In the end it was a frightened little boy who triggered the climax of the Moscow siege, shouting, “Mummy, I don’t know what to do any more!” Then... threw a bottle at a Chechen... guarding him and fled towards the exit. For the terrorists it was too much. One casually raised his Kalashnikov and fired, missing the boy and hitting a row of hostages... For the Russian special forces monitoring the unfolding drama from the tunnels under the theatre, the killing was the signal to begin the assault which left 117 hostages and 50 rebels dead... Doctors said that several hostages had died choking on their own vomit, a likely effect of the knockout gas... Of the 646 surviving hostages, 45 remain critically ill... [H]eightened security meant that many Russians could not get to see relatives being treated in hospital for the effects of the gas... [P]olice stepped up checks yesterday and distraught relatives begged for information about loved ones, hoping they survived the siege by Chechen guerrillas whom [Russia’s]President... called “armed scum.” Police in Moscow... checked cars, passengers and luggage to prevent a feared repeat attack.

...A senior Russian general said Moscow had lost 1864 troops in its six-month campaign against Chechen separatists, including 25 soldiers killed in the past week. [The g]eneral... also said 5338 soldiers had been wounded. Throughout the conflict, casualty estimates issued by the two sides have differed greatly and proved impossible to verify by independent sources... An estimated 12,000 Chechen civilians... [were] killed or wounded...

The [Paraguayan]Government said three people, all civilians, were wounded by gunfire[during]... a night of chaos in Asuncion, where... [a] Paraguayan Army barracks rose up in support of a fugitive coup leader... [B]ut just hours later the rebels were persuaded to lay down their arms, the Government said last night. “The situation is totally under control. We are going to be relentless in applying the law to all those who have violated the law and the constitution,” P[araguay’s P]resident... told a local television channel. Hours earlier a group of light tanks filed past Congress in the centre of the capital... and blew a hole in the building’s facade. A burst of light arms fire was then heard before the vehicles withdrew. A group of retired colonels and low-ranking officers who support... [the] ex-General... seized control of the Army’s biggest armoured unit, helped by guards at the base, according to [the]Defence Minister... Speaking while the revolt was underway, the Defence Minister said Air Force planes would attack the rebels if they did not surrender... A police unit also joined the revolt aimed at toppling the Government in the notoriously corrupt country. Paraguay’s weak economy is bolstered by an enormous smuggling industry. An anonymous rebel officer read a communique over the radio calling for [the President] to step down to allow an immediate presidential election. It was the third time in four years that Paraguay’s weak democracy has seemed threatened with a relapse into military rule. Each time the former Army chief... has been near the centre of events and each time the U[S], Brazil and Argentina have exerted pressure to ensure democracy survives. During the tense hours before the revolt ended, the U[S] and Paraguay’s neighbours Brazil and Argentina condemned the violence and warned that any Government arising from the coup would face international isolation.

...After suspending foreign debt payments, Argentina’s new populist leader drafted plans yesterday to... effectively... print cash. It was a bid to help cut the poverty and unemployment behind the bloody riots that toppled his predecessor last week. The Interim President... wants to end a gruelling four-year recession... by... [creating] the “Argentino”, a new third currency to circulate alongside Argentine pesos and US dollars. The Government hopes to create one million new jobs with the currency... after riots and looting over Government austerity plans left 27 people dead.

...Thousands of protesting Argentines banged pots and pans yesterday in a baptism of fire for [the country’s]new Peronist President... [–] the fifth President in two weeks after bloody protests sparked political chaos... [– as it] aimed to end a four-year recession and appease social protests... Despite rapturous applause from the Peronist-dominated Congress that elected him, voters were harder to convince amid one of the worst crises to have hit Latin America’s third-largest economy... People are angry at politicians – widely seen as corrupt and incompetent – as recession continues to erode confidence in the courts, Congress and Government officials. Several thousand gathered outside the presidential palace. It seemed a smaller protest to the massive demonstrations that helped topple two Presidents last month... Two law-makers served as provisional 48-hour Presidents... [T]he real test could come when the Government explains how it will save the economy from near meltdown. In a population of 36 million, around 2000 people a day fall below the poverty line and many are so angry at politicians they have insulted and spat on legislators and Government officials in the street. But political analysts say [the new President], elected to the Senate in an impressive victory in mid-term congressional elections in October, may be the only politician with the ability to garner legitimacy and popular backing. Sources close to [the new President] said the new Government might be preparing a devaluation in the one-to-one peg of the peso to the U[S] dollar, the axis from which Argentina’s inflation-free economy has spun for more than 10 years. This could be accompanied by the transformation of dollar debts into pesos. That would stop widespread bankruptcies as most Argentines earn in the local currency but have debts – such as mortgages – in the greenback. Fear of a devaluation already caused a run on the bank late last year, forcing... the unpopular [then]President... to restrict cash withdrawals to \$US1000 a month. The unpopular measure was a major reason for his downfall. In his inauguration speech, [the latest President said it] would end free-market policies and appeared to continue... his Peronist [predecessor’s]... policy of suspending payments on the Government’s \$US132 billion debt. “My commitment from today is to finish with an economic model that has brought desperation to the vast majority of our people.” But some analysts worry about the track record of the former Governor of Buenos Aires province, which racked up debts during his tenure. Fears persist that Argentina’s collapse could spread to other emerging markets, as well as hurting US, Spanish, Italian, French and British companies with investments there. Political turmoil has been constant in Argentina for decades as the country tumbled from the world’s seventh-richest nation in the 1930s – comparable to Canada – to what many now see as a [Last] World pariah in global financial markets.

...Two Argentines were shot dead yesterday, [at]... least 15 people were injured, two seriously, and 50 people were arrested... as hundreds of demonstrators fought pitched battles with police in the worst riots since [the last] elected government was toppled... Argentina’s [current President, who is] at the bottom of polls and fighting for his political future, had vowed a get-tough approach on protests as [it] struggled to convince a sceptical International Monetary Fund to grant an aid pact vital to stem a spiralling social crisis and four-year recession. The riots came just as [the]Economy Minister... flew to the U[S] to meet senior IMF officials and try to get talks on the pact rolling. But things look bleak... One in four of Argentina’s workers is out of work, [‘bank accounts have been frozen by the Government’ and the country has]... a... \$US140 billion... public debt pile... The riots were the latest chapter of violence and protests this year against Latin American Governments as they grapple with mounting economic problems in a region also affected by chaos in Peru and financial jitters in Brazil. Peru has been hit by major riots against privatisation plans, Venezuela was rocked by a failed coup and neighbouring Uruguayans have gone on strike against IMF austerity policies.

...[Venezuela’s] paratrooper-turned-President... sent soldiers into dilapidated schools and hospitals across the country at the weekend as part of a huge effort to combat decades of Government neglect. Ten years to the day after troops massacred 360 people to put down the country’s worst riots in recent history, soldiers swapped their automatic weapons for brooms and screwdrivers to lead [the President]’s war on the collapse of public services. Battalions swept school yards, regiments sold cheap food in local markets and armies of barbers were called up to supply free haircuts to the homeless, who were removed by the busload from the capital’s streets. A total of 70,000 troops took part in the nationwide action, along with 80,000 civil servants, unemployed people and community volunteers. “In 25 years of public service this is the first time I have seen anyone hold out their hand to us like this,” said... [the] headmistress of a huge inner-city school in a poor district called Prado de Maria. “Even if they manage to do

half of what they have promised, that will be something.”... The populist [President], who was jailed after leading a failed coup but went on to win the presidency in a landslide vote... wants to integrate the military into civilian life as part of his war on poverty and social disintegration... The 1989 uprising – sparked by sudden price rises – and its brutal suppression are widely interpreted as the beginning of the political transformation in Venezuela that led to the rise of... [the former coup-leader. ■ Across the border,] Colombia’s mayors and judges are under threat of death or kidnap after a rebel deadline for the officials to resign passed last night. The threat by the country’s largest rebel army is the biggest offensive against civilian authorities in 38 years of guerrilla war. In a mountain-top interview outside the capital, Bogota, a Revolutionary Armed Forces of Colombia (Farc) commander said the rebels aimed to destroy the state from the bottom up... [T]he elimination of mayors and all municipal authorities was the first step. “The Government has declared total war against us, and our response is to politically disregard the state, its representatives and... laws,” said the... commander of the rebel army’s 51st front. “A new grassroots power must be built by the people... The birth of this new power will not recognise old institutions,” [the commander] added, clad in camouflage and toting an Israeli-made Galil assault rifle... [The rebel’s] offensive followed the outgoing Government’s “unilateral” decision four months ago to scrap peace talks with the Marxist rebels. The Farc previously threatened about 120 mayors, but the newest threat extends to officials in all 1097 municipalities of the war-torn nation.

...[a former US] President... symbolically placed the Panama Canal into Panamanian hands yesterday with the simple words, “It’s yours.” The ceremony gives the tiny Central American nation sovereignty over all its territory for the first time since its birth in 1903[(‘the 81km canal across the isthmus of Panama, connecting the Atlantic and Pacific Oceans, was begun by Ferdinand de Lesseps in 1882, abandoned through bankruptcy in 1889, and built by the USA in 1904-14 in territory – the *Panama Canal Zone* – that was ceded in perpetuity from the Republic of Panama’; ‘the U.S. acquired the necessary lease of land following its support of a revolt in which the state of Panama won independence from Colombia, Nov. 1903 – Colombia did not recognize Panama’s independence until 1914 – and U.S. personnel began to occupy the leased land, May 1904, to construct the canal that accommodates all but the very largest of ships, saving inter-ocean traffic the long trip around Cape Horn, thus giving it great commercial and military importance’). In what the 39th US President] and Panama President... called a pivotal moment in the history of the hemisphere, the two leaders signed a symbolic accord... Under the 1977 Panama Canal Treaties brokered by [the peanut-growing 39th US President], the US will officially relinquish control of the famous waterway on December 31. “At last we have reached victory; the canal is ours,” [Panama’s President] said, framed in the backdrop by the canal boat *Atlas*, decked in festive maritime bunting... Outside the locks, demonstrators burned an American flag, rejecting any future US presence in Panama and protesting against a plan to flood indigenous and peasant communities to increase the canal watershed.

...Constructing a canal to link the Atlantic and Pacific Oceans was the largest, most expensive project ever undertaken at the time. Battling disease and incredible hardship, 100,000 workers took on the challenge of the century. [Estimates of the number of ‘worker deaths – often due to malaria rather than land slides, dynamiting accidents (23 black labourers were killed in one explosion when the charge went off early) and other mishaps – during construction range from 5,000 to 22,000. The canal’s locks were the largest concrete structures of the day – it takes enough water to last a city for two days to raise or lower each lock. Today the canal is being widened so the largest ships can pass each other and save the 30-day trip around Cape Horn.’

...At the beginning of 1988, the ‘US sent its Assistant Defence Secretary to urge Panama’s military commander – who had been indicted by the US for converting Panama’s government into a “criminal enterprise” (the general then accused the US Administration of preparing drug charges after it refused to co-operate in a plan to invade Nicaragua, alleged CIA involvement in the 1985 murder of a politician, and called for the US to end its presence in Panama) – to step down and allow free elections. In February, Panama’s President dismissed the general, who refused to leave office despite the public’s joyful reaction to his sacking. Neither the military nor the legislative assembly backed the President’s moves. A replacement President was named and sworn in (the US continued to support the former President but ruled out intervention – other than withholding payments for the operation of the canal). In March, Panama witnessed an abortive military coup as thousands of anti-government protesters wreaked havoc for three successive days. In early 1989, as details were revealed of the US President’s involvement in a CIA plot to oust the general, polls showed the latter’s lack of support among voters in the run-up to presidential elections. After the election, the poll count was suspended as both sides claimed victory amidst reports of widespread corruption. The US was among countries who condemned the general’s manipulation of the election result, before the general declared the elections null and void. The US ridiculed the naming of the general as head of government. The killing of a US officer by Panamanian Defence Force soldiers – Panamanian forces had earlier condemned the US decision to send more personnel to the area – resulted in both sides being put on a state of alert (the US feared an emerging pattern of violence against its service-people may have been linked to the general’s declaration of being in a “state of war” with the US). Invoking the UN charter to justify its action, the US President ordered his troops to invade – offering a \$1m reward for the capture of the general. Three foreign journalists were killed by US troops in a controversial shooting incident. The general surrendered to a Vatican diplomatic mission in Panama City; Cuba offered him safe haven. Results of new presidential elections were officially recognized. A new Panamanian President was sworn in, ending 1989’s post-invasion “Sugarloaf” government’.]

...last week’s referendum... reinstated [Iraq’s dictator] as President for another seven years. All 11.5 million eligible voters apparently cast their ballot for him, an improbable 100[%] “yes” vote. There... [were ‘500 people sent to jail for voting “no” seven years ago’ – although, if they are still in jail, they will be released under the President’s ‘general amnesty for prisoners to celebrate his victory.’ D]espite the dictatorship, poverty and corruption they endure... [d]istrust of America runs deep among ordinary Iraqis... [One] is trying to study the great works of American literature in her rundown classroom at Baghdad University. [The Iraqi] used to be fascinated by American culture, but lately the 23-year-old postgraduate student has had a change of heart. Her library stocks a handful of copies of the Steinbeck texts [the 23-year-old] needs, but not a single work of literary theory or criticism. “I tried sending letters to American universities to ask for help. But I got nothing back... I know they don’t want to help us, but now they want to attack our country again. I just don’t understand why they hate us.” Life for many Iraqis under the [dictator’s] regime... has been unbearably harsh. No one will say so in public, but few would mourn his departure after a US and British attack. But... years of sanctions and... American-led bombing raids have significantly changed attitudes towards the West. Iraqis are well aware of the imminent return of U[N] weapons inspectors... and the threat of war. Yet many appear concerned about America’s intentions once the promise of “regime change” has been achieved. “We will not submit to American demands. This is just not fair,” said... a... 32[-year-old]... student of English literature at the university. “Our people want to live in safety. Why do they consider us all guilty? Why do they want to force themselves on us? [The US President] behaves like a teenager, not the leader of a great country.” Most believe Iraq’s oil, the world’s second-largest proven reserve, is at the heart of the problem. “Our oil is the most important strategic item in the world,” said... a Turkish and Russian business translator. “America and Europe need our oil. It is that simple. Saudi Arabia is helpless because there are so many American bases there...” Last week, Spain’s top diplomat in Baghdad resigned, saying [it] felt under increasing pressure to toe a pro-Washington line. “The official position is so markedly pro-US that, if you don’t support Washington’s policy, it is as if you are working against your own Government... The way the situation is presented, you are asked to choose between [the Iraqi and US Presidents], and I won’t side with either.” [The dictator’s] propaganda machine has helped to fuel Iraqi anger at America. In a rare speech, televised nationwide, [the dictator] accused Washington of trying to deceive the Muslim world. “The Americans want to conceal their true thinking from the Arabs. When the Americans show their ugly face, only then will people realise what they are doing.”... Many Iraqis are too frightened to speak their minds for fear of [the regime’s] ruthless Mukhabarat intelligence agency. But there are whispers of dissent... There are... grumbles that the state is sending money to support Palestinian families while Iraqis live on the breadline. And there is anger that an elite has made a vast fortune from illegal trade throughout the embargo. Illegal oil sales are put at around US\$1 billion... a year and the fruits of the trade are obvious. The shops in Baghdad’s Arasat St reek of the opulence of corrupt [Last] World elites. Wide-screen televisions... are on sale.

Supermarkets sell foreign cigarettes and under-the-counter Cuban cigars at US\$150... a box. Every other car on the road is a new BMW or Mercedes-Benz. All this in a country in which UN sanctions have supposedly limited imports to humanitarian goods alone.

...Imagine you lived in a country where... the land is rich in exportable oil, but money was worth nothing, and you traded basic foods for shoes and clothing. Where, if children died before they reached school age – and one in seven were doing that, many in hospitals lacking the most basic drugs – you didn't let the authorities know because the dead child's ration book was a lifeline for those who lived on. And all because the leaders of what we call the "Free World" don't like your head of state. [One person] doesn't have to imagine. [It] remembers Iraq, the land once called Mesopotamia, where Saladin fought the Crusaders. Where ziggurats like the Tower of Babel dotted the fertile landscape. Where the Hanging Gardens of Babylon scented the air. [It] lived in Iraq for a year after his boss, the U[N] Secretary-General... sent him to coordinate UN humanitarian relief. In September 1998 [it] resigned and quit the UN altogether. The reason: his heartfelt view that the trade sanctions against Iraq, designed to break the will of [its] President... are destroying a nation and killing innocent civilians and not reaching into the dictator's gilded fastnesses. They are, [it] says, "both illegal and immoral and they fit the definition of genocide." His resignation uncorked a fizz of discontent. In February, his successor... quit too, lamenting that the civilian population of Iraq was being "exposed to such punishment for something they have never done." Two days later, [the]... head of the World Food Programme in Iraq, threw it in as well. For much of the... [time since it] ended a "fantastic" 34-year career, [the former coordinator] has travelled the world, knocking on doors throughout Europe... and North America, trying to drum up support. As luck would have it, [the coordinator] was in Wellington this week when our Government became the first in the world publicly to denounce the sanctions. [The Foreign Affairs] Minister... said blanket trade sanctions were "a blunt instrument" harming ordinary Iraqis but not the ruling elite. "They could cause devastating suffering and long-term degradation to civilian populations." [The coordinator] might have wanted to amend that "could cause" to "are causing," but... was too gracious to say so. N[Z]'s stance, though largely symbolic (we are bound by the UN Charter to adhere to the sanctions regime), meant a lot to him. "N[Z] has a reputation in the UN which is out of proportion to its size... It has the capacity to lead others in a coalition of member states who know this ain't working." ...In October, [t]he... tall and elegant Irish[person]... went back to Iraq with [a] crusading journalist... and a television crew. The physical decay made his blood run cold. Because Iraq is a rich – and energy-rich – country, its infrastructure is highly electrified... "They had money and they went first class. Irrigation systems, hospitals, clinics, food processing, incubators, the whole gamut. But even when I was living in Baghdad – and I was living in a good part of town – I was invariably driving through sewage. They're still [only] getting about three or four hours' electricity a day where the temperature routinely goes above 50 degrees." The official death rate of children under 5 is 131 per 1000 live births – ...but... the figure is almost certainly higher. Particularly in country areas, babies die before being registered as born, so their deaths are not recorded. Give or take a few tiny lives, it means that a couple of hundred Iraqi children will die by this time tomorrow. Half a million in eight years. These deaths, [the coordinator] is keen to remind us, are not occurring because of some cruel accident of climate, a biblical plague, a civil insurrection. They are the direct and demonstrable result of a sanctions policy hammered out at the UN. [The coordinator] wrestled for six months with the idea that [it] might have to quit a job where the need was so great. But in his time in Iraq [the coordinator] did make a difference. The doubling to \$US8 billion of the "oil for food" programme... occurred largely at his instigation... And sometimes [the coordinator] was able to focus on the little picture, too. Inspecting Baghdad Hospital with the head of the W[HO, they] came across four children with leukaemia, certain to die for lack of basic drugs. "I told him to get me the drugs and I'd pay for them... [The head] got the drugs, imported them directly, illegally, outside the sanctions framework. Of course by the time we got them, two of the kids were dead already." When [the coordinator] went back in October, only one was alive... [The 12-year-old] smiles tentatively from a photograph her saviour always carries in his briefcase. [The coordinator] smiles wistfully, perhaps at the naivety of the question, when asked why the sanctions persist when their failure is so widely documented. "Those who are in charge understand very well that they are on the wrong track. But that's not what rules the decisions of states. The politics of oil, the need to control Iraq, th[at's the crux]... There is no democracy in the Security Council. It is totally manipulated by the U[S]. The problem when you have one superpower is that nobody's going to stand up against it. The Russians aren't going to stand up too high because they don't want to be embarrassed about Chechnya, the Chinese are sensitive because they want to get into the W[TO] and they are embarrassed about Tibet." ...writing in the *Guardian* of his October trip to Iraq... [the coordinator concluded]: "The Iraqis are more sophisticated than we are. They can come up to you and me and say: 'I like you as an individual; your Government is the problem.' We don't do that. We blacklist every Arab in town, they're all terrorists." A one-time Quaker ([it] describes himself as "lapsed"), [the coordinator] says conscience, not faith, drives him now. "I couldn't sleep with myself if I didn't do what I am doing. I've got to stick with it until something changes."

...*Sea of Galilee sticking-point for summit*... Watchers of the Arab world have... suggested that... Syria's President... is becoming more forgetful by the day. But [Syria's President] has kept one memory intact... [- swimming] in the Sea of Galilee and ca[tching] fish in its waters. No matter that this was more than 30 years ago, when the sea's northeastern shores were controlled by Syria, before the land was lost to Israel in the 1967 Arab-Israel war, along with the Syrian Golan Heights. Last week, it became clear that the chief reason for the failure of the summit in Geneva between [Syria's President and his US counterpart] was a fundamental disagreement over the Sea of Galilee (also known as Lake Tiberius and... the Israelis[call it] Lake Kinneret). The Syrians want the Israelis to withdraw to the positions held on June 4, 1967 – the day before war broke out – by returning the occupied Golan Heights and restoring to Syria the lake's northeastern shores. Syria has the weight of international law on its side through UN Resolution 242, which calls for a withdrawal from all territories seized during the 1967 war. Anything less would compromise, in Damascus' view, the loss of what is legally Syria's. It emerged during the Geneva negotiations that the Israelis are now willing to leave the Golan, but not to withdraw to the exact line of June 4, 1967. They want to keep a 100m-wide strip of land along the lake's eastern edge to block the Syrians from having access to the water itself. The lake provides 40[%] of Israel's water and it is feared that Syria would pump water for its own purposes or pollute it. Syria has said this would not occur and has guaranteed not to use the water, so long as Syria got its part of the shoreline back. But Israel remained unconvinced... Syrians see a deal that leaves the lake's shores in Israeli hands as peace without honour. They point out that every child in Syria knew that their forefathers bathed in the lake... So the process is in trouble again. [The US President] has, in effect, blamed the Syrians for Geneva's failure, although [Syria's President] simply stuck by the letter of international law. Happy in the knowledge that [it] can blame Syria for scuttling the talks... Israel's premier... seems set to withdraw Israeli troops from the Lebanon occupation zone by July without an agreement – despite the risk that this could lead to more bloodshed and instability.

...*The ultimate price of peace*... WHEN the first Irish U[N] force came to Lebanon in 1978, I found an Irish Army Air Corps Captain... sheltering under a truck as Palestinian[s]... shrieked abuse and the French Foreign Legion fixed bayonets 50 feet away. Recalling his country's bloody experience in the Congo, [the Captain] asked me a question very matter-of-factly from beside one of the truck's axles. "Could this be the same?" It was worse. In all, 48 Irish soldiers were to die in Lebanon... and this St Patrick's Day – the last for the UN's Irish battalion – there was talk of how they hoped their one unrecovered body might go home too: [the Private who is] missing presumed dead after being kidnapped by dissident Palestinians in 1980. One more battalion will be sent to southern Lebanon and it will close down Camp Shamrock... The Irish will then leave behind a land that looks like County Mayo, in which they have been loved, harassed, insulted, murdered and maligned. But their peacekeepers... [- armed only with] personal weapons and light armour... [-] stayed on through the worst shellfire and the most deliberate killings. In the town of Tibnin, the Lebanese speak English with Dublin accents. In the village of Bradchit, they have Galway accents. In Haddata, the Lebanese speak like Waterford [residents]... It may be apocryphal, but legend has it that... [an Irish] scholar, historian, UN diplomat, government minister and

supporter of Israel, turned up at the village of Beit Yahoun and told the local kids to leave him alone. “Emshi” (“go away”), the eminent Dr... is said to have told them. To which a small Lebanese boy answered in a perfect Dublin accent: “Emshi, me bollocks!” ...At their... last... St Patrick’s Day parade... the Irish debated what to do with the memorials to their dead. Should they stay in the land where the... soldiers died? Or should they be freighted back to Ireland? The mission of the U[N] Interim Force in Lebanon was supposed “to confirm the withdrawal of Israeli forces” after Israel’s 1978 invasion and help the Beirut Government restore its sovereignty across southern Lebanon. But the Israelis continued to occupy the southernmost part of the country – 10[%] of Lebanon... If “interim” can now be [re]defined... much of [the Irish Army’s] time has been made ferocious by Lebanon’s militias, by Israel’s murderous little proxy army, the South Lebanon Army and – on one terrible occasion – by an Irish soldier who turned his gun on three of his own comrades. The Israelis insulted the battalions as “Johnny Walker Irish,” infuriated because Irish troops, whose sobriety has never been in question, refused to retreat before Israel’s proxy [army] in 1980. In the village of At Tiri that year, the Irish went into battle to prevent the South Lebanon Army taking over. They killed one of Israel’s Lebanese allies and lost one of their own... In revenge, one of Israel’s militiamen... murdered two Irish soldiers... in an incident that might be regarded as a war crime. But [the Israeli militiaman] now lives in safety in the U[S]. The Americans – otherwise so keen on hunting terrorists – have shown no interest in arresting him. Then there was Lieutenant Aonghus Murphy, one of Ireland’s most promising young officers, deliberately blown up in a mine explosion by the Hizbollah in August 1986. The guerrillas were angry that his [squad] regularly cleared a road upon which they had planted mines to kill Israelis. The [person] held responsible was a Hizbollah official... now one of 19 Lebanese held illegally in Israel. His release is demanded by the Hizbollah, and his Unifil (U[N] Interim Force in Lebanon) liaison officer... was sitting as a guest of honour at this year’s St Patrick’s parade. What, I wondered, would St Patrick have made of that? ...■ IN BRIEF... The Israeli Army has admitted that its troops shot and killed a U[N] official on the West Bank. Some Israeli radio stations said Briton Iain Hook, who UN colleagues said had been calling Israelis to try to arrange a ceasefire during a gun battle on Saturday, was shot when soldiers mistook his mobile phone for a weapon.

...A new book is about to cast dark shadows over Anzac mythology... [T]he taped recollections of a trooper of the Light Horse, one of A[US]’s most hallowed units... held at the A[US]n War Memorial in Canberra... described the... slaughter of... [a]s many as 120... villagers... at the Palestinian town of Surafend... shortly after the end of W[W]I... as the A[nzac]... and British troops prepared to go home after a long campaign against the Turks. The... Anzacs had exhausted their patience with the “treachery of the natives” and... their frustration with their “constant thieving” came to a head when a NZ machine-gunner was shot and killed by an intruder. Angered further by the failure of British officials to respond adequately, the troops took matters into their own hands... “The native [gals] and children were first put out of harm’s way, and then the [troops], fired by hate... entered the village... A Bedouin camp situated nearby was treated in a like manner.” ...the massacre highlighted the moral complexity of war and how otherwise-good [guys] could do terrible things. “The Anzacs were not... mono-dimensional heroes...” [the author] says.

