford such extravagances as the theatre and concert performances, which were relatively more expensive than they are today. Since those days, leisure has steadily become less of a luxury. By 1991, the average household needed to devote only 38[%] of its income to the basic necessities, and was able to spend 6[%] on recreation... Much of the... changing structure of leisure spending... may be due to the fact that poorer [USer[s]'] have more time off than they used to. [USer[s]'] also have had an increasing number of recreational possibilities to choose from. At a time when many economists are pointing accusing fingers at technology for causing a widening inequality in the wages of skilled and unskilled workers, [their MIT associate]'s research gives it a much more egalitarian face. High earners have always been able to afford amusement. By lowering the price of entertainment, technology has improved the standard of living of those in the lower end of the income distribution. The implications of her results... are not watertight... [They] depend heavily upon what exactly is classed as a recreational expenditure. Reading is an example. This was the most popular leisure activity for work[ers]... in 1888, accounting for [25%] of all recreational spending. In 1991, reading took only 16[%] of the entertainment dollar. But Department of Labour expenditure surveys do not distinguish between the purchase of a mathematics tome and that of a best-selling novel... If

more money is being spent on textbooks and professional books now than in earlier years, this could make recreational spending appear stronger than it really is... Nonetheless, her broad conclusion seems fair. Recreation is more available to all and less dependent on income. On this measure at least, inequality of living standards has fallen. So why the pervasive feeling that people are worse off? One reason may be that while lower-income families now enjoy more leisure, technology has created new... activities... they may desire but cannot afford. Or maybe the greater variety and quality of entertainment options makes [USer]s value their free time more than they used to... making the feeling of over-work more onerous. When it comes to well-being, perceptions play a large role. People who spend more time and dollars on having fun do not necessarily enjoy life more.

...People often ask... where they might go to find adventure. But adventure is not something you... travel to find, it's something you take with you.

[If you're looking for adventure in a national park, don't take your mountain bike!] The Conservation Authority [has decided it] will not amend the general policy for national parks, which prohibits mountain biking. The authority chair[person was reported as saying]: "There are a great variety of tracks and natural areas where mountain biking is permitted in N[Z, so] national parks should not [need to be another] one of those places."

...Tired? Experts suggest going for a long run... This controversial treatment[- which] goes against much expert advice[- was]... devised by doctors at St Bartholomew's Hospital in London... [as] the answer to ME, also known as chronic fatigue syndrome[, after patients took part]... in a research project to find out if exercise would make them fitter, stronger and less tired. It did so - but critics claim it is unrepresentative and excluded severely affected patients... "Critics say the patients were unrepresentative without producing any evidence to prove it. These were not special patients. We screened 167 patients for the study and treated 66. Of the 47 who stayed the course, three-quarters rated themselves better after a year." The results suggest a quarter of Britain's estimated 250,000 sufferers would benefit from graded exercise... "We lose 10[%] of muscle power by staying in bed for a week. By three weeks, fitness or aerobic capacity falls by more than a quarter." ...ME charities fear [the critics] will reinforce the old idea that the ailment "is all in the mind." ...a 47-year-old freelance consultant in health and social services... [says the project] "totally transformed" her life... [The consultant] had ME for 10 years and at one time was unable to walk up the stairs after work - [instead, it] had to crawl. But after starting a graded exercise programme... [the consultant] now... swims 30 lengths... and... runs 3km... on alternate days.

... "There is nothing less attractive than a panting, middle-aged [guy] with knackered kneecaps pounding the pavements in shorts and sweatshirt under the misapprehension that [it] is getting fit, when all [it] is doing is accelerating the arrival of new hip joints and a triple bypass[", according to the] co-writer of the BBC sitcom *Are You Being Served?*

...Rates capped... The Mayor of Waitakere... is claiming... victory after his council... had "cut some things to the bone" to avoid raising... rates... in its annual plan. [Fo]r weeks... the council has... [been] considering projects suggested by ratepayers... "There'll be a number of community projects that we will not be able to take up this year," [the mayor] said. But... the \$7.7[m] Massey leisure centre near Westgate... [was o]ne project to survive the budget knife... The centre... which includes a community hall with a full-size indoor court... will cater for a fast-growing community of 46,000...

Northern Lifeguard Services has been left more than \$10,000 out of pocket ...[or] the professional guard season... after money anticipated from the North Shore City Council failed to come through. The council says the service did not ask for the money in the proper manner... [so] it would not repeat the \$10,000 it gave last year... "Hell, we are talking about lives here," the service's general manager... said yesterday... "The options are that we restrict the number of weeks we run pro-guards or we restrict the number of beaches that receive pro-guards..." ...the problem illustrated the frustrations the service faces in having to plead for money from councils each year... [■ If lifeguard services are restricted, that could encourage people to visit public swimming pools instead of beaches. However,] two surveys of public swimming pools... in Auckland[were recently published that showed a]... third of the[m]... failed to comply with chlorine levels... The surveys[, which] were done in June and... last... [month,] tested 75 swimming pools and 15 spa pools in 28 swimming complexes... A health protection officer... said the pools that failed chlorine tests would not sufficiently kill bacteria and disinfect the water... [In addition,] faecal coliforms were found in one in 10... pools[, which is a concern because]... public pools were supposed to have a contingency plan for cleaning excrement - usually after children had "accidents." "We shouldn't be finding faecal coliforms in a swimming pool because if they are there one can expect there will be viruses and other bacteria that can cause illness." ...The survey report said water quality was covered by a N[Z] standard but it was not mandatory. The survey covered almost all of the large public pools in the region but excluded school pools.

...Health officials on both sides of the Tasman have issued warnings of the possible spread of hepatitis A in spa pools. The alerts follow a report of A[US]'s first-known case... In the Melbourne outbreak, seven boys aged between 8 and 15 came down with hepatitis A after going for a spa at a party... The Victorian Human Services Department medical officer... said... "Whilst in the pool, 'whale spitting' was performed, in which mouthfuls of spa water were spat in a projectile fashion,"... Auckland health officials have investigated hepatitis A cases where transmission is thought to have come from spa pools... [but they said the AUSn] case served as a timely reminder about behaviour in spa pools and maintenance of them. People should keep their heads above the water. The A[US]n pool had been treated with hydrogen peroxide solution which inhibits microbial growth but would not be strong enough to kill bacteria or viral particles. Public pools must by law use stronger chemicals such as chlorine.

...In a case of coals to Newcastle... N[Z] scientists... are showing the A[US]ns how to create better surfing waves at Queensland's Surfers Paradise. The team, from the Centre of Excellence in Coastal Oceanography in Hamilton, is about to sign a contract to design an artificial reef to protect the... shoreline from erosion. But it was the scientists' skill in the waves that won them the job... [A] marine biologist with a love of surfing, said his team had mastered the art of building artificial reefs at just the right angle to create the perfect wave... [and] that after working on the project for nearly three years, [they] could create world-class surf at virtually any exposed beach with a decent swell. The reefs are built from enormous sandbags filled with sediment which can be moved, will not hurt any surfer who hits them and will create an ideal home for marine life... [H]is team of graduate students have put many hours of hard work into their studies - including as much time as possible in the water. [One team member]'s job was to study the wave peel at Raglan, while [another team member] examined the world's top surfing spots to determine the best gradient for reefs - an assignment which took him to A[US], Hawaii, California, Indonesia and Brazil. N[Z] surfers may also get a chance to use the team's waves... [- they've] been working with the Port of Gisborne on plans to create a reef on the city's doorstep, with waves to rival Waikiki.

...AN EXTREME white water event will see kayakers paddle over Taupo's Huka Falls. It's understood to be the first competition involving... the seven-metre waterfall. [The race's] organiser... expects criticism of the event, but both [the organiser] and the Taupo police confirmed it was not illegal to kayak the falls... In recent years there has been one death involving a kayak on this section of the Waikato River. The kayaker lost control above the waterfall... [However, w]ith five rides over the falls behind him, [the organiser] is adamant the frothing water is safe for experienced kayakers. [The organiser] said running the falls is no longer exceptional. "There is not quite the same karma around running Huka as there used to be... I know one person who did it eight times in the one day. In the last two years, Huka has been kayaked... [by] between 20 and 40 people..." ...[NZ] has a number of well-performed white water kayakers[- one of them] finished third at this year's world white water rodeo championships in Canada, while... [a 19-year-old who] is believed to be the youngest [perso]n to kayak the falls... filled a similar position in the 1995 event[)]... Apart from the risk factor, [the organiser] suspects critics may also suggest the event could encourage copycat attempts on the falls[- although]... the officer in charge of search and rescue for the Taupo police... did not have any problems with the event. "There have been comments in the past that it is not an appropriate waterway to kayak... I personally would not kayak it and I don't believe people who do so are wise, but if they have sufficient experience and take all the precautions, I don't believe it's the job of the police to say they can't. They are not breaking the law." [The officer] suggested it was only because Huka Falls was so well known that people reacted to kayakers making the run... [O]ther less-known, but

more dangerous stretches of water, would be kayaked and draw no comments... There will be stringent controls over who can enter the Huka race and there will also be strict safety controls. Water flow is an important factor in... safe[ty]... The flow can be as high as 280-300cu m a second, but... ECNZ would cut it to 50cu m for the event. "The lowest amount of water they can release is 30cu m... So it is almost down to its lowest."

...A Queenstown jetboat flipped in shallow water on the Shotover River yesterday afternoon, spilling its 10 passengers and briefly trapping the driver underneath... Passengers hurt were treated... [at] Lake District Hospital... and discharged. The boat was not badly damaged. The crash is being investigated by the Queenstown harbourmaster... The managing director of Kawarau Jet... said it was the first accident for the company in its 15 years... It was the second incident on Queenstown waters in recent days. A raft with seven people on board flipped on the Kawarau River... all were rescued uninjured.

...SOME local authorities are planning designated areas for jetskiers to safeguard other water users from danger this summer. The moves come after a teenager, charged with [hu]manslaughter after his jetski struck a kayak on Porirua Harbour killing Shaymaa Abood (16), will face a new trial after the initial jury failed to reach a verdict... Water Safety N[Z]'s chief executive... backed more designated areas, although promoting safety through education was also vital... Auckland Regional Council['s] marine officer... said a trial was planned in the Orakei Basin, near Bastion Point, to gauge noise levels before deciding whether to establish a jetski zone. About six potential sites were identified in recent years, although they were dropped after objections from residents about noise. Auckland experienced the most problems with jetskis – there are more than 5000 owned in the city compared with about 70 in Wellington. Wellington and Tauranga authorities are also considering adding to designated areas already provided.

...Authorities are moving to safeguard swimmers by luring speed-loving jetskiers away from popular beaches. Two trial jetski zones are proposed for the Waitemata Harbour, with slalom courses and "racetracks" established to encourage their use... and... bring the burgeoning sport under control... [– although the regional] council would not ban jetskis from other areas... Up to 6000 jetskis ply the region's waterways and about 30[%] of harbour-related complaints last year involved the machines. A [16-year-old] died in Wellington in March after a jetski ploughed through her kayak, and injury accidents are rising nationally... The president of the Auckland Jetsports Association... supported the move... "It is becoming a problem where everyone wants to get rid of us and we want to stay, so it comes down to who wants to give us a bit of beach,"... Jetskiers often liked to congregate and the zones would be well-used, [the president] said. The association also supported registration of machines and the use of speed radar – two other measures likely to be introduced. Registration would allow authorities to trace reckless riders and fine them.

...A radar speed gun is being tried on the Waitemata Harbour and Tamaki River by the A[RC] Harbour Patrol. The council's maritime coordinator and harbourmaster... said the gun should show boaters that it was serious about stopping offenders... Hauraki Gulf maritime agencies are [also] installing navigation lights in previously unlit waters as a safety measure for skippers of recreational craft. Solar-powered lights are being mounted on buoys in the Rangitoto, Motuihe and Tamaki River areas... in the upper Waitemata Harbour... and East Coast Bays... Ports of Auckland Ltd... will prepare the buoys, the... [ARC] will provide the lights[, which]... cost \$1000 each... and... Auckland Coastguard... will maintain the lights... About 80,000 recreational yachts and launches use Auckland coastal waters, with more boats joining the crowded waters each year.

...The A[RC] has asked Statistics N[Z] to include a question about boat ownership in the 2001 census to help to set safety standards... [for] the City of Sails... The council, using the 1981 census as a guide, believes there could be up to 100,000 boats – or one for every 10 people – in the area but wants more exact figures.