...Kiwis are highly acclaimed internationally for their work in clearing land mines. Not many people know that, nor how wide-ranging the activities of N[Z] soldiers overseas are. The documentary, *Keeping The Peace*, on TV1 at 10.35pm, Tuesday, aims to put the record straight. Shot before N[Z] forces were called to E[T], the programme shows how experiences gained in dozens of different war zones in far-flung corners of the world have prepared the soldiers for their current assignment. The film crew... caught up with a Kiwi corporal in Mozambique leading a group of Americans on a world tour teaching them about mine-clearing techniques. But our soldiers... are[also] seen... observing cease-fire lines in South Lebanon; ...rebuilding a school in Bougainville; ...driving main battle tanks... driver training and testing soldiers... [plus] doing environmental protection work... in Sinai... and running Nato’s reconstruction programme in Bosnia.

...There is more than a little irony in the fact that we refer to the years since 1945 as the post-war era. It took only four years from the signing of the Japanese surrender... before N[Z]ers were again under arms in the Malayan Emergency, fighting against communist insurgents. It would prove to be a 12-year campaign, involving two N[Z] infantry battalions and the S[A]S, that was to establish the Kiwis’ reputation as jungle fighters. A year later we were fighting under a U[N] mandate in Korea in one of the bloodiest wars in history... Our casualties were comparatively light – 41 dead... Contrast our losses with more than 580,000 U[N] and South Korean dead, wounded or missing and the estimated 1.6 million communist casualties... [In addition, over] a million South Korean civilians had been killed and several million more made homeless... Given those statistics, it is somewhat shameful that my only childhood memory of the Korean War is being told that it created such a demand for clothing and blankets that N[Z] woolgrowers were in clover. The average wool price a pound jumped from 38 pence in 1949-50 to almost 88 pence in 1950-51. However, that war gave rise to the institution that moulded N[Z] foreign policy for the next 30 years – the Anzus pact... In 1963 we again committed troops to assist Malaysia fight a border war with Indonesia. Dubbed, euphemistically, “confrontation,” this undeclared war involved more than 11,000 Commonwealth troops over a three-year period. It saw our infantry and SAS deployed in some of Asia’s most inhospitable jungle. When it was over our unit did not come home. The First Battalion of the Royal N[Z] Infantry Regiment was more at home in Asia than in N[Z] and maintained its base there until the late 1980s. While confrontation with Indonesia was still being waged, N[Z] became involved in the most divisive war in its history – Vietnam. Our ties with the U[S] were beginning to carry a price... Vietnam had a cathartic effect on N[Z] and on N[Z] politicians who would think hard and long before committing us to another war. So, with the exception of a numerically small commitment to the Gulf War, N[Z] has become a peacekeeper, reluctant to fire a shot in anger and “protected” by the blue beret of the U[N]. It has been our principal protection in places like Mogadishu and Bosnia. And as I write, a bright young [guy] I have known since [it] was a schoolboy is somewhere in E[T]...

As the sun rises over the dusty lands of E[T] this morning, it will be a new dawn for the world’s newest nation... Yesterday thousands of its 850,000 people... knelt in the dirt to pray for a better future, as celebrations of their independence as the world’s 190th country began... In a ceremony that began at dusk with a solemn three-hour mass and scheduled to end with a pageant of fireworks, thousands witnessed the formal birth of a sovereign nation. A weekend show of military strength by former occupying force Indonesia did not quell the spirit of the... [ETese. L]ocals and international visitors poured into the celebration site... 8km from the capital... to watch the U[N] flag come down and the E[T]ese flag go up at midnight... [The] UN Secretary-General[, who was] given the task of handing over authority for the country’s administration to the Speaker of the E[T] Parliament, described plans by Indonesia[’s] President... to briefly attend, despite domestic critics, as a “wise and courageous decision.” ...The UN Security Council on Saturday voted to extend its presence in E[T], with the support of the new Government... The 8000 peacekeepers will be phased down to 5000. N[Z]’s last battalion of 621 left for duty this month... [After winning 82%] of the popular vote... a... [Nobel Peace Prize laureate] was installed as... [ET’s first]president... More than 90 countries sent delegations to celebrate independence, putting enormous strain on Dili. Guests included [the AUSn and NZ PMs. NZ]... has pledged E[T] \$10 million over the next four years.

...ON THE far-flung atolls of Tokelau some 3000km from Auckland, the N[Z] flag flies high in the gentle Pacific breeze. It is no visitor to those shores, and it is no stranger either. Our ensign belongs as much to the inhabitants of those palm-lined islets as it does to so many [thousand]s of kilometres to the south. “Colony” is not a fashionable word these days, so Tokelau... is, in the politically correct diplo-speak of modern politics, a non self-governing territory... N[Z]’s last dependency... has not always been bound to us. N[Z] inherited the three atolls... from the British in 1925. And in 1948 the territory, with its land mass measuring less than 13 sq km and never wider than 200m, was formally made part of N[Z] with the passage of the Tokelau Act... The aid N[Z] gives to the fewer than 1500 people of Tokelau – \$6.5[million] in 1999... – makes up four-fifths of its budget. Most of it goes into grants to the Tokelau administration to fund transport, education and health. The rest goes into scholarships, telecommunications, power, village development and sanitation. Tokelau also receives U[N] development programme money and generates about

\$1.5 m... itself in income tax, levies, duties, and selling off-shore fishing licences. But the U[N] wants change. Several years ago it named Tokelau as one of 27 nations worldwide it wanted to see become independent by 2000. We, too, are happy to help if our dependent chooses to be independent. With N[Z]'s aid, Tokelau is working towards drawing up its own constitution and taking a further step towards independence by considering an act of self-determination. Yet when it goes, colonisation will have left its indelible mark. For... Tokelau's oldest resident... one of the evils of modernisation has been the introduction of Western food... Despite never having dental care, elders... have a full set of teeth. However, today children as young as 6 have rotten teeth... Each atoll is literally built on coral rubble so, unlike other Pacific islands growing export crops is almost impossible. More significantly, the tourist dollar is a rare visitor... The nearest big island is Western Samoa, which lies 480km to the south. Without an airport only one or two hardy visitors are keen to brave the 32-hour boat ride from Samoa. Once there, the island hospitality is renowned, but life is basic. There are no hotels, no bars, no restaurants. Tokelau is believed to be the last country in the world to get a phone service (in 1997), and the generators mean power is only on several hours a day. Many families still cook on open fires and almost all use open "latrines" or toilets on stilts above the water. Space is also in short supply and the villages are congested. The 1996 census found an average of 123 people living on each square kilometre. Fakaoka, one of the most densely populated, is so crowded that its population of several hundred pigs... [- which along with] breadfruit... and... taro... have been introduced... [-] lives on the reef because there is nowhere else to put them. When the tide comes in, the animals swim or scramble on to the rocks. They are hand-fed by the families who own them and forage for shellfish, seaweed and fish... Like neighbouring Tuvalu 1000km to the west, the atolls of Tokelau are gradually sinking at a rate of about 1cm a year and the highest point above sea level is 5m... That is the present for Tokelau, but the past has seen worse. As a little boy, [the elder] remembers hearing stories of the Peruvian slave ships that came ashore and captured almost half the able-bodied [guys] on Tokelau. The 252 taken were sold at the markets in Callao in 1863 and only one returned home... [O]ne of the new faces of Tokelau... won a scholarship which enabled her to do her Sixth and Seventh Form at Wairarapa College, then on to Waikato University where [it] completed a Bachelor of Arts and a law degree. Although many other Tokelauans graduated from university before her, [it] was the first to be admitted as a barrister and solicitor of the High Court in Waikato last year. Married to a Fijian resident, also a lawyer, [it]... made the hard decision to return to Tokelau to give her skills back to her people... Although there is no need for a lawyer on Tokelau (there are three police officers but virtually no crime), [it] works as a senior policy advisory officer for the Office of the Council of Faipule, the island leader... Tokelau will need her. When N[Z]'s flag is lowered for the last time in these tiny atolls, the challenge will be to replace it with the standard of successful self-determination... "My hope for the future is that the next generation of people will have the best of both worlds. That they will never forget our heritage, but can use their education for the betterment of our people," says [the elder].

...Waitakere City has been named as N[Z]'s very first Peace City, and now has its own little haven of peace in the heart of Henderson. The award comes from Waitakere City and Henderson Rotary Clubs in the form of a special peace garden, gifted to the city as recognition of its work in conflict resolution. That work includes the restorative justice pilot scheme and Living Values. "It provides a focal point for what Waitakere City stands for," says [the]mayor. The... \$6,000... circular, paved garden[- which] can be found in Falls Park on Alderman Dr, with a breathtaking vista of the new Falls Bridge... [-] features Chicago peace roses, and has been professionally landscaped in a design resembling the Rotary Club's distinctive wheel logo... The garden is dedicated to the memory of Rotarian founding member and past president Don Page, "a [hu]man of peace"... "The objective is world peace and understanding, so that when people come and see the garden they'll take that away with them," says... Rotary's immediate past president. "Peace is more than stopping bombs, it's about working towards the resolution of conflict in general as a community," says Rotary's district governor. "That means stopping bullying in schoolyards, domestic disputes, and road rage." There are... 24 official Peace Cities around the world, a project started in 1991 by the Wagga Wagga Koorringal Rotary Club in N[S]W... The project involves promoting peace through a wide variety of activities, particularly those focused on youth. Rotary is involved in many school leadership programmes like Reaching Forward and Reaching Out, peer support, a mock U[N] assembly, and is looking forward to celebrating World Peace Day on February 23, 2000.

...Is it possible to write a history of [hu]mankind spanning... the past 1000 years? The first impulse is to grin at the folly of trying to encapsulate so much and so many in a single work. But [one] Oxford history don... is a [perso]n not troubled by lack of confidence in his own intellect. His succinctly titled history *Millennium* captures 1000 years of civilisation as a shifting pattern of settlement, technology advance and conquest. But it was not a history that saw events as a continuous parade from that most powerful of cities in 1000, the Sung capital Kai-feng in northern China, to Washington DC, seat of government for the world's greatest superpower at 2000. Instead [the don] synthesised history as a series of flashes illuminating those moments when civilisation struck a new paradigm and through technology or political power developed a significant and novel world order that overturned what came before. Taking that concept a step further is *Millennium: A Thousand Years of History*... While it cannot have the depth and brilliance of the work it was based on, it takes [the don]'s template and through images matches the flashes of word and deed that [the don] settled on to capture moments in the past 1000 years, when all would never be quite the same again. The millennium begins with the Century of the Sword, a time when China was the most advanced civilisation on the planet... We know about gunpowder and porcelain, but there are so many other... technolog[ies]... which to this day continue to form the basis of our civilisation: the mechanical clock, the magnetic compass, paper money and printing with movable type, (yes, three centuries before Gutenberg) used to publish a 1000-volume encyclopaedia in 1006. This century belonged to the East - China, the Islamic states, India and Japan - where great knowledge... was amassed. The next century belongs to the Axe, not in the sense of a weapon of war but a means to subjugate nature. In 1124 the Chinese census claimed 20 million households. Forests and wilderness gave way to cities. The path of urbanisation began in earnest. In western Europe Italian city states arose, based on the Roman ideal of a city republic, fiercely proud of sometimes imagined Roman origins or sites of Christian significance that brought the mini-republics a sense of allure and power. Today we call it branding. The 13th century belonged to the Stirrup - a symbol for the wild... Mongols. Their territory peaked as the largest continuous land empire the world has known. Their great ruler, Genghis Khan, controlled an empire that ran from the Pacific in the east to the Danube in the west. His very name meant "World-ruler" and this was no boast, just a fair description. At its peak the Mongol empire could transmit information at a rate of 300 miles... a day and its trade routes offered safe passage for goods to move freely between east and west. Yet those same trade routes made the next century a time of great suffering. The 14th century belongs to the Scythe - symbol of death - because the... Mongol... trade routes... were the means for... transmitting the Black Plague that crushed the advances of the eastern empires. If the symbolic Scythe halted civilisation's advance, the next century can be called catch-up time, the Century of Sail. It was marked by China's failure to realise the potential it offered... The illustrative example is Zheng He, admiral of the emperor Yung-lo. As the 15th century began Zheng He sailed armadas of up to 300 ships, crewed by some 30,000... Some reports suggest Zheng He reached the southern ocean and A[US], but without doubt [H]e did sail to the furthest reaches of the Indian Ocean. It was a crucial decade. Chinese technology could have ruled the waves, but influential Confucian scholars decided the outside world offered nothing to China. One scholar wrote: "Barbarian kings should be treated like harmless seagulls." They were wrong, as the Portuguese and Spanish, among other European states, discovered. For them the 16th century can be symbolised as the Century of the Compass that made it possible to envisage the world as a globe whose emptiness was quickly filled as colonial European powers extended their reach. That territorial conquest was sheeted home in the 17th century, which can be dubbed the Century of the Telescope. For the first time in the millennium, western science and technology began to outpace the Far East's. The [perso]n who symbolised the century is Galileo, because [the Italian] reordered the world by deducting that the Earth was not the centre of the universe. But [Galileo] was forced to recant by a Church that could not countenance what it saw as heresy. The 18th century, dubbed the Century of the Furnace, is another figurative description. It refers to the fervent of ideas that shook the century as the Enlightenment became ascendant in Western Europe, a

movement that persists today. The world was now ruled by forces that could be rationally explained using scientific laws. Everything could be measured, catalogued and set in order. So it is entirely logical for the 19th century to be the Century of the Machine. European countries doubled their populations, but still needed more sheer [hu]man-power to satisfy colonial ambition. Technology again provided the solution with the steam engine, the repeating rifle and the first successful explorations of electricity and magnetism. The century was marked by another paradigm-buster as important as Galileo. Charles Darwin's *On the Origin of the Species* sold out on the first day of publication. His research and theory of evolution and natural selection turned belief upside-down. In... h[is book Darwin] wrote: "...from the war of nature, from famine and death, the production of higher animals directly follows." Nothing could be the same again. And so the millennium draws to a close with our own time which can surely be called the Century of the Globe. True global powers arose in the Soviet Union and U[S] and with them pretensions of a global culture. Again technology let humanity take another step: this time into space. For the first time in history we could look back and see the globe that we had formed from science, deduction, exploration and conquest. It is a heady sight to contemplate as the third millennium arrives.

...The U[S] has been soundly defeated in a fresh bid to cripple a draft anti-torture treaty that has been a decade in the making, paving the way for the pact's final UN approval next month. The UN General Assembly's Social, Humanitarian and Cultural Committee approved the draft treaty by a vote of 104 to eight, with 37 abstentions. The US said... that opening prisons to international inspections would violate states' rights under the US Constitution... and... the pact would divert UN resources from other, more efficient, anti-torture mechanisms...

The U[N] has been hit by an unprecedented wave of fraud, waste and corruption. Officials at its anti-fraud investigation unit say they are expecting to have to run more than 350 inquiries by the end of the year – nearly twice the total for 1998... Thousands of staff, contractors and consultants have been interviewed in scores of countries... The alleged crimes being investigated by the unit, the Office of Internal Oversight Services, range from the petty – such as employers using... UN planes for personal travel – to the huge, such as million-dollar frauds... In one major success this year a former UN official was jailed for three-and-a-half years for embezzling \$US770,000 while working in the former Yugoslavia... In another case, \$US700,000 was recouped after it had been misdirected into a private individual's account by a bank. Other investigations have been into false claims of living allowances and education grants, the payment of \$US6 million for sub-standard supplies in Angola, mismanagement of a number of conferences and alleged fraud by... contractors. Peacekeeping operations are a focus of criticism. One recent independent report alleged that troops provided by member countries for peacekeeping missions were often inadequate. "Some countries have provided soldiers without rifles, or with rifles but no helmets, or with helmets but no flak jackets... This must stop." A former UN official said the UN had "an absurd and unaccountable system of abuse, embezzlement and ineptitude." [The former official] described a series of cases that included assistants to a senior official based in another country not realising their superior had died for more than a year, and an official report on the human rights situation in Czechoslovakia which "cut and pasted" a report from Colombia... about guerrillas and narco-traffickers... [The former official] also criticised "an addiction to perks and luxury." ...The revelations will embarrass... the UN Secretary-General, who hosted national leaders to the Millennium Summit in New York this week. The summit was the biggest such meeting in the UN's history and [the Secretary-General] was hoping to convince sceptical heads of state that the UN has provided value for money and that its role should be expanded.

...[the US President] arrived in Seattle early today to... attend the... W[TO] meeting to set the agenda for a new round of negotiations aimed at reducing trade barriers in sectors ranging from agriculture to electronic commerce... Earlier, [the President] acknowledged that addressing labour and environmental concerns in trade talks was "not going to be easy" because many [Last World] countries saw concerns about environment and labour standards as a way to "keep them down." ...[the] UN Secretary-General... echoed [the President]'s comments... in the speech [the Secretary-General had] prepared for the conference but... was unable to present because... protests forced him to stay in his hotel suite. In it, [the Secretary-General]... said, "it seldom makes sense to use trade restrictions to tackle problems whose origins lie not in trade but in other areas of national and international policy." ...[□ Last night r]iot police broke up a violent protest... by hundreds of anarchists who ignited a fire outside a major London train station in a demonstration against capitalism and the WTO summit in Seattle... [A]t about 7 pm local time... up to 2000 protesters... brandishing placards saying "Kill Capitalism" and "WTO equals World Thieves Organisation" started ripping up paving stones and guard rails just outside... Euston Station... In a two-hour rampage the anarchists overturned vehicles and disrupted London's evening rush-hour commuter travel... Kings Cross Station and several other stations in the area were... closed to ensure the violence did not spread... A similar protest on June 18 turned into London's most violent for a decade as protesters burned cars, smashed offices and battled with police.

...**BATTLE OF SEATTLE**... Seattle is under dusk-to-dawn curfew and the National Guard is patrolling the streets after violent protests... In scenes reminiscent of U[S] civil rights and antiwar protests of the 1960s and 1970s, police in riot gear sprayed teargas and shot rubber bullets to disperse demonstrators who had blocked access to the convention centre where the W[TO]... director-general... and... delegates... tried to begin their millennium round yesterday... Masked protesters broke shop windows, set fire to rubbish bins and hurled teargas canisters back at police. They vandalised stores as they retreated. Seattle police admit they were taken by surprise... "It was a calculated strategy of major, active and threatening disturbances." ...The protesters – some peaceful... – were an unlikely alliance of anarchists, watersiders, animal rights activists, punk youths, senior citizens and students. But what they had in common was a belief that the WTO is a tool of big business... "This is an unprecedented convergence of ordinary people from different sectors of U[S] society who have decided to take a stand against the corporate takeover of the planet and the assault on family farms, forests and endangered species," said [one] demonstrator... "It's an unarmed civilian insurrection on the streets of Seattle at the brink of the millennium," said the member of a Californian activist group called the Resource Centre for Nonviolence. More than 16,000 unionists marched through Seattle demanding that the WTO put jobs ahead of free trade and profit. A dock-workers' union temporarily closed ports along the US West Coast in sympathy... At the... Westin Hotel, where [the] US Trade Representative... and her Japanese counterparts were staying, guests were told to go to their rooms for fear that demonstrators would storm the building... Undeterred by the protests, Trade Ministers representing the 135 WTO members went ahead and delivered dry speeches about their vision for the global trading system.

...[the former NZ Labour Party PM] is making a good impression... [as the new WTO] director-general... amid the protests at the Seattle conference... Protesters demanding the WTO's destruction are working against poor people and developing countries, [the NZer] told a news conference in a voice brimming with emotion. "To those who argue that we should stop our work, I say: tell that to the poor, to the marginalised around the world who are looking to us to help."

...*Globalisation has made most of world poorer*... There has been intense media interest in the demonstrations at the World Economic Forum meeting in Melbourne last week and some people have been critical of the Green Party's decision to send [another MP (r:p1384, ln47)] and myself as representatives. To understand why we felt it necessary to support the demonstrations it is important to understand exactly what was happening in Melbourne last week. The World Economic Forum was a meeting between hand-picked representatives of the 1000 richest corporations and individuals and guests from the Government, academic and media elites of the world. Essentially, the meeting was to give the world's wealthiest people unparalleled access to global decision-makers and Governments around the world. The meeting was to discuss how "free trade" could be sped up and how a "global economy" could be further advanced. Against the backdrop of this meeting, let's consider these basic and indisputable facts, the clear results of globalisation: • The world has around 500 billionaires, whose combined assets are roughly equal to the combined annual income of the poorest half of all people on the planet. • The collective assets of the world's top three billionaires equals more than the combined gross national product of the 600 million people in the least developed countries. • The world's 200 richest people more than doubled their net worth between 1994 and 1998 to more than \$1 trillion. • The richest fifth of the world's population has amassed around 86[%] of the world's

wealth. The poorest fifth gets just 1[%] of that wealth. It was the economic elite of this richest fifth who were represented at the... Forum. Despite the talk about improved prosperity for everyone in the world, we should not forget it was the 1000 richest who were invited to attend. Neither the Green Party nor I have a problem with people making profit from work or enterprise, or having a comfortable existence. We recognise that N[Z] is a trading nation and that some trade is essential to our economic prosperity. However, we also recognise that there are limited resources on Earth and if a small group of people own or control big chunks of it, there is less for everybody else. The accumulating wealth of these people and companies comes at a price – not only through deprivation of resources and wealth for smaller developing nations, but also through environmental degradation and the exploitation of people who make the goods and supply the labour to create these profits. The Green Party deplores the sweatshops of South Asia where Chinese workers earn 23c an hour and Bangladeshis [considerably less] an hour, with no union or human rights. N[Z] has unfortunately been a world leader in the ideology of globalisation. We have removed nearly all protections for local production and have sold off or privatised huge chunks of our economy to foreign interests. These changes have led to lower wages, increased unemployment and the absurd situation where we import goods which we should be making ourselves – such as pet food, biscuits, clothing and footwear. N[Z] production plants – Bendon clothing factory, Matarua paper mill, car assembly plants – have closed as global competitiveness squeezes prices to see who can produce goods the cheapest and secure entrance into other markets. The drive to produce the cheapest goods means cutting corners. Producing environmentally friendly goods and looking after the environment are all viewed as costs and, as such, the environment has been a huge loser from globalisation... [But p]eople around the world are waking up to how this system works and who runs it and why. They are rightly angry... I hope the day will come – and I believe it will come soon – when the majority of people in this country see the work of some of us now as work for a more equitable world economy.

...Sweden's police chief insisted yesterday that his officers had done a "fabulous" job patrolling a E[U] summit in Gothenburg, despite two days of rioting in which three people were shot and wounded. Around 20,000 protesters took to the streets again on Saturday... staging a peaceful march in contrast to earlier rioting which turned the city centre into a war zone and left one [protester] fighting for his life after police shot him. "I readily admit there have been things happening on the streets of Gothenburg that no one wants to see," [Sweden's]National Police Commissioner... told a tense news conference. "But if you compare the outcome... with what could have happened if police had not done their job, I think the police have carried out the task in an absolutely fabulous way." Sweden witnessed its worst street violence in memory on Friday as rioters smashed and looted shops and lit a huge bonfire in the area's main avenue. Protesters stoned police and pulled mounted police... off their horses, forcing the terrified animals to gallop riderless back into police lines, skidding on the cobbled streets. The activists, from dozens of anti-EU, anti-U[S] and anti-globalisation groups, descended on Sweden's second largest city, greatly outnumbering police... 4000 police – a quarter of Sweden's total force – had been deployed to control the protests. But police, unfamiliar with the corralling and isolating of troublemakers, could not cope. Under Swedish law neither water cannon nor teargas are allowed to be used – leaving the police with either heavy batons or their guns. The shootings are said to have taken place when one police[officer] in a group of five fell in front of an advancing crowd. Anxious to protect a colleague, one of the other officers is understood to have opened fire... Police chiefs said police had opened fire in self-defence, but declined to give further details or answer questions on why guns were used, saying an inquiry was under way... Police said 500 to 600 people were detained during the protests. Most were later released, with around 100 issued with formal arrest warrants... Sweden has declared a temporary exemption from the EU's Schengen open-border accord to re-impose frontier controls in a bid to stop further protesters arriving.

...Hundreds of Italian anti-terrorist police fought masked anarchists yesterday as the Genoa summit of wealthy industrialised nations ended. The anarchists were seeking revenge for the death of 23-year-old Carlo Giuliani, who was shot dead when tr[ying] to attack a police vehicle with a fire extinguisher on Saturday. The 20-year-old police[officer] who shot him was in hospital in shock. [The officer faces hu]manslaughter charges. The new battles in the historic city came as more than 150,000 mostly peaceful protesters staged a sombre and nervous march. The marchers – campaigning on issues from debt relief to fair trade – sought to distance themselves from the worst anti-globalisation violence in 18 months. The violence overshadowed the Group of Eight summit and left the city in shambles. The fury of the anti-capitalist protests shocked the G8 leaders. Many of the marchers chanted "murderers" and "assassins" at police as they passed the spot where Giuliani, an unemployed squatter from Rome, was shot in the head. The leaders expressed "sorrow and regret" at the killing, and urged demonstrators to reject violence. But anarchists ran amok, smashing shop windows and hurling paving stones at riot police, who then responded with teargas. The Corso Torino, the main route of the march, was a scene of devastation. Shops and offices were wrecked; cash machines pulled from graffiti-daubed walls... The scale of the devastation – estimated to have cost the city millions of dollars – hastened a decision to slash the size of summits in the future. Canada wants just 400 delegates at its Alberta conference next year. In Genoa, the U[S] alone had 900 delegates... Japan had 600... Secure behind kilometres of fences and protected by 20,000 police, the G8 leaders promised to draw poor nations into the world economy and make globalisation work. "Those who claim to represent the voices of the poor aren't doing so," [the]US President... said during a picture-taking session with [the]French President...

'Death' summit spells end of era... The "Death in Genoa summit," tragically marked by the first death of a protester in two years of attacks on international economic gatherings, drew to a close, with world leaders shaken by events of the past three days. Their final act was a communique drawing together results of deliberations over the past drama-filled days which put the very concept of G8 meetings of the world's richest nations under the microscope... "Virtually everyone agrees these protests grew out of people's real concerns linked to policies [by Governments,]" [the] Russian President... said. "People lack confidence." [The]French President... said: "We were of course traumatised by the events that occurred around us." ...by comparison, h[is] US counterpart said it... was determined hardcore troublemakers would not win and stop international leaders having legitimate discussions. "Those who claim to represent the voices of reform aren't doing so. Those protesters who try to shut down our talks on trade and aid don't represent the poor as far as I'm concerned." Anxious to shed the image of the G8 as a club of rich nations exploiting poor economies, the leaders announced they had set in motion a new deal to alleviate poverty. They would appoint personal representatives to liaise with African leaders in drawing up a concrete plan to be approved at the next G8 summit in Canada, they said. The partnership covers questions of hunger, conflict, democracy and health, including Aids, corruption, private investment, and boosting trade.

...The Italian Government bowed to international pressure yesterday to look into "fascist" behaviour by its police force, as protesters arrested at the G8 summit in Genoa left with accounts of... brutality... Across the Continent reports emerged of protesters being beaten, tortured and deprived of their legal rights. One German politician likened the police's behaviour at the summit to the old military junta in Argentina. An Italian senator claimed the force had been infiltrated by fascists... [A] Green Party Senator representing Genoa, said: "We have heard stories about police... singing fascist hymns and threatening people with rape and with further violence, and we do think this behaviour has no place in a democra[cy]..."

...Pragmatic Mob gets back to running everyday business... IN the past, the Mafia tried to influence elections with unequivocal messages, such as a calf's head left on a doorstep in the night. But times have changed and so has the Mob. The Mafia has cleaned up its political act enormously in the past decade. It no longer kills politicians and judges. It even no longer kills its own kin. It has a new "chief executive officer" – ...a calm, calculating [perso]n who favours a truce with the State instead of all-out war, the self-destructive strategy relished by his mercurial predecessor... What hasn't changed is the Mafia's aim: to do business. And like any corporation that wants to thrive in tough times, the Mafia knows it has to influence politicians. As Italy's... general election approaches, officials say the Mafia has no real preference between the two main blocs, centre left or centre right. Anyone willing to do business is fine, thank you... "The Mafia has never had problems about who is in power,"... says... [the] secretary-general of Sicily's regional parliament... "It has always tried to cuddle up to those in charge because they are the ones who control the purse strings

of public financing.” ...One of the Mafia’s traditional ways of making money is by trying to influence the awarding of public contracts and steering them to companies it controls... Italy’s fight against the Mafia has made great strides since the twin killings in 1992 of magistrates Giovanni Falcone and Paolo Borsellino galvanised officials. [The predecessor] was arrested in 1993, a raft of top bosses and small-fry lieutenants have been nabbed since then and several times police have come close to arresting [the Mafia’s current ce]o. A truce... may give the crime organisation more opportunities to reforge political links. [In the last] three general elections in Italy... – in 92, 94 and 96 – ...the Mafia fine-tuned its political strategy each time. “Under [the predecessor]’s leadership, the Mafia tried to get [people] it controlled elected... Today, the Mafia can reorganise its relations with the political world in a more traditional way, a relationship of an exchange of favours.” ...[By the way,] Italy... mobilised 2700 armed forces to patrol land, air and sea... at the [recent] ...G8... Summit... in... Genoa... The port was closed – scoured by minisubs and divers to prevent a terrorist attack – and customs officers at border posts turned back suspected protesters. Fences 4.5m high sealed off the 4 sq km “red zone” around the Ducal Palace, the 13th century venue for the summit. But the pattern of peaceful protest was broken on Saturday... when a 5000-strong group moved in to “liberate” the red zone.

...FOR the first few hours, it looked like the usual fare – if a bit more fierce. Like a regular weather pattern, so-called anti-globalisation protesters have descended on every major economic meeting since Seattle. Genoa, too, was engulfed in tear gas and shouts of rage, in hailstorms of rock-throwing at police. Surging crowds of demonstrators, many wearing helmets and masks, engaged in a game of attack-and-retreat with police. But when 23-year-old Carlo Giuliani hoisted a fire extinguisher to throw at a police vehicle, everything changed. [Caught on film, a]n officer inside aimed his 9mm Beretta 92 service pistol and fired twice. Giuliani fell, shot through the head. The driver jammed into reverse – running... [Giuliani] over. It was the anti-globalisation movement’s first blood, and the radicals’ first martyr. Some protest leaders denounced the death as murder, yet most other demonstrators were appalled by the violence – and were determined to make the movement’s first blood its last. Genoa may thus mark a turning point for the [anti-globalisation] protest movement. What began as a motley, if united, collection of causes – from save-the-Earth greens to labour unionists – could well now rupture into a permanent schism, pitting moderates who seek constructive debate against radicals who seek only confrontation... The anti-globalisation movement, it seems, has lost its innocence. ■... Three Italian law enforcement officials lost their jobs yesterday in the first action taken against police since last month’s violence-marred Group of Eight summit... Reassigned from their posts were... the deputy chief of police in charge of the G8, [the]... head of the anti-terrorism department, and... [the] police superintendent of Genoa... The decision was announced by I[Italy’s] Interior Minister... who was the focus of a parliamentary confidence vote this week over allegations that police used excessive force... Police have been particularly criticised for a pre-dawn raid on a school that was housing demonstrators. Allegations of police brutality from officials and demonstrators in other European countries have embarrassed... [Italy]’s new Government.

...Communism and Nazism are gone. But nationalism, fundamentalism and globalism still have to sort themselves out. Mister Dooley, a fictional newspaper character at the last turn of the century, described a fanatic as someone who viewed himself as “doing what the Lord would do – if [the Lord] only had the facts.” The century that followed was beset by just such grandiose fanaticism, and it became the bloodiest in human history. Will we see a sequel in the century to come? Communism and Nazism are gone, but their suffixes remain. The biggest of the big political questions is whether other malignant “isms” can be held in check. The health of the new century hinges on the answer. The mother of all isms is utopianism, the belief that some belief structure can bring a perfect world. This has proved to be history’s greatest mirage. We’ve learned the hard way that ideologies imbued with great certitude tend to be dangerous. That’s not an argument against firm convictions or even against spreading them. But it does suggest that the world is safer when we are moderating ideology rather than imposing it. The big struggle ahead is between globalism and nationalism, with fundamentalism the wild card. So far, the best logic for the eventual triumph of global thinking is technological – cyberspace knows no borders. Just as 19th-century national technologies such as the transcontinental railroad aided nationalism, so 21st-century international technologies... will aid internationalism... The isms that would seem most directly threatened by the Internet are nationalism and its economic face, protectionism. If history has proved anything, it’s that the economic case for erecting barriers is weak. But for many nations, the political case remains strong. If you’re trying to hang on to power... [from] Russia to the Middle East, stirring up nationalist fervour is still a good strategy. If nationalism reflects the urge to preserve common heritage, fundamentalism is about spiritual longing in a sinful and materialistic world.

The people of the earth having agreed that the advancement of [humanity] in spiritual excellence and physical welfare is the common goal of [hu]mankind; that universal peace is the prerequisite for the pursuit of that goal; that justice in turn is the prerequisite of peace, and peace and justice stand or fall together; that iniquity and war inseparably spring from the competitive anarchy of the national states; that therefore the age of nations must end, and the era of humanity begin; the government of the nations have decided to order their separate sovereignties in one government of justice, to which they surrender their arms; and to establish... this Constitution as the covenant and fundamental law of the Federal Republic of the World. Preliminary Draft of a World Constitution, 1948. – A vision of the future

Because there are *about* 200 national leaders and even more multinational leaders, human society is currently being pulled in hundreds of different directions. If the world was united under one political system, that system would be able to take humanity in one direction – and make its members see themselves as being human first, regionally or culturally specific (e.g., Chinese, Indian, German, French, English, Maori, American) second, instead of the other way round.

The failure of the UN to achieve most of the aims for which it was created could be attributed to inadequate leadership within the organisation, or to the fact that its leaders have been forced to deal with so many unqualified leaders from outside the organisation (though few if any of them, be they national or multinational leaders, consider themselves to be unqualified to hold their positions of responsibility) – or their representatives – plus their conflicting ideas of how human society should be managed and where it should be heading. In its present form, however, the UN could be converted into a world government without too much difficulty. After all, it already has departments that run programs dealing with most areas of society (e.g., those handling human settlements, social development, environmental concerns and children), and specialised agencies which cover most of the remaining areas (e.g., food and agriculture, energy, labour, civil aviation, maritime, education, science, industry, postage, health, meteorology). Alternatively, the UN, the national and regional political bodies, plus the multinational and non-government organisations (including Amnesty International, Greenpeace, etc.) could all be disbanded and replaced by one network. As alternatives to the FRW (*Federal Republic of the World*) or the UCS (United Civilised States – r:p154, Ins13-4), such a network might be called the WUS (World of United States) or the USE (United States of Earth). If this new government needs a charter or constitution, something like the following might be suitable: OUR AIM IS TO GUARANTEE THAT EVERY CITIZEN RECEIVES WHAT IT GENUINELY NEEDS TO HAVE A HEALTHY AND HAPPY LIFE; TO RESPECT THE EXISTENCE OF THE OTHER LIFEFORMS WITH WHOM WE SHARE THIS PLANET; AND TO PUT THE NEEDS OF THIS PLANET AHEAD OF THE NEEDS OF INDIVIDUALS, THEREBY ENSURING THAT THE HUMAN SPECIES CAN LIVE ON IT – HAPPILY AND HEALTHILY – FOR AS LONG AS THE SUN ALLOWS THEM. This aim can be achieved by creating a new style of moneyless system (as opposed to those used by many past cultures – e.g., pre-European Aborigines and Maoris) – one that works worldwide. But, in order for such a system to be properly implemented, the first step is for human society to complete a process that it has long promised – unification.

The next chapter contains an explanation of how a worldwide government can be set up and operate, while the remaining chapters contain suggestions on what a worldwide moneyless society could be like and how it might be achieved.

RULE

Be wise... ye kings: be instructed, ye judges of the earth. - Psalms 2:10

“Why do we live in a town where the smartest have no power and the stupidest run everything...?” ...“Where’s the mayor?” “[It] skipped town.” “Really? So who’s in charge?” “Well, that’s a good question. Let’s take a quick look at the town charter... According to the charter, should the mayor abdicate, a council of learned citizens may rule in his stead...” ...“...Today we embark on a new era of intellectual governance... With our superior intellects we could rebuild this city on a foundation of reason and enlightenment. We could turn [our city] into a Utopia!” “A new Athens!”

Aristotle... says that [a hu]man is basically a political and social animal and... must exist in some society in order to fulfill [it]self... Aristotle’s state would be tightly controlled either by a monarch or a group of [people] intellectually and morally superior. These would guide the rest of the people... [Plato had said] that the ruler of the state must be a wise [person] (philosopher king), or a group of wise [people]... Plato... equates political activity with moral endeavor, and... believed that the perfect state should be organized in such a way that [citizens] can strive for the ideal... In a perfect society, each individual functions to his best capacity according to his natural abilities. This leads to the most harmonious type of society.

...ethics was the chief occupation of Socrates, for the interests of human life and its perplexities entirely absorbed him. In the history of ethics his position is supreme; [Socrates] was the founder of utilitarianism.

Utilitarianism is among those moral theories, often called teleological (concerning ends or purposes), that derive judgments about right or wrong from judgments about the quality of certain states of affairs – e.g., the quality of people’s lives... [A]ction is held to be right if it tends to promote happiness – not only that of the agent but of everyone affected by his act... Some of the strands of Utilitarianism, especially hedonism and consequentialism, are traceable to ancient Greek philosophy; but Utilitarianism in its full sense, with its emphasis on impartial utility maximization, is an essentially modern theory... The leading proponents... were the English philosophers Jeremy Bentham and John Stuart Mill.

Although... Bentham... was in many ways a strict individualist, the test that Bentham applied for the... conduct either of the individual or of the government was *social* usefulness or, in his often-quoted summation of his philosophy, “the greatest happiness of the greatest number.” Bentham himself acknowledged his indebtedness[not to ‘Epicurus (the Greek philosopher, b. Samos, 341BC, for whom happiness consists in pleasure or, rather, in the absence of pain; but people need a correct idea of the nature of pleasure – intellectual pleasures are superior to those of the body’) but] to Joseph Priestley who wrote in his *Essay on the First Principles of Government* (1768) that “all people live in society for their essential advantage, so that the goodness and happiness of the member, that is, the majority of the members of every State, is the great standard by which everything relating to the State must finally be determined.” The significance of Bentham’s theory, and that of his forerunners and followers, lies in the fact that they based their system on a doctrine that claims that the ethically good can be ascertained and proved, not by dogma, or outside prescription but by starting from the elementary motivations of human nature – namely, the evident wish... to obtain happiness, or pleasure, and avoid pain... In other words, the Utilitarians claimed to have answered the most perplexing questions: What should be the guide for individual conduct? What should be the functions of government, the main organizational aspect of the community? And how can one’s interests be reconciled with opposing interests of others and of the community as a whole? According to Utilitarians, the pleasure-pain principle not only answers the first two questions, but it also proves that there can be no clash between individual and group interest, because if the conduct of both is based on “utility,” the interests of both will be the same. This holds true for every field – for example, in... education, the administration of justice, or international affairs. As long as the criterion of usefulness is applied, there will be harmony between private and public and national and international interests. To be sure, Bentham realized the need of defining “pleasure.” ...As far as the individual was concerned, the Utilitarians saw a main problem in making people aware of what pleasures they should seek, of understanding their true interests. Hence they insisted on the need for more education and were confident that a well-ordered society would disapprove socially harmful conduct. (Bentham was among the first to demand public instruction and was one of the founders of the University of London.) Through education and social disapproval, the individual will learn that evil action – that is, action causing pain to others – is a “miscalculation of self-interest.” During his long life, Bentham initiated many, and became prominently associated with most, of the reforms that changed the face of England and, to a large measure, of the world.

Kipling greatly overrated our ability to carry out political reform and greatly underestimated the endurance of nationalistic rivalries. In his world of 2000, war has gone “out of fashion” in a manner never described. [Kipling] guessed that by then all nations would have abdicated sovereignty to the “Aerial Board of Control,” A.B.C., a panel of “a few dozen” wise, unselfish sages, who would administer for the good of us all a world remarkably free of bureaucracy... In his *Shape of Things to Come* (1933)... H. G. Wells... foresaw... that... all national governments would collapse and banking would disappear... Well’s... vision of technology and economics in the future was spotty at best... but his... foresight was remarkably clear when it focused on emotional and intellectual issues...

...recently the world of learning has become afflicted with a vicious specialization and compartmentalization. With few exceptions one sees a remorseless fragmentation and trivialization of knowledge. Moreover, the specialist who knows more and more about less and less finds [it]self in an unassailable status position. No matter how inconsequential the particular narrow slice of knowledge which [a specialist commands, the specialist] ranks as ‘the expert’ who can lord it over the hapless lay[person] even if the latter possesses much more in the way of genuine wisdom. A Scottish or Vermont farmer may manifest a far more rounded and balanced philosophy of life than that exhibited by the high-salaried, high-status expert. Commonly it is the former, not the latter, who has a better insight into the durable verities which should govern the conduct of human affairs.

[Some] people... argue forcibly that, for the sake of humanity, [USers] and Europeans should reduce their standard of living, stop buying luxury goods, and restrict their consumption levels to “essential needs”... Yet... [who] is to decide on priorities. Presumably the state would, in the end,

have to undertake to define human “needs” and to determine whose needs deserve to be met. Such an all-powerful state... would therefore have to take over all means of production... This can only be done by transfer of all... decision making to the state...

It is self-evident that an effective image of a humane high-technology society, congenial to the new image of [humanity], will have to be constructed... Adam Smith, in *The Wealth of Nations*, justified capitalism by claiming that when the entrepreneur “intends only his own gain... [the entrepreneur] is... led by an invisible hand to promote an end which was no part of his intention... By pursuing his own interest [the entrepreneur] frequently promotes that of the society more effectively than when [the entrepreneur] intends to promote it.” By now we know the reverse may frequently also be true because individuals often choose on the basis of their own short-term, imprudent self-interest instead of long-term, enlightened self-interest. Accordingly, the invisible hand clearly needs a little help. Such help has existed for years in the form of government control via antitrust laws, commerce regulations, Keynesian manipulations of the money supply and interest rates, and so on. Yet the basic management dilemma worsens. The fundamental problem is not simply a matter of tradeoffs – it is that the tradeoffs seem to grow steadily more intolerable. As one cartoon caption described it, “There’s a pricetag on everything. You want a high standard of living, you settle for a low quality of life.” An obvious solution would be to select desired macrodecisions and derive microdecisions from them. This is logic appealing. It would seem possible to select appropriate national and planetary goals that are in accord with the best available knowledge regarding human fulfillment, and then determine what types of microdecisions would be necessary to achieve those goals. But there is a catch. The *means* used to obtain those necessary individual actions have to be compatible with the ends... The microdecisions necessary to actualize the chosen goals have to be guided primarily by an understanding of the linkages among them... The example of environmental protection will help to clarify the issue. Changing public awareness during the decade of the 1960s resulted in the macrodecision to place a somewhat higher priority than before on the preservation and enhancement of the physical environment... Environmental deterioration is directly related to the rate of use of energy and resources, and that in turn to economic growth. The decision to preserve and enhance the environment implies... in the longer run, decisions to evolve toward a more frugal kind of civilization, which may involve changes in consumer patterns and life-styles, industrial processes and products, agricultural methods and the rural way of life, population distribution, and social goals. All aspects of individual life will eventually be affected. For all this to take place... requires a collective and voluntary redirection of the whole society, with widespread understanding of the implications of the macrodecision and willingness to make individual microdecisions in accord with the overall social choice. It also requires institutional changes for effectively employing widespread citizen participation at local, regional, national, and global levels... Citizen participation in decision making is one of the most effective ways of stimulating socially responsible behaviour – far more so than imposing restraints by means of governmental regulations. When given such responsibility, even quite ordinary individuals may be moved to broaden their horizons – to weigh seriously global as well as local concerns, future as well as present consequences. - 1976

In the... future... it [is] possible to imagine an eventual dissolution of centralised power... As a general rule, each country, each region, each district... would aim to be rather more self-sufficient... in food production and energy, and to be less dependent on traded commodities and traded manufactures... But... [this general rule ignores] the idea that progress involves greater... interdependence... [and the fact that] the French tradition of strong central government has facilitated the development of continuing, organised arrangements for... planning[for the future]. In the USA, on the other hand, where strong central government is traditionally anathema, national... planning has not existed. Britain comes half way between France and the U[SA]: ...planning has not been ruled out, but it has been fitful and half-hearted. In Japan, as in France... planning appears to have been successful. But in Japan as compared with France, the role of government is more limited. By coordinating different interests it can help a consensus to develop. But unlike the French government it cannot exercise real leadership, except when this arises from a consensus with business leaders... [However,] thinkers... who have lived through the last thirty years in countries like Britain and France... find it... easy to perceive... that the practical limits to centralised state control are quite quickly reached, and that decentralisation then becomes necessary... [A] study of business civilisation in decline... concluded that the demise of the business system is likely to proceed by... insensibly altering a civilisation that can be called ‘capitalist’ into one that, whatever we decide to call it, will be very different... – such, for example, as is implied by utilitarianism... It will be a society which reflects the dynamic equilibrium of ecological systems in nature. - 1978

It has to deal with the mutual causality of all relationships... [B]ut in order to deal with these awesome global interdependencies that we have created, and to deal with the first law of ecology – “everything is connected to everything else” – we must... reintegrate ourselves... The first thing that has to go is linear economics, which is based on competition, rather than cooperation. For years, economists have used the concept of “externalities” to explain those social costs of production that they did not want to include in their balance sheets and accounting... Now we have come to the realization that these “externalities” – the social costs of a polluted environment, disrupted communities, disrupted family life, and eroded primary relationships – may be the only part of our GNP that is growing. We are so confused that we add these social costs into the GNP as if they were real, useful products. We have no idea whether we are going forward or backward, or how much of the GNP is social costs and how much of it is useful production that we intended... [T]he planet calls for new models of organization, governance, and decentralization... [– while maintaining] lots of feedback in all the diverse views and groups, which can help prevent spectacular disasters... – and... wherever possible, the localizing of production, consumption, and participation, together with the democratic formulation of planetary agreements, declarations of principles, and the rights and responsibilities of all people. This “thinking globally, acting locally” formula, the theme of the first Global Conference on the Future... can inform local action with the understanding of the requirements of planetary interdependence and limits. - 1980

...[using] a computerized study... sponsored by the Club of Rome... a book, *The Limits to Growth*... predicts that the industrial revolution will end in catastrophe within the next hundred years as the result of resource depletion and pollution. The catastrophic conclusions of the *Limits to Growth* study are serious enough, but even more serious are its recommendations: that all of humanity should make the transition to a globally managed static society (the... [authors] refer to it as a “steady-state” society), in which the individual could only move and use energy and materials within tightly circumscribed limits; those constraints would bind not only those of us alive now, but our descendants to the end of time.

...[at least one writer] has drawn the logical conclusion from accepting the ‘limits’ work at face value: ‘only two outcomes are imaginable – “anarchy” or “totalitarianism”’. It says something of the despair induced by taking these computer models as gospel that [the writer] then accepts totalitarianism as the lesser of the two possible evils, and there are many who would agree with him... And there is, still, another face to the problem which appears more welcoming but which could mark a... dramatic... development of our future world: disarmament. Preparations for war have been a part of human society for so long that what we now like to call ‘defence’ activities have become an integral feature of the structure of society... If ‘defence’... continues to be a major use of resources, then sooner or later, by accident or design, war must come... [W]hile we may hope that all-out war can... be avoided, how long can preparation for war continue without war? - 1981

In *The World in 1984*, the physicist... said that his idea of federating all nations under one world authority will not be achieved before the end of the century, but that the role of scientists as peacemakers would meanwhile grow... Yet you only have to listen to scientists wrangling, on professional

as well as nationalistic lines, to doubt this concept of scientists as all-wise troubleshooters... [Furthermore, the] President of the US National Academy of Sciences... had high hopes for big civilian science, in space and in the oceans, for example, which have been disappointed; except in high-energy physics, the big projects are mainly military... I recall the anguish of the French chemists... writing in *Unless Peace Comes*: 'The question may arise: is all science damned? We must either eliminate science or eliminate war. We cannot have both.' - 1983

...because the League of Nations was not and the U[N] is not a government with a monopoly of authorized force, neither can be regarded as an instrument for establishing and preserving genuine peace... The lesson to be learned should be patently plain. If government is the indispensable means for establishing and preserving genuine peace wherever it is found on earth in the plural peaces that exist (however small or large their extent may be, varying with the size of the domain and the population that is governed), then it inexorably follows that genuine world peace requires world government. The obstacles to the establishment of world government are many and various. The probability of its being realized can be estimated in terms of the difficulty of overcoming those impediments... But the improbable, in whatever degree, is never the same as the impossible. However improbable may be the establishment and preservation of world peace by the institution of world federal government, its possibility remains untouched – for, since world government is *necessary* for world peace, and world peace is *necessary* for the survival and welfare of [hu]mankind, both must also be *possible*... Since it is plainly contrary to the law of nature... that the privileged few should gorge themselves with superfluities while the starving multitude are in want of the bare necessities of life... [it is] one of the most important functions of government to prevent extreme inequities of fortunes; not by taking away wealth from its possessors, but by depriving all [citizens] of means to accumulate it: not by building asylums for the poor, but by securing the citizens from becoming poor... You ask what is the proper limit to a person's wealth? First, having what is essential, and second, having what is enough.

...The indelible fact of life is that most people, most of the time do not provide surpluses of income in the right amounts on the right occasions to permit them to provide themselves and their dependents with sufficient supply of the personal services of opportunity, learning, care, security and employment. The task of provision must be a shared task and co-operative and collective contribution by the community has been the greatest single source of individual emancipation of our century. It has not diminished vitality, it has increased fitness. It has multiplied not eroded talent. It has not frustrated inventiveness; it has given the inventive the facility for development. It has not subordinated peoples, it has stimulated their self-confidence.

...When we asked people... if they would be more inclined to vote if they could vote on national *issues* as well as candidates, a significant number responded yes... In other words, people don't want to shirk their responsibilities as citizens. They just want a more direct voice in government – a purer form of democracy than we have now... A majority of voters back a proposal to use search committees to seek out the most highly qualified candidates. This approach would follow the procedure used by large corporations, foundations, and universities in filling top-level vacancies. - 1984

A common theme of powerlessness – and consumer disaffection – came through to us in the submissions we received. People clearly felt unable to influence the system – even to find the right person caused considerable difficulty... Our investigations convinced us that the present administrative structure is overcentralised and made overly complex by having too many decision points... The administrative system should be simple and uncomplicated with as few layers and sectors as practicable. There should be no duplication of services and no services overlapped or paralleled by others. To the greatest extent, the same management structure should overlay all sectors of the system. - 1988

The Greens advocate not only smaller units of domestic government but also smaller countries, which they refer to as regions... and they suggest that cultural and ecological boundaries could determine the regions. There are many such regions in Europe, usually determined by a shared dialect... At present, there are fifty-four regions within the EEC that form administrative units... [T]he newsletter of the E. F. Schumacher Society of America... expressed a position that closely parallels the philosophy of the German Greens: We finally comprehend that if there is to be salvation for this world, it will come through the development of bioregions into fully empowered, politically autonomous... self-sufficient social units in which bioregional citizens understand, and control, the decisions that affect their lives.

...Despite Green politics often being identified with... self-sufficiency... my understanding is that Green politics is most generally seen to be organized around principles of self-reliance rather than self-sufficiency. What is the difference? Self-sufficiency can be described as 'a state of absolute... independence', while self-reliance is best understood as 'a state of relative independence'... There is nothing in the theory of self-reliance that forbids trade, but it certainly aims to shift the onus of justification away from those who would reduce it and on to those who would maximize it. It would be wrong, then, to characterize Greens as recommending complete... independence – they are perfectly aware that 'There are always goods or services that cannot be generated or provided locally, regionally or nationally'... The ground-rule, however, would be that 'self-reliance starts with the idea of producing things yourself rather than getting them through exchange'... However, if... Greens demand long-term policies, we might argue that they will have to be planned and coordinated... But... who is to do the planning and coordinating if not some supra-community political agency? ...Moreover... dealing with the environmental problems that the Green movement has identified requires the kind of planning that can only be provided by centralized political structures; and... such structures are needed to organize the redistribution required by the Greens' egalitarian project... Until individuals and groups accept the unpalatable news that stateless, decentralized, moneyless, small-scale communes or other informal alternatives are not viable without the complex administration and social structures necessary to guarantee democratic participation, civil rights and egalitarian co-ordination of... resources, there is not much hope of... [achieving] an... ecologically enlightened... post-industrial society... - 1990

In *Crochet Castle*, [a]... roman `a chef satirizing various contemporary ideologues, the reader was told that the... New Age... figure "will have neither fighting nor praying; but wants to parcel out the world into squares like a chess-board, with a community in each, raising everything for one another, with a great steam-engine to serve them in common." ...Or we might cite... Wells's book *Anticipations*... "all experience shows that [humans] need organizing as much as machines, or rather, much more."