...A prominent boat designer says... lives could be saved if craft had to meet buoyancy and stability standards... [The retired Auckland] who spent nearly 50 years designing yachts and power boats... says the report into the capsizing of a Kaikoura Whale Watch boat, with the death of a Taiwanese tourist, highlights the need for safety regulations for all boats. "At the moment anyone can set up a business manufacturing boats and the public has no way of knowing whether they're safe,"... [120] people have drowned while using small boats in N[Z] waters between 1980 and 1996. A report by the Transport Accident Investigation Commission said that the Whale Watch boat Uruao capsized after... coming unstable when her buoyancy pontoons were ripped off. The Maritime Safety Authority says that it has checked all [of the country's] 12.6m craft like Uruao and found them sound in every respect and has reminded owners of the need for the highest standard of maintenance. But... the... [retiree said that m]any rigid-hull inflatable boats relied on their pontoons for stability... "If one of these pontoons is punctured it is like an aeroplane losing a wing." [The retiree] was also worried about the stability of many small open aluminium or fibreglass boats. Most were unstable with two or more people in them and sank quickly if swamped or capsized... [His] concerns are backed by the M[SA], which last year issued a marine notice warning about the instability of many small boats. The notice said that the buoyancy chambers fitted in many boats had drainage bungs which often leaked water. "This arrangement has caused a number of deaths," the notice said... [However, t]he Deputy Director of Maritime Safety... said that the authority did not intend setting buoyancy and stability regulations for recreational craft. I[nstead, i]t was... mounting a large public education campaign on the issue. The Boating Industries Association also rejects the idea of regulations, saying that voluntary codes are more effective. [The association's p]resident... said that the first voluntary code on small boat safety would be launched at a boat show in Auckland next week. The code would apply to N[Z]-built trailable power boats between 3.5m and 7.5m long and would not include buoyancy standards, [although the]... buoyancy issue would be reviewed in the next year. [The president] said that 11 manufacturers – or 80[%] of the major N[Z] producers – had agreed to meet the code.

...Professional seafarers are calling for compulsory licensing of amateur skippers and registration of their boats in the wake of a fatal collision in Wellington Harbour. The Merchant Services Guild, which represents ships' officers, says too many people sail small boats without knowing the basic rules of the sea. The union secretary... said the... collision between a container ship and a fishing boat highlighted the need for compulsory education. A Transport Accident Investigation Report, released on Friday, says, among other things, that the... collision between the Sydney Express and the trawler Maria Luisa would not have happened if the trawler and a yacht had been in the right place. Under international rules, vessels less than 20m in length must not get in the way of large vessels which have difficulty navigating narrow channels. "If the[yacht] Soundsgood and the Maria Luisa had been keeping to their own starboard [righthand] side of the channel or fairway then there would not have been any conflict..." the report says. [The union secretary] said ships' officers lived in constant fear of running down smaller craft. The problem was bad in Auckland, where the harbour was often full of people in pleasure boats, many of whom did not know that they should steer clear of ships. Often members piloting ships in the Rangitoto Channel late at night came across little boats with no navigation lights. "It's almost impossible to manoeuvre a big ship in conditions like that and we just have to hope they will move in time,"... The president of the Auckland Coastguard... said his organisation favoured education over regulation because of costs.

...A[US]n authorities, counting the huge cost of trying to rescue two stranded yachties, say... the solo round-the-world Vendee Globe race... route took the sailors too far into the stormy Southern Ocean. The French organisers of... the race... blame massive storms for blowing the yachts towards Antarctica. A[US] has mobilised four Air Force Orion, costing \$NZ260,000 a day... The frigate HMAS Adelaide is also on her way to the scene... to save... [a French sailor, who] is bobbing in a liferaft 1400 nautical miles south-west of the West A[US]n coastline in treacherous seas. The 29-year-old sent out a distress call on Sunday and was found clinging to the hull of his upturned yacht, Amnesty International, in crashing waves. After an earlier attempt failed, [the sailor] was able to get on a raft dropped to him early yesterday. The Orion dropped a sonar tracker buoy designed to drift next to the liferaft so it could be found quickly by... the Adelaide. [The second sailor]'s fate is still unknown, but there are hopes... the 56-year-old Briton is sheltering beneath his upturned Globe Exide Challenger... 1300 nautical miles south-west of Perth. Damage to the keel indicated... [his yacht] may have struck a submerged iceberg. The A[US]n Maritime Safety Authority, responsible for co-ordinating the rescue, has

urged the race organisers to set courses above the 50th parallel, and despite difficulties in enforcing any restrictions, will put the proposal to the International Yachting Federation. There is little else A[US] can do. It ratified the Law of the Sea in 1994, and is obliged under Article 98 to render assistance to ships in distress. The treaty also prevents governments from trying to recover the costs of any rescues. "We have that obligation, even though it is a long way from A[US] – and we can't forget that a couple of years ago the French Navy rescued one of our yacht[ies],"... said... the Minister for Defence Industry, Science and Personnel... "What price do you put on a life? If we don't go... they're dead."

...*Double rescue: Could we cope?* ...Not since the phenomenal storm which created havoc in the mid-Pacific in June 1994 have search and rescue authorities been tested as severely as they were this week – plucking two sailors from the Southern Ocean. By luck, and international convention, the responsibility and cost for the rescue... fell on A[US]. The crew from the Royal A[US]n Air Force and the frigate Adelaide are now celebrating a job well done, but A[US]n defence treasury officials will be looking at a bill approaching \$NZ1 million for Orion flying time alone. If [the sailors] had capsized in N[Z]'s vast search and rescue area, only a short distance to the east of their last-known positions, there is a good chance their rescues could have blown our entire 1997 search-and-rescue budget of just over \$1 million... [The Civil Aviation Authority's] search and rescue co-ordinator... says if the rescue had fallen on N[Z], our co-ordinators would have deployed exactly the same resources as A[US]. Air Force Orion aircraft carrying life-rafts and life-saving equipment would have been dispatched from Whenuapai Air Force base no more than five hours after receiving an emergency alert... [But t]he decision whether to send frigates would depend on the position and physical circumstances of the vessels in distress... [-] it may be easier and quicker to locate merchant ships to help if those in distress are close to recognised shipping lanes. In the cases of [the Vendee Globe sailors] who capsized around 52 degrees south, it is possible that help could have been obtained more quickly and economically by Antarctic research vessels in the area – rather than N[Z] vessels – although... a frigate remains on 24-hour standby expressly for search and rescue operations and, all going well, could be at sea within eight hours. With a range of 3000 miles at 20 knots, a frigate would have had little difficulty reaching [the sailor]s'... upturned yachts... [W]hen rescues are needed beyond the fuel range of frigates, the Navy tanker Endeavour would be dispatched as well – to refuel the frigates at sea... [The CAA co-ordinator says NZ] is a signatory to two international conventions which oblige us to give search and rescue assistance free of charge. There have been no cases that [the co-ordinator] is aware of where rescued parties have been charged. The media recently reported calls for user-charges to be imposed[, but]... these have not been discussed or considered by Civil Aviation authorities.

...[yesterday, a British sailor wa]s still experiencing the euphoria of his miraculous rescue from a watery death as [it] gleefully cut... a big hole in the bottom of his yacht – a task [the Brit] was too terrified to try at sea. This 'hull', however, is only a cake, baked in the shape of his capsized yacht Exide Challenger. It was given to him to celebrate the 58th birthday [the Brit didn't expect to] ever see... "No, I didn't think I'd be around for my next birthday,"... says[the Brit who, along with a French sailor, was]... plucked from the ocean during the Vendee Globe around-the-world solo yacht race by the HMAS Adelaide in a rescue mission that cost \$6 million. [The Brit]'s harrowing ordeal lasted five days. [The Brit] survived by lashing himself to netting in an air pocket in the upturned boat. "This cake is a marvellous gesture," [the Brit says as it] relaxes in the Perth home of [the local] British Consul-General... [The Brit] expects to remain in WA for at least two weeks. "The doctors have advised me not to return to England just yet..." Besides the inevitable mental scars, [the Brit] has lost part of his little finger after jamming it in a hatch. "My feet are the problem now," [the Brit] adds. Both are wrapped in bandages due to frostbite. [The Brit is also] having decompression treatment... [H]is beaming wife... is adamant about what's in store for the future. "I don't want him to go long-distance sailing again. I want to enjoy more of him, just like I am now... It might be [hi]s birthday, but I'm the one who has got the best present of all – I've got my old bulldog back!" The old bulldog laughs and promises [it] won't be so crusty any more. "I've become more human since the ordeal,"...

Taking the search out of search and rescue saves time, money and lives but many boaties still put to sea without emergency locator beacons that cost about as much as a fishing rod. The all-night search for [two]Wellington fishers... and their two sons off the Wairarapa coast illustrates the problem. Searchers say if the four carried a beacon, known as an EPIRB, their open dinghy would have been found hours earlier and spared taxpayers unnecessary Orion flying time. They would also have been rescued in relatively sheltered waters rather than the open sea which threatened to flip their boat. The benefit of beacons, particularly the more advanced 406 type, has been highlighted many times, particularly during the Southern Ocean rescue of [a British solo-]round-the-world sailor... Once activated, the beacons transmit a radio signal which is picked up by satellite and relayed to the closest Local User Terminal... N[Z]'s only terminal, at search and rescue headquarters in Wellington, not only alerts authorities that a vessel or aircraft is in distress but gives searchers an accurate position... [and] also allows searchers to access critical information. This may include the name of the vessel or aircraft in distress, the number of passengers and safety equipment on board, [which can] take much of the guesswork out of rescues. The cheaper and more common 121.5 beacon works on the same principle as the 406 type but does not provide [any additional] details... While not as accurate as the 406, the 121.5 beacon is capable of determining a vessel's location within a kilometre of its true position. That... means aircraft can fly directly to the vessel and assess how to assist without expensive and lengthy grid searches. The average 121.5 beacon retails for about \$300 but is just as effective off-shore as the 406 type, which costs about \$1500 – as was illustrated during the June 1994 Pacific storm, when at least 10 yachts were rescued as a direct result of activating beacons. All vessels and aircraft leaving N[Z] are now required to carry 121.5 beacons... [However, s]ome time after the year 2000 new satellites will receive on the 406 frequency only. By that time 406 beacons will be considerably cheaper... [The CAA] says all aircraft except single-seaters and gliders have been required to carry beacons since 1986. In the past year, search and rescue co-ordinators have detected 545 beacons, though the large majority, 386, have been of unknown origin. Most of those... can be put down to users testing their beacons or accidentally activating them, then turning them off. Beacons have, however, alerted rescue co-ordinators to genuine emergencies 39 times in the past 12 months, evenly divided between aircraft and vessels.

...*Cost of getting lost...* DoC's decision to pull out of... rescues on Mt Cook has raised questions about the state of N[Z]'s multi-million dollar search and rescue industry. In these days of user-pays, when more people are taking advantage of the great outdoors, who picks up the pieces when a sojourn turns to disaster? Who will come when a distress call is made and, just as important, who will pick up the tab? In most cases, it is not the fallen victims but the taxpayer. Rescue operations, costing more than \$22 million annually, come to the aid of more than 9500 people each year – from lost trampers and climbers to distressed sailors and pilots. Only a few of the groups are government-financed, such as police and defence, plus the C[AA]. DoC was funded for search and rescue services until last year. They formed part of DoC's \$24.97 million deal with the Government in 1994-95, which also covered providing facilities such as recreational huts and campgrounds. But search and rescue services were left off the list of responsibilities last year when the money was cut to \$20.6 million. Last month, DoC pulled out of body recoveries on Mt Cook – the only place where it had primary responsibility for the task – and it will end links with search and rescue operations in June. The ramifications of DoC's new direction hit last weekend when the body of a German tourist, Joachim Gottfried Anton Noeth (46), of Cologne, was not retrieved from the Tasman Glacier for 17 hours. [Joachim] had fallen 150m to his death... [after stepping] on to the edge of a moraine wall to take a photograph. [In futur]e, DoC staff will be allowed to assist police only as volunteers. Police say they are financed to co-ordinate search and rescues only, not carry them out. The burden is likely to fall on volunteers, who already make a huge and hidden contribution... Rescues in N[Z] are graded according to their seriousness and the parties involved. The first, class I, is looked after by police using their own resources. This could be a missing toddler or elderly person. Rescues on a larger scale, class II, see the police receiving help from outside experts such as Coastguard or search and rescue teams. But they still control and have overall responsibility for the operation. This could be a missing tramp or fisher... close to the shore. In class III rescues, responsibility for... provid[ing] a 24-hour service to cover... international-type operations is handed to the Wellington National Rescue Co-