...[and humans] need to coordinate... the... structures at inter-local, inter-regional, and inter-national levels... so that they can learn from one another and apply to one locale the lessons of success and failure discovered in another... The more territorially inclusive structures must, in this world-conception, serve the interests of the less territorially inclusive, and on down to the grassroots... Greens... take strategy out of the context of power-over and into a context of power-with or next-to. Instead of talking about "up" and "down," Greens have begun talking about "inward" and "outward." In this new way of looking, the... grassroots is not at the "bottom"... It is more... correct that each local is at the center. Concentric circles are then seen to range outward from this center, regionally, inter-regionally, globally, and on to the farthest reaches of the universe. - 1992

Sometimes it is declared that... any additions made by happy [human] lives to the goodness of the universe would somehow have reached an upper limit in the early twenty-first century... [Meanwhile, t]orture would be worse and... there... [would be] more people who suffered... Astonishingly many professional philosophers... recognize no moral call to keep the human race in existence: if waving a hand were enough to guarantee the

existence of a trillion happy galaxy-colonizing humans, they would see no duty to wave. And scores of others... allege that the utilitarian who urges us to... work for the happiness of others by making... minor present-day... sacrifices... put[s] the happiness of future generations at tremendous risk... [because] things like pollution control might have to be imposed undemocratically or in defiance of 'rights'... and so forth... Having thereby dismissed utilitarianism with suspicious ease, they find all manner of curious reasons for... declar[ing] that... 'we are not obligated to future others' – so... nobody can feel sympathetic concern for people who haven't yet been born. Besides being almost as silly as trying to prove that nobody really likes beer, this is an instance of a... conclusion that we ought therefore to work hard to end the human race (its continued joys being worthless duplications of what had come before, whereas each new instance of misery added negative value)... Other... contemporary theorists... emphasize that love for one's grandchildren can be logically linked to a wish that they too should have the joy of having grandchildren. - 1996

It is often claimed that human evolution has ended because technology cushions... us and our descendants... from disease and death; and, equally often, it is claimed that human... adaptations... tell us about long-lost worlds in which our ancestors dwelt... And this enduring thread of humanity reminds us that, however novel our environments, their most salient feature... is other human beings like ourselves... Like ants and bees, we cannot live outside of a communal society. We have become so dependent on divisions of labor that nobody could conceivably feed, clothe or shelter himself entirely by his own efforts. Many people regret this and yearn to rediscover the virtues of a simpler age of self-sufficiency. But there never was such an age for our species. Anthropologists are gradually discovering that trade, which is an expression of divisions of labor, started in the Paleolithic, before the Neanderthals were extinct in Europe... We are fairly sure that human beings have been exchanging food between the sexes (meat for plants) for millions of years. We suspect they have been exchanging artefacts for almost as long. Now, with globalization, we see such exchanges taking place on a worldwide scale. But probably the most ancient form of exchange is also the latest to go global: the exchange of information... If society is to consist of specialists, dividing labor between them, then a mechanism for exchanging products is needed. We are, in fact, obsessed with exchange, deals, contracts, bargains, fairness and reciprocity... because it is through exchange between specialists that we make society more than the sum of its parts... Far from regretting the division of labor, we should celebrate it as the cause of cooperation in society... It is no accident that the other animals capable of rare instances of elementary reciprocity are the ones that live in stable communities... Reciprocity, though, is only part of the story. To behave reciprocally... ("You scratch my back, I'll scratch yours") requires each individual to be able to recognize and remember others...

"India, like N[Z], took too long to recognise that a state command economy – socialism – had done its day. I have nothing doctrinally against socialism. But in N[Z] we screwed it up because it just became a monster and made us all terribly lazy and we weren't really producing and developing. So in 1984 we woke up to it... But it took... 10 long painful years to turn it around... How much longer is it going to take India, who has 27 million bureaucrats...? ...Most Westerners... are coming into Delhi and Bombay and saying to the Indians: get real, the only way forward is to... let... economic rationalisation take its course, let the economy flower and blossom... But at what cost? If you are sitting in the P[M]'s office, and you have 300 million people under the international poverty line it's a difficult question..." In India... the path to reform has been erratic and slow, dictated by population size... and... uncertain leadership...

The criticism I hear most relates to leadership or more accurately the lack of political leadership... Where are our leaders? I've been talking with them. They're in your factories, offices and boardrooms and their positive leadership will do more... to meet the challenges... of the... many... issues putting pressure on our... [society] than that of politicians. [Incidentally, 'of the 18.369 million public employees in the US in 1990, 3.105 million were in the Federal government, 4.503 million in state governments, and 10.760 million in local governments (there were also 4,094 political action committees: 1,738 were corporate; 338 labour; and 742 trade, membership and health organizations). In 1989 there were 17.879 million public employees. There were wide variations among cities in the number of employees per 10,000 population – ranging from 776 for Washington D.C to 66 for San Jose, California']...

Employment in the [NZ] public sector dropped from 55,000 fulltime jobs in December, 1990, to 47,600 by last June... [In related news, t]he Act leader... says the ideal cabinet would have 12 ministers and four under-secretaries – and... says a law should set the limit. - 1997

The [NZ PM] has called for a radical down-sizing in the state bureaucracy from 38 Government departments to as few as 15... They would be overseen by a director-general or chief executive providing overall policy and management advice... Any reduction in the number of departments would lead to a strong debate about reducing the size and structure of cabinet. However, it appear[s that the PM]... is backing off the idea of cutting Parliament from 120 MPs to 100... [□ The] Auckland Regional Council chair[person thinks]... the idea... of a Greater Auckland Council to replace the existing seven local bodies[is] "absolutely wonderful... At the moment we have 380 local body politicians in Auckland. That's more than the US Congress." ...Auckland's problems – like traffic and stormwater disposal – did not stop at artificial council boundaries... The 1989 amalgamation of the city's 29 local bodies into [four city councils and three district councils] made an "enormous difference" in the way the region was administered, "but we can do better." ...Most mayors believe a change to the way Auckland is run is inevitable – but they do not want a single super-city... The proposal for a single city did find some favour, however, with the Mayor of Papakura... provided local communities could be safeguarded. [The Mayor of Papakura], who this year visited Taipei, which has a unified city council... had traditionally been opposed to "super-cities," but the growth of Auckland's clout through the Auckland Mayoral Forum and seeing the system in action in Taipei convinced him it could have merit.

...An informal poll of Northcote residents by [an] MP... shows support for a single city for Auckland. Of 19,400 questionnaires delivered to households in his seat, 4000 were returned and two-thirds said they supported further amalgamation of Auckland's seven local bodies. [The MP], who proposed a single city to the Auckland Region Community Boards Association last month, said the existing bodies should be amalgamated into one super council of 25 representatives. Councillors should be elected from wards based on the city's parliamentary electorates. [● Back in 1997, when Auckland's mayor was the Minister of Local Government, the idea of creating 'a super-city covering metropolitan Auckland – by divided it into 12 wards represented by a total of 36 councillors – was put to the minister as a way to gain "a huge saving to the ratepayer and give the opportunity to synchronise staff services."']

...Here's a parable of our time. And if you're a ratepayer, then there's a message in it for you. Once upon a time, during her reign as Mayor of a Great City, [the mayor]... had a dream which [it] shared with a group of her trusty liege[people]... which involved a great and mysterious scroll of law called the Local Government Act. It was, they all agreed, too long and too complex for ordinary citizens – or even City Fathers – to understand. And that, they said, was not good. "Let us," they said, "shorten it and bless it with simple words and laws." And they did, working sometimes long into the night, even calling on the wisdom of a goodly knight and once-powerful leader of the land... who had deep knowledge of such things. Once complete, the new scroll was rolled up with reverence and sent post-haste to Wellington, where [the dreamer] had once sat at the Great Table of Decision. But there the precious document fell into the hands of sorcerers called Bureaucrats, who worked their will upon it. They touched the parchment with what they believed were their magic wands and mesmerised the Minister [of Local Government] with their ready words and opinionated views. When they released the ghost of the once-proud short scroll, it did not find favour with those in faraway Auckland – or in many other places in the country for that matter – but particularly among those who had laboured long and well on what they called "The Amendment". They now cursed heartily and long when it was returned to them in its new form. "It is not shorter and it is not simpler", they said. And indeed they were right. They abjectly pleaded for change. But the Minister, under the spell of the Bureaucrats, was unmoved, saying: "Let it be so". And so it is. The Local Government Act, which is the product of this epic saga, has grown under the tutelage of the Wellington word

wizards from 28 pages to 173. For example, it now requires local bodies to engage in tedious consultation, particularly with Maori communities, on virtually every aspect of governance. Local body leaders fear it will spawn a tidal wave of reports and commentaries, will slow the already laborious patterns of decision-making and call for new, highly-qualified and equally highly-paid expert staff. Already, councils beginning their long annual plan process are budgeting on rate rises of 3 to 5% to cover the cost of the new bureaucracy and the methods it will require. The body I have close knowledge of talks of nearly \$800,000 more, plus five high-cost new staff. Early versions of the projected systems are said to have cost Christchurch millions. When MPs were warned of these likely costs during select committee submissions, they waved the complaints aside. "These are the price of democracy," they said. Which is probably how some now justify their new jobs in a government executive in which more than every second MP has cabinet, near-cabinet, or minister-in-training status.

...Cost of shifting We, the ratepayers will be paying for this stupid idea that moving the [Waitakere City C]ouncil into a new building in Trading Place is going to increase business – how? We will not only have to pay into the 21st century but into the 22nd as well. The council should be made to have a public vote on this by way of a pre-paid, single page questionnaire (not a 10-page load of hog-wash). The present council building is quite modern in appearance and can easily be extended on three sides and upwards one to three storeys. Also of course the number of staff and councillors should be reduced. This would help pay for the alterations and if sufficient floors are built upwards they could rent out spare space to help the ratepayers paying for it.

...Waitakere residents may go to the polls under a new voting system at the[next] local government elections. The council is considering the single transferable vote (STV) system, which it is able to adopt under the updated Local Electoral Act... Eight of N[Z]'s 86 local authorities have[already] decided to use STV in [the next election]... Under the STV system voters choose candidates in order of preference. If the preferred candidate has more than the required number of votes to be elected, or so few as to have the least chance of being elected, then the elector's vote is transferred to a second or subsequent choice. The new legislation makes it mandatory for district health board elections to be carried out under the STV system. City and district councils can stay with the first past the post system... Waitakere City Council's democracy and support services manager, says the council's decision must be publicly notified... [The manager] says there are advantages and disadvantages in both systems and the public is likely to welcome consultation. The council does not have to consult Waitakere residents and can pass a resolution to adopt STV. But people can still demand a say. A petition by 5% of registered electors in the city can force a poll on the issue. The council can voluntarily hold a poll to let Waitakere residents decide which voting system they want. Councillors will hold a meeting to discuss STV and its implications for Waitakere City.

...The sacking of the Rodney District Council was yesterday called a stern warning to all councils who get into political strife. [A l]ocal government expert... said most local authorities had never considered that they could be "biffed out" before the Government replaced the council with a commissioner on Monday. "But now the Government has broken the mould. When other councils get into serious political strife that threatens their work, they will remember what happened to Rodney." [The p]rofessor... said local bodies were not laws unto themselves and were a subordinate part of the nation's government structure. No Government could waive its right to intervene if a local body failed to carry out its statutory duties. [The p]rofessor... approved of the way the Minister of Local Government... had handled the issue, which had no modern precedent. [The minister] had given Rodney a nice, clean break by arranging for a commissioner... to start work the day after [it] sacked the dysfunctional council... [The p]rofessor... said the minister had been astute and sensitive towards local democracy by saying the commissioner was a holding measure until fresh elections by next March at the latest. The election gave former councillors the opportunity to convince voters they were unfortunate victims of the need to dismiss the council. Four out of 12 former councillors said yesterday they would stand at the next election... But... [one f]ormer councillor... said yesterday that [the former MP]... had not intended serving more than one term... [and has already] sold his property in the district. His work as an investment adviser, and as a part-time policy adviser to [the NZ] First leader... takes him out of the district.

...[for the former Deputy-PM], it will be a nerve-racking nine days until the special votes are counted. The election-night tally left the N[Z] First leader holding Tauranga by a slim 323-vote margin over National's [candidate]... If the specials go against him, [the NZ First leader and former National minister] will be out of Parliament, as will his five top list colleagues. For the Greens, high spirits gave way to a heart-sinking loss on Saturday night as their 4.86% of the nationwide party vote and [the party co-leader's] 114-vote loss in Coromandel left them with only a slim chance of seating six MPs. To reach the 5% party-vote threshold for seats in Parliament, the Greens need 6% or better of the remaining 208,000 special votes... Alternatively, [the co-leader] could overturn National's... election-night majority when about 3500 special votes are counted... In Tauranga, as many as 3000 special votes could threaten [the NZ First leader's]... majority and wipe him and his... team-mates from Parliament. And the seat may be subject to a judicial recount, whichever way the specials go... [The] National list MP who is trailing [the NZ First leader] and has missed out being re-elected from the party list, confirmed that [it] would discuss the possibility of a recount with her team today, but said no decision would be made until the special votes were counted. [The NZ First leader] hinted on election night that [it] might also challenge if [the career MP] lost narrowly – as [it] successfully did in Hunua in 1978. NZ First polled below 5% on Saturday, but if [the leader] holds Tauranga the party can claim its 4.3% share of the seats in Parliament... Last election, more than 3000 special votes were cast, heavily favouring [the NZ First leader]...

There was a quiet note of smug self-satisfaction during National Radio's recent coverage of the A[US]n election results. Across the Tasman, our commentators repeatedly pointed out, the winning Liberal-National Coalition actually won a smaller percentage of the two-party first preference votes than the losing Labour Party. Labour won just over 51% of those two-party preference votes while the Coalition won just over 48%. And yet the Coalition won a small majority of seats in the Lower House of Representatives and will stay in government. The implication was clear to all, or should have been. N[Z], with its MMP voting system, one of the most proportional in operation anywhere, has a fairer, more just system. National Radio listeners did not really need to be told that their instincts tended more toward fairness and justice than those of A[US]ns. Most of them pretty much take such things as self-evident truths. Meantime, National Radio continues quietly to like MMP, even when polls show an ever-growing majority of the rest of us disliking it and wishing it gone. So let me explain why, in fact, the A[US]n Lower House elections employ what is, in my view, the best voting system in the world... The A[US]n Lower House electors employ a preferential voting system. This requires voters to vote by ranking all the candidates, from first to last in their constituency. To determine the winner in a constituency, the first step is to count all the first preferences. If any candidate were to receive over half of these, [it] would be the winner. This, though, is incredibly rare... [T]he next step is to take the candidate who got the fewest first preferences... and look at the second preferences of the people who voted for him... If there is still no candidate with more than half the votes, the next-to-the-bottom-placed candidate is out and again his supporters' second preferences redistributed. Eventually, one of the candidates will get over the 50%-plus-one hurdle and be elected. More importantly, the winner is often not the one who polled the most first preferences... This is not inadvertent or a flaw in the system. It is the explicit, deliberate goal of preferential voting systems. The system was designed to measure voters' dislikes as well as likes[, whereas] FPP measures only whom you most want elected... Frankly, I think th[e AUSn version] accords with human nature pretty well... To be provocative then, we can say FPP is "fairer" (whatever "fairness" means) than MMP. And by improving on FPP, as I think it does, preferential voting systems are better still. Indeed, they're the best on offer. But don't tell any A[US]ns. You see, they're rather backward when it comes to that sort of thing. •... Next year's presidential election in the U[S] may provide an opportunity to pioneer yet another use for the Internet – voting for political candidates. At least two state political parties are considering using the Internet for primary elections... And the... Government plans to allow up to 350 members of the military stationed overseas to vote via the Internet... Internet voting has already been used by companies holding shareholder votes, including fast-food giant McDonald's. In the Government arena... election officials are tempted by the Internet's promise of faster vote tallies and increased voter participation...

At the University of Princeton in New Jersey, one of the four oldest and among the wealthiest and most prominent in the U[S], a traditional week's holiday is given to students immediately before a presidential election so they can do their own campaigning before voting. But whereas once the week had vigorous debating and protesting between campus Republicans and Democrats, very few students even bother to take part any more, and many won't even vote. Positions for setting up physical barriers around the campus to control mass student protests during more politically tumultuous years have fallen into disuse. Reasons offered for this apathy – considered typical of students throughout the major American universities – include that most are the children of the middle and upper socio-economic classes, complacently content after a decade of prosperity... Another reason offered for apathy is a sense of powerlessness, a belief that politicians don't listen to the young, that money and professional persuaders dominate election campaigns and that the country is always run by an establishment and nothing they can do will affect that. Whatever the cause, the sense that politics is irrelevant to the young seems to be confirmed by an MTV... poll that says a quarter of Americans between 18 and 24 cannot name both presidential candidates, and that only one-third of those polled would vote, compared with just over half in the last election. More than 70[%] could not name the vice-presidential candidates and only 30[%] said politics was of any interest to them. My own view is that young people are responding to the surreal condition of contemporary politics. The right has a misplaced arrogance that it has appropriated and defined truth and is impatient with those who resist it, just as communists did 30 years ago. And in an age of absurd accretions of wealth by individuals, business leaders with their cynicism and hubris believe simply that the standard measurement of personal worth and morality is money. So most young people – and many not so young – who understand that these pretended philosophies are simply conceits, have turned their backs on politics and drifted into caring only for themselves and their own satisfactions... University students might show no interest in the presidential campaign, but primary schoolkids sure do. [The Democratic candidate touched]... hands with enthusiastic youngsters at Jefferson Elementary School in Des Moines, Iowa[, yesterday]... By the way, the... environment Avondale Community Board chair[perso]n... spent four days... at the Democrat party conference in Los Angeles earlier this month. As a guest of the International Leaders Forum [it] watched the political machine wind up into a frenzy of support for [the party's]presidential candidate... and... [his] deputy... "The atmosphere was awe inspiring and just being there I was certainly infatuated with the whole thing,"... [The councillor] says the TV images of banner-waving crowds of thousands as speakers deliver news soundbites is exactly the conference [it expected. The councillor also]... says the overt corporate sponsorship is something which N[Z]ers may have to get used to and [it] has come back with some fundraising ideas. "Every lunch, every telephone, every suite, everything had a corporate sponsor... I think we are driving in that direction." ...there's a definite style to American politics some of which N[Z] can adopt without losing its own uniqueness. And his prediction for the election? [The Democrat], by the skin of his teeth.

...THIS ELECTION IS MORE CONTENTIOUS THAN USUAL BECAUSE... WELL, NO ONE REALLY LIKES EITHER CANDIDATE... SO THEY'RE ARGUING OVER WHICH ONE IS THE LESSER EVIL[.] "SURELY YOU'RE MISTAKEN, MOM... THE POLITICIANS ARE THE BEST AND BRIGHTEST OF THEIR GENERATION! THEY'RE PUBLIC-MINDED SAINTS WHO SACRIFICE PERSONAL GAIN FOR THE BENEFIT OF ALL CITIZENS... WHY ARE [YOU LAUGHING?" "NEVER MIND. JUST ENJOY THE FANTASY OF CHILDHOOD...

Americans wait for a result in their closest-ever presidential election The race for the White House hung on 987 votes in Florida last night as the American presidential election remained too close to declare a winner. In a night of trauma, see-sawing fortunes and miscalled results, the election took an extraordinary turn when [the]Vice-President... conceded the race, then 90 minutes later retracted his concession... as the state of Florida balanced on a knife-edge. As... supporters outside his headquarters in Nashville, Tennessee, chanted "recount, recount," [the Vice-President's campaign chairperso]n... told the throng the campaign would continue until [the Democrat] was officially declared the winner. But [his Republican counterpart]... told crowds in Texas: "They are still counting. I am confident when all is said and done we will prevail." Under Florida state law, a margin so close automatically triggers a recount. As the long American election night dragged towards dawn, [both candidates]... abandoned their speeches until official results in Florida had been declared. After 18 months of intense campaigning, the two candidates were deadlocked in the popular vote. [The Vice-President] edged ahead of [his rival] by 269,904 of the 95 million votes cast... The Vice-President received 47,788,828 votes and [the Republican candidate 47,518,924. The] Green Party candidate[s] 2.5 million votes could have made the difference. Control of the White House came down to a few of the nearly 6 million votes cast in Florida for its vital 25 Electoral College seats in America's indirect voting system. The race for Florida was so close that American television networks called the state twice – once for [the Democrat, once for the Republican] – and twice retracted. An official recount is being made today. The knife-edge vote leaves both candidates short of the 270 electoral college votes needed to enter the White House. Last night, [the Vice-President] had 249 electoral votes to [his rival]'s 246... Before the late night drama, [NZ's PM said it]... expected no fundamental changes to the N[Z]-US relationship. "In a congratulatory message[to the Vice-President], I have told the President-elect that N[Z] is committed to the launch of a new W[TO] round, an issue which is also a priority for the U[S]," the PM] said.

...To students of American history, it all sounds familiar... Election 1879, when Rutherford B. Hayes won 48[%] of the poll, but wound up with 185 votes in the then-smaller Electoral College, one more than his rival, Samuel J. Tilden who won a majority of 254,000 in the popular vote. That was the last time that the... U[S] election system produced different winners in the public vote and the Electoral College... It also happened, less contentiously, in 1888 when another Republican, Benjamin Harrison, was the beneficiary. There are similarities between the late 19th century and [today]... Once again... a Republican... stands to gain; once again there are objections that the will of the people is not being respected. But in other respects circumstances have been transformed. Television, newspapers and the internet mean the entire country... can follow every development... virtually as it happens. And America is a far more legalistic and litigious country than it was then, meaning there is a far greater risk of the controversy becoming ensnared in the courts, instead of being handed off to a smokefilled room in Washington DC. The margin between victory and defeat is unprecedentedly narrow. By early yesterday, [the Vice-President]'s... lead in the popular vote had shrunk to less than 100,000, or 0.1[%] of the total. Absentee, overseas and military votes could further reduce, perhaps even eradicate, this lead. If so, what happens? The obvious risk is of lawsuits. But unless fraud is proved, these are unlikely to succeed. The Palm Beach County ballot paper – now surely the most famous document of its kind in history – may not have been a model of clarity, but so far, no one has been talking of fraud.

...Mobs of angry voters are demanding that Florida officials sort out a growing election mess that could leave the U[S] in limbo for weeks. Crowds of... supporters [for both candidates]surrounded the Palm Beach County election offices yesterday, chanting angry slogans as the battle to lead America narrowed... Banner-waving voters in Palm Beach were especially furious at a confusing ballot paper that forced officials to throw out 19,000 votes that were double-punched. The ballot's design apparently made some [Democrat] supporters vote for [the]right-wing Reform candidate... by mistake... "Something happened that shouldn't have happened," one [Democrat] supporter yelled in the face of a [Republican] voter. "What happened was absolutely stupid," the placard-toting [Republican voter] yelled back... It was all part of another day of chaos in which[the] Vice-President... flew 50 lawyers to Florida, talkback hosts mocked everyone involved and officials admitted they would take at least another week to sort out who had won. The premature declarations by news organisations claiming that [the Vice-President] had won Florida have come under Congressional scrutiny, with claims the early call may have discouraged voters elsewhere from going to the polls... The election result is even less clear now than it was on Tuesday night, when figures had [the Republican candidate] winning by 1784 votes in Florida... Last night, estimates from 66 of 67 Florida... counties put [the Republican]'s lead at 327 votes... The 67th county, Palm Beach, is to recount today. The disarray in Palm Beach, which includes one of the wealthiest communities in the US, is causing the most problems. Three people have already filed lawsuits about the confusing ballot paper, although no election challenge has succeeded in Florida since 1974. The ballot paper had candidates' names lined up on the

right and left of a thin strip. Voters had to punch holes out of the strip to show who they wanted for President – but many people said they were confused and punched the wrong hole. The problem is exacerbated by a Florida election law, which says candidates' names must be to the left of the holes. Meanwhile, thousands of votes trickling in from overseas have yet to be counted. Florida[']s Secretary of State... said it would take at least until Friday, US time, for the results to be certified. That is the deadline for overseas votes. But even then, legal challenges are likely to extend the drama. [Democrat] officials yesterday called for a recount in four Florida counties and maybe even a new election in Palm Beach. But [Republicans, who]... are considering challenges to results in Wisconsin and Iowa... said that that would "politicise and distort" the electoral system.

...All the pent-up tensions of America's unresolved presidential election exploded into the public arena yesterday, as representatives of the two candidates traded legal and personal invective over the conduct of the vote. With the most powerful job in the world at stake, the U[S] was plunged into a political crisis of the first order – one that called into question the soundness and durability of some of its most fundamental institutions. Even the vote recount in Florida... was subject to controversy... The [Democrats]... requested... 1.78 million ballots be hand-counted in Palm Beach, Volusia, Broward and Miami-Dade counties. Eight lawsuits challenging the results were filed in state or federal court... – ...six in Palm Beach... and two in Tallahassee, where race discrimination was alleged. As the recount progressed through the day, the... Vice-President[']s... camp... made an extraordinary public intervention. Announcing that the Democratic Party would back legal action by aggrieved voters in one Florida county, [hi]s campaign manager... threw down the gauntlet to the rival camp... "We are taking steps to make sure that the people's choice becomes our President." [The manager]'s words amounted to a direct appeal to the American people, past all legal and constitutional niceties. It also contained an implicit challenge to the current system, where the vote of the 538-member Electoral College, and not the popular vote, decides the victor... In the cooler atmosphere of the previous day, [the]... past Secretary of State, respected lawyer and sage, who is [the Democrat] representative at the Florida recount... had dismissed talk of any Constitutional crisis. There were no such denials yesterday... Just two years after... a... Judge... released a report which almost toppled [the]President... the fate of the White House could once again be in the hands of judges and lawyers.

...As the drama of a presidential vote recount in Florida played in every town and city in America, lawsuits challenging the results in one key county could lead to an unprecedented order for a new vote there. Law professors specialising in constitutional and election laws say the cases filed in Florida are particularly compelling because the state's laws allow challenges to election results if there is evidence the wrong person, through irregularities, somehow received more votes. There are at least two suits filed in state court by Palm Beach County voters who allege a confusing ballot caused them to mistakenly cast... votes for [the]Reform Party candidate... instead of [the]Vice-President... The ballot used in Palm Beach County was the only design of its type used in Florida. The 3400 votes cast for [the Reform Party candidate] in the county, were far more than [the candidate] received in nearby counties... In addition, Democrats also say 19,000 voters in Palm Beach County were invalidated because the ballot design prompted voters to double-punch their cards, voting for both [the Democrat and the Reform Party candidates. A]... professor at the University of Chicago... said that... the Palm Beach voters... "do not have to make allegations of fraud or that the confusion was intentional. It is not required by the statute. People can vote wrong all the time. But the question here was whether this was systematic and it appears that it was. It looks like something was seriously wrong." ...a professor at Harvard Law School said: "The only remedy that makes sense is to redo the election in the precincts where the ballots were confusing. A new election could be held quickly if the courts act quickly."

...Election officials in Palm Beach... last night ordered a laborious hand recount of hundreds of thousands of votes. Their decision came after a manual recount of a small percentage of ballots showed a net gain in ballots cast for [the]Vice-President... But... [the] Republican Party has sent the presidential race into the courts by requesting an order blocking the manual recounts from continuing in Florida's improbably close vote. A federal judge has set a hearing on the [Republican] application for today in Miami... Further complicating the outcome... police were yesterday looking after two locked ballot boxes found days after the election – one in a downtown hotel and the other in a church – but they may contain just supplies, not votes... Police had not opened either box and were keeping them in a safe place... until election officials came to claim them.

...Florida officials won approval to forge ahead with counting presidential ballots by hand yesterday as [the Democrat candidat]e had requested, but lawyers for [the Republican candidate]... claimed the state did not have to include them in its final total... The recount had been in limbo since Florida[']s Secretary of State... a Republican and co-chair[person of the Republican candidate]'s Florida campaign, announced that the state would not accept any recounts that occurred after Wednesday. The Florida Supreme Court said yesterday that Florida counters could continue manual vote counts but that hardly ended the legal battle that was being played out in the state and on the Federal level in Atlanta.

...Republican[s]... cited "clear and compelling evidence" of serious irregularities in the manual recount of presidential votes in Florida yesterday but Democrats dismissed the charges as partisan politics. The Texas governor's campaign took a newly aggressive tack in challenging the hand recounts in three heavily Democratic counties, calling them "fundamentally flawed,"... In a preview of the arguments [the Republican candidate's] lawyers will put to the Florida Supreme Court later today when it decides if the manual recounts should be added to the state's official election tally... a... Republican... spokes[person]n... called them "completely untrustworthy." ...Although [the governor]'s lead over [the Vice-President] in Florida widened to 930 votes after the overseas absentee ballots were counted yesterday... Democrats... had succeeded in having as many as 1,100 of the votes, many from military personnel, thrown out. "No one who aspires to be commander in chief should seek to unfairly deny the votes of... [service people it] would seek to command," [the Republican spokesperson] said... "I am very sorry to say, but the Vice-President's lawyers have gone to war, in my judgment, against them [guys and gals] who serve in our armed forces,"... Montana's Republican governor... said.

...Florida Supreme Court pondered the issue of hand recounts yesterday and county workers soldiered on, examining thousands of ballots, in the U[S] presidential election that refuses to end. The seven justices of the state Supreme Court studied arguments made by competing lawyers seeking to clear the way to the White House for either [the]Democrat... or Republican [candidate]... The panel's decision on the legitimacy of hand recount tallies in three... Florida counties could come at any time – and could finally resolve the... election... [t]wo weeks after Americans went to the polls...

After the Florida Supreme Court makes its ruling, legal manoeuvring in the long-running presidential race could continue... "There may well be further legal challenges – what they would be, one can only speculate," said... an expert on the presidency at the Brookings Institute in Washington. "You're entering an area in which we don't have any very clear precedents." One possibility is that if the Florida high court rules that the hand recounting of votes should continue and should be included in the final Florida tally, the [Republican] camp could appeal to the Federal Appeals Court in Atlanta. If the Atlanta appellate court ruling favoured [the Republicans, the Democrat] camp could appeal the matter to the US Supreme Court in Washington... [A] professor at Cumberland School of Law in Birmingham, Alabama, said there could be an even more direct path to the highest US court... [– either candidate would just] have to allege violations by Florida authorities. There are other questions that also must be settled... But practically, one [Democrat] adviser said, the questions would conclude with the Florida Supreme Court's decision. [The professor] agreed, especially if the Florida court favoured [the Republican camp]. "I think at that point the political reality would tend to favour [the Texas governor]... The public would simply be out of patience with any challenges."

...Voters' patience running out... A... poll due to appear in *Newsweek* magazine this week[found that t]he percentage of people who still support the continuing legal process rather than a speedy resolution to the affair has dropped from 72... two weeks ago to... just 52[%] this week... An increasing number of adults – 55[%] – ...expressed disapproval at... [the Vice-President]'s handling of the dispute. Some 53[%] said the Democrat] should concede the election now... [However, 64%] did not think the country would be seriously hurt by a delay in the presidential transition...

Litigation rules, no surrender A deadline seems merely a milestone on the tortuous path that is the presidential election... [Democrat lawyers say the Vice-President] will contest election results from Florida's Miami-Dade County and won't concede defeat, even if [the]Texas Governor...

remains ahead in votes to be certified... at 11 am on Monday... Meanwhile, [hi]s lawyers argued in a brief filed with the US Supreme Court that the high court should stay out of the Florida election controversy, saying such interference would “diminish the legitimacy” of the presidential election. The brief was in response to a request by the [Republican] campaign that the US Supreme Court bar the consideration of hand-counted ballots from two predominantly Democratic Florida counties. In court papers, lawyers for [the]Democratic candidate... called the request by [the]Republican candidate... a “bald attempt to federalise” Florida’s legal and election process... Adding to the election drama, [the]Republican vice-presidential candidate... was reported to be recovering in hospital from a “very slight” heart attack – his fourth. [The Republican presidential candidate] earlier also filed suit in a Florida court asking 13 counties with heavy military populations to count overseas ballots. Hundreds of ballots, many from military outposts, were rejected last week when Democratic lawyers urged county boards to scrutinise them.

...[the Vice-President’s] bid for the presidency has been boosted by a ruling for a fresh recount. The Florida supreme court has ordered the recount of more than 12,000 disputed ballots in the southern state, but it may be challenged by... the... Republican... [candidate], who is still clinging to the lead. The ruling came little more than an hour after two trial court judges rejected a bid by Democrats to throw out 25,000 absentee ballots in Seminole and Martin counties. A month after voting closed there is still no official announcement about who will hold America’s top job.

...A divided U[S] Supreme Court, throwing out the latest bombshell into the... presidential election debacle... yesterday halt[ed] manual recounts of the vote in Florida, freezing the battle between [the Democratic and Republican candidates] until it can hear arguments tomorrow... The[Supreme Court] also voided an order by the Florida court that had reduced [the Republican]’s lead from 537 to 154 votes... The decision, possibly robbing [the Vice-President] of his best hope of victory, means that the... justices of the US Supreme Court could well decide the winner of the... presidential election... Seven of the nine... justices were appointed by Republican Presidents... The state court... judges were all appointed by Democrat Governors...

Just weeks after legal experts questioned whether the U[S] Supreme Court’s decision on Florida voting might have been political, the Chief Justice said [it] hoped the US court system “will seldom, if ever” become embroiled in another presidential election. [The chief justice]’s annual report... on the US Judiciary did not try to defend the 5-4 ruling that... gave the election to [the Republican candidate. But the chief justice] said the election “tested our constitutional system in ways it has never been tested before...”

...*Just when everyone thought the counting was over...* Newspapers appear close to winning the chance to review contested Florida ballots... in an effort to see whether [the Republican]... received more votes than [the]Democrat... in the decisive state... On Wednesday, the US Supreme Court ruled to effectively prevent a recount of disputed ballots, leaving many Americans in doubt over which candidate received most votes in Florida. The court’s ruling prompted [the Democrat] to concede and ended the fight for the state’s 25 Electoral College votes... For five weeks after the... election, backers of [the]Vice-President... claimed reviewing the “undervotes” was necessary to certify those not picked up by machines due to chads not punched all the way through, and also to decide which ballots had no markings for either candidate. But [Republican] supporters objected to recounts, charging voter intent cannot legally be determined... The... Republican Party would... no[longer] object to the count.

...When this unbelievable American presidential election... finally assumes its place in history, what image will best convey its madness? The security vans under police escort ferrying ballot papers from Miami-Dade and Palm Beach counties to Florida’s capital Tallahassee, with TV news helicopters in pursuit...? Or... Florida’s secretary of state... whose award of her state’s electoral college votes to [her Republican mate] in retrospect sealed the final outcome? Or the... sad spectacle of the Supreme Court of the U[S] split on political lines, as it delivered the first ruling in its history that would determine the result of a presidential election? ...In the end time simply ran out for [the Democrat candidate], whatever his inextinguishable conviction that [it] had won the election. Ultimately, the national yearning for political closure was too strong. The world’s dominant country, so fond of lecturing others on the conduct of their elections, made a farcical mess of its own. Other countries have managed to resolve desperately close elections without a legal brawl. Most other countries would have employed a single, easily understandable method of voting, and managed to count those votes in a reasonable time. This election proved that a passion for democratic accountability can be too much of a good thing. The vigour and combativeness of the American system is due in large part of the fact that so many officials, judges and administrators are elected and thus have, or are perceived to have, a political allegiance. Which is all very well – providing you have humble but unimpeachably impartial Westminster-style returning officers as well.

...It was Winston Churchill who branded democracy the worst of all political systems – except for every one of the alternatives. Had [Winston] lived to see the cavalcade of low farce and high comedy that has consumed the U[S] these past five weeks, [the former British PM] may well have developed a belated sympathy for totalitarianism. From the night of the [Democratic]... victory, that became a... [Republican] victory, that spawned a stalemate, that finally spat [the Texan Govenor] on to the doorstep of the Oval Office on Thursday, there is hardly a face in the pantheon of American politics not now covered with egg to one degree or another... [T]he Florida fiasco has produced no winners whatsoever. And that applies particularly to [the Republican candidate], whose newly resurgent smirk must surely speak of innocence rather than eagerness for the task of leading a riven nation... At every point along the tortured road to the final resolution, the experts called it wrong... Having spewed one wrong prediction after another, the punditocracy has been reduced to noting that there have been no riots or military coups, and that Wall St, while a tad wobbly, remains sound. Americans are never shy about singing their own praises but, taken at face value, the combined tonnage of barf-bag boilerplate on the nation’s editorial pages does not amount to much more than a celebration of the fact that the US is more stable than Serbia, its military is better behaved than Pakistan’s, and the country’s financial institutions are more reliable than those of Russia. On the whole, not much to boast about... And the final absurdity? After five weeks of blaming everybody but themselves for the confusion in Palm Springs that cost [the Democrats] so many votes, a local party official finally admitted that evil Republicans might not have been to blame after all. It seems the real reason so many elderly Jews voted for [the wrong candidate] was because local Democratic functionaries handed out thousands of erroneous how-to-vote guides that instructed recipients to punch the wrong hole. Given his reluctant enthusiasms for democracy, Churchill would have had a big laugh over that one.

...[Labour’s leader] is finding life tougher than expected... as British P[M] – and... is nervous about the arrival of his fourth child next month... Although... more popular than any recent... [British PM, the PM said i]n an interview... [that it] had “lost some of his optimism, some of his bounce... The reality... [o]f being P[M]... is different from anything you might have anticipated... It is more intense and... endless... and there are things that come along and knock you about. You get things like Ireland that are just a constant and terrible frustration... But I am not regretting it – not yet.”

...Another week, another nightmare. Spare a thought for a hard-working father trying to come to terms with the demands of a 2-month-old son. Sleepless nights? [The father] must know them only too well. But what must [it] think about in those long, lonely, dark hours? Crying baby? A Government falling apart? Does [baby]’s nappy need changing? Are colleagues plotting against me? Maybe [the baby]’s hungry? Don’t voters like me any more? Is [my]... 16-year-old son... out getting drunk? Leaks, leaks and more leaks? Crisis? Oh no, not again! Yes, these days [the British PM] has plenty to keep him awake. Whether it has been in his role as a father or British P[M], you could say that [the Labour Party leader] has enjoyed better times than the beginning of the 21st Century. Cast adrift on a sea of spin, his Government, populated by unelected advisers and shadowy spin-doctors, is reeling in a public image that is plummeting faster than the Titanic. According to his own advisers, a British public who loved him dearly is now on the verge of filing for divorce and jumping into bed with a bald rival who sounds constipated every time [it] opens his mouth... In the last couple of months, [the PM] has looked a tired [perso]n, a shadow of the youthful, enthusiastic leader who took power in 1997... [Incidentally, the PM’s mate, the out-going] US president... is set to become a TV star after signing up with a top Hollywood agent. And... has

already won his first role – in American show *CSI* (Crime Scene Investigation). Producers expect to see ratings soar when the silver-haired states[person] joins the team.

...[the out-going US President has] pardoned... one of the world's richest [people] from prosecution on more than 50 counts of racketeering, wire fraud, tax evasion and illegal oil trading with Iran. The conviction of [the rich person] and his business partner for evading more than \$US48 million in taxes was the biggest fraud case in U[S] history. The *Washington Post*... said the... fugitive financier[']s ex-wife]... who lobbied... the... President... to pardon her former husband... has donated... from \$US400,000 to \$US1 million... to [the President]'s presidential library fund since 1998... The Government Reform Committee will this week issue subpoenas for donor lists for [the] presidential library fund and for [the wife]'s bank records... [The wife], who has also given hundreds of thousands of dollars to the Democratic Party in recent years, refused to answer 14 written questions submitted by the committee, claiming constitutional protection against self-incrimination... [The President's attorney said his client] would fight a subpoena for the library donor list, because it would be "flagrantly violative of the First Amendment." The... [President]'s library foundation... hopes to raise \$US200 million to pay for building [hi]s presidential library in Little Rock, Arkansas. A tax-exempt organisation, it must file an annual financial disclosure form with the Internal Revenue Service, but unlike politicians and political parties it does not have to reveal individual donors. Republicans... called the pardon "sleazy" and questioned the influence of the donations on [the President]'s decision. The bank records, while helping determine the amount of the library donations, could also help investigators determine whether any of the funds originated with [the pardoned fraudster], who fled to Switzerland 17 years ago. Meanwhile, the *Washington Post* has revealed that [the President] and his wife... started shipping furniture from the White House to their new home in New York... despite questions about whether they were entitled to some of the items... According to the *Post*, the White House counsel's officer told... [the] White House chief usher... that the items... were personal gifts received by the [First Couple, who]... have now returned the... items to the White House... All the furnishings had been designated official White House property by the National Park Service in 1993... ■ The out-going President's wife] triumphed in her historic quest... to become the only first [wife] ever elected to public office... The campaign, which pitted her against a powerhouse New York City mayor and then a lesser-known Republican Congress[person], was the longest and costliest race in the state's history... [The first wife and the Republican] spent a combined \$US58.6 million... With the \$US19 million spent by [the New York mayor] added in, the race became among the most expensive Senate campaigns in history.

...The phone was answered after only a couple of rings – just the sort of efficiency you would expect in the office of a legislator whose friends once liked to describe her as The Smartest [Gal] in America... "How can I help you?" asked the voice. Real easy, I began, explaining how selling crack cocaine to inner-city teenagers seemed like such a lucrative business, I'd decided to grab a piece of the action. "So, what I need to know, is this: What sort of discount is [the new New York senator] offering if I pay for a pardon in advance? You know, if I get busted like... that guy in LA her husband let out of jail?" The response, which began with an excremental obscenity and ended in a procreative one, wasn't an example of the civility [the senator] herself was urging last week as [it, the soon-to-be-]ex President, and assorted members of their families tumbled deeper into the pardons-for-sale scandal. And with that, the line went dead. It's something that also has been happening to plenty of other telephones lately, most notably the hotlines that once led from the White House war room to the apparatchiks who spent most of the past eight years attacking [their leader's] critics and defending the indefensible. The Big Jerk, as [a former White House trainee] memorably described the [person] now holed up in suburban New York with an army of news[people] besieging his front gate, could always count on those supporters. They were there no matter what. If [the President] ravaged the White House help, the toady legion would rise to argue that, hey, Kennedy did it, too. When [the President] solicited contributions from drug dealers, Mafia associates and pornographers, another squad of talk-show apologists would take the field to blame the campaign-finance system for forcing a good [person] to hang with people [it] would rather not. The scandal was immaterial – Whitewater, Zippergate, suicidal aides, cattle-futures scams, whichever reeking stink du jour it happened to be – the flacks and flunkies were always there to smear their idols' enemies with "opposition research" collected by the [President's] private eyes and other, even more odious allies. "This is war," snarled [one presidential]strategist... who actually expressed a willingness "to die for the guy" if it would help to preserve the President's political viability. Lose your power, lose your friends. It's a lesson that a savvy duo like [the out-going First Couple] should have known. And perhaps they did – once, before so many escapes convinced them that they were untouchable. Now they're revisiting that wisdom in spades. With every day's sordid revelations – rules broken, propriety trampled, grasping relatives enriched – the pit into which they have cast themselves grows that much deeper, the ranks of their friends so much thinner... [By the way, i]t is barely a year since massive upheaval erupted in Argentina, one that seemed to herald the end of a decade of IMF-sanctioned policies that sent unemployment soaring while creating pockets of near-starvation... Four leaders came and went in a fortnight, and a nation imploded... But when Argentinians go to the polls next weekend to elect a new president, their most likely choice is the [guy] whose policies are held to have caused the downfall in the first place[, who]... the *New York Times* report[s]... may have received US\$10 million from Iranian intelligence... Said [one]taxi driver... "In a country ruled by rogues, the only way out of this mess is to vote for the top rogue."

...A New World Order Is Coming! ...While the world is absorbed in sport, pleasure, revelry and money-making, powerful [people] are quietly organising the future. On the surface their remedies appear to be a solution to the world's problems. Others are uneasy at the massive centralising of political, economic and religious power into the hands of a few elitists... The U[N] and the I[MF] are playing a major part in committing every nation on earth to a New World Order... The IMF and the International Bankers have every nation committed to export and import, so they can be easily controlled. The nations plead with these financial institutions to obtain credit in order to pay the ever-increasing interest-bill, and to keep their economies rolling. Their requests are met, but the conditions attached to the loans usually require actions which, four or five steps down the line, add-up to that nation losing its sovereignty... Politicians are passing New World Order legislation into law, without a mandate from the people who voted them into power... For years this movement was veiled in utmost secrecy, but now that it is nearly fully established, it is no longer veiled behind their semi secret organisation such as:– the Council on Foreign Relations, Skull and Bones Society, the Tri-lateralists, Bilderburgers, and other secret societies. They have moved out of the woodwork as the following statement from the then U[S] President... reveals:– "It's a big idea: a new world order, where diverse nations are drawn together in common cause... Only the U[S] has both the moral standing and the means to back it up." State of the Union Address, *Los Angeles Times*, Feb. 18, 1991... [Now his son is about to become] THE STRONGEST M[ANAGER] ON EARTH

...for a huge tranche of America's governing elite, the frenetic times start now. After every presidential election, and especially at the end of the maximum... term that the Constitution allows... there is a huge clearout of offices in the... capital. The transition has been described as the single greatest display of patronage since the Medicis. During the... days between... [the] election and inauguration... 6000 jobs will be allocated to people from all over the country. These vary in importance from the Secretary of State to the deputy assistant director of the subcommittee on purchase management in the Department of the Interior. But they all have three things in common: each is a presidential appointee, each is a stepping stone to something grander, and each is desperately coveted by dozens of people. It is at this time of every... political cycle that people in Washington begin to talk about the Plum Book... in which each of the jobs, or "plums," up for grabs... is laid out in detail. Every Administration-related job has a serial number and a brief job description. No one in town and no one attached to the winner would dare to be without the Plum Book until [it]... has plucked a sinecure from its pages. To the uninitiated coming in from outside the Beltway, the eight-lane highway that isolates Washington DC from the rest of the world, a serial number is not much to go on when it comes to choosing that particular stepping stone that will help them on the

road to riches and fame. That is where the Prune Book comes in. This unofficial volume, thicker than its orthodox cousin, contains proper detail on which job does what, whom the holder answers to, what career progressions might be offered and warns of potential dead ends. Most new Administration employees will jockey for position to get their names mentioned to someone who has been appointed to the coveted presidential transition team. In fact, a place on that team is the surest way of getting a plum and not a prune. For instance, last time out, [the]... head of the transition team... coincidentally pulled out the plum of plums when the President chose him as Secretary of State... History suggests that the victory of a Washington insider is as likely to lead to a clearout as of an outsider. The bloodletting after [the President-elect's] father won in 1988 was almost as complete as [his successor's] four years later. Before the [41st] Administration, no Vice-President had stepped up to the White House since the 1840s, so no one knew what would happen. In the event, when [the then]President-elect... sent out demands for the resignation of all [40th Administration] appointees, no one took it seriously. Only when a second letter went out did they realise that the new broom was going to sweep clean.

...[the out-going US] President... brought down the curtain on the scandals that marred his presidency after reaching an 11th-hour agreement to end all risk of prosecution for past crimes. [The 42nd President] agreed to admit that [it] “knowingly misled” the court when... g[iv]ing evidence in the sexual harassment case brought against him by [a]former Arkansas state employee... [The 42nd President] had faced the possibility of prosecution after [it] left office for allegedly lying under oath about his relationship with... [a]White House trainee... That threat has been lifted, as have all other judicial investigations... Judicial forgiveness was not a one-way affair, however... All told, [the 42nd President] pardoned 140 people and commuted the sentences of 36 others. One of those pardoned was [hi]s 44-year-old half-brother... a musician who served a year in jail on a drug offence... A presidential pardon – providing official forgiveness for criminal wrongdoing – gives convicted criminals benefits enjoyed by full citizens, including right to vote... After... attending [his successor's inauguration, the 42nd President] left the Capitol by motorcade – his last helicopter ride scotched by bad weather – heading for Andrews Air Force base and then his new home in New York.

...one of the new Administration's most pressing considerations will be an overhaul of the voting system that has turned the world's mightiest democracy into a laughing-stock of incompetence. Many voters... were forced to record their choices on fiddly bits of cardboard that were then read by out-of-date machines of dubious accuracy... In most elections, even large numbers of discarded or inaccurately read ballots don't make much of a difference. But this was not most elections, and the sheer closeness of the contest... exposed the rottenness of a system that should have been fixed years ago. [‘A system that was designed in the 17th century has failed’ at the end of the 20th century.]The punch-card ballot is based on early 20th century technology and was never intended for use in elections. A 1975 study conducted for the Federal Election Commission showed the accuracy of punch-card reading machines at only 99.5[%], a margin of error that would translate into 30,000 votes in Florida. Around 37[%] of voters in this election used punch cards. Another 20[%] used an even more antiquated system of mechanical lever machines. Also, the autonomy granted to local counties leaves states bereft of any kind of organisation with the authority or the financial muscle to make meaningful improvements.

...World's front pages mock paragon of democracy... The world's newspapers are revelling in the embarrassment of the American political system, making comparisons with... “spaghetti westerns” and the endemic corruption of Indian and Italian politics. The most caustic mockery came from countries whose democratic failings have been criticised by Washington. For many writers America was receiving its comeuppance for holding itself up as a model for others to emulate. Nepotistic dynasties, a dead [perso]n elected and scandals over ballot boxes were not just confined to the [Last] World, they said. A “great victory for democracy, desi-style [Indian-style],” the *Times of India* gleefully described the debacle... *La Reference Plus*, published in the Democratic Republic of Congo, said the chaos in [America's presidential election] only encouraged African dictators. “If this happens in the U[S], how do you want everything to be clean and transparent in the poor African countries?” it asked... Italians, who have had 58 post-war Governments, enjoyed a field day. The Rome daily, *La Repubblica*, ran the mocking headline: “A[n election] worthy of a Banana Republic.” German newspapers were more sanctimonious, with several arguing that America's electoral system was outdated and undermined the legitimacy of the eventual winner.

Once admired as the seat of democracy, the U[S] has reached a point at which it is actually regarded as an enemy of social progress by many liberals within its own borders and by most intellectuals [outside them (‘US political life has lost its centre and now pits two irreconcilable opposites – increasingly unhappy even about living together – directly against each other in a winner-takes-all election every four years; the solution: don't move the people, just move the border as the blue parts of the US all lie along the Canadian border or next to other states that do – at the global level, everybody else would be quite happy with a bigger Canada and a smaller US’)]... One of the burning questions about the future is whether democratic government as we know it can or will survive the wrenching challenges ahead. If not to which form of government will the hitherto democratic nations of the world turn?

The Country That Works Perfectly... [– where s]treets are clean, crime is rare and everyone prospers. But what about democracy? AS MY TAXI drove along the palm-fringed roadway from the airport, I looked out onto what may well be the cleanest, safest and most efficient country in the world – the prosperous, futuristic Singapore. Amid the clutter and chaos of urban Asia, this nation of 2.9 million people at the tip of the Malay Peninsula is a refreshing oasis. Here, everything not only functions but usually works perfectly: the streets are clean, potholes are fixed within 48 hours, and water can be drunk straight from the tap. Impoverished just two generations ago, Singapore today boasts gleaming new office towers, planned suburbs, broad boulevards – and a degree of middle-class prosperity that almost any city in the world might envy. Suddenly I heard chimes from the taxi dashboard. “What's that?” I inquired. “Excuse me, sir,” the driver apologised. “I was speeding.” The chimes... w[ere] a reminder to me... that if Singapore is a brilliant economic machine, it is also a place where behaviour is rigidly monitored by the state. Fines can be draconian: as much as \$500... for littering, smoking in public places, or for failing to flush a public toilet. The government may even impose up to \$2200 in fines for something as seemingly innocuous as importing chewing gum. (Technically, it's illegal to chew gum in public in Singapore.) Singapore's mix of prosperity and social control has made it attractive to countries such as Vietnam and China, which hope their own authoritarian rule might survive capitalist-style reform... It is not hard to see why. Under pressure to liberalise, they see a nation that has grown rich while still maintaining tight control and having the same ruling party for 36 years... Yet, if increasing numbers of Singaporeans have their say, the tiny republic may ultimately become a model of democracy instead... The growing proportion of votes for opposition candidates clearly shows that Singaporeans want a more open society. And the coming transformation of their country into an “Intelligent Island” will make controls over free expression irrelevant: it is meaningless to restrict sales of a newspaper when anyone in the country can get all the information [they want on their] home computer.

The Internet could be used to enable societies to become 100% democratic – all of the arguments for and against, plus any other information relevant to the issue or legislation to be voted on, can be posted on the Internet; citizens would be personally responsible for reading that information then registering their vote over the Internet (the modern telephone system and pin numbering can also be used to enable ‘each citizen to take a personal part in deliberations’ – in which case the arguments and relevant information might be published on TV, radio and in newspapers). The obligation to participate will be on individual citizens (i.e., the majority decision should prevail even if only 1% of citizens bother to vote). However, such a political system fails to address the main problem with democracy – that the majority of citizens only have average intelligence or less, which makes their opinion less valid than the

minority who have above average intelligence; yet, in an election, it is the opinion of the majority that prevails). Furthermore, even if it were possible to raise the intelligence of every citizen to the same level, the issue of whether the average citizen has time to study all of the relevant information remains – and new problems may be created because such a system eliminates decision-making government bodies (especially cabinets). The solution ought to be obvious – a political system that gives every citizen an equal chance to prove their worthiness to participate in government while allowing only the most-worthy to do so.

Most contemporary political systems have ministries which attempt to control the activities of various industries. These ministries are headed by a cabinet minister, who is selected by the governing party (or coalition) from among its MPs. Each minister is meant to solve conflicts of interest between the various competing factions within the industry it represents, and between its industry and other industries or the public, while trying to implement government policy. This means that each industry effectively contains numerous decision-makers – those who are employers (who could number in the thousands) and a minister (who may once have worked in the industry, but not necessarily – and, even if a minister has worked in the industry, that doesn't automatically mean the minister knows enough about the industry to be making major decisions concerning it). Employers generally make decisions according to self-interest, while ministers are supposed to make decisions according to the interests of the industry, its workers and the rest of the community. Unfortunately, ministerial decisions may come too late: because ministers often have to learn what is going on in their industry first – by listening to their own advisers, the employers and other lobbyists, or via commissions of inquiry – before making a decision (which may involve another time-consuming process – introducing new legislation), by which time the decision (or new legislation) may be out-of-date, or the employers (who often have an opposing agenda to the ministry) have already worked out how to circumvent it (a scenario that might require the minister to repeat from the beginning the process of making a decision)! An alternative to this situation is where all of the workers employed in an industry are united under one ministry (hence they would be co-operating instead of competing with each other; and the minister is the person who leads the industry instead of being someone who merely chases its tail).

Most industries employ both skilled and unskilled workers. The unskilled are thought of as being at the bottom of an industry's decision-making process. It logically follows from this that the MOST skilled worker should be at the top of an industry's decision-making process (i.e., be the industry's minister). Political systems of this type are called MERITOCRACIES. Any political system based on the premise that every worker within an industry has a theoretically equal opportunity to prove itself worthy of becoming the leader of that industry, would be far more democratic than simply allowing each worker to vote for members of parliament from candidates who have been selected by political parties or by themselves. It also removes the process of holding elections – unless the unlikely situation arises where two or more candidates are equally qualified to become an industry's minister (such elections can be limited to relevant people within the industry).