ordination Centre. This government-financed service – run by the C[AA] as a separate business unit – covers missing or distressed aircraft, sea vessels and all other operations where emergency locator beacons are activated. In the last financial year, it responded to 557 incidents and saved 62 lives at a cost of \$1.08 million for 1494 hours of work. Another 11 people died. That was roughly the same budget as the year before. This[financial] year, the authority forecasts 470 search and rescues – or 1765 hours of work – at a cost to taxpayers of \$1.1 million. But the budget is limitless. If the centre needs more money, it asks the Government... But most of its time – 80[%] – is spent chasing false alarms, similar to overseas rates... In the past, beacons have mainly been carried on ships and aircraft but they are now available to trampers and climbers. Carrying and activating a beacon is a guarantee that someone will come looking for you, says [a NRCC spokesperson]. “This place will respond as soon as it gets a transmission. We would mount an aeroplane with a detector... If they couldn’t do the job, we call in the Air Force.” ...A total of 672 people were rescued in the past year by the network known as N[Z] Land Search and Rescue. Another 61 people died. The network is an independent organisation made up of police, DoC, mountain and caving experts. It is called in by police to deal with class II emergencies and, where necessary, class III... The most likely group to need to call on the service is... [guys – five to every gal] – in their 20s, who made up 346 of the total rescued. Victims could be trampers, climbers or cavers and are most likely to have fractures. Last year, 13% of victims were from overseas. Land search and rescues cost the police \$1,139,747 last year, which comes out of their general operations budget. The average bill for a mission is \$2863 but that is not a true cost... Last year, \$8388 was paid to volunteers who worked 22,011 hours – a meagre 38c an hour... Volunteers can apply for reimbursement for lost wages and damaged equipment but few do. “That’s the nature of volunteers and we appreciate it very much...” The search and rescue bill included \$348,720 for hiring commercial helicopters, a total of 362.5 hours. That was on top of the cost of their police helicopter – \$30,771 for 23 hours. Air Force helicopters provided another 147 flying hours, worth around \$102,900, which comes from the defence budget. Police also paid \$1877 for hiring a commercial fixed-wing aircraft (10.5 hours) and \$1340 for a commercial vessel (2.5 hours). The police gave a \$103,000 grant to Land Search and Rescue, \$50,000 to the Coastguard Federation and \$9000 to the Amateur Radio Emergency Corps. Community-based search and rescue teams continue to struggle. A South Westland unit recently spent around \$13,000 rescuing one lost and sick trampler from the Haast region. That was \$3000 more than the grant it received from the police, which is supposed to last the year... Thousands of people owe their lives to surf lifesavers who drag or tow them out of perilous waters. Most rescues happen in Auckland, the water leisure capital... The most common group rescued are dubbed “the invincibles” – young [guys] in their teens and early 20s, who also figure prominently in drowning statistics. Alcohol is a factor. But children caught out of their depth in holes or on boogie boards and elderly people having heart attacks are also regular customers. The funding the surf clubs receive from the people they rescue is minimal. “Most people... that... are saved[say:] ‘thanks very much, see you later’...” Although services have never really been costed, a rescue by inflatable boat would be worth several hundred dollars, once the cost of equipment and training is considered. A rescue by a tube would cost around \$100. Two-thirds of the funding for the \$3 million operation is provided by the Lottery Grants Board. The rest comes from corporate sponsors and public funding. Surf lifesavers aren’t about to ask rescued victims to pull out their wallets. If the national body lost its funding, it would more likely ask all beachgoers for a service fee, rather than charge for each rescue... Beyond the surfline is the Coastguard’s domain. The 53-unit organisation patrols the sea within 16km of the beach, as well as Lakes Rotorua and Taupo. The volunteers respond to 2600 callouts a year – about one in five are requests for help from the police. In those cases, the police refund fuel at \$100 an hour... In many cases, it is small ill-equipped boats that need rescuing, or ones that have broken down. Last year, 5000 people were pulled to safety. They are not charged for the service and neither will they be in future. [Its c]hief executive... says turning into a user-pays service goes against the Coastguard Federation’s philosophy. “We can’t because we are a voluntary group with a charitable status. If you charge, you lose status and can’t get grants made to you.” The L[GB] provides \$1.3 million of the operation’s \$2.5 million total cost. The rest has to be raised by individual units. [Despite the shortfall], the coastguard is working towards upgrading its fleet so it can do class III rescues... Meanwhile, [two more]... accidents involving tourists in adventure activities have prompted fresh calls for stricter safety standards in the industry. Eleven people – including four children – had to jump from a jet boat after it sank while on a tourist trip on the Waikato River recently. And a 20-year-old Canadian... was badly injured in a bungi-jumping accident in Queenstown when [the tourist] plunged 40m into the Shotover River – less than a month after an English[tourist] was seriously injured when bungi-jumping from the Kawarau River bridge... Despite the latest injuries, N[Z has] a relatively low accident record in adventure tourism compared with overseas... [Even so, t]he Minister of Tourism... [has] called for an urgent update on progress in introducing codes of practices to the industry... Some sectors of the booming adrenalin-rush business already have their own codes. Bungi-jumping has had its own transtasman-wide voluntary code of practice since 1992 and the M[SA] monitors jet-boating and white-water rafting... The Adventure Tourism Council increased its push for operators to adopt codes of practice that include safety standards last April, following a series of fatal accidents involving adventure activities in the previous months. It has since introduced a voluntary code of practice covering the country’s up to 500 horse-trekking operators as a trial programme. The Tourism Board supports the initiative. If it proves successful, similar codes will be established for... activities such as... sea kayaking and paragliding... Operators also fear the possibility they could be sued for negligence, as happened to a Queenstown rafting company two years ago after the death of a British tourist. Developing standards for the adventure tourism industry is a huge task, with new activities starting up all the time... [The minister] said adventure tourism... is a powerful drawcard for visitors to N[Z]... However, the popularity of adventure tourism has not pleased everyone. A British teacher and his wife travelling in the South Island were horrified to discover “the ugly and threatening phenomenon that we had previously overlooked: the adventure tourist” while visiting Queenstown. [The teacher] wrote recently in the *Weekly Telegraph*: “[The typical adventure tourist]... is the baggy-trousered, reversed-baseball-capped one to whom every bridge is a ‘choice’ bungi-jumping opportunity, every river an ‘awesome’ chance to raft the white waters, and every piece of sky is to be dived out of... [T]he country’s most scenic town... ha[s] become the playground for an army of 20-ish hedonists... Adventure tourism may not harm the environment, but it devalues the area for anyone who does not choose to spend most of their time treating it as a giant theme park designed solely to facilitate their shallow desire for the latest adrenalin rush.”

...I FIND this time of year, which should be delightful because of long days with a reasonable amount of sun, infuriating because of the harebrained activities of people with too much time on their hands and a self-destructive urge to wind up the level of danger in their environment. We already live in conditions that are risky enough for normal tastes. We’re in constant danger of being wiped out by comets and asteroids, for a start. Then there’s earthquakes, tidal waves, fires, cyclones and the ultraviolet rays from the sun. And there’s constant pressure from the merchants and lobbyists of death to get us involved in war. We’ve got diseases coming at us from every direction. The bugs that cause them have adapted to the stage where they love having antibiotics for breakfast. Even our sex lives condemn large numbers of us to death from Aids. We travel to and from work in cars and on motorcycles, at speeds which turn a moment’s inattention into mutilating death by decapitation, evisceration and other distressing forms of mutilation. From time to time we get into airliners which when they go wrong do the mutilating even faster, in greater numbers and more spectacularly. I make a good case, I think, for rating the life of the common homo sapien inescapably dangerous. We don’t have to go far to find danger. But everyday danger is not enough for the lunatic segment that can’t resist pervertedly seeking it out. Worse of all, these idiots create danger for the people who have to rescue them from the consequences of their folly. We have people roping themselves together and climbing up snow-covered rocks on the sides of mountains when there’s no good reason for doing so. If mountains were in the habit of concealing gold or diamond deposits I could understand it, but there’s nothing on top of the things except more rock and more snow. Other people get into little boats that are only just seaworthy, and head for the horizon because they get an adrenalin rush from the thought of pitting themselves against all that water and wind. Still others go hang-gliding, or tie elastic around their silly ankles and jump off high places

because they enjoy the thrill of thinking that the rope might break. People jump out of perfectly good aeroplanes that are in no danger of crashing, keeping their fingers crossed that their parachutes will open before they strike the ground. Parachutes were invented for one purpose: To save the lives of people trapped in aeroplanes about to fall out of the sky, not to provide unwholesome excitement for watchers on the ground wondering if this is the time when a jumper will hit the deck with a loud bang. These are just a few of the silly things that... people... [do which] cause me and other taxpayers to fork out our hard-earned dollars to finance the rescues. As reported in this newspaper last week, the taxpayer picks up a \$22 million yearly bill for rescues. Some of it is for extricating people from dangers that overtook them through no fault of their own, but far too much of it goes on plucking people out of dangerous situations they deliberately put themselves in... My musings on the costs of rescues usually reduce me to smouldering resentment. What brings me to the boil is calculating the extra cost of repairing the damage these clowns do to themselves and others. They break legs, arms, ribs, heads, and sometimes turn themselves into paraplegics. Off they go to hospital and occupy beds for weeks, months, years or the rest of their lives. All at my expense, whether it's through the public cost of the rescue services, the health service billions, accident compensation or higher private insurance premiums. Now this needn't happen. I have a foolproof plan, called user-pays, to stop it. We'll never stop people taking unnecessary risks, but we should make them pay for it themselves. Under my scheme, everyone who wants to put themselves in unnecessary danger would be required by law to put up a bond, to insure themselves and their likely rescuers, against the consequences of their folly. No bond deposited and registered, no rescue. Sorry about that... But so[meone]... is eventually going to pay for the damage, and who better than the people who initiate it? ...The premiums would be high... for anyone setting out to climb a mountain... or take part in a motor race. They'd be moderately high for anyone wanting to play rugby[, and low for anyone who performs safer leisure activities like the arts].

...According to Whitecliffe College of Art and Design administrators, there are around 27,000 arts-related businesses in N[Z – of which 88% are]... directly involved with private enterprise... This situation has prompted the Auckland college to offer an MA in Arts Administration. The course has been developed to provide business-related knowledge and skills from the perspective of the arts... with a strong emphasis on entrepreneurial arts management. Keen interest has been shown from people with backgrounds in theatre, film, visual arts, dance, music, advertising, craft, design, art dealing... museum work, photographic agencies, writers, as well as other cultural... industries.

...*Old-style art still holds all the fun of the circus*... If you think your job is interesting, consider a day in the life of [one Russian]. Belly dancing elephants, Olympic gymnasts and former government officials are just some of the employees on the Russian[']s... staff. As financial vice-president of one of her country's most esteemed institutions – the Moscow State Circus Company – [the Russian reckons it] has one of the best jobs around. Not that it is exactly the institution it once was. In Auckland this week to tee-up a three-centre tour of the... [company, the Russian] happily explained through an interpreter the struggles [it] now faces trying to ensure such an old-fashioned art form survives in the post-communist age... [S]ince the break-up of the... Soviet Union... the former... junior clerk in the Ministry of Culture – the Government body originally responsible for... cultural organisations, including the Bolshoi Ballet... theatres, galleries and museums... [-] has been given the job of establishing the circus as a commercial, independent company. No longer given free access to the state's coffers, the company is 70[%] reliant on outside revenue to pay its bills. [4%] of Russians' taxes is set aside for cultural organisations, and of that, 7[%] is available for the circus – about \$22 million a year. The money helps maintain a property portfolio of 40 huge buildings designed for shows and a staff of about 10,000 people, a third of whom are performers. It also enables the company to run specialist academies for performing arts and sports, and helps feed and house numerous animals. [Before the collapse of the Soviet Union], visiting the circus was almost compulsory, and ticket prices were tightly controlled so as to be affordable for everyone. However, in the post-perestroika period the company has been forced to raise its prices. Competition from television and other forms of entertainment is increasing, and generally tough times face most Russians, so audiences are smaller. Nevertheless, [the financial vice-president] remains confident the circus will always have a place in most Russians' hearts. It will also continue to tour, as about half of its income comes from international audiences. Eventually, [the vice-president] hopes, merchandising will also provide the company with steady revenue.

...*REVIEW – [New CD-ROM] Music Works 2... liberates composers from notational tedium*... It can't supply the inspiration but... [w]ith... Music Works 2... you can write music from simple Tin Pan Alley ditties... through to full symphonic scores like Beethoven's. Installation is easy enough and it comes with a built-in tutorial. The moment of truth comes, though, when you sit down in front of it and start to churn out that number one-with-a-bullet chart topper you've always had in mind. How easy is it? Very easy indeed. The screen comes up with a blank piano score. This can be modified and set up to suit whatever sort of music you have in mind, be it piano trio, tin whistle and organ duet or an opera. Drop down palettes supply the type of note you want. You click on the minim, crochet or whatever length note you want and then click the cross hairs on the score where you want it to go. There are menus for speed indications (Allegro, Largo, etc) and dynamics (fortissimo, pianissimo etc). Notes can be tied, slurred or dotted by clicking and dragging. Lyrics can be added... Any standard musical notation can be written. Once the sonata, concerto, trio or pop tune is finished... the magnum opus can... be played back and recorded... [u]sing appropriate MIDI cards and drivers... Some composers who write music on computers in this way have told me they find it frustrating in that it is too easy to go back and modify things. They spend a lot of time fine tuning and fiddling with the music rather than letting it be as they would if they had written it on paper... Price (including GST): \$110...