Properly qualified, trained and conscientious workers require little supervision. However, even if every member of a group of workers performing similar tasks are all properly qualified, trained and conscientious, one of the group would be expected to ultimately prove itself slightly more qualified, etc., than the rest (e.g., one member could have worked in the position for a longer time than its peers). Furthermore, the members of a group performing the same tasks should be able to identify their most qualified co-worker. The most qualified co-worker ought to become the group's SUPERVISOR (or FOREPERSON) and be the link between the group and the next level up of the industry's decision-making structure (it is responsible for ensuring that the group performs the tasks set by the next level) – and be chosen on merit by a member (or members) of that next level, or by its own peers.

If all of the workers of a particular industry within Auckland, for example, were united in their efforts, the industry would have x groups of workers. Depending on the type of industry, these groups might all be performing the same tasks but at different locations, different tasks at the same locations, or different tasks at different locations. This also means that there would be x supervisors in Auckland. The next level of the industry – lower management – would be the one which is responsible for organising the activities of the groups (and, therefore, the person a supervisor links with could be called an ORGANISER – as opposed to being called a LOWER MANAGER). Because of Auckland's size, there are likely to be so many groups of workers at the lowest decision-making level of each industry that each will require y organisers (with each handling the activities of groups from one suburb or a number of adjacent suburbs, or groups performing a set of different but related tasks all over the Auckland region). Each organiser should be selected – on merit – from the supervisors it is responsible for (either by the supervisors or by the member, or members, from the next level of the industry's decision-making structure – the upper management level, whose members could simply be called MANAGERS). Because of Auckland's size, each industry is still likely to require more than one manager. Each manager should be selected – on merit – from the organisers it is responsible for (either by the organisers or by the member, or members, of the next decision-making level). Some industries may not require both a lower and upper management level, but all require an overall leader. This leader would be the industry's MINISTER and should be selected – on merit – from the industry's managers, or by an outgoing (e.g., retiring) minister. The minister, however, may need at least one assistant to perform its role properly. The promotional system would operate more smoothly if the primary assistant (a minister's office might also require additional secretaries) was the candidate identified to replace the minister. This would enable the assistant (or deputy) to become familiarised with the role before obtaining it, and to serve as a stand-in minister whenever the actual minister is sick or on leave. Likewise, each manager, organiser and supervisor could have a deputy (when a deputy is promoted, if its former boss isn't also being promoted, the former boss might temporarily become its deputy until the new boss is settled into the role – or until a suitable replacement deputy has been identified and is able to take up the position). Promotions won't be forced upon anyone who doesn't want added responsibility.

A minister would be responsible for ensuring that its managers perform their tasks, while the managers act as advisers to the minister (although the minister ought to be a source of advice rather than someone who needs to seek it). However, if the managers are capable of performing their tasks, there should be little for the minister to do that relates directly to the activities of its industry. Instead, the minister will primarily be a link between its industry and other industries. Each industry is responsible for meeting certain needs of the community, but an industry can't operate in a manner that adversely affects another industry's ability to fulfil its responsibilities. Furthermore, most industries require the assistance of other industries to perform their work tasks. Therefore, the various industries have to cooperate with each other to enable the society to function properly. The role of ministers is to ensure that such cooperation is maintained. In order to do this, they would need to form a council (or cabinet) which meets at regular intervals (e.g., weekly or monthly) and whenever the region is facing an adverse problem (e.g., a natural disaster). This council can serve as a local (or district) government.

The world should be divided up into districts of approximately equal size (in population and area), with each district government being responsible for meeting the needs of citizens from within their district. However, few if any districts could be expected to be completely self-sufficient (e.g., because they lack certain material resources). Therefore, it would be necessary for some trade between districts to be maintained. In order to facilitate trade between districts (whereby one district permanently provides a product or service to another in exchange for a product or service that it can't provide for itself; whereby a number of districts temporarily set aside a percentage of their production in order to provide for a district whose productive capacity has been affected by a natural disaster), they should be grouped into states. A state minister for each industry can be selected – on merit – from its district ministers, to serve on the state government along with representatives of the other industries. Finally, representatives need to be selected – on merit, and from amongst the state ministers of each industry – to represent each industry in a world government.

Although the world government would essentially function in a similar fashion to the state and district governments, there is one major difference – the activities of district and state governments are overseen, and answerable to, a higher authority, whereas there is no human authority higher than the world government. Although there should be no problems with the quality of world ministers – if the system is operated correctly, they ought to be the WISEST, or BEST AND BRIGHTEST, most moral, energetic, able and respected members of their industry – it would be sensible to have more than one minister represent each industry on the world government. Ideally, each industry should have 3 world ministers – because that would mean any decisions which the

world ministers of an industry make in regard to their industry will be decided unanimously or by a 2-to-1 majority. In addition, it may be hard for one person to know enough about its own industry to handle the responsibility of being a world minister, but not three people whose knowledge is being combined (and, if their industry is divided into more than one sector – e.g., the Education industry can be divided into pre-schools, primary schools and high schools – it might be possible to have each minister come from a different sector). Furthermore, having 3 world ministers (who could have equal standing – although one ought to be designated as a chairperson of the trio; the position of chair could be rotated) may remove the necessity to have deputy world ministers – because, if one world minister retires or has to be replaced for another reason, there would still be 2 experienced world ministers (who should be able to cope while a new world minister settles into its role, as well as helping the new world minister to settle in). They ought to be able to cope because, assuming that all of the state and district ministers are qualified to be in their positions, the necessity for the world minister to make decisions – once such a system is up-and-running – could be extremely limited (i.e., apart from participating in periodic meetings with the co-world ministers of their own industry, and with the world ministers from other industries, plus keeping up-to-date with any developments within their own industry – via their state ministers – or developments in other industries which affect their own industry, world ministers may only need to be on-call in case they are required in the event of a disaster or to give advice to a state minister, and contribute to the occasional process of selecting replacement state and world ministers).

In order to start up such a system, it might be more ideal to initially have 5 or 7 (r:p605, ln56) world ministers for each industry instead of just 3 (but this doesn't mean that it should then be called a POLYARCHY – a 'government by many persons'). Initial world ministers would have to clarify what their industry's responsibilities are (both to individual citizens and to other industries) and work out how to turn a presently disunited industry into one which is united and capable of fulfilling those responsibilities on a worldwide scale, as well as selecting the initial state ministers. This would be far more complicated than simply maintaining the system once it has been operating for a while, and the initial system may require many adjustments before it is able to operate with little interference from the top – so having more than 3 world ministers will reduce the workload. Once the system is up-and-running, the number of world ministers in each industry can be reduced.

There are said to be 15 *industry groups* (r:p604, ln16 + p1858, ln41). Therefore, assuming each industry is going to initially have 7 world ministers, human society needs to find 105 suitable candidates. Fortunately, there are currently about 6 billion people, which means – in this example – finding approximately one candidate from every 57 million people. That shouldn't be as hard as it might sound – especially when organisations such as the UN are around to assist the selection process (note: recall that the Bible suggests there are 144,000 worthy candidates). Candidates could be nominated by each industry, and the UN General Assembly – or a UN department affiliated to an industry – can choose the initial world ministers from those nominations. The most suitable candidates ought to be able to converse in the same language and might be those currently serving as consultants, advisers to politicians, chairpersons or chief executives of multinational corporations, and the heads of UN departments. The UN should also be responsible for dividing the world into states – which would need to occur before the initial world ministers can begin to select the initial state ministers (although initial state boundaries may need some alterations before being finalised) – then the body of initial world ministers could supersede the UN plus existing national and state governments.

The initial state ministers can select initial district ministers, who would be responsible for implementing the unification process as specified by their world ministers. When an industry has been unified within a district, the district minister will know what the industry can and can't provide for its citizens from within the district, and what it can provide in excess in order to use as trade for whatever it can't provide. The state minister will then be responsible for arranging trade between its districts. In some instances, a state may be unable to provide all its needs, in which case trade between states would need to be arranged by the world ministers.

World ministers would also be responsible for seeing that information – especially regarding successful initiatives – is shared between districts (r:p1857, ln62-3). Wise people tend to make less mistakes than unwise people (because the wise think – and learn – about what they are going to do before doing it) but, while the system is being set up and initial ministers are gaining experience, those ministers could be forgiven for making some mistakes – unless they repeat mistakes made by other initial ministers (but if information regarding mistakes is *shared between districts*, it shouldn't be possible for a mistake to be repeated). Sharing information ought to enable the whole system to gradually become more perfect, until it eventually reaches a stage where it seems unable to be improved any further (i.e., a *steady-state* or societal equilibrium). Once this has been achieved, humanity could be said to have built *heaven on Earth*.

The length of time it takes humanity to achieve *societal equilibrium* will depend on how much effort current generations put into doing so. If we assume that their lifestyles and ambitions proves the current older generation would be unwilling to adjust to a new social philosophy, it might not be possible to achieve societal equilibrium until all of those older people have died off. That could take at least 40 years (r:p1736, ln23)! Furthermore, although the current younger generation may be willing to adjust, most of them have been so mis-educated that they may be unable to properly raise their own children. Therefore, it might take until a properly educated generation reaches adulthood to achieve societal equilibrium. If, as part of setting up the new system, the Education industry is overhauled to educate human children properly, societal equilibrium might not be achieved until the children of the first properly educated children become adults – which again means taking *at least 40 years* before humanity as a collective has evolved ('developed as a species').

A child has been *properly educated* if it is able to reach its full potential. For a human, reaching full potential could mean becoming the Messiah! Obviously, not every child can be the Messiah – but if every child was taught what a Messiah would have to learn, might they all grow up to behave like one?

Working out what a Messiah needs to learn may prove to be problematic. However, if it is assumed that a Messiah is the most god-like of all humans (r:p1734, ln55), and the only way a human can be like God is to be wise, it logically follows that a Messiah would have to be the wisest of humans. Working out what a child needs to learn to become wise is less problematic – because past generations have produced examples of people who have been called wise, so their personalities and lifestyles can be compared to find common characteristics (note that few if any figures from the past have been completely wise according to contemporary definitions – e.g., unless Einstein became domesticated in his latter years, the wisdom ascribed to him is less than the wisdom which can be ascribed to anyone who shares his characteristics and has also lived through, or since, the sexual revolution; r:p282, ln64 + p1212, ln24).

According to Paul... Jesus... surpasses Adam in a positive way... Jesus is the perfected Adam, the first human being as [it] was truly intended to be.

If it is assumed that a human has reached full potential by being wise, it follows that being unwise means being less-than-human, sub-human, pre-human, primitive, Neanderthal, ape-like or *beast-like*, B- or 2nd-grade. As an alternative to those phrases, however, the unwise could simply be called HUMAN BEINGS (i.e., human beings are humans being something other than being human) – after all, it makes no sense for people to use a two-word phrase to name something if the first word of that phrase used on its own denotes exactly the same thing! For the remainder of this thesis, the phrase HUMAN BEING will be abbreviated to HB and used when the editor is referring to a person who isn't wise (or god-like), and the word HUMAN will be used when referring to someone who is.

...you see it's true an ape like me can learn to be human too...

LEARN

About 2.5 million years ago, global temperatures fell, initiating a... shift toward more open, savannalike habitats in Africa, resulting in the appearance of many new animal species and spurring the evolution of early humans... Their small brain size indicates that early humans did not have the prolonged period of juvenile dependency that allows modern children to develop their mental abilities.

The accumulation of objective knowledge began, the evidence suggests... in the Great Rift Valley of southern Africa[, where s]tone tools have been found... At first, this tool-making advantage had to be conveyed to the next generation by genetic inheritance... Later in our biological evolution came a time when an innovation in toolmaking achieved by one generation could be conveyed to the next by the extragenetic procedure of teaching.

Concerning education, it is stated in *The Republic*: “The soul of every [hu]man possesses the power of learning the truth and the organ to see it with... Hence there may well be an art whose aim would[n’t] be... to put the power of sight into the soul’s eye, which already has it, but to insure that, instead of looking in the wrong direction, it is turned the way it ought to be.” ...In *Nicomachean Ethics*, Aristotle writes: “Moral excellence is concerned with pleasure and pain; it is pleasure that makes us perform base action, and pain that prevents us from acting nobly. For that reason, as Plato says, [humans] must be reared from childhood to feel pleasure and pain at the proper things. This is proper education.”

Believing that play materials, practical occupations, and songs were needed to develop a child’s real nature... Friedrich Wilhelm [Froebel, a] German educationalist... open[ed] a school in his native Thuringia to put his theories into practice... when his two brothers died [leaving him in charge of] the education of their children... In 1837 [Froebel] opened a school for younger children, naming it the Kindergarten (= children’s garden), and later developed a system of specialized training for teachers. In the reactionary period after the 1848 uprisings, however, his reforms fell into disfavour, with the result that his schools were closed by Prussian authorities in 1851[, a year before his death.

...‘EDUCATION in NZ was at first a matter for the churches and some private secular organisations. After the Constitution Act of 1852 had divided the country into provinces, provincial councils were given responsibility for education. Many opted for providing financial help for denominational schools rather than the establishment of public schools. The first move towards free compulsory education at secular schools was the Education Act of 1877. The real momentum towards a comprehensive school system, however, came under the leadership of George HOGBEN who was Inspector-General of Education from 1899 until 1915. Hogben was energetic, progressive and established an intelligent, modern curriculum and examination system that gave education a national coherence and purpose that it had always previously lacked. Hogben’s enthusiasm for secondary education created the climate in which the new Labour government in 1936 made free education up to the age of 19 available for all pupils who had gone through primary school’]...

In the 1930s... [John Dewey] observed that most[US] schools were proceeding along traditional lines and failing to take account of the findings of child psychologists or of the needs of a changing and democratic social environment, and argued strongly for learning by experience and necessity rather than through authoritarian instruction...

The only rational way of educating is to be an example – of what to avoid, if one can’t be the other sort... But... [t]he most important method of education... always has consisted of that in which the pupil was urged to actual performance... [Unlike the procession of] intelligent and well-meaning [commentators from the past and today who] have dealt with educational problems and have certainly repeatedly expressed their views... I cannot lay any claim to being an authority... [when it comes to] educational matters... However... knowledge must continually be renewed by ceaseless effort, if it is not to be lost. It resembles a statue of marble which stands in the desert and is continuously threatened with burial by the shifting sand. The hands of service must ever be at work, in order that the marble continue lastingly to shine in the sun. To these serving hands mine also shall belong... It is “society” which provides [individuals] with food, clothing, a home, the tools of work, language, the forms of thought, and most of the content of thought... It is evident, therefore, that the dependence of the individual upon society is a fact of nature which cannot be abolished – just as in the case of ants and bees. However, while the whole life process of ants and bees is fixed down to the smallest detail by rigid, hereditary instincts, the social pattern and interrelationships of human[s]... are very variable and susceptible to change. Memory, the capacity to make new combinations, the gift of oral communication have made possible developments among human[s]... which are not dictated by biological necessities. Such developments manifest themselves in traditions... in literature; in scientific and engineering accomplishments... We... have, therefore, to admit that we owe our principal advantage over the beasts to the fact of living in human society. The individual, if left alone from birth, would remain primitive and beast-like in his thoughts and feelings to a degree that we can hardly conceive. The individual is what [it] is and has the significance that [it] has not so much in virtue of his individuality, but rather as a member of a great human society, which directs his material and spiritual existence from the cradle to the grave... [A hu]man acquires at birth, through heredity, a biological constitution which we must consider fixed and unalterable, including the natural urges which are characteristic of the human species. In addition, during [its lifetime, a human] acquires a cultural constitution which [it] adopts from society through communication and through many other types of influences. It is this cultural constitution which, with the passage of time, is subject to change and which determines to a very large extent the relationship between the individual and society... But... in... the present day economy... [t]here is no provision that all those able and willing to work will always be in a position to find employment; an “army of unemployed” almost always exists. The worker is constantly in fear of losing his job... Technological progress frequently results in more unemployment rather than an easing of the burden of work for all... Unlimited competition leads to a huge waste of labor, and to [a] crippling of the social consciousness of individuals... This crippling of individuals I consider the worst evil of capitalism. Our whole educational system suffers from this evil. An exaggerated competitive attitude is inculcated into the student, who is trained to worship acquisitive success as a preparation for his future career... [My solution – *the establishment of a socialist economy* (r:p283, lns42-3) – must be] accompanied by an educational system which would be oriented toward social goals... The education of the individual, in addition to promoting his own innate abilities, would attempt to develop in him a sense of responsibility for his fellow [citizens] in place of the glorification of power and [material] success in our present society... The school has always been the most important means of transferring the wealth of tradition from one generation to the next. This applies today in an even higher degree than in former times for, through modern development of the economic life, the family as bearer of tradition and education has been weakened... Sometimes one sees in the school simply the instrument for transferring a certain maximum quantity of knowledge to the growing generation. But that is not right. Knowledge is dead; the school, however, serves the living. It should develop in the young individuals those qualities and capabilities which are of value for the welfare of the commonwealth. But that does not

mean that individuality should be destroyed and the individual become a mere tool of the community, like a bee or an ant. For a community of standardized individuals without personal originality and personal aims would be a poor community without possibilities for development. On the contrary, the aim must be the training of independently acting and thinking individuals, who, however, see in the service of the community their highest life problem. As far as I can judge, the English school system comes nearest to the realization of this ideal. - Einstein

If every individual were reared in conditions as favourable to health as science can make them, [and] received an equally thorough and stimulating education up to sixteen... the most shocking of existing inequalities would be on the way to disappear. - 1964

Excessive equality makes for cultural uniformity and... [hence,] investment in education... becomes very close to being the basic index of social... progress. It is... investment in human as distinct from material capital. - 1977

One problem is that... in... any school there is a sector of the population that is there only because it is required to be so by law. These young people are in fact detainees because there are no jobs outside – or, if they did find jobs, they would decrease those available for the adult population. Naturally, this breeds resentment which leads to behavioural difficulties that throw an increasing burden on the rest of the structure, reducing its efficiency. Worse still, it is beginning to breed resentment also on the part of those who *want* to learn. Thus a system of compulsory, equal education for all, designed to reduce social tensions, may well have exactly the opposite effect... - 1979

On the subject of warfare, Wells is most restrained[, perhaps because Wells]... looks forward to greater unity between nations and to the gradual development of a “New Republic” – a peaceful and mature world state formed by the... Efficients, who are a heterogeneous group “applying the growing body of scientific knowledge to the general needs”... [Wells also] forecasts the expansion of the English language to the extent that it will be understood by “the whole functional body of human society” by 2000. - 1980

With the advent of social structure and language, a significant change in the mode of evolution occurs. Previously the only significant transfer of information from one organism to another was genetic. There was no reason for the brain to be able to store and process more information than could be encountered in one lifetime. The knowledge gained by a genius chimpanzee died with the chimpanzee. But with language, a significant fraction of the knowledge of the community could be passed to a new member. Knowledge could thus grow rapidly. To a large extent evolution becomes an evolution of societies rather than an evolution of organisms... In important ways, societies and technology seem to evolve together. In our history we can trace this from the development of agriculture (which made cities possible) to the present explosion in communication hardware that makes the entire world available to individuals in advanced civilizations.

...high-quality educational programs such as “Sesame Street” have taught many preschoolers to read. Unfortunately, when those same children reach primary schools they find only the traditional educational methods that have changed little over the centuries. Within a year or two many of them become bored, lose interest in learning, and turn to the easy distractions of television and social life. New developments in communications, aided by computers, can stop that tragic loss of talent and keep students interested. It’s an established fact that the very few naturally gifted “born teachers” are enormously more effective than the great mass of those in the teaching profession who teach with care and attention and even with good new ideas, but without the charisma and flair that distinguishes the best teachers as well as the best actors. In my ideal school of the future, children would assemble... in a private room in one-on-one interaction with a “tutor,” the realistic, holographic presentation of... one of the rare, inspiring, one-in-a-thousand superbly gifted teachers... [L]ectures would have been staged as carefully as a dramatic movie and would have been preserved on video discs. With computer-generated responses, apparently coming from the... tutor, there would then be an amusing rapid-fire give-and-take, teasing out answers... and always stimulating thought and reinforcing memory. - 1981

Education during the next century is certain to center around the learning of skills rather than the accumulation of abstract information. Rote learning of historical dates and facts, for instance, will be useless, since it will be much simpler to demand the information from a computer... Although English will remain the prevalent global language, the need for an international computer language will become a pressing concern. - 1982

We still need to find out how the individual features of a stimulus are “combined” to produce unified perceptions of whole objects and scenes... The essential nature of the memory trace, whether it is localised to a few specific nerves or widely distributed in the brain, is still a mystery... One of the greatest challenges facing psychobiologists is to understand the brain processes responsible for such higher cognitive activities as thought, language and conscious awareness.

...Modern neurophysiology has shown that, beyond doubt, the capacity of the human brain to establish connections (synapses) between its cells (neurons) is virtually infinite; but the number of such connections actually made is decidedly limited. If one accepts that memory and the power of rational thought are in some way correlated to the number or quality of the networks of these synaptic connections (which is probable) then it follows that [our species] has by no means yet reached the limits of [its] potential intellectual capacity. It is easy to jump unjustifiably from this conclusion to a further one, namely that because of the undeveloped capacity that is latent in everyone, all children are capable of far more intellectual achievements than they exhibit; and that the reason for this failure to achieve lies wholly in the environment... As educationists we can in any event do nothing to modify genetic determinants; but we can, and should, do all we can to try to make the environment of development approach the ideal... Most people agree that, whatever it may be... that ideal environment... should be made available, as far as possible, to everyone. In other words we should aim not only at an ideal environment; we should also aim at equality of opportunity... But... [o]ne cannot compensate for the differences between parents in providing opportunities for their children unless one wholly eliminates the family unit; and even then one must replace it by the creche where the qualities of those adults chosen to look after the children will vary as greatly as do the qualities of parents... In all that I have said I have taken it as axiomatic that ‘education is a good thing’. I do not subscribe to the view that society would be happier with less education. Even if it were true... that the uneducated manual worker of the past was more content with his lot than the semi-educated one of today, the communication explosion has made retreat to such a situation quite impossible. Society will go on being informed, society will go on being concerned about what it is informed about, and society will go on coming to the wrong conclusions and taking the wrong actions about these matters of concern unless we can, by educating each member of society to this limit of his or her capacity, produce a really dramatic change... This leads quite naturally to the most fundamental question of all, namely ‘What is education for?’ or ‘What are we trying to achieve by our educational programmes?’ It seems to me that educational theorists who have tried to answer this question in the last two decades have nearly all framed their answers in terms of satisfying the needs of the members of a modern society... It seems to me, however, that there is a gap in all this theory, a gap that is the root cause of many of our current problems, a gap that is extremely difficult to fill. There is seldom any mention of educating people to have values. Indeed we have, as a society, torn down and abandoned all the values that formerly provided the principles on which human behaviour in societies was founded... I am not arguing that we were wrong to abandon all these values; I am, however,

arguing strongly that we were wrong to abandon them unless we had something else to put in their place. Those of us, and I was one, who, as adults, embraced humanism as a basis for an ethical code – the Mr. Do-as-you-would-be-done-by philosophy – failed to appreciate that it is a sophisticated concept which cannot easily be taught to young children. It has neither carrot nor whip to attract or compel acceptance. It is essentially based on self-discipline... I would therefore answer the fundamental question... by saying that we aim (a) to instil a set of values (b) to develop innate creative talents and skills (c) to develop intellectual capacity as far as possible (d) to instil a knowledge of the customs and structure of society (e)... to select and train for a vocation[.] For several years... people in many countries have come to realize that the pace of acquisition of new knowledge is not only very fast but is accelerating. All sorts of figures are quoted to dramatize the situation; as, for example, the calculation that more new information emerged last year than emerged in the whole of recorded history up to 1900. This sort of statement is easy to make and impossible to prove or disprove; but it indicates well enough the dilemma that we face. It follows that the traditional idea that the initial education that a child is given can be a preparation – and an adequate preparation – for the whole of his or her working life is simply no longer tenable. The average American, it is now stated, changes... career twice and moves house fourteen times during ...[t]s active life. Much of what [a person] learns at school, college and university will be out-of-date not just before [it] retires but even before [it finishes its] initial education. It thus seems sensible to consider whether a period of initial education that *averages* sixteen years is any longer sensible. Clearly education must continue throughout life... - 1983

Thomas Jefferson warned that “if a nation expects to be free and ignorant, it expects that which never was and never will be.” In a similar vein, one of the earliest foreign observers... on life in America... Alexis de Tocqueville, commented, “The universal and sincere faith that they profess here in the efficaciousness of education seems to be one of the most remarkable features of America.” It’s still a cherished American dream that through education we can perfect the individual; then, through the individual, we can go on to transform society... [A] recent article... sums up this belief quite well...: We face many insistently urgent problems... To solve these problems, we need resourceful and innovative leadership. For that to arise and be effective, an educated populace is needed... Achieving peace, prosperity, and plenty could put us on the threshold of an early paradise. But a much better educational system than now exists also is needed, for that alone can carry us across the threshold. [“A Revolution in Education,” *The American Educator*...] ...After W[W]II... the key word in education became cooperation. To further this value, a system of education called core curriculum became very popular. It was based on the concept of progressive education developed by John Dewey and [other progressives]. The progressives believed that the curriculum should be built upon practical problems and experiences of contemporary life, with less organization of courses by subject matter. They stressed the development of the total child through “activity-centered” teaching... Simply stated, core curriculum was a system in which one subject became the focal point, with all other subjects subordinated to it. For example, the class and teacher might choose to study about American Indians. The reading, mathematics, writing, spelling, music, art history, and geography lessons would then all be related in some way to the topic of American Indians. Using this basic approach, children were also taught how to work in committees and share their various reports and research. In this postwar period, problem solving by committees was seen as the wave of the future. The U[N] was held up as the prime international example of this way of thinking... In other words, the classroom became a training ground for what, with typical American optimism, many supposed to be taking place in the world at large. But then the world began to change dramatically, and the educational system failed to measure up... Progressive education... no longer seemed to be the solution to existing world problems. Consequently, an educational philosophy supported by a group called the essentialists came to the fore and offered a new set of answers... They demanded a return to the traditional methods of teaching with emphasis upon systematic training in subject matter and upon more rigorous academic standards for all learners. Also, they... paid more attention to discipline... In the early 1980s, the school system moved into still another phase of this ongoing cycle. “Our nation is at risk,” proclaimed [the US] Secretary of Education, in May, 1983. “The education foundations of our society are presently being eroded by a rising tide of mediocrity. If an unfriendly foreign power had attempted to impose on America the mediocre educational performance that exists today, we might well have viewed it as an act of war. We have, in effect, been committing an act of unthinking unilateral educational disarmament. History is not kind to idlers.” These tough words... came after... the U.S. Education Secretary... reviewed a rather alarming two-year study on the state of American education... which was issued by the eighteen-member National Commission on Excellence in Education... (the commission noted that in England, many students spend eight hours a day, 220 days a year in high school, while in the U[S] students typically face only 180 six-hour days); [and another survey which showed ‘average SAT scores were 87 points lower than they had been in 1963’]... To solve those profound, far-reaching issues of war and peace, crime and punishment, or hatred and love among human beings, our schools can certainly help. But we must also look back to our families and to other institutions that serve as repositories of our cultural values.