Price to pay for funding by the book When I plucked the local paper from our North Shore letterbox recently, I was distressed to read the headline "User-pay bid for libraries." My hands trembling, I stood at the top of the drive and scanned the article – the news was all bad. Apparently the North Shore City Council has begun a funding review which has founded its initial focus on free public libraries on the Shore. As I read on, I became aware that the minds of city councillors move in mysterious and boorish ways. In determining ratios of "appropriate funding," the council, ensconced in its lofty Temple of Higher Thought, has tried to define the public benefits versus the private benefits from each service that it funds. My eyes boggled at the dubious logic. Whereas swimming pools and fitness centres had both been set at a 20[%] public benefit and an 80[%] private benefit, libraries were deemed to hold a 65[%] public benefit... The inference from this would appear to support free public or business access to libraries... With a family of five, we can sometimes have up to 50 books out on issue at any one time. These books... form an indispensable part of our [lives]... I've always encouraged our children to read for pleasure and borrow books to research their hobbies and school projects. Whenever my husband wrings his hands about the excessive rates we pay, I have always shrugged my shoulders and reminded him that we have an excellent library service. Now it seems that my platitudes could be rendered meaningless. Primary, secondary and tertiary students who use local libraries to borrow material, access the reference collections and study in peace may now find themselves paying a high price for the privilege. While the council is bemoaning the \$8 million expenditure of our public library service, it is loath to prune its own bureaucratic inefficiencies or their public expenditure on private council functions. Free public libraries have become a treasured N[Z] heritage. The council should remember that it is empowered by the will of the people. When Marie Antoinette denied the people bread and proffered cake instead, a revolution took place. If the council refuses us books and offers fitness centres instead, it may find itself facing a similar fate.

...['About 300 staff will lose their jobs in the third round of restructuring at the Wellington City Council. The layoffs will occur in libraries, city works and the city and suburban offices where members of the public do all their council business. The council chief executive has promised that the public will get better services and ratepayers will get a cheaper deal. Libraries were closed and services reduced yesterday morning as the 800 staff involved were told about their future. The 220 librarians are hardest hit in the restructuring, which will cost \$4 million there alone, with the hope of savings of \$2.2 million a year. Only 93 full-time positions will remain. It is understood the libraries will replace permanent staff with casuals, who do not have to be paid sick leave or overtime. The announcement follows the axing of 240 of 420 jobs in the environment division and administration and support services over the past two years. The council restructuring is taking its toll on staff morale and has been directly linked to the suicide of a worker last November.' Incidentally, t]he

Auckland City Council officials who recommended that the Grey Lynn Library be closed had just two weeks to come up with a plan to cut the libraries' operating budget. Their report to the council's combined budget committee recommends closure of the library on Great North Rd that has served Grey Lynn since 1924. They hope the move will prune the libraries' budget by 4.11[%]. The budget is under pressure partly because of a modest increase in staff to cope with demand in excess of population growth. The... Save Grey Lynn Library group, which in 1990 fought off a similar council bid, is holding a public meeting on Thursday in the Westmere School hall. Critics of the lack of resources in the city's western suburbs were quick to point out yesterday that Grey Lynn Library was threatened at a time when the council was building a \$1.2 million replacement library for Epsom in Manukau Rd... The author of the report, [the]city librarian... said yesterday that cutting the budget was difficult and Grey Lynn had been chosen ahead of others because the area was not growing as quickly as others... [(the Epsom Library)] would be in one of the fastest-growing areas in the city[)]. Grey Lynn's]... proximity to the Pt Chevalier, Ponsonby and central city libraries was also a factor. - 1997

The Auckland City Council officially begins a new 10-year budget today where core services like parks, libraries, swimming pools and footpaths will be cut, reduced or deferred. [The]Finance committee... said yesterday that the council would have to make some unpopular decisions...

The cost-cutting council of Auckland... is looking to save \$65,000 by axing a mobile library service used by elderly residents. The library visits 18 resthomes and 31 pensioner villages as well as making two street stops every one or two weeks. It issued 37,000 books in the past year, at a cost of \$80,000. For the second year running the council has targeted the elderly to save money. Last year it sold pensioner houses and raised rents just before the sale. A budget report to be considered by councillors this week says the mobile library was a relatively high-cost service used by fewer numbers of mostly elderly people. A second mobile library was closed three years ago. [The]library manager... recommended "retiring" the service and using \$15,000 to extend a homebound service... [(performed largely by volunteers)]... to 115 people in resthomes who cannot get to a library.

...If you borrow... a book from a library this year – you're in good company. A total of 34 million items were borrowed from the country's 15 largest public libraries alone last year... "The figures clearly indicate that libraries continue to play an important role in peoples' lives," says... [a] spokesperson for MetroNet – the incorporated society of large metropolitan libraries serving populations of 50,000 or more. "N[Z]ers are using their libraries as much as ever. Whether it is to borrow books, magazines, CDs or videos, or to use the Internet or other web-based resources, libraries are continuing to fulfil the recreation and information needs of their users."

...Universities say million-dollar cuts to their libraries have depleted the country's knowledge banks and threaten N[Z]'s bid to become a knowledge economy. University libraries have had to make huge cuts in journal subscriptions in the past three years because of a lack of Government funding... and a 30[%] increase in the cost of publications. The Council of N[Z] University Librarians... said university libraries provided specialist journals used for research by academics, scientists, public libraries and crown institutes. "The information held in this country is dwindling. A huge amount of knowledge is no longer available and we will never be able to replace it,"... The libraries import more than 98[%] of their books, journals and databases to keep up with international research... Canterbury University had cancelled about 1000 journals this year, slashing \$1 million or 20[%] from its journals budget... [Despite being] rescued with a 25[%] budget increase this year... Victoria University... had had to cut \$500,000-worth of journal titles – about 800... Waikato University had lost 1330 journals... but had increased its electronic databases... The Vice-Chancellors Committee... chair[person]... said the A[US]n Vice-Chancellors Committee had offered N[Z] the opportunity to become part of a national electronic database licence, which gives libraries access to the database at a cost of \$5 million a year. [Editor's note: 'Pergamos had one of the most famous libraries in the world. It contained no fewer than 200,000 books, an immense number in an age when every book had to be written and copied by hand. So close was the connection to Pergamos with literary activity that the word *parchment* is in fact derived from the name *Pergamos*. *Parchment*, or, as it is sometimes called, *vellum*, was a writing material made from the skins of animals. All the great New Testament manuscripts are written on it. Its original name was *he Pergamene charta*, which means the Pergamene sheet. Prior to the invention and manufacture of parchment the main writing material was *papyrus*, which was manufactured from the pith of a bulrush growing almost exclusively on the banks of the Nile.']

...Since... New Zealand's Toy Library Federation... started in Hamilton back in 1972, just over 200 libraries have sprouted all over New Zealand. Parents can take their kids along and, in return for a small fee, borrow a different toy each week. "Kids tend to grow in and out of toys so quickly... This is an opportunity to get access to a wide range of toys across the whole of a child's development without breaking the bank."

...Toys, toys everywhere, plenty of room to play. West Auckland Toy Library is buzzing as soon as it opens. As one of the biggest and longest running in N[Z], the toy library just keeps growing, particularly since it moved into its spacious premises in Green Bay last year. Good, quality toys are a luxury rather than a necessity for many families, so the library provides hired items including videos, puzzles, games, audio tapes with books, puppets and dress-up costumes. [The library's p]resident... says they now have 250 families and whenever they get funding, they can increase their membership. "We've started shopping now following an ASB Trust grant for \$9000... It's just what we needed. We're the only one in Auckland that doesn't have a waiting list." The toy library is also dependent on volunteer help by its members... "There aren't enough toy libraries in Auckland and people are trying to start them up but it's a lot of work. There's a new one in Helensville and there are plans for one in Te Atatu."

...Five-year-old twins... are engrossed in racing their plastic tricycles around the room, while a little girl seems happy with her activity zoo. These are just some of the play things sure to set children's eyes dancing in the newly established Te Atatu Toy Library, which opens this Friday... Local families should warmly welcome the new service, as the next closest toy libraries are in Green Bay and Mt Albert. Demand in those areas is so great that people often have to wait up to nine months to become members. Green Bay Toy Library owns about 1000 toys and serves about 250 families, but Te Atatu only has enough toys to cater for about 12 families at the moment... T[he t]oy buyer... says the library – aimed at babies and toddlers under five years old – is starting out small but wants to expand as soon as more funding comes through... Some of the toys are incredibly expensive, like a baby's 'exasaucer' with a retail price of \$170... Committee members are looking to buy more ride-on tractors, building blocks and action figures through charitable grants and fundraising, but will also accept second-hand toys. "We'll take anything and just use it as best we can, whether that means selling it or keeping it,"... It costs \$80 a year to join the library, or \$40 for members who take turns to help run the library. Half-price concession rates are available for community service card holders. On top of membership fees, there is also a small charge of 50c or \$2 per toy to borrow it for two weeks... The national toy libraries federation motto is Let The Children Play... "Play is such an important avenue for children,"... says... [the federation's f]undraising and publicity officer[, who]... wears a couple of federation hats as a board member and toy buyer.

...Children are not learning to play imaginatively because they are inundated with toys, according to research. A US study shows playthings and games could even be restricting their development. It concluded youngsters, particularly those under five, are not being stimulated by the range of toys available and suggested children from affluent homes are more likely to suffer. [The c]hildhood development researcher... whose work was funded by the US Government, says her studies showed giving children too many toys or toys of the "wrong type", which do not promote imaginative play, could actually do them harm. "They get overwhelmed and cannot concentrate on any one thing long enough to learn from it."

...Primary schools are moving to ban another kids toy craze, saying they are too dangerous to be in playgrounds. The Yo-Yo Ball is the latest craze to hit schools with kids finding them easy to buy because of their cheap cost. The Minister of Consumer affairs... has already issued caution over the toy following a ban in the United Kingdom. Public warnings against using the toy have been made in Germany, Sweden, the USA and Canada. "The Yo-Yo Ball can pose a hazard if it is whirled and the extended strap wraps around a child's throat," says [the minister]. "They can wrap very tightly and be difficult to remove." The Yo-Yo Ball is a little smaller than a tennis ball, is made from soft rubber material and filled with liquid. They are covered in small nodules and have a stretchy rubber strap with a finger loop at the end. The material is highly elastic and can

stretch from 250mm in its resting state, to over one and a half metres. Between 30,000 and 45,000 Yo-Yo Balls were imported recently into N[Z]. The principal of] Glendene Primary... is hoping the craze bypasses her school. "I guess the[manufacturers we]re thinking of the fun children will have with them before really trialing them out," [the principal] says. To date there have been no reported incidents of injury in N[Z]. An additional concern however is the Yo Yo Balls kerosene odour, which may indicate the possibility of toxic content. The Yo-Yo Ball craze follows the Yu Gi Oh swap card game craze which has been banned from most West Auckland schools because of schoolyard thuggery.

...The Yu Gi Oh game cards [we]re blamed for a sudden spate of intimidation, bullying and extortion among primary pupils... Yu Gi Oh is based around a character called Yugi and his friends. Yugi's grandfather manages a gaming shop and introduces him to an ancient Egyptian card fighting game called "Duel Monsters." The game pits mystical creatures against one another, but only one can be called "Yu Gi Oh," King of Games... Children buy game characters in packs of 50 cards for around \$15. They then sell the cards onto their friends for more or less money depending on its popularity. It's the act of trading that... caus[ed] problems in the school grounds... Pomaria Primary[']s acting principal... says the school has sent a strong message to homes in the school newsletter. Despite being banned the cards have been at the bottom of a recent spate of playground troubles. "We have told the children not to bring them to school, but if parents are not informed then nothing changes,"... Laingholm Primary[']s principal... banned the cards from his school only last week after a short trial period. "Usually, when something like this happens kids spend lots of money on these cards, so they end up flogging them off and often bullying and leaning on other kids to sell up... We don't want to ban all kiddy things, so we told the children they could have them but the moment we hear of trading and hassles they will be banned."

...Hard-hearted thieves have pinched a school's "Friendship Seat"... The loss has deeply upset staff and pupils alike at close-knit Laingholm Primary, where the macrocarpa seat acted as a play-ground "ice-breaker" for kids who felt out in the cold. The heavyweight seat set in concrete came as the result of a... Waitakere Community Board grant. [The p]rincipal... says the theft has baffled the school. The macrocarpa seat... had recently been uplifted to make room to expand the adventure playground – but it still needed three or four [guys] to lift it. "Someone must have come into the school with a trailer. What sort of mean spirited person would flog a seat?" ...Waitakere[']s Mayor... pledged \$250... for a new seat.

...after the cruel theft of Laingholm Primary School's Friendship Seat, it now has a new one thanks to a generous community. The seat helps children, who are lonely or sad, during play time. By sitting on the seat other children come and talk to them and include them in their games. [The school's p]rincipal... says thanks to [the Waitakere City Council]'s mayoral fund, parents and Nature's Edge Furniture, the school now has a bigger, better seat made out of large macrocarpa slabs. "It's much more kid friendly – it can hold 4-5-6-7 of them, it's much bigger. It's great!"

...40[%] of US elementary schools have eliminated play time over the last 20 years, so they could squeeze in more classroom time... [P]layground equipment has al[so] been removed because of concerns over children's safety and fear of lawsuits... [In local news,] for about 40 years a rope swing in various forms has dangled from a pohutukawa branch overhanging the small beach at Jenkins Bay... During summer high tides it gives youngsters the bonus of being able to splash down over shallow water. [But] recently the swing has fallen [into disrepair, causing Waitakere City Council officials t]o fear someone may get hurt. They [also thought] the tree could be damaged by the rope rubbing... [The chairperso]n of the South Titirangi Residents and Ratepayers Association, said the swing was removed by a council worker late last summer. "We were mystified at the swing's disappearance. No one consulted [u]s about it... A council worker defended its removal by saying 'you can't engineer a tree'. When I asked for the bits of swing back, [the worker] said it had been thrown away." ...a residents' meeting... [suggested putting a swing] back on the tree... – and "someone" did... It was not as cleverly designed as the previous swing, which had features such as cable sheathed in plastic hose to avoid rubbing on the branch. "But it does the trick..." ...the residents had appealed to councillors reviewing the management of foreshore reserves to allow a swing on the tree. But [they] feared the response would be installing a standard playground steel swing on a bark safety pad, which would spoil the simple nature of the reserve... [The chairperso]n of the council's community facilities and recreation committee, said the swing could be returned... But the council's parks and reserves manager... said it would be "bad practice" for staff to allow tree swings because of the risks to trees and people. Any swings found would be removed.

...My daughter nearly died falling from a SWING... One Thursday afternoon two months ago [a]Wellington nine-year-old... and her friend... decided to venture down a steep damp track in a Stokes Valley gully and play on a rope swing which had been put up by local children eight years ago. Concealed from the road in a small area of bush, not all the youngsters living in the area knew the swing was there and it had been almost six months since the Tui Glen School pupils had used it. [The nine-year-old] took the first swing on the rope to check that it was safe. "[My friend] says I swung twice but... I can't remember," says the nine-year-old... who was holding on to the fraying rope when it suddenly snapped, sending her hurtling 30m into the bottom of the bush-covered gully... Emergency services were called and because of the difficulty of getting to [the girl], firefighters taking equipment to paramedics were forced to slide down the damp incline using ropes... A helicopter flew [the girl] to Wellington Hospital and doctors told her worried parents that their daughter had a brain injury and fractured skull. [The girl] had surgery to minimise damage caused by the fall. Then, with her brain pressure fluctuating, [the girl] was kept in a drug-induced coma for 12 days. "...The doctors... gave her a 50/50 chance... People were so good to us. The word went out and we had friends bringing us meals at home and there were even prayers said for [our daughter] as far away as Dubai." Thankfully [the girl] woke from her coma... and so far it appears [the nine-year-old] has suffered no permanent damage. Her parents... don't blame anyone for the accident but they do advise parents to make regular safety checks on home-made swings. ● [A young west Auckland girl recently died in hospital from head injuries it sustained after falling from a local playground climbing structure.]

...A Christian youth camp fined \$20,000 after a schoolboy hurt himself on a slide has warned other camps and groups to insure themselves against playground accidents. Christian Youth Camps in Ngaruawahia was fined in the Hamilton District Court after the 10-year-old fell down a waterslide while on a school trip. The camp pleaded guilty to failing to ensure the boy's safety. [The j]udge... ordered that the fine be paid to the victim... who injured his head and neck in the accident... [The boy] landed on a chain placed across the bottom of the waterslide to deter unsupervised use. Occupational Safety and Health... believed the fine was one of the highest in N[Z] for this type of incident. The maximum fine is \$50,000. The incident was taken very seriously because it was the second of its kind at the camp. Camp managers had not removed the chain after the first incident... The chair[person]n of the Christian Youth Camps council... said the camp was covered by liability insurance. It had expected to be fined \$8000... [The chairperson] understood the court had fined a Waihi mine \$20,000 two or three months ago after the death of a worker. "The comparison doesn't quite seem fair to me,"... The boy's father... said his son could have died... [and] was no longer the same child. His reactions had slowed, [the boy] slept longer and sometimes stared blankly at the ceiling. His movements were limited and [the boy] could no longer play rugby.

...[NZ's] seven major... playground manufacturers have formed an association and voluntarily adopted Canadian guidelines... for safety standards amid fears that local regulations are endangering children. [One m]anufacturer... says there is nothing in local regulations prohibiting gaps in equipment which children could get their heads, feet or fingers caught in. There also need to be rules preventing protruding objects on which youngsters could hurt their eyes or cut themselves, and signs to indicate what ages equipment is appropriate for. "Children probably aren't going to die from these problems, but we are concerned..." ...[a p]layground safety expert... says the standard of playgrounds has improved considerably in 20 years. But because the amount of equipment has trebled, injuries are still on the rise. In 1981, only 12[%] of playgrounds had impact-absorbing mats or bark which could prevent concussion, compared with 80[%] in 1997. However, some very old and dangerous playgrounds are still in existence – including the one [the expert] played on as a child more than 40 years ago... [By the way, 'in most animals, youth is a time of learning – by trial and error, by imitation and in the sheer delight of play' – but a] court in northern Switzerland has ordered a local

playground be dismantled after neighbours complained the children were making too much noise... The children's shouts and laughter were judged to be "unacceptable noise emissions" under environmental law... court officials say.

...Residents of Ranui's Coroglen subdivision want to pull the plug on a local playground. The playground, on a small reserve in the middle of the high density housing area, sometimes attracts a great number of children who residents say are noisy and abusive. Problems with the Corran reserve playground were first raised [last year at a] meeting of the Massey Community Board. Residents cited concerns with noise, people hanging around and climbing upon the play equipment and looking into neighbouring properties. The board decided to lower the height of the play equipment but residents now say that's not enough. They told last week's board meeting they want the play equipment removed... The board wants a survey of the 100 or so homes in the area reported back to its [next] meeting – but that doesn't satisfy the residents. "A survey will be lost because it is only about 25 to 30 houses that have the problem, the others are not affected,"... The playground was installed by developer Universal Homes, which says it won't remove the equipment because it complies with Waitakere Council requirements... [But one c]ouncilor... says the amount of play equipment is not in proportion to the size of the park. "It is not a big enough reserve for that equipment. It was a blunder on someone's behalf..." ...The council estimates it will have to spend about \$8000 to remove and relocate the equipment, but residents say they will do it for much less.

...Having an adventure playground just metres from their houses is not a dream come true for a group of Ranui residents – it disrupts their lifestyles and they want it removed. They bought houses in the Coroglen area with the belief the then empty reserve was "passive", says [the resident] who lives closest to the playground. But within six months of moving to the cluster housing development, [the resident] got home from work one day to find a very active playground being built. In just days the new adventure playground, which... is "squashed onto the size of a stamp", was attracting more than 20 children during the day and well into the night... "I just want to be able to go home and relax and I can't. As a health professional I get concerned for the little ones I see on the playground alone." [A f]ellow resident... says a lot of children from out of the area play in the reserve. "The children that live in the estate won't play in the playground because they're afraid of kids from out of the area." Another resident... says the value of his house has diminished since the playground was established, and the area has become more of a "ghetto" with the Ranui community constable... called in regularly to handle problems among the children. [However, the community constable] says the playground is like any other – as are the children who play on it. "Kids are going to be kids... I think some of the less tolerant people have a bit of a problem with the playground." The playground was built under the subdivision process to meet the local children's needs, says a council parks and reserves manager. It was only since the playground became council property that it needs to go through the community board processes. More than 10 Coroglen residents attended the Massey Community Board meeting last week to give their support to the issue, and said they will pay for the \$3000 removal cost if necessary... A recent study into Coroglen's housing shows residents feel negative about high density housing. The study is part of the Auckland Regional Council's regional Growth Strategy, and researched five areas in Auckland including Coroglen. The collective results[were] published in last week's regional council Strategy Policy Committee meeting... "Overall both residents and neighbours are reasonably satisfied with the good look and feel of their communities and sense of community, but less satisfied with their ability to influence decisions about the area... [R]esidents were less satisfied with the access to outdoor open space, such as parks and reserves," says the report... ■

...200 storks migrating from Europe to Africa flew to their deaths in Israel[after] landing in an acid-filled pool of waste outside a chemical plant... [Manukau City Council] planners have finally given up hope of turning one of Auckland's most polluted waterways into an aquatic wonderland... Lake Otara... is contaminated with heavy metals from industrial stormwater discharges and probably sewage from residential stormwater... Manukau City Council has concluded that no amount of money will make [the l]ake safe for swimming – despite ambitious plans in the 1960s to turn the area into a swimming and boating playground for residents. Instead, the council has settled on a draft budget of more than \$4.5 million over the next three to four years for a lake and catchment area improvement project, which may make the lake safe for boats. However, the move has not been accepted by a local organisation, Enterprise Otara, which has vowed to make the lake accessible and usable no matter how long it takes... The lake was created in 1967 when the Electricity Department built a weir, separating... Otara Creek... from the... Tamaki Estuary. The department lauded the area as a haven for Otara residents. *Herald* files from 1967 paint an idyllic picture of the lake... The Electricity Department was considering landscaping the area... But ideas of providing "many happy hours of pleasant recreation to Otara residents" were shortlived. Instead, the picturesque Otara Lake turned into a polluted, stagnant mess. A similar saga is the debate over whether the public should be allowed access to coastal land where the Contact Energy power station operates. The Electricity Corporation of N[Z], the previous owners, signed an accord with the community and tangata whenua in 1994 ensuring public access to the land via a heritage trail. But Contact says there was no commitment in the accord to uphold these conditions... [and], for safety reasons, public access to Contact's coastal land would not be allowed.

...The race is on to ensure future Aucklanders are only ever a boule throw away from a local petanque terrain, tennis court, swimming pool or playground... The Auckland City Council plan... comes as the A[RC] develops an "acquisitions" policy to secure up to 5000ha of additional parkland over the next 20 years... giv[ing] priority to purchases near the most populated areas. Auckland City's plan divides the city into 20 precincts, each with a park of at least 5ha in size, at its hub. It divides the precincts into city-wide facilities aimed at all Aucklanders, and local ones to be used mainly by nearby residents. Around them, facilities such as recreation centres, libraries, swimming pools, playgrounds, sports fields, picnic and barbecue areas, community centres and walking tracks will be grouped.

...Group snub for flagship centre... [The] controversial award-winning flagship community centre in New Lynn is to undergo a revamp after seven groups refused to use it. The issue was debated at a New Lynn Community Board meeting on Tuesday night following presentation of a council report outlining problem-solving measures... [The board's chairperson] says teething problems have to be expected with a new building. "Taken overall, the centre has been a great success and is popular with the vast majority of users,"... The New Lynn Community Centre was opened with much fanfare [last] June... But despite two NZIA Architecture awards, the centre has come under criticism from community groups who found the centre impersonal and hard to heat... "The whole place is far too big..."... says... [the] secretary of the Retired Persons Association... The association stopped using the centre five months ago and now meets in the New Lynn RSA... [The secretary] says using the centre became a nightmare. "We had very unfortunate experiences there. Straight away we saw a lot of things were wrong and we complained,"... Other complaints included complicated taps in bathrooms, tiny kitchen facilities... [– although this] had been fixed... [–] patrons struggling with the bulky swing doors... the lack of staff, no public phone and no clock. In the hall area... there were no plugs near the stage for entertainers microphones...