...Twenty-five centuries ago, Socrates asked, “Can moral virtue be taught?” [Socrates] argued that it cannot be... His reasons boiled down to three things. First, moral virtue is a habit formed by free choice on our part... A second point made by Socrates... concerns the role of prudence as an inseparable aspect of moral virtue. If moral virtue were identical with knowledge, it could be taught, but it is not identical with knowledge. We are acquainted with instances, in our own life and the lives of others, where individuals know what they ought to do and fail to do it, or do what they know they ought not to do... In the third place, Socrates calls our attention to facts of experience with which everyone is acquainted. If moral virtue could be taught, why do virtuous parents, who make every effort they know how to inculcate it in their offspring, succeed with some and fail with others? ...To my knowledge, no one has successfully countered the arguments advanced by Socrates in Plato’s dialogues... However... I firmly believe that the educational reforms that must be accomplished to provide all with the kind of schooling needed to inculcate the intellectual virtues requisite for a good life and a good society can be achieved... in the foreseeable future. - 1984

One of the major questions that confronts developmental psychologists is how to characterize the nature of change across development. Some theorists view development as a continuous process, whereby each new event or change builds upon earlier experiences in an orderly way... Others view development as occurring in a series of discrete steps or stages, with the organization of behaviour being qualitatively different at each new stage or plateau... Are there *critical periods* in which the child must experience certain kinds of social and sensory input if development is to proceed normally? In recent years hospitals have allowed mothers and infants to have close contact in the minutes and hours immediately after birth in order to permit bonding... to take place. It was assumed that the emotional attachment between mothers and infants would not develop adequately if the mother was deprived of this opportunity for contact with her baby during this early critical period. [However, c]areful evaluation of the bonding notion has yielded little support for the necessity of early mother-baby contact... The human mother-child relationship is malleable and plastic, and opportunities at a variety of time periods can promote good parent-child relations. Similarly, if the child is deprived of many opportunities for normal social and cognitive development in infancy, the effects are not necessarily irreversible. In... 1966... a classic study... found that infants who were reared in a very impoverished orphanage, but later transferred to a stimulating adoptive home, grew up without any identifiable intellectual deficits. Those who continued in the orphanage grew up to be retarded... The issue remains a controversial one. Some behaviors may be more open to modification at certain periods of development. We can think of these as sensitive, rather than critical, periods. Other behaviors may be highly plastic and open to change across all points of development... Earlier biological extremists argued that biology is destiny and development is merely a matter of maturation... At the other extreme, some early theorists... placed their emphasis strictly on the environment... Most modern viewpoints recognize that both biological and environmental factors are influential, but there is disagreement over the

relative importance of these factors for development... The question for modern developmental psychologists is to explore how biological and environmental factors interact to produce developmental differences in various children... Some developmental psychologists... [believe c]hildren are assertive or shy largely as a result of parental childrearing practices. Delinquency is caused by being associated with an antisocial peer group. Children's interest in history and geometry is the product of a talented teacher. Others sharply disagree with this view... Instead of assuming that children are only passive recipients of environmental influence, they believe that children are often active agents who shape, control, and direct the course of their own development. Children are seen as curious information-seekers who intentionally try to understand and explore the world about them... Children are constantly seeking to adapt to the world by relating new experiences to their existing knowledge and by modifying their knowledge base... Moreover, in the social world the child is not simply molded by socializing agents such as parents, peers, or teachers. Instead, influence is a two-way process, with children actively modifying the actions of their parents and other people that they encounter in their daily lives... Some researchers have as their goal the provision of a description of behavior and how it changes across development. For example, the description of how children's play changes or how many words children can remember or when children learn to crawl, sit, and walk are all of interest to child psychologists. This information is valuable in developing norms... Norms provide important guidelines against which to measure the individual child's progress in relation to other children of similar age. If developmental delays are detected, interventions to correct the problem can often be instituted... Children who grow up on a farm in China, on a kibbutz in Israel, or in a village in Peru have very different kinds of experiences from children who spend their childhood in a suburb in the U[S]. Developmental psychologists differ in how they view the importance of culture. Some argue that culture-free laws of development can be discovered that apply to all children in all cultures. Others argue that the cultural setting... will have a profound influence on the laws governing development. Between these extreme views is one suggesting that development proceeds in the same orderly fashion, but the rates at which children in different societies progress may vary. In some cultures, children are encouraged to walk very early and are given opportunities to exercise their new skills. In other cultures, infants are carried or swaddled, which reduces their chances to walk until they are older... Cultures are, of course, constantly undergoing change... Theories differ considerably in how seriously they take these kinds of changes into account, but all recognize that these changes may play a part in influencing the child's development... Television is [now] available to 99[% of US] households... Can children learn new intellectual skills from watching television? To answer this question, "Sesame Street" was introduced to millions of American children in the late 1960s. The show aimed to improve the cognitive skills of preschoolers so that they would be better prepared for elementary school education... And it has worked... Children who watched "Sesame Street" showed a marked improvement in a variety of cognitive skills; more important... as viewing became heavier, the amount of improvement increased... Perhaps one of the most interesting outcomes is that reading skill improved, even though this was not specifically taught on "Sesame Street." These results leave little doubt that... TV can be an important educational tool... According to... *social learning theory*... children learn not only through classical and operant conditioning but also by observing and imitating others... In... 1977... a series of classic studies... showed that children's aggressive behavior could be increased by exposing them to another person behaving aggressively. Nursery school children watched an adult punch, kick and pummel a large inflated... doll. In contrast to children who had not see the model, the children who watched the adult assault the doll were more aggressive when given the chance to play with the inflated toy. Moreover, many of the bizarre and novel responses that the adult model had exhibited were accurately reproduced by the child observers... Imitation is not automatic; children are selective about which behaviors they imitate, and they don't imitate every behavior they observe... [But i]n order to imitate, children must be capable of remembering the behavior the model is displaying and those who use active strategies in trying to recall, rehearse, and organize the behaviors are more effective learners... [Unfortunately], development does not always conform to a previously prescribed schedule; unexpected events often intervene to push development in new directions. Life span theorists term those *nonnormative events*, since they neither happen to everyone in the normal course of development nor follow any preset schedule... Divorce, job loss, or residence change are events that may have a profound impact on the child, but are not part of the normal, expected occurrences... In addition... according to the life span perspective, a [further] set of factors influence development, namely cohort effects. Cohort is a term used to describe a group of children who were born in the same year... or the same general period... As cohorts develop, they share the same set of historical experiences that are unique to each group born in a particular era... Development may be different for different cohorts... Therefore, the historical context is an important source of influence on the developing child... If you look at newborn infants in the nursery of a maternity ward, one of the things that is most striking is their diversity... not only in their physical characteristics but also in their behavior... Before birth, and, according to some researchers, even before conception, the transactions between a vast array of genetic... and environmental factors begin. These genetic-environmental transactions make the individual unique and continue to shape development throughout the entire life span... Human development is the process by which the genotype comes to be expressed as a phenotype... An individual's *genotype* is the material inherited from ancestors which makes the individual genetically unique. With the exception of identical twins, no two individuals have the same genotype. An individual's *phenotype* is the way the genotype is expressed in observable or measurable characteristics. The expression of the genotype is modified by a variety of experiences. Whether or not a child's genotype for high intellectual activity is manifested in school performance will depend in part upon whether or not the child's parents stimulate and encourage the child in intellectual pursuits... Heredity does not rigidly fix behavior, but instead establishes a range of possible responses that the individual may make to different environments... These genetically based variations of an individual's responsiveness to environments are called the *range of reaction*... The genotype thus sets boundaries on the range of possible phenotypes within which individual characteristics may be expressed... Some kinds of genotypes are more difficult to deflect from their genetically programmed path of growth than others... The term *canalization* is used to describe the limiting of phenotypes to one or a few developmental outcomes... A characteristic that is strongly canalized is relatively difficult to modify even by what might be viewed as widely divergent or extreme experiences. For example, infant babbling is strongly canalized since babbling occurs even in infants who are born deaf and have never heard their own voices or the speech of others... In contrast, intelligence is less highly canalized since it can be modified by a variety of physical, social, and educational experiences and will be manifested in a wide range of problem-solving and adaptive behaviors... Socialization is the process whereby an individual's standards, skills, motives, attitudes, and behaviors are shaped to conform to those regarded as desirable and appropriate for his or her present or future role in society... [T]he parent socializes the child by serving as a model for the child to imitate... and rewarding or punishing the child's behavior... Parental warmth is regarded as important in the socialization process... [because] the child is likely to wish to maintain the approval, and be distressed at any prospect of the loss of love of a warm parent, and therefore the need for harsh forms of discipline to gain compliance is often unnecessary. In contrast, the threat of withdrawal of love is unlikely to be an effective mechanism of socialization when used by hostile parents who have little demonstrable affection to rescind. What has the child to lose? Even on those occasions when physical punishment is utilized by warm parents, they find it more effective in limiting their child's behavior than do hostile parents. Again, this is probably both because the child wishes to conform to the standards of warm parents and because these parents are more likely to provide information about alternative socially desirable responses available to the child... Parental love alone is not enough to lead to positive social development in children. Some degree of parental control is necessary if children are to develop into socially and intellectually competent individuals. However, it should be kept in mind that the ultimate goal of socialization is self-regulation rather than regulation by external agents... Although socialization is certainly occurring in the first year of life, it seems to become more conscious and systematic with the occurrence of greater mobility and the beginning of language in the second year... [By the end of the second year, the brain has already reached 75% of its adult weight, and the infant's active vocabulary may reach 250 words. One of the key reasons infants can produce

more sounds is the developing larynx, or voice box, which “descends” between the ages of 1 1/2 to 2 years.’] One of the most outstanding of the child’s developmental achievements is the mastery of language. Language is one of the most complex systems of rules a person ever learns, but children in a wide range of different environments and cultures learn to understand and use language in a remarkably short period... Children very early become aware of group hierarchies. Although preschool children’s perception of their own position of relative dominance may be somewhat aggrandized, their accuracy in perceiving their own status increases rapidly in the early school years... [E]ven in the preschool years... children form “pecking orders,”... Young children seem to differentiate the status of peers on the basis of toughness, the ability to direct the behavior of others, leadership in play, and physical coercion. In contrast, in older children such status structures are more likely to be based on appearance, leadership skills, pubertal development, athletic prowess, and academic performance... Dominance and status affect social interaction as well. A number of researchers, observing nursery school children in free play, found that dominant children are looked at and imitated more than nondominant children... In addition, children are more likely to conform to the opinions and behavior of high-status peers... Most of the social interchanges of peers occur in the setting of play, and children spend more of their time outside of school playing with friends than they do in any other activity... [However, p]robably no other institution has as much opportunity as the school to shape the developing child. After the first grade, an increasingly large proportion of the child’s life will be dominated by the school... Children attend school for more hours each day and more days each year than ever before. Children in the U[S] now go to school an average of five hours a day, 180 days a year. In 1880 the average pupil attended school about 80 days each year... Even outside of school hours, the demands of the school through homework assignments, the social obligations and ties of school clubs and activities, and the ways in which school structures children’s social networks make the school a salient force in the child’s daily existence. The school differs from the family as a socializing institution in several important ways: it is more impersonal; the contacts and relationships between adults and children are short-term; the child has contact with a range of adults who offer views different from one another and different in some ways from those of the parents; and evaluation of performance is comparative, public, and recurring... Schooling teaches an abstract symbolic orientation to the world... that allows children to develop the capacity to think in terms of general concepts, rules, and hypothetical events... [Yet s]chools are not all the same even within the same neighborhood or district. Some are integrated, others segregated; some are coed, others single-sex; some are parochial, others secular; some are large, others small. Moreover, they differ in their social climate, educational ideology, extracurricular activities, and a myriad of other ways. These variations within and across schools have an important effect on children’s emotional and social adjustment as well as on their academic progress... Not all children learn at the same pace or in the same way. Some... learn faster than their classmates; some are blind or deaf or in a wheelchair. A major issue of the 1970s was the question of whether these “special” children should be placed in separate classes or whether they should be integrated into regular classrooms. In the world of special education, this shift toward including children of all abilities in regular classrooms is known as “mainstreaming,” and in the 1970s it became a law. Supporters of this legislation... argue that mainstreaming will result in higher levels of achievement, both academically and socially... [The supporters] suggest that this move away from special isolated classes to a regular school setting “does a better job than a segregated setting of helping children to adjust to and cope with the real world when they grow up”... [The supporters] assume that exposure to a wide range of children will help normal children understand individual differences in people and that it will also help to diminish the stereotyping of children with various types of handicaps or disabilities... In spite of the legal fact of mainstreaming, there are skeptics... Elementary school children express less liking for retarded children than nonretarded children, and increased contact through integrated classrooms leads to increased rejection of the retarded... Just as there are special problems in organizing the best type of education for retarded and handicapped children, similar problems exist for exceptionally talented children... Should these extremely bright children be accelerated and be permitted to begin school early, skip grades, and graduate ahead of their age-mates? These are controversial issues. Some argue that acceleration is necessary to maintain interest and motivation. Critics retort that the accelerated child’s intellectual needs may be met at the expense of the child’s social and emotional development. Since the accelerated child is with older peers, [it] may be socially isolated. However... very bright children often seek out the company of older children and of adults... Other educational alternatives for gifted children include enrichment programs, which avoid accelerating the child’s grade level. These include extra work on the same level of difficulty... A second type involves “irrelevant academic enrichment,” which consists of setting up a special... activity meant to enrich the educational lives of some group of intellectually talented students... Another form of enrichment is “cultural” which involves supplying opportunities in the performing arts... creative writing or offering instruction in foreign language. - 1986

In 19[86, over one] million students were enrolled in foreign language courses... [- including] classical languages courses[, such as]... Latin... and Ancient Greek[- in the US]... The... most chosen language[- with over 50% of enrolments -] ...was... Spanish... followed by French... and German...

[The people of the Soviet Union cannot] do without a common means of communication. The Russian language has naturally come to fulfil this role. Everybody needs this language, and history itself has determined that the objective process of communication develops on the basis of the language of the biggest nation. For example, though representatives of many ethnic groups came together in the United States, English became their common language. Apparently, this was a natural choice. One can imagine what would have happened if members of each nation moving to the US had spoken only their own tongues and refused to learn English! The same applies to this country, where the Russian people have proven by their entire history that they have a tremendous potential for internationalism, respect and good will to all other peoples. Experience has shown that two languages should be studied (apart from a foreign one) – one’s mother-tongue and Russian – so as to communicate with others. - 1987

ENGLISH IS the most widely used language in the history of our planet. One in every seven human beings can speak it. More than half of the world’s books and three-quarters of international mail are in English. Of all languages, English has the largest vocabulary – perhaps as many as two *million* words – and one of the noblest bodies of literature. Nonetheless, let’s face it: English is a crazy language... Sometimes I wonder if all English speakers should be committed to an asylum for the verbally insane... You have to marvel at the unique lunacy of a language in which your house can burn up as it burns down, in which you fill in a form by filling it out and in which your alarm clock goes off by going on... [Furthermore, ‘when you wind up a watch it starts, but when you wind up a speech it ends’.] In what other language do people drive on a parkway and park on a driveway? ...Have noses that run and feet that smell? How can a slim chance and a fat chance be the same, while a wise [hu]man and a wise guy are opposites? ...There is no egg in an eggplant, neither pine nor apple in pineapple and no ham in hamburger. English muffins weren’t invented in England or french fries in France... while sweetmeats... aren’t... meat... [but] confection... - 1989

We have been fed the false notion that the purpose of education is to ensure that the needs of the industrialized and capitalist society in which we live are met. In other words, the primary function of the modern education system is to ensure a continuing supply of workers and managers, with appropriate skills in appropriate numbers, for corporate capital needs. Children are taught that the purpose of education is to prepare them for a lifetime of paid employment. We compartmentize our children at an early age, expecting them to make decisions that direct their future work patterns at the age of 16 – in some cases as young as 11[(‘under Britain’s Education Act of 1944 children were examined at age 11 – the so-called eleven plus – on the basis of which they were assigned either to grammar schools, which prepared them for higher education, or to secondary modern schools, which they usually left at the minimum leaving age, often without having passed public examinations or having been awarded a certificate; in

1964 the Labour government abolished eleven plus in many areas, and reorganized secondary education on comprehensive lines – that is, each school accepted pupils of all abilities; the Education Reform Act of 1988 laid on the secretary of state a duty to establish a national curriculum, applicable to all state schools’)]. Recognizing the dangers of early specialization Greens state, ‘We wish to see developed a broad, holistic type of education and, although later specialization may be necessary, we should strongly advise against the dangers of students becoming blinded, by that specialization, to the wider implications of the subjects being studied... [E]ducation should result in the development of each individual personality and of the potential, which all possess, to serve the community in a variety of ways’... Thomas Huxley, talking at the South London Working [Perso]n’s College in the 1860s, stated, ‘We allow education, which ought to be directed to the making of [humans], to be diverted into a process of manufacturing human tools, wonderfully adroit in the exercise of some technical industry, but good for nothing else.’ A century on from Huxley all mainstream... [education] enforces dependence; we learn to become subservient so that we will fit comfortably into our future social niche. By contrast, cooperation and self-management are the qualities that are necessary for an ecological future: schooling has to be changed to meet the needs of a new society based on empowering the individual. It has to invite pupils to question, challenge and contradict. Teachers need to understand why they are asking pupils to undertake certain tasks and to be prepared to justify their own actions and demands... The idea behind a uniform is to deprive children of individuality by forcing them all to look the same. Many teachers argue that without school uniform discipline would be unmanageable, pupils would forget their ‘place’ and there would be competition in the fashion stakes. The argument that uniform abolishes class distinctions is false, as it ignores the difference between patched and pristine clothes... Students [sh]ould emerge feeling that education is a life-long process, not a fifteen-year indoctrination. The child who has a free spirit and refuses to be cannon fodder is often labelled ‘difficult’ by today’s educators and is thus marked for life... The wasted potential in our schools is a national scandal. Operation Babynsatch illustrates that wasted potential. In the 1960s an experiment at the University of Wisconsin demonstrated that special attention given to babies born to [mothers] who were socially disadvantaged could turn those children into what is commonly known as ‘gifted’. Forty babies were ‘snatched’ from their mothers, taken to the university centre, played and sung to and generally stimulated. Later, tuition was given in small groups. By the age of 4 the children were scoring a mean IQ of 128 on one test, 132 on another. They were brighter than the average child from a traditional middle-class home. Forty children who had not received special attention scored IQs of 85 by the age of 4... No wonder so many of us long for the radical transformation of the education process.

...questioning of the value of the examination system is not new. Arthur James Balfour, speaking as Chancellor of the University of Edinburgh, said in May 1907: ‘[I] do think it of importance that we should have present to our minds the inevitable evils which examinations carry in their train, or the system of competitive examinations as it has been developed of recent years... The truth is that a book which is read for examination purposes is a book which has been read wrongly. Every student ought to read a book, not to answer questions to somebody else, but to answer his own questions. The modern plan... is really a dereliction and a falling away from all that is highest in the idea of study and investigation.’] Recent research into the value of examinations as a method of obtaining knowledge has revealed that many pupils, after receiving a good grade in maths O-Level, have quite forgotten the techniques only months after sitting the exam. The conclusion must be that in the rush to pass the exam the concepts are not mastered, the necessity for passing the exam... far outweighing the necessity for proper understanding. Other research shows that exam... results rarely predict subsequent performance, and examples abound of individuals who failed at school but excelled in later life. - 1990

TRY [this simple] test on your child – and yourself. A laundry dryer contains ten black and eight navy socks. Without looking, how many socks must you take out to be sure you have a matched pair? Or explain the meaning of this formula: $36b + 52w = 88k$. In the first example, the correct answer is three. As for the second... it’s a shorthand description of a piano – 36 black keys plus 52 white. Neither example calls for academic skills. Both demand the ability to think, to stretch the mind beyond the obvious. And thinking is an area where our children need help. “We fill students full of data,” says... [the] director of a centre for critical thinking. “But the essence of education is to use information to address new situations and questions. We’re neglecting that.” Consequently... kids can’t apply reasonable thought to everyday situations. “A kid is much more likely to choose a bicycle by its colour or by what model a friend has than to think out more relevant considerations like price, durability or performance.” More ominously, says [an] educational psychologist... some problems, including drug use, may occur because young people have not learned to measure actions against consequences... Young people don’t develop the habits of logical thought overnight. “It’s like tennis,” [the director] says. “The first time you play after lessons, you may forget all you’ve learned and just swing away. But eventually the lessons will become part of you. Thinking takes practice... but it’s worth it.” - 1991

Socrates, Plato and Aristotle are making their mark on the minds of Auckland youngsters. The ancient Greek thinkers feature on school timetables as part of a drive to introduce children to philosophy... Under the programme, philosophy is stripped of its forbidding language; it becomes a mixture of ideas and the discipline of logic... Through... novels... [which] focus on fictional children who inquire about a range of topics... children in the classroom [are encouraged] to think about the subjects and offer opinions and questions... The programme has been designed for children of different age groups... In one exercise from the novel *Pixie*, eight to 10-year-olds discuss what is real, and what only seems to be real... The novels canvass more complex ideas as the children get older and start demanding more complicated reasoning... The... novel *Lisa* asks 12 to 13-year-olds to consider the ethical dilemma of whether you can both love animals and eat them... According to research in the *U[S]*, children exposed to philosophy classes do better in all school subjects within two years... The use of philosophical questions to improve the thinking process of schoolchildren was the brainchild of a... philosophy professor... [t]wenty years ago... Since then, philosophy classes for children have spread to 30 other countries, including A[US], where the programme has been... further developed... by introducing a kit suitable for preschool children. - 1994

WHAT’S YOUR earliest memory? Do you remember learning to walk? The birth of a sibling? Kindergarten? Adults rarely remember events from much before kindergarten, just as children younger than three or four seldom recall experiences. Psychologists have floated various explanations of “childhood amnesia,” but the prevalent theory holds that, since adults do not think like children, they cannot access childhood memories. Now[a] psychologist... of the City University of New York offers a new theory... that children don’t form lasting memories of personal events until they share their experiences with others and learn to use someone else’s description to turn their own fleeting recollections into permanent memories. In other words, children have to talk about their experiences and hear others talk about them.

...IT WAS a strange sight, a [professor], standing before a fountain, watching the falling water and tilting his head from side to side. Drawing closer, I saw [the professor] was rapidly moving the fingers of his right hand up and down in front of his face. I was 11, visiting Princeton University with my science class, and the [professor] at the fountain was Albert Einstein. For several minutes, [Einstein] continued silently flicking his fingers. Then... turned and asked, “Can you do it? Can you see the individual drops?” Copying him, I spread my fingers and moved them up and down before my eyes. Suddenly the fountain’s stream seemed to freeze into individual droplets. For some time, the two of us stood there perfecting our strobe technique. Then, as the professor turned to leave, [Einstein] looked me in the eye and said, “Never forget that science is just that kind of exploring and fun.” Nearly a half century later, I’ve spent an entire career trying to impart Einstein’s words to adults and children all over the world: science is exploring, and exploring is fun. Sadly, very few schools make the subject appealing. Science courses introduce more new vocabulary than foreign-language classes. Textbooks are as dull as dictionaries. As a result, too many children think science is only for people as

smart as Einstein. The irony is that children start out as natural scientists, instinctively eager to investigate the world around them. Helping them enjoy science can be easy... You only have to share your children's curiosity... By sharing your child's curiosity, you can give them a valuable lesson that extends far beyond the realm of science. They will learn that it pays to persist, to experiment, in the face of difficulties. And they will clearly see that learning is not drudgery or something that happens only in school. - 1995

The job of a science teacher starts early in the morning by sorting out the gear, inspecting the bunsen burners, fixing the batteries in preparation for the lessons to give to the six or seven classes which will file into the lab during the day. Lunch is a sandwich in the lab while repairing a microscope. Hours after school closes test tubes need to be cleaned, pulley systems disassembled, rags disposed of and fresh ones cut. Since 1920 when... [a] professor of education... stated that the arts and the humanities were the heart of education, the sciences were... [s]queezed into a narrow time-slot... Gallons of useful knowledge didn't fit the pint-sized time allotment... [so] the sciences didn't flourish. During the 1930s N[Z] imported... from England: "general science," a concept... to present the sciences no longer as separate... sub-subjects like heat, light, sound, motion... electricity... metals, acids, salts, plants, animals, the human body, the planets and the stars... but as a coherent whole. Marvellously and seamlessly all the sciences were put through the mincer to be served in one helping as a not very tasty stew. The sad mixture was responsible for overworked teachers, confused and bored students. The mission impossible of teaching general science in a satisfactory way has been demonstrated since. While we combined, the schools in other parts of the world diversified making more study time available for plastics, lasers, microchips and suchlike; a wide variety was accepted as a guarantee to retain the interest of the students. A weekly schedule for a secondary school in an overseas country may indicate: physics, three hours; chemistry, two; electricity, two; plants, animals, mechanics and cosmography, one each... maybe a few hours of practical as well, a[l] taught by specialist teachers each in their own lab assisted by trained amanuenses and with assistants in charge of the gear and the storerooms. That's at least six staff for the work the N[Z] teacher is supposed to carry out all by him or herself single-handedly.

...Primary school classes should get bigger, not smaller, says a visiting British academic... [(NZ's 'state primary schools have a teacher-pupil classroom ratio of about 1:25; the ratio for secondary schools is about 1:18' - 'the second worst teacher-pupil ratio in the OECD'). The] dean of the new initiatives programme at the University of London, [who] addressed 230 principals at the Auckland Primary Principals' Association[(APPA)] conference... this week... favours larger classes in which teachers receive help from teacher aides. "Schools need to become like hospitals, with teachers like doctors. Specialist doctors don't do everything - they tackle the core issues, supported by a team of nurses and volunteers... The future of the teaching profession will see fewer... teachers, responsible for core subjects, with more learning done outside the schools, in museums, for example,"... [The dean] said his ideas would give teachers more time to cope with new areas such as electronic education and computer competency.

...THE... post-primary school teachers' negotiator[, who is]... in his second two-year term as president of the 14,500-strong PPTA... points out that every secondary school teacher in effect has a double career - a degree of some form applicable in the private sector or, in the case of technical teachers, a trade such as metal work, engineering and the like. They can readily "go outside" although they may not get the same leave provisions or the same job satisfaction. Then again they probably won't have to work as long. A Massey University survey found that teachers, on average, worked up to 500 more hours a year than those in outside industry. Estimates are that the country will be between 3500 and 18,000 teachers short by the turn of the century, with half the shortfall in secondary schools... [The negotiator says s]omething has got to be done to meet that gap, and it's money that will do it... [The negotiator] won't wear an increase in class sizes as a temporary answer, bumping the average form size from 25 to 30 pupils. "Parents are not going to accept that these days. They want a fair go for their kids and that's why they pay their taxes. They want smaller classes, not larger ones... Teacher retention is the only answer and the wherewithal to do it... is... [paying enough] money to hold people..." ...THE annual loss rate is between 13 and 14[%]... If this loss rate could be cut to about 8[%] it would mean about 800 to 900 teachers would be retained. "...While we agree that it's important to get recruitment right, we've also got to knock the loss rate back. We know that 60[%] of teachers say they'd get out if they could." Pick [him] up on the point "if they could" - that teachers are being precious, that well-paid jobs aren't that easily come by - and [the negotiator] asks what the country wants in terms of education. "It only takes a small shift of 5 or 6[%] to get quite a big disaster occurring in teacher availability. The difference between teaching and some other markets is that you have to have an oversupply of teachers. You can't get into a situation of the kids turning up and there are no teachers. You can't have waiting lists like there are in public hospitals. We know the baby bulge starts in secondary schools next year and continues for another decade or more. What are principals and boards to do - hire the first person who comes along regardless of qualifications? That's the scenario of the 60s. It was unacceptable then and it's even more so today..."