Security problems at the New Lynn Community Centre are being dealt with after a "high level of theft, vandalism and internal graffiti"... A report, presented to the New Lynn Community Board, says the... incidents occur day and night, whether the centre is being used or when it is unattended. Locker and kitchen storage areas have been the main targets for thefts. Vandalism has occurred in the service corridor, foyer and exterior walls. New Lynn[']s Community Constable... says [since the centre opened it has had] at least 10 to 15 break-ins... [The constable] says there was never any sign of forced entry, suggesting doors were left unlocked or the offenders had keys to get in. But changes to locks, doors and lights have reduced the number of incidents. Security cameras, recording seven days a week, have also been installed with all footage being kept for 14 days. Groups hiring rooms at the centre are being reminded to secure the venue during their stay, and the alarm system has been reconfigured. Storage lockers have been reinforced... Issues surrounding security, management and design have plagued the \$3.6 million centre since it opened...

...during the opening of the... Te Atatu RSA[']s... \$800,000 upgrade... its president... [told the PM that the returned servicepersons' club had] reclaimed... the... best in the west title... Auckland's executive committee bestowed the title after visiting the Harbourview Rd club. [The PM

responded by telling] the packed hall of RSA members that the place looks great... “I remember it being very dark in here but it’s been opened up... [But] I can’t say whether it’s the best in the west because I’m patron of Avondale and Pt Chev[.]” The... National RSA president and former Te Atatu president... who attended the opening with [the PM] marvelled at the cost of the work. “We built the sports bar in the 1960s... it cost \$8000 and we still had \$1000 left in the kitty,”... [The present president] says patrons will have to drink a lot of beer to pay off the huge bank loan, despite hefty grants from the Waitakere Licensing Trust, ASB Trust and Lotteries. “[But]... independent valuers were impressed and said we’ve put more than half a million dollars on the property.” The RSA decided to modernise when the bowling club moved out of the shared premises into purpose built rooms... Licks of paint were still being applied... and last minute touches to the newly resealed car park [completed before the PM]’s visit...

A SECOND-BEST outcome is how Te Atatu residents describe the Waitakere City Council’s move to delay yet again a decision on Harbourview. About 140 observers, most from the Te Atatu Residents and Ratepayers Association, packed the council chambers on Tuesday for the decision that never came. Instead, councillors deferred without a formal vote any decision until after a city-wide public-consultation, this time on specific options for the prime Te Atatu Peninsula land. The move got a mixed reception from the ratepayers association, which wants the Harbourview land kept as open space and developed as a park... The... Mayor... [had] opened the debate by calling it D-Day, and urging councillors to avoid talking themselves into another “limbo situation”. “The council has spent thousands of dollars on evaluations and spent years without making a decision – we have to get a resolution today,” said... [the mayor, who] is worried future councils desperate for money “may turn the land into another West Harbour...” [– which has been transformed by commercial and residential building projects. But one]... councillor... wasn’t happy with any of the 13 recommendations in the final report from [the] city projects manager... They included a mix of open space-parkland and commercial development as the council’s preferred use for the land. The report also rejected the ratepayers association proposal to vest the land in a charitable trust... And it endorsed the museum of gardens to be funded by proceeds from [the] commercial and residential development... One victory for [the mayor] is the council’s decision to retake control of 3.7 hectares near the panelbeater’s shop, which had been transferred to Waitakere Properties for housing development. [The mayor says it] will direct Waitakere Properties to ensure there is no development on the land.

...THE head of Waitakere’s development agency says the city cannot afford to keep Harbourview as passive parkland... “Ratepayers would have to pick up a hefty tab to develop and care for passive parkland... Relying on volunteer labour care for such a large park might be feasible in the short term, but further out it is likely to result in a shortage of volunteers, irregular work and a mess of uncared-for land.” [The head] says some balance is needed in the debate over Harbourview’s future... His organisation... Enterprise Waitakere... backs the “mixed-use” proposal by Waitakere Properties, with up to 15 hectares for commercial and residential use and 42ha already set aside for lowland reserve... [The head] says that’s the best way to get quality passive parkland for the remaining 20 to 23ha at no cost to ratepayers... A people’s park – or option three in the council’s consultation – is being promoted by the Te Atatu Resident and Ratepayers Association, and by west Labour, National and Alliance MPs.

...Last Friday afternoon... I... [– the] Labour MP for Te Atatu... [–] lost my temper at a joint meeting of local MPs and Waitakere City councillors and community board members. I would like to explain why I felt moved to shout at the mayor and councillors and accuse some of them of pursuing their own agendas against the expressed wishes of local residents. The issue in question was the fate of the Harbourview estate on Te Atatu Peninsula. Development of the Harbourview site has been marked by broken promises and changing rules. When the land was given to the council by the Auckland Harbour Board it was vested as a gift to our city. The then P[M] Norman Kirk intervened in 1974 and ensured that Waitakere City gained ownership rather than an oil refinery be built on the site. Local body politicians of the time discussed a variety of uses for the Harbourview land. All claimed the unique Harbourview land, the last large open space left on the inner Waitemata Harbour, offered unique opportunities to develop something special. In the 1980s, [the then] Waitakere Mayor... explored the possibility of building a sports dome and associated park on the site. In the [early] 1990s the Waitakere City Council began to eye the land as a potential revenue source. A plan was announced that a small amount of the total site would be developed by the council’s development arm, Waitakere Properties, for residential development. The rest would be vested in a public park or facility. The rationale was that the residential development would fund the development of the public areas. The land set aside for residential development just got larger and larger. I lost my temper at the forum because I am outraged at the sheer waste of this unique resource for residential development. Every public meeting held on this issue, and there have been many, has demonstrated overwhelming support for a public park. A number of petitions signed by hundreds of local residents have called for the same thing. All these clear messages have been repeatedly dismissed by some councillors as the selfish wishes of a few Te Atatu residents. I have distributed 22,000 surveys to all households in the Te Atatu electorate... and... I have to say the replies received so far indicate 90[%] of residents want a park...

West Auckland residents have had their say about Harbourview South land, and the response is loud and clear – they want a park. Recently-released survey results show having a park without commercial development on the empty expanse is just over half of the respondents’ wish... Asked to rate their level of preference for parkland, 79.5[%] of... the 3358 people who voted... say they liked the idea, with only 9.2[%] disliking it. The proposal involves long-term community involvement to establish the park, similar to how Western Springs park was created... The ratepayers association president... hails the results as showing overwhelming support for the people’s park. “The council said they would honour the majority view.” Only 13[%] of the respondents favour the Museum of Gardens, which proposes 15 of 35ha be commercially developed... [S]ay some respondents: “Auckland is in dire need of another sizeable passive reserve.” “This is a golden opportunity... Please do not develop this land commercially at all.” Some respondents are critical of the council: “I’m sure the ratbag council have already made up their minds,” says one. “There’s been too much money spent on ‘consultation’ when people have been saying for years they want a naturally formed park,” says another... [The] Te Atatu MP[’s]... survey about Harbourview land earlier this year showed 83[%] of 3000 respondents chose to keep the land as a park.

...A PEOPLE’S Park will be set up on Te Atatu Peninsula – and ratepayers will fund it. Waitakere City councillors voted unanimously on Tuesday to introduce a special annual charge of \$8 plus GST to develop the park on Harbourview south. The special charge will be levied for five years, raising about \$500,000 annually. [The] Mayor... says people will get a park for the price of two burgers and a thick shake. The Te Atatu Residents and Ratepayers Association presented the council with its proposal for a... special events area with a terraced amphitheatre, an information centre, toilets, benches and car park. The plan called for a partnership between the council, the Friends of the Park Trust, the A[R]C and the Department of Conservation... [Meanwhile, a] High Court judge has criticised the D[oc], reversed a decision of its minister... and restored reserve status to a North Shore headland the Navy was hoping to sell. Local campaigners who wanted Takapuna Head kept as a reserve were celebrating yesterday after [the judge ruled the minister]’s 1997 decision was invalid... An earlier decision by [a] former Minister of Lands... in 1993 setting the block aside for defence purposes was also overturned because the required consent of the conservation minister at the time had not been gained... However, the Minister of Conservation last night warned them not to count on opening the area to the public yet. “There’s a lot of water to pass the point,” [it] said. The 11.2ha headland, behind Narrow Neck and Cheltenham Beach, has been described as “the grandstand to the gulf.”

...The receding Te Atatu coastline will be a line-up of sandy beaches if construction goes to plan. The last stages in designing a series of artificial headlands on the northern and eastern sides of Te Atatu Peninsula have finished, and work is due to begin in [two months], says... the... principal planner at Wood and Partners... They will be reconstructing headlands that were there before but have eroded away... The... Te Atatu Ratepayers and Residents Association president... says the idea of constructing headlands is better than building the traditional sea walls, but if it fails the city’s ratepayers may bear the cost... [T]he association’s main concern is that there is no comprehensive assessment of coastal hazards, and if it all goes wrong “the natural environment would be destroyed just so people can sit on the beach in the sun”... Two coastal management documents are

today being officially launched by the ARC. These are the Coastal Hazard Strategy and the Coastal Erosion Management Manual. Both were considered when the ARC was deciding whether to give permission for the artificial headlands to be constructed, says... [an ARC] coastal scientist...

The findings are part of an 18-month youth leisure needs study by the Waitakere City Council. It follows community pleas for an indoor youth activity centre. The study, conducted in seven schools in the area, shows... youth like to play sports, meet at shopping malls, go to parties, movies and friends' homes, and enjoy skateboarding and going to the beach... [The l]eisure services acting team leader... says a centralised venue for a variety of youth activities was one of the top priorities identified by focus groups at schools surveyed... [T]eens say they want "somewhere to hang out – to chill, listen to music and not be hassled, not have to pay"... [T]he council will now review the resources the city gives to youth...

The Waitakere Sports Complex has its own goal posts in sight as... Waitakere City Council... prepares to hand over a hefty cheque towards the \$21m development. The... [council will] provide \$10.6m over the next three years, plus an operations grant of \$250,000 a year. Covering... 11,000 sqm on Henderson's Central Park Drive, the complex... will be the city's biggest ever community facility... The sports complex will feature an all-weather, international athletics track, six indoor courts... [- with] fixed and retractable seating for 5000 people[-] ...a gymnasium, three playing fields, a cafe, creche, carparking and provide a home for several sports clubs and organisations... [The p]roject development board chair[perso]n... says the facility will provide a much-needed breeding ground for top sporting talent. "Waitakere City has always suffered from having no sporting heart or home base and it's been a tragedy to see so many of our top sports people travel outside the city for their sporting needs. This complex is set to change that." ...a... former Commonwealth Games decathlon gold medallist... looks forward to the completion of the centre. "I do believe this is going to be the best multisports centre in N[Z]. The No 1 field is considered by many reputable people... as the best surface in the country,"...

Outside of work, N[Z]ers express themselves and develop their talents through participation in... arts and music, through movement and sports, and in recreational pursuits... To encourage emerging young... talent, [the PM's]... announced a package of \$146 million for the creative industries.

...The dollar is falling, prices are rising and the Government announces an \$86 million injection for the arts. On the street, the *Western Leader* asks readers what they think about... [it. Mrs Retired:] "I think... the arts should get more money because they've been neglected for a long time." ...[Mrs Parent:] "I think... it's choice that they've given more money to the arts... Hopefully the economy will get better." ...[Mr Unemployed:] "The prices going up are a bit of a rip off, it's okay if you are rich. I... can't see... the price of... anything going down. I think the money given to the arts is good. If you can get some money off the government you are lucky." ...[Mr Student: "The rising prices isn't]t good when you are a student and have a loan to pay off. I'd probably give the... arts... money... to people who need more help like the people on the waiting lists, they are dying."

...*Is this plain ballet stupid?* ...the Wellington hospital nurse... loves ballet and opera but... thinks the government's \$80 million arts funding package should have been injected into the health system. "Health is for the masses but the arts are for a select part of the population. The money would be best directed to the general public..."... [The PM] proudly unveiled a... cultural package two weeks ago. But it has left average Kiwis questioning the... government's priorities. The \$80m would have paid for an extra 2500 nurses and could also have been used to slash waiting lists... N[Z]'s nursing shortage should be solved before worrying about operas, the head of the nurses' union... said. "It is awful for nurses to have to go to work and decide which patient to neglect,"... Wellington hospital is 120 nurses short and loses 35[%] of its staff each year, as they look for better paid jobs. Of the... arts package, \$760,000... [-] equivalent to 85 hip replacements... [-] will go to the Royal N[Z] Ballet... The N[Z] Symphony Orchestra will get \$3m this year – 240 pace-maker operations. The new Christchurch art gallery will get \$6.4m – 300 heart bypass operations. [The Opposition's health spokesperson said: "The]... finance minister... says there is a \$200m budget shortfall but then [the PM] can find an \$80m windfall for the arts, which are a minority interest."

...*May as well pay the money and let them paint* There is absolutely no point in complaining about the extra funding [the PM] has served up for the arts. I've tried to oppose the concept – what about giving money to the poor? – but even I am beginning to see the point of it. I discovered this again at the weekend, when a series of chance rendezvous and happy flukes saw me mincing up the path of the tidy Ponsonby pile that houses... [the] Associate Minister of Arts, Culture and Heritage, or something like that... Also present were a couple of media people, and a couple of other people, one of whom was apparently a kinetic artist. ("What the hell is a kinetic artist?" yelled one of the media people in alarm. Poor sod was clearly worried about being left alone with one...). I was always going to emerge as the afternoon's most humourless punter, and this proved the case when I suggested that extra arts funding was a waste of time and money, which this nation did not have, especially since most of the talent lived in England. [The minister] seemed to understand that there was an element of pouring good money after bad in handing out extra arts dosh. And [the minister] was rather witty about it, which in the end is half the battle for any... politician... "One of the complaints [the great unwashed made about the extra funding] was: 'Oh God – more films... about... little bastards in some back valley in the Taranaki wearing balaclavas.'" It's true that [the minister] also delivered buckets of the usual fertiliser. "I think that we have an exotic and unique different culture, reinterpreted in our clear Pacific light..." ...it probably would have been rude to turn the hose on her. Next up was the kinetic artist, who had "pretty much given art up" because [the kinetic artist] found it a bit hard to make a living that way. Still, [the kinetic artist] was pleased to think there was money around to help others. So was a [gal] at the table. Her feeling was that N[Z] was old enough now to take the arts and culture seriously. [The gal] also felt that the extent to which a nation was prepared to spend on arts and culture spoke in some ways of that nation's... sophistication. And hell, why not? Well, "Because everything [N[Z] artists] do is crap," as another, somewhat disgruntled local punter hissed at me last week. I wonder about this line of argument, though. Perhaps it is time we learned to accept that most artwork is rubbish, and fund it nonetheless. Perhaps the ability to do that is a sign of maturity. It is in every other country in the world. In every other country in the world it is widely understood that the greater percentage of arts funding is spent on producing work so awful that you wouldn't mount it at a dogfight. America's National Endowment for the Arts is considered (particularly by Republicans) a hideous waste of money, a fund used by pimps, paedophiles and pornographers and/or their victims to create works to which nobody except the original funder ought to be exposed. There has also been no end of argument about the funding of British neoconceptualists like... the winner who paints with (after somehow locating) elephant flop. The point is not results. The point is that arts funding allows people to express themselves... – even if the rest of us can't understand what they're trying to say... It's a freedom of speech gig.

...*ART adds up...* Artists may hold the key to our success in the new economy, [a journalist] reports... Within... Auckland – ...rated 7th best city in the world for quality of life... – ...there are... 36 Museums, 28 Theatres... and... 42 Art Galleries... □ [The a]verage number of seconds art gallery visitors spent in front of each painting in 1987[was 10. 3 was the a]verage number of seconds gallery visitors spent in front of each painting in 1997

...More than 450 cu m of water gushed into... the middle of Aotea Square... yesterday, creating a knee-deep pond in preparation for The Launching, a free stage show to be held there this weekend... [The] water... is prevented from leaking by two thick plastic sheets lining the 800 sq m concrete area. It will be pumped out next week... A... [10]-year-old... spent the afternoon cooling off... "I was allowed to walk in the water as it filled and I slipped, so I decided to get right on in," [the boy] said... Other children will not be as lucky...; swimming is now banned... The project manager... said the liners cost about \$50,000 and could be used several more times. The council had to take out a "rather pricey" insurance policy; the square sits on top of an underground car-parking building. Because the square was built on a slight angle, the water is deepest on the east side, at 60cm. The Launching... [-] which... will feature top kapa haka teams, the Auckland Philharmonia and the Black Grace dance company... [- is] being... held over three consecutive days, starting at 8.30 pm on Friday. It introduces the Auckland Festival, an arts and cultural event... A stage to accommodate musicians will be erected over the pond, which is being patrolled 24 hours by security guards, and is fenced... The stage shows are

free, but those wanting to attend will need to organise wristbands from Ticketek or any Westfield Shoppingtown to gain entry. Tickets for the seated area cost \$25... [A locally renowned composer and percussionist... has been involved in composing a contemporary opera for the event.

...Kiwi music is the 484th most-searched-for music on the net after Indonesian folk ([despite the fact that one Kiwi –] ...the... force field... [who was a founding member of NZ music legends Split Enz, and is about to release his fifth solo album – has been described as] “a universe unto himself,” ...).

...IT’S nearly dinner time but [the toddler] is dead keen on watching and listening. [The toddler is] just not that keen on watching and listening to Dad. “Wiggles,” [the toddler] intones at the sort of insistent volume only a 2-year-old can generate. “Wiggles.” “You can’t actually watch the Wiggles at the moment...,” comes the patient reply, “I know you’d love to, but I’m talking to the [reporter]. Daddy’s working.” Daddy might be just about to release his fifth solo record – *Say It Is So*, his first in six years – but in the few moments since the “[reporter]” arrived at his pop-star dad’s Mt Eden home, it is the bashful, gentle son who has had all the limelight... “It’s the centre of my life now, my marriage and... fatherhood... It’s something from which everything springs. But as [another muso once] said, ‘Just because it’s true it doesn’t mean it’s interesting.’” But it is. [Daddy] could be just another father but [it] is also the 47-year-old guy with a 25-year career that gave New Zild its first really successful export stamped “music.” [Daddy] gave us... Split Enz, the seminal local act, the reason [daddy] will always be cherished and remembered. In the nearly two decades since Enz ceased as a fulltime outfit, his work has had its share of success, though measured at times with indifference, but up till now [dad] had remained singularly focused on writing, performing and charting the next perfect pop hit. Now [dad] seems just as focused on being a perfect pop. “I didn’t really have any expectations [about parenthood]. I wanted to experience it, I was very open to it.” If Split Enz was... the... family which first took him from these shores – for what became a quarter of a century based overseas – it is the new one that in many ways brought him home. And it was literally by accident. While [the muso] and his wife... a former A[US]n MTV presenter, were over from their Sydney home last year, the toddler had a mishap with hot water and was admitted for treatment to Middlemore Hospital. “[My son]’s fine now... but it was very scary at the time. The whole family came out of the woodwork when that was going on, cousins and uncles, everybody was chipping in and ringing up and it just made me feel very protected, very nurtured. It made me realise I wanted [my son] to be among all that.” The [parents] started looking around at houses to distract themselves from the seriousness of going to Middlemore every day. The one they bought and moved into [last] September turned out to be the first they looked at. And its leafy street – surely the model for any young family – is a close walk to the suburb’s well-stocked village, well-funded schools and a major bus route (although there’s always the Volvo – the safest family car on the road according to the cliché – in the garage for rainy days). Above the work-in-progress garden – [daddy]’s no green-fingers, a friend’s doing it – of the [family]’s new home the wooden-floored, white-walled interior is dominated by a gallery of modern, original art and objets d’art. The effect is much like [dad] himself: serious, arty, cool and interesting... Without a record label deal, *Say It Is So* is a record [daddy]’s made himself... and... is selling himself... The product of a two-year journey, the album was written on road trips... and recorded... in country’s hit factory, Nashville... “I had the luxury of a lot of time, I suppose. I was not with a label, so I was kind of free to drift around and imagine the next period instead of having a template imposed upon me from the [music] business... There is more humour, perhaps. I suppose I was very influenced by the Beatles, but especially by John Lennon, who sort of pioneered a certain confessional style of writing... Lennon was interesting to us, therefore what [John] was saying about his life was interesting – there are very few people in rock who have ever been as riveting in their personal life and in their persona as Lennon. I am not Lennon, and I’ve learned to my cost that certain songs I have written were written, I think, because I thought they were valid because they were true, but actually they weren’t very interesting. But then other songs have been interesting and they weren’t very true.” What seems to be more or less true is that [dad]’s happy, well “happy enough.” [Dad]’s just getting sick and tired of having to say so. “Why are people even interested in whether I’m happy or not? Do they ask every other songwriter they talk to, ‘Are you happy?’ Is it just me? ...The main thing I want to talk about is my work and my music.” Ah yes, the music. It’s delivered him pop’s prizes – popularity, hits, critical plaudits – even an OBE. But has it delivered his share? [His share has been], it hardly needs noting, less than his younger brother[(rp2337, ln12)]... “I’ve had plenty. Maybe I’ll get more, maybe I won’t. But I do feel I’ve had plenty... of whatever’s going... In Split Enz it was sort of a quest in a way, and in that sense it was a kind of selfless seeking of glory...” [I close by asking him about] his son’s enthusiasm for his music... “[My son]’s not a fan. It’s so weird. [My son] loves the Wiggles, [and] loves me to play Wiggles songs live. At least [my son] can accept me being a covers band.”

...Bagpipes get degree of respectability... The profile of Scotland’s national instrument has been given a boost by the launch of the world’s first degree in piping. A collaboration between the Piping Centre and the Royal Scottish Academy of Music and Drama, both based in Glasgow, has devised the BA (Scottish Music-Piping) – or bachelor of bagpiping. The four-year course will combine the study of subjects such as piping technology, the physics of sound and musical manuscripts with placement at teacher training colleges. It hopes to pave the way for more musicians to make a living from teaching and playing the pipes. Ten students are expected to start the degree course next year. It is expected that half will be from abroad and students from 17 countries, including Brazil, Norway, Germany and Japan, have already expressed an interest in taking the degree.

...A top Auckland cellist has been silenced by a neighbour who has complained about his “screechy” playing... [The cellist] was practising around 5 pm on Saturday when a noise-control security officer arrived at his Panmure apartment and served him with a 72-hour abatement notice... [The] Auckland Symphony Orchestra cellist... could have his \$6000 instrument confiscated if [the cellist] continues to play... [The cellist] was particularly distressed because [it] had to prepare for the orchestra’s Monday night rehearsal and... did not consider the noise to be excessive. “It’s not like I’ve got a rock band in here or throwing a party or anything. If you played continually for three or four hours then I could understand people getting upset but I only play in short bursts. I pour myself into my music so to be told you can’t play any more is pretty devastating.” ...After the notice was served... [t]he musician... phoned the Auckland City Council to explain the “ridiculous” situation and request that a decibel reading be taken. [The cellist said it] was told someone would be there shortly but that person failed to turn up. Four phone calls later, [the cellist] was told his call would not be returned, and noise control stood by the original security officer’s decision to serve the abatement notice. “I think it’s totally unreasonable that they slapped the notice on me in the first place but the fact that they then would not respond to me at all really irked me,”... A spokesperson for the noise-control unit... said a decibel reading did not have to be taken for a noise complaint...” [The spokesperson] said it was not practical for officers to return and take decibel readings as the noise level was often reduced by the person responsible for it... The [tenant who complained, and lives] in the apartment directly above... [the cellist’s,] said it was difficult to hear her television over the cello and the music disturbed her peace and quiet. “A cello is not different to a loud stereo. It is a screechy continuous noise and I am sick of it... It is not an instrument... that is acceptable to be played in a block of flats.” However, [the cellist]’s other neighbour... said noise was to be expected in buildings such as theirs. “This building isn’t soundproof and in any block of flats I think you will find noise... To be quite honest, [his music is] very relaxing and right now I’m missing it.”

...An Auckland Symphony Orchestra cellist who was served with a noise abatement order has been offered a “silent cello” to keep his neighbour happy... Yesterday Yamaha N[Z] offered to reduce the price... by \$2000 to help out. [The company’s managing director... said the silent cello, which was invented last year and normally costs \$5000, emitted one-tenth of the noise produced by a regular cello. “The sound is done electronically so the person puts a set of headphones on and plays away. People can then practise in apartments and play in confined spaces without disturbing others.” ...Music lovers also contacted the *Herald* yesterday to offer rehearsal venues... [One] offered... space in a Glen Innes church, and a Panmure resident offered her home. Her daughter used to play the cello when they lived in a small apartment... and “we always had the most wonderful feedback from the neighbours so I felt sorry for him.” [The cellist said it] was grateful for the offers, which were totally

unexpected. "...but obviously I still want the right to practise in my own home." The Auckland City Council environmental noise coordinator... said [it] would personally make a full assessment of [the case] this week.

...Being one of that multitude of music lovers who can neither read a score nor play any instrument, I have always paid perhaps unwarranted homage to just about anybody who can. That being the case, I was surprised to read, in [the Naked Civil Servant]'s New York diary, *Resident Alien*, [that Britain's most infamous gay] was a self-declared "sworn enemy of music." I suppose my astonishment was heightened because I would have expected the Naked Civil Servant – who unashamedly displayed the exhibitionistic instincts of both a peacock and a peahen – to have loved and embraced aspects of all of the arts, painting, sculpture, literature and music. It was his blanket statement that music is "the most noise conveying the least information" that really caught my attention because it made no concession whatsoever to any type of music. I could understand it if [the Brit] loathed pop but liked the classics, or hated Schoenberg but adored Mozart but, no, [the Brit] rubbished the whole gamut from penny whistle to Royal Philharmonic. Indeed, at the age of 86, [the Brit] claimed to have been to only one concert in his life. Only a week before I read *Resident Alien*, I had been fascinated by the story... [about a] cellist of the Auckland Symphony Orchestra whose neighbour had called in the noise abatement mafia from the council... It seemed a monstrous complaint, especially when [the cellist] appeared before us on the television as a likeable, inoffensive sort of chap with sad eyes, a wry wit and long, boney fingers built for caressing a finger board rather than sticking up at the neighbours. I felt for him not only for his culture but his evident charitable willingness to cast the pearls of his talent before the people of Auckland (from whose symphony orchestra [nobody]'s... likely ever to accumulate enough wealth to feature in the rich list). I don't mind admitting that I bristled and my instinct was to consign the carping and troublesome [neighbour] to a heap of philistines. How could anybody object to the sounds of a cello, especially in the hands of a professional? But upon reflection, and putting aside [the gay Brit, the cellist] and the querulous neighbour altogether, I have come to acknowledge that what to one person might be a celestial arpeggio could quite easily, to another, be hell. Pursuing a there's-always-two-sides-to-a-story reasonability, I remembered that for all my love of good music, my mother hated violins. [Mum] said they sounded like cats in torment and would rush to turn off the wireless whenever [it emitted the sounds of] one... My father, too, had a pet musical aversion... [-] Spanish guitar solos... [However,] the sound of a full-blooded brass band... brought Dad swiftly to attention. Much as I love the cello, I confess that there's one instrument I abhor. It's the solo saxophone, a nauseating mongrel of a thing neither woodwind nor brass... And if [the cellist] decides to give up the cello and take up the sax, [it]'d better not move into a flat that's next door to anywhere I might be living... [-] one spit down its reed and I'll have the council's noise mafia around so fast that [the offender] won't know whether [his life is] upstrung or brass-bound.

...I WAS furious to hear on *One News* (March 8) that \$28 million is owed by people who have not paid their broadcasting fees and apparently have no intention of doing so. It also seems nothing can be done about collecting this money and the non-payers are going to get away with it. That means those, like me, who meet their obligations, are carrying these defaulters. If they have even thought about it, they probably consider that if we are stupid enough to pay, it serves us right. The broadcasting fee works out at only about 33c a day and for that you get not only TV programmes but radio as well. How mean-spirited and anti-social can some people get? DISGUSTED (Auckland) ● *NZ On Air says historically it collects 95[%] of all fees owing, but this takes time. The termination of the broadcasting fee has effectively left NZ On Air with little more than a year to collect all debt remaining on its books. When the fee is abolished on July 1, it's reckoned about \$36 million will be outstanding from owners of TV sets. But there is provision in legislation for un-paid fees to be collected after that date.*

...The plug is pulled on the public broadcasting fee today, but NZ On Air will still pursue more than 150,000 people who have not paid. This has outraged anti-fee campaigners, who say the \$110 fee is an illegal tax and its abolition should signal the end of any outstanding payments... NZ On Air's chief executive... said it would still enforce payment of outstanding fees for the year ending yesterday, in fairness to the 850,000 who had paid... Funding... [for] locally made radio and television programmes... will in [future] come from the Government's consolidated fund.

...*Me TV lets you call all the shots...* [A] technological revolution may let us create our own channels within a few years... Television industry experts believe this future may not be as far off as we think. It includes many changes already under way, including its most striking feature – the so-called "me-channel", which lets viewers choose what they want to watch whenever they like. The changes are outlined in a report, *New Technologies and the Digital Future*, prepared for the funding agency N[Z] on Air by [a] former TVNZ head of news... and the N[Z] Broadcasting School. The 143-page report predicts sweeping changes in the way we watch television and the effect on television networks, advertisers and the idea of public broadcasting... However, the... authors... warn that these advances could be held back by continuing disagreements over the technology itself, business dilemmas over how it can be made profitable and possibly consumer resistance to an often bewildering combination of choices... So far television, computer and phone companies have struggled to send large amounts of data to consumers. For instance, most home internet users with a standard phone line and dial-up modem cannot download good-quality television pictures on their computers or have the phone and internet working at the same time. The main problem is bandwidth, which the report says can be seen as the size of the "pipe" used to send material. "If you want to get more information down the pipe and send it faster, you need a bigger pipe." Broadband uses a much bigger pipe to send information 36 times faster than a current "narrowband" home internet connection. It can also compress the elements to be transmitted, freeing more bandwidth. "The real significance of broadband is that it will provide high-speed access that is always on," says the report. "There will be no need to dial up or switch between phone and internet connection..." Broadband services can be delivered by satellite, cable, wireless or by phone lines... Some industry watchers think... personal video recorders... could change our television habits for ever by allowing us to... make up our own viewing timetables. The PVR allows you to record television programmes much like a videotape recorder, but while it is recording you can watch instant replays, pause, rewind, etc, without losing any of the programme... One consultant the report quotes predicts the combination of broadband and PVRs could "blow things wide open" in a real threat to conventional broadcasting. "There's no reason why people wouldn't use this to pull content off the web, circumventing the broadcast stream in the process. Think of the chaos." *If I can effectively run my own television channel, where does this leave the TV networks?* Probably feeling nervous, although most are still upbeat about the continued role of traditional free-to-air channels. On the one hand, free-to-air has already been overtaken by pay TV in the U[S] and its audience share is falling worldwide. This trend is likely to continue... On the other hand, the new channels cannot offer advertisers the same mass market. The more optimistic big-network executives argue that they will actually become more valuable to advertisers in an increasingly fragmented market.

...With giant strides [being made] in home entertainment – the relentless growth of the Internet, DVD taking on VHS for home video, music downloading from the Web – it is little wonder that home gaming is also changing rapidly... [The home gaming industry is now] just as prosperous as the film industry and every bit as competitive as the music world... Sega's 128-bit Dreamcast, about to go on sale in N[Z], is the most powerful game machine created. It represents a watershed for gaming and signals a new era in home entertainment. Apart from the machine's speed and advanced screen effects, the Dreamcast user can lounge on the couch and tap into the Internet to play rivals anywhere on the planet... Microsoft provides the operating system for the Dreamcast that also... allows the user to... browse Websites on a television... Sega, the once-legendary Japanese games company, has spent several years in the wilderness. The Mega-Drive was the box of choice at the beginning of this decade when console gaming was a fledgling industry. Sega was happy to share the spoils with rivals Nintendo. Everything turned to custard for Sega when Sony's PlayStation arrived and began breaking sales records almost immediately. Meanwhile, Sega's humble 32-bit Saturn failed to capture the imagination of Kiwi Mega-Drive fans. Sega was forced to sit back and focus on producing high-quality arcade titles, helpless as Sony and Nintendo battled for control of the lucrative end of the market, the boom in home-gaming consoles and games. Now, Sega is back with a machine so incredible that it will have the eager gaming public wondering if they really need that expensive Christmas holiday, and wouldn't be happier with

a little grey box under the Christmas tree. The Dreamcast will initially retail here for \$600 with roughly 12 launch titles, most of these going for \$130. Add-ons include extra hand-controllers and the visual memory unit, both selling for around \$70... This may sound highly expensive, but before gamers gag on their coffee they should remember that the Nintendo cost \$500 when it arrived on the shelves... And they could cast their minds back further, to just before Christmas 1995, when the new PlayStations were going for a whopping \$700 and no one so much as batted an eyelid. Now they are down to less than \$200. The price will sting at first but the pain becomes more tolerable when the players realise that the Dreamcast is more than a conventional games console... In technical talk, it... runs in a standard resolution that is four times higher... [and] has polygon-generating abilities more than 30 times higher than the Nintendo 64. It... has more than three times the polygon-generating ability of today's fastest PCs while containing a more advanced memory that allows transfer rates that PCs cannot match... Combine this with the Dreamcast's advanced effects and graphics abilities and the home game-player has a console that can generate extraordinarily detailed 3D worlds at realistically smooth frame rates, which leaves the competition for dead... [However,] Sony's PlayStation 2 is out in a few months in Japan... Early reports indicate that PlayStation 2 will do everything the Dreamcast can... and more – it will even play DVD movies.

...KIWI computer game fanatics are paying... to fly to Japan to buy the new PlayStation2. But their game could be up unless they speak Japanese... "The PlayStation2 from Japan only works with Japanese games and the player will have to speak Japanese to understand instructions," said... [the] sales manager for PlayStation in N[Z]. "It is naive to buy a PlayStation2 before they are released here. It's better to wait and it's not long to go." The warning also applied to people buying PlayStation2 from the internet at inflated prices... PlayStation2 will cost around \$700...

PLAYSTATION brought the video game arcade into the family lounge and millions were grateful – even if it gave teenage [boys]... one more reason not to talk to anyone besides the younger sibling they were racing, shooting or beating up on screen. However, the console's... successor... isn't just an upgrade. No, the developers say, it will supercharge interactive entertainment, democratise e-commerce, explode the DVD market and make the Sony company a dominant force in the Internet age. All of which makes the arrival of the little black box, which is being demonstrated at a pop culture expo in Auckland this weekend, arguably the entertainment event of... [the year. I]t is geared to play movie DVDs just as mainstream consumers are considering switching from clunky VCRs to the dramatically enhanced digital alternative. And, of course, PS2 will also spin your audio CDs. But the most significant aspect of the machine might be its ability to [eventually] hook into the Internet... For now, though, it will be judged as a game machine. And don't dismiss that as kid stuff. Last year the industry in the U[S] alone raked in almost \$NZ14 billion, and analysts predict that [this year] the revenue will surpass the ticket sales of movies. Something that raises the bar is big news indeed. Does PS2 raise the bar? Just punch the power button on the unit, a sleek black and blue, 40cm-tall mini-tower... [i]nset a disc in the slide-out tray, and it's instantly clear that computer games are edging towards territory previously monopolised by movies. You see skies with multiple layers of moving clouds. Coats that behave like real cloth. Rustling grass. And here's not-so-good news: in this post-Columbine era, social critics now have to contend with muzzle flash from a pistol that illuminates the shooter's face, double-helix smoke trails from missiles and gorgeously granulated blood splatter as you lop off [a] head... The secret is the Emotion Engine, a fast, high-powered chip set that is fine-tuned to generate polygons, the building blocks of 3-D graphics. While the original PlayStation could handle a mere 360,000 polygons a second, version 2 can spit out... 20 million... And when connected to a home-theatre setup, surround sound will allow game designers to assault the eardrums in style. One action-horror game, *Onimusha*, was scored by a 203-piece orchestra... PS2 isn't a sure thing – the launch could be flubbed by an initial short supply or people could balk at the price, thought to be around \$NZ700... – but most people figure it to win. One immediate advantage: it plays almost all original PlayStation games... [Ironically, when a former engineer fi]rst conceived of a new type of entertainment based on high-end graphics... Sony's brain trust[considered] the idea... embarrassing. "Sony was very much an audio-visual hardware company [that considered] game machines as toys,"... Finally, Sony's CEO... took a chance and [the engineer] created the first PlayStation, released in 1994. Gamers loved it, snapping up... 70 million units worldwide. In one of every three N[Z] households... there's a parent begging a kid to drop the game controller and rejoin the family. While developers created hundreds of titles for his machine, [the engineer] set about building a successor that... would redefine computing itself... While that... [successor was being developed], other game-console companies ha[d] their own strategies for "next-gen" games... First to hit the stores was Sega's Dreamcast, which [so far has] sold... 4 million units... surprising those who thought that people would save their money for PS2. Nintendo's Dolphin will... [be released shortly. The] founder of Electronic Arts and CEO of 3DO, two major game designers[, believes the latest game consoles will]... fundamentally change... society in the way the printing press did... "This is a new canvas for humanity that takes us back to our nature." Such hyperbole is music to the ears of [the engineer]. These days, the 53-year-old... is already thinking about PlayStation 3... due around 2005.

...IN THE FUTURE LIFE WILL BE VERY DIFFERENT... FAMILIES AND MACHINES WILL PLAY TOGETHER... CHILDREN WILL BE ABLE TO... FULFIL THEIR WILDEST DREAMS... [Both sexes] will be equal and the drudgery of today will give way to a life of unending pleasure... Work will be limited to only a few hours as robots and computers will remove toil... from everyone's existence leaving us all with hours of carefree time to enjoy together in a fantasy world. Utopian dreams become reality... IN THE FUTURE EVERYONE HAS A PLAYSTATION...