...SCHOOLS in N[Z] have few means of measuring teacher performance and cannot guarantee that their pupils are getting the best quality teaching, says the Education Review Office. In a report titled *Supplying Teachers for N[Z]'s Students* the ERO says... the current system, where teachers are rewarded with higher pay for qualifications gained and years of service, does not guarantee that those teachers are, in fact, good at their job. "The overwhelming evidence is that the quality of teacher performance both among, and within institutions, varies markedly," the report says... [M]ost schools rely on minimum standards of competence, which may not be reliable. The report [also] says institutions that train teachers are worried they have reached the limit of their ability to attract top students... It adds that trainee teachers are supposed to demonstrate strong personal qualities but there is little incentive for providers to enforce this. "It is far from clear that a training institution could actually decline to pass a trainee who met academic requirements on the basis that... [the trainee] had not demonstrated one or more of the required personal qualities." ...The report says that since the Department of Education was abolished in 1989 no one has held a watching brief on teacher training. There is little central control over course content and staff quality and little competition [for] the main colleges of education... [The] Education Minister... says the report adds weight to the Government's commitment to a review of teacher training and for the introduction of criteria to measure performance in schools... But teacher unions say the report contains inaccuracies and seems to be unaware of current practices in schools... "Principals are required to have a process for annually determining the objectives for each teacher and for determining that those objectives have been met,"... [a spokesperson] from NZEI Te Riu Roa said... "Teachers are required to be competent before passing through the pay scale and, to reach the final pay step must be 'highly competent' and have 'proven initiative in the performance of classroom duties'..."

...Teacher training will soon undergo a Government-ordered review to make sure all new graduates are ready for the classroom. The Minister of Education... said yesterday... [m]any principals had told him that new teachers often lacked practical classroom knowledge - a criticism of training echoed by the new teachers themselves... [T]eacher training also needed updating for the new technology available in schools. The review is also expected to challenge the dominance of colleges of education by encouraging the trend for other organisations, such as polytechnics, to run courses. Unitec in Auckland already plans to train 60 primary and 40 secondary teachers next year in a one-year programme designed to meet Government pressure for shorter courses. The Auckland College of Education is responding to the competition by launching a full teaching degree. The course could take student funding from Auckland University, which is understood to be planning its own move into the teacher training market.

...Unqualified teachers will be forced to seek official licences to teach... for 12 months at a time... under new legislation reviving compulsory teacher registration. The new law... will require all teachers to be screened by the registration board to ensure their qualifications and character are suitable for the classroom. Supporters concede it will not stop teachers taking advantage of vulnerable pupils in the classroom, but a centralised checking system is expected to help to ensure teachers meet professional standards... [T]he legislation requires qualified teachers to demonstrate they are still competent to teach every three years... The return to compulsory registration, abolished by National in 1991, is a step backwards for

school boards which for the past five years have had the power to employ a teacher, notwithstanding registration... The head of the Teacher Registration Board... [estimates that] up to 1000 teachers... have been able to work in schools for the past five years without any official licence to teach... Schools were able to offer teaching positions to people with specialist knowledge, such as fluent Maori speakers or experts in information technology. Others found it easier to employ relief teachers... [In related news, the] Minister of Education... yesterday announced initiatives with an emphasis on bringing more young people into the profession through 1500 extra training places next year and a \$900,000 advertising campaign. The extra teachers are needed to cope with rapidly rising school rolls, mostly in primary schools next year but feeding through to secondary schools... Alongside the extra training places, the Ministry of Education will also step up its efforts to bring former teachers back into the classrooms. But [the minister] acknowledged that the size of the projected shortfall next year – estimated at 880 primary and secondary school teachers – would require overseas teachers in the short term. “The simple reality is that it takes time to train a teacher, and to fill the gap when you haven’t got that time, your only option is to bring teachers from overseas.” ...600 overseas teachers... [–] double the 300 overseas teachers brought in this year... [–] are being sought for the next school year, many for Auckland... schools... which... are responsible for almost half the national growth... Information videos and \$1300 “finder’s fees” for recruiting agencies will be used to bring more teachers... from countries such as A[US], Canada and Scotland... Foreign teachers were permitted to work in N[Z] schools for up to three years... a spokes[person] for the Ministry of Immigration’s office said... Immigration policy allowed overseas recruiting for any jobs which could not be filled by N[Z]ers.

...The front-page photograph was ineffectually sad: the principal of Elm Park School in Pakuranga... sat at her table at a “recruitment fair” organised to lure one of a few unemployed South Island teacher training graduates into South Auckland schools. “There are so many of us,” [the principal] lamented, “and so few of them.” In a turn of events which would have been bleakly funny if it were not just bleak, desperate principals made job offers to our reporter as [the reporter] moved among them. To say, as a ministry spokes[person] did in our report, that it is “a graduates’ market” is a piece of civil service understatement worthy of *Yes Minister*... When our kids sit in classrooms without permanent teachers; when principals sit forlornly behind tables hoping their folders of photographs will attract an applicant; when vacancies are filled by applicants recruited wholesale overseas, it is not just an applicants’ job market, it is a crisis... At times like this, as schools prepare to [take another] break... I sometimes think wistfully of a job which gave me 12 weeks’ holiday a year. But I come down to earth with a thump when I remember the soul-battering stress I endured as a classroom teacher – and it doesn’t take much imagination to recognise that the job is a good deal tougher now than it was in the 70s when I was at the chalkface. Teaching other people’s children is the hardest job I ever did, apart from raising my own. If market forces were the ultimate economic truth, of course, teachers would be earning as much as surgeons. But there is little chance of that and... I know I’d need to be offered twice what I’m earning now to go back. Worse, there’s ample anecdotal evidence that many teacher trainees are not going into teaching at all, and that training colleges are functioning as finishing schools to create management cadets for private industry.

...Principals should take tertiary-level courses which train them how to manage their schools, says the E[RO]. A report to be made public today... says many principals take on their jobs with very little training in management... It was especially necessary for some principals aged 45 or more who had done virtually no outside study or training since their teachers college days. The report [also] says many principals rely too heavily on each other for advice, which does not encourage innovative thinking... [Incidentally, a] South Auckland primary school is deliberately breaking the law by turning away new students because it does not have enough teachers. Manukau View School in Manurewa will today close its roll to stop its bigger classes growing beyond 34 children... As a junior primary school taking five to eight-year-olds, it is supposed to have an average of only 23 children in each class... It is the first school to carry out a threat by the A[PPA] three months ago that new pupils would be turned away if the teacher shortage continued, but the association does not expect it to be the last. The school is also protesting against a loophole in the Education Act which lets schools stop taking children if they do not have enough classrooms – but not if they have a shortage of teachers. Its decision follows Papatoetoe Central School’s refusal to accept four new classrooms from the Government this week. The overcrowded school said more classrooms without extra toilets, car parking and office space would only make its problems worse.

...The primary teacher shortage in Auckland and Northland may now be worse than the 564 vacancies found in a survey last month. “There are still resignations happening right now...,” said... the president of the A[PPA]. The shortage was extremely serious... Recruitment agencies had about 1000... teachers... from overseas on their books and moves must be made quickly to hire them... [but there seems to be] a... reluctance by some schools to recruit from overseas.

...Agencies are trying to recruit [overseas] teachers for British schools that are virtual no-go zones for local teachers... [U]p to 200 teachers [are needed] to fill vacancies and provide substitute or “supply” teachers to fill a gap in mainly inner-city schools. They are advertising in N[Z]... and A[US], as well as seeking teachers from those countries who are living in Britain. But... the national secretary of the teaching union, said N[Z]ers did not know “what the discipline was like in these schools[.]” ...where there are problems with violence, drugs and gangs. Often inner-city schools also have a high proportion of immigrant families, and children sometimes do not speak English. Large class sizes are also common because of teacher shortages... “They aren’t being told, because if they were they wouldn’t come. British-trained teachers are not prepared to work in these schools... and who can blame them?”

...Travelling 14,000km... to teach... in Auckland was a sensible career move, says... [a] 25-year-old first-year teacher from Windsor, Ontario, [who] graduated from college last December in the middle of a local job shortage. [The Canadian] was eventually offered two positions, one in Canada’s North West Territories (temperatures minus 34 deg C) or teaching English in Korea. [The 25-year-old] chose Korea but then decided [that what it really wanted was] a school job in an English-speaking country. The first embassy [the Canadian tried was NZ’s, where the 25-year-old] learned that this country urgently needed teachers. Her inquiries led to seven job offers, including Edendale Primary School... Since about a third of the children speak English as a second language her English teaching skills have come in handy. [The 25-year-old] is one of four overseas teachers at the school. Two are from Canada, one is from A[US] and one is from the U[S]... For the 22-year-old... from Dallas, Texas... whose second language experience... is limited to a few words of Spanish, the language barrier found in Auckland schools came as a shock. “I have 10 in my class that speak hardly any English... I have to say ‘tree’ and point to a tree – that’s very basic. But there’s a lot of help in the school.” The main complaint from both teachers is the lack of classroom resources – books, pencils, paper, art materials and basic technological aids such as overhead projectors. They are also surprised at the cost of living in N[Z] on a teacher’s salary. Both estimate they are paid at least \$10,000 a year less than they would be at home and echo N[Z] teachers’ resentment at the low status of teaching here compared with other professions... “To me it seems a sales position is more respected... I know someone who’s getting a company car, a cell phone and \$40,000 a year to sell pet food,” said... [the Texan, who] came here... on a teacher training programme organised by her university, whose education dean was a fan of N[Z] reading programmes.

...*Righting Reading*... [The] co-ordinator... wanders the streets of east Papakura looking for care-worn houses with kiddies’ trikes and other tell-tale paraphernalia scattered about the section. [Upon finding a target, the co-ordinator] spends a couple of minutes screwing up her courage... Then... knocks on the front door, introduces herself to the mother and asks if [it] wants to help her child succeed at school. Most say yes; there are a few noes. The negative response always saddens... [the] co-ordinator of the Hippy programme attached to the Kelvin Rd Primary School, who has been rounding up “customers” for more than a year. [The co-ordinator knows Hippy can help] disadvantaged children and save them from becoming more of South Auckland’s “statistical failures.” [So far the co-ordinator] has 89... disadvantaged... four- and five-year-olds... improving their language skills and concentration in a two-year course which requires only 15 minutes’ instruction a day. [Local p]rincipals... enthusiastically endorse the programme. They say the Hippy kids demonstrate an overall readiness for school and expectation of success compared to those from

similarly dysfunctional families with no preschool preparation. “I would hope within the next decade there’s a Hippy programme nationwide,” says... [the principal] of Kelvin Rd... “There are many children who are just not getting the right start... Some politicians and report writers blame the school which is so unfair. The truth is we’re totally under-resourced. As teachers we’re overwhelmed by the social problems of the underprivileged. But Hippy can do so much... I know the[re] are 89 kids who aren’t going to... [be] unable to cope, falling further and further behind, until they get to intermediate and secondary schools where reviewers write them off as social misfits destined for life at the bottom of the social heap.” Hippy is short for Home Instruction Programme for Preschool Youngsters and is an Israeli concept, devised in the late sixties, which spread to Europe and the U[S]. It was introduced here four-and-a-half years ago and Kelvin Rd school was the first to adopt it. Now there are Hippys attached to [another nine] primary schools... Six share about \$270,000 from Social Welfare. The other four depend on charity funding... Hippy was introduced to N[Z] by the Pacific Foundation’s executive director... The programme... [which includes] instruction manuals and the salaries of co-ordinators and part-time home tutors... costs the service \$1300 a year a family. That’s not cheap and may be the reason for a bureaucratic lack of interest... The idea behind [Hippy] is to keep the parents involved in their child’s first year at school in the hope that they will continue to take an interest and make sure the children don’t drop out... Hippy tutors’ instruction includes child development, behaviour management and dealing with wider social issues which they may find in a family. They role-play with parents and rehearse details because some parents are only semi-literate. Every second week parents are got together for an hour-and-a-half and this helps break barriers, shyness and loneliness. Many of the families... live in rented accommodation, and don’t know anybody [else in the neighbourhood] until they join Hippy... [By the way, a Nepalese mother, aged 35... nearly lost the use of her eyes after her illiterate daughter... (13)... mistakenly put superglue in them instead of... medically prescribed... eyedrops.

...THERE has been no official study of illiteracy in [NZ] primary and intermediate schools but the E[RO] has sharply criticised the language ability of some South Auckland secondary pupils. Poor-quality teaching is blamed for illiteracy reportedly as high as 80[%] among third formers at Hillary College and Tangaroa College in Otara... [The latter school’s] principal... agrees the level of literacy in his school is below the national norm. Part of the problem is absenteeism and the transitory nature of the Otara population... There was a 50[%] roll turnover between [last year]’s third form and the fourth form this year... [■] Papakura has just lost its remedial teaching programme. After 18 months the money provided by the Ministry of Education to run the programme for 50 children from various schools has run out. Appeals to the Minister of Education have failed.

...[teachers] secretly use phonics during reading lessons because of the failure rate of the accepted “whole language” method... “I have a lot saying ‘When no one was looking, we did our phonics’ or ‘As soon as the door was shut, we could get on with it’,” said [a] British-based... phonics teacher and author... who has... been running seminars for N[Z] teachers in the past week. The whole language approach in most schools uses the “look and say” method of reading teaching, assuming that children learn by recognising the shapes of whole words. Using... phonics – which went out of vogue as long ago as the 1950s... [-] children learn letter sounds and then build up words gradually... Children could begin learning to read by phonics from three... “And at least, using phonics, they know where to look up the words in the dictionary.” ...In N[Z], 28% of children taught by the look and say method need reading help. Teachers became desperate at the results... “And so they should be with these failure rates.” ...whole language often failed because it did not teach children how to break the alphabetic code. Some children worked it out but others, who had poor memories or difficulty hearing word sounds, never could... The education system leaves behind a child unable to read and write fluently by the age of eight... Children could have high IQs but struggle to read – and knowing they were failing made them feel far worse than those with lesser intellects.

...PONDER THIS SCENARIO: As the parents of children aged nine and five, you think you’ve done your best to help them develop their minds. You started reading to them as infants; you bought them educational toys and took them to the library. Now they’re doing well in school. But should you take credit? According to some scientists, your children would have done just as well without your zealous efforts. For example... *The Limits of Family Influence*... from the University of Arizona maintains that parenting styles have no influence on a child’s intelligence... After years of being told how important it was to stimulate their children’s intellects, many parents have understandably become quite confused. Are efforts to improve their kids’ academic skills just time down the drain? No, say many researchers... Your attention won’t necessarily create an Einstein, but it remains a vital ingredient in your child’s intelligence... [E]ven such a simple activity as playing *peekaboo*... helps construct the complex brain circuitry essential to a child’s intellectual development... A infant is born with billions of brain cells... Some are wired to other cells before birth to regulate the basics of life, such as heartbeat and breathing. Others are waiting to be wired to help the child interpret and respond to the outside world. Their experiences dictate the hookups. As the child matures, cells reach out and set up pathways to other cells needed to determine a behaviour... Each time an experience is repeated, the pathways are strengthened. The first two years of life are an explosion of brain growth and connections. By the time a child reaches two years of age, the brain has over 300 trillion connections. At the same time, cells that aren’t being connected or used are being discarded. There seems to be a timetable for this programming of the young brain – “windows of opportunity,” as one neurobiologist puts it – when specific connections may be made... If you miss a window of opportunity, will your child be handicapped for ever? No, because opportunities abound throughout childhood... Consider the process of learning a foreign language. While preschoolers pick up an unfamiliar tongue more readily than nine-year-olds, nine-year-olds learn more readily than high-school students or adults.

...[the n]ine-year-old... is studying school certificate English, as well as Japanese, music and science[, and even] uses her free periods at Freyberg High School, in Palmerston North, to study extra mathematics. That is when the fifth former is not doing two Massey University mathematics papers, with calculus... As a fourth former, [it] gained a B-pass in bursary-level mathematics with calculus... [The child] went straight to high school at the age of seven, after skipping standard two and standard three, and now... is “really happy.” “I’ve just got a whole lot of assignments and tertiary results back, and I’m delighted with how things have gone,” [the nine-year-old] told *Campus News* at the University... While some nine-year-olds would feel intimidated in a classroom of 15 and 16-year-olds, [the daughter of] a university lecturer, and... a doctor[, claims to be]... at ease with the situation... although... [sometimes the nine-year-old] found it hard to understand their topics of conversation, and... was occasionally teased with “Shorty,”... Next year [the child] hopes to progress to the sixth form, and take in another extramural Massey paper in operations research, and one paper a semester in mathematics. The year after that, [it] wants to study... at university... mathematics... music... chemistry... and Japanese...

With examination season starting... dozens of tiny tots at Tomu Young Children’s School in Tokyo[are] set for their first taste of Japan’s educational ratrace... Entrance exams are a rite of passage in Japanese education, where destinies are largely determined by tests to enter high school and college and serious students attend after-hours “cram schools”. But the mounting competition for top schools has pushed the cramming craze to new extremes... Many schools now train infants from six months old to pass entrance exams for kindergarten and elementary schools run by private universities. Acceptance puts children on the elite fast track. A browse through a Tokyo guide turns up dozens of cram schools. Two major chains have 500,000 preschoolers enrolled throughout Japan, says [a] Tokyo University education professor... [The professor] and other experts fear youngsters are pushed by parents to meet high expectations before they can handle it emotionally. “To pressure kids who can’t even express themselves yet to do something they don’t want to do will end up warping Japanese society,”... Some mothers are wooed by scientific studies – highlighted in Tomu’s advertising – showing almost all the brain’s capacity is determined in the first few years. “While his brain is still flexible, it would be good to give him a chance for intellectual stimulation,”... says [the mother of a] three-year-old... [His] hour-long class, which

students take once a week, is lively, with the children eagerly introducing themselves at the start of the lesson and shouting out answers to [their teacher]'s questions. But it's clear there is a right and wrong way to do things. "Have you ever seen a pink apple?" [the teacher sceptically asks a three-year-old]. The toddler protests, insisting her grandmother recently bought her pink apples. But [the girl eventually follows the teacher]'s instructions to colour in her unorthodox pink apples with a red crayon. As [the girl] hands in her work, [it] whispers: "This one might not be that delicious."

...IN THE high school class of his dreams, [a]philosophy teacher... picks a line by a famous thinker and lets students wrestle with its meaning. In real life, there are no such classroom debates. Instead, [the philosophy teacher] lectures hour after hour, racing to cover the facts that will help his students leap the hurdle that will decide their destiny: University entrance exams. What goes on in... [his] classroom at Osaki Metropolitan High School in Tokyo – and others throughout Japan – is at the centre of a national debate on how to overhaul one of the most lauded education systems in the world. The Japanese way, with its rote learning and rigorous entrance exams, has long been considered a key to economic success and a lesson in how to mass-produce smart, capable and dedicated workers... Japan's education system has its similarities with the country's automotive industry... But just as economic pressures and dramatic social change have forced the factories of Honda and Mitsubishi to review operations, the education sector is also in a state of flux. The Japanese are opening up to new teaching methods and more variety in what students learn. But as assessment remains rooted in tough, old-style entrance exams, these changes remain cosmetic at best... Exam results can determine a student's entire life. Once streamed into academic, commercial, technical or agricultural high schools from age 15, the chance of making it into a top university and then a top job from anything other than a top school is limited at best... The pursuit of excellence means Japanese teenagers lead the world in literacy, numeracy and scientific knowledge... As an added attraction, all this comes relatively cheap, as teacher salaries, per-pupil spending and teacher-student ratios are low by international standards... Until recently, classes of 40 were the norm, with six-day weeks... [while p]upils often come to school with a dinner box as well as a lunch box because they... do not get home until 9 pm... But... [the] Ministry of Education, Science and Sports and Culture (Monbusho) aims by early next century to get class numbers in the low 30s, Monday to Friday. Also up for change are the very teaching methods responsible for drumming facts into teenage minds... The attitude of "the nail that sticks up got hammered down" (those who are different are forced to change) [still]permeates Japanese society... [However,] Japanese education is now promoting the rise of the individual... "[M]oral education" – encouraging students to work together, participate fully in school life and broaden their learning horizons beyond the classroom – is a goal in more and more schools... [F]oreign language teaching has led the charge... spurred by an ambitious – and costly – programme importing native-speaker assistants into classrooms... N[Z]ers account for 214 of the 5000 young graduates on the Japan Exchange and Teaching (JET) Programme this year... [They have] one-year renewable contracts... While enjoying the experience... [they are] not regarded as a "real teacher." "I am not treated seriously. I am not given any responsibility. I tried to start a touch rugby club. All these problems came up – no space to practise, no one to supervise me. I canned it – too much hassle[.]" says one NZer]... Then there are the students themselves. Motivation in... agricultural schools can be low – "in a class of 40 students, 12 may be sleeping." [In further news 'from Japan comes this new twist to the school curriculum – public schools near Tokyo are offering three-year go-kart courses for "slow" pupils of wealthy families. It is to make up for the under-achievers having to attend other lessons like maths' and English.]

...English-language instruction is a multi-billion-dollar business. In most of continental Europe, the British version prevails: students learn to write "theatre" and "offence," not "theater" and "offense." In... most of Latin America, American style has the edge. Each style has its strongholds in South-east Asia. Canada has its own distinct, sometimes confused style that employs both [US] and British usage. Just look at the 1995-96 pre-season guide-book put out by the Toronto Raptors. It mixes... "favorite" and "favourite." One player... won college MVP... "honors" in his junior year and MVP "honours" the next. If there is a trend, experts say, it is probably in favor (favour) of the [US] style. American usage dominates on the Internet and other online networks, and multinational corporations tend to use [US] spellings. "In sheer numbers, there are more [USers, and the US] is a bigger economic machine, so people tend to gravitate in that direction," said [a]Professor... of Duke University, who is an expert on the American dialect. However, the British are not ready to take a back seat in promoting their own language. The Government-supported British Council, which runs 90 language schools worldwide, has launched a global programme called English 2000 to defend and increase Britain's share of the market for English-language instruction: British English, that is... In Japan, occupied by [US] troops for seven years after... [WW2], American usage dominates, and the British Council there is realistic. "The more people who speak English of any variety, the better for us," said... [the] deputy director of the council for Japan. "That being said, we do seek to promote the study of modern British culture, including British English." Germans who study English at school are taught British spellings, but are made aware of American usages... [A] Scot... who teaches at a German high school... points out[to her students], for example, that [USers] say "sidewalk" while the British say "pavement." But students are less interested in grammar and spelling differences than in... films, music and other aspects of [US] culture... "They are more interested in America than England..." British English is dominant among older Russians and in formal settings like universities, in part because of old teaching materials. But in everyday life, especially among younger people, American English tends to prevail, showing up in widespread popularity of [US] films, television, music and products.

...More than half of Britain's primary school children failed standards tests in English and maths last year, the... Government said yesterday... [T]he results were an absolute disaster for the country's future and underlined the need for new policies to raise the standards and cut class sizes. "That change is more urgent than ever before..." All 600,000 11-year-olds in England and Wales took National Curriculum tests last year for the first time, with 52[%] failing to make the grade in English and 56[%] in maths. The... [t]eachers' union leader... blamed the poor results partly on an overloaded curriculum. "Teachers just don't have the time to teach the basics,"... [Incidentally 'a study by a NZ researcher shows that teenagers in England are less intelligent than a generation ago. IQ scores for the average 14-year-old had dropped by more than two points. For those in the upper half of the intelligence scale, average IQ scores were six points down. The study contrasts with the researcher's previous work, which suggested that intelligence has been consistently rising among all age groups in industrialised countries. The researcher thought a growing tendency in schools to "teach to the test" was affecting youngsters' ability to think laterally, but also suggested that today's pervasive youth culture dumbs down teenagers'...

NZ s[t]udents look set to be graded again with major changes tipped for the qualifications system critics say leads to a "dumbing down" of education... The system – plagued by problems since it was set up in 1989 – previously allowed only for a pass-fail indication in units of learning... The Minister of Education... was sympathetic to the idea because the lack of grades had been one of the system's most controversial aspects... One of the leaders of school opposition to the system... has previously said that students would lose motivation without recognition for excellence... Even strong supporters thought one of its weaknesses was its inability to offer any merit award to students... The P[PTA] has commissioned an inquiry into the framework. Its convenor[, who]... has recently returned from a year studying standards-based educational assessment in Britain... greeted the idea of a competency scale with cautious optimism.

...Plans for sweeping changes to the education qualifications system have vanished well over the... horizon. The Minister of Education... has set up a lengthy consultation round – due to report back in mid-1997 – on post-school qualifications. It follows an official slowdown on changes at secondary school level announced [two months ago. The minister] said yesterday that the consultation was necessary because universities had made it clear they would not break their degrees into nationally approved units of learning, known as "unit standards." ...Debate over unit standards has bogged down plans for a national qualifications framework for the last seven years.

...During previous debates about the lack of incentive for more advanced students the N[Z] Qualifications Authority has suggested these students could work on unit standards at a higher level than others and rack them up at a faster rate towards a qualification. At the same time slower learners are able to chip away at qualifications by working towards them at a piece, or unit standard, at a time... Two weeks into the job, the new... [NZQA head, who] was previously deputy-director of the Canberra Institute of Technology, and before that head of the School of Management, Human Resources and Industrial Relations at Queensland Institute of Technology... has done his homework on N[Z]'s qualifications framework aided by educational debate in A[US] over some of the same matters that are under the microscope on this side of the Tasman. The education systems are similar in their search for a range of education pathways... but... A[US]ns have gone further in examining the gap between academic and vocational education.

...Eighteen months as principal of Bader Intermediate, Mangere, has exhausted [him]... "You need to be a missionary to teach in South Auckland,"... said... [the principal who disputes an ERO] claim that poverty is not the cause of low educational achievement in South Auckland. "Before you can teach that one and one makes two you have to make sure that your students aren't hungry, that they haven't got headaches, that they haven't been beaten up the night before, that they have pencils to write with. In other areas you don't have to worry about things like that. You just teach." According to his surveys, 76[%] of his students come to school without lunch. [15%] live in homes which do not contain a single reference book, not even a dictionary... "[Mind you, the school's] library hasn't seen a new book in years. And we haven't got the equipment to properly implement the technology curriculum." ...Annual school fees of \$20 a family have been paid by only five families this year and working bees attract only one or two parents... [The principal] goes to a fleamarket every weekend to buy cheap socks for students... gets shoes for "next to nothing" from a caring manufacturer and writes to stationary companies in an effort to get free supplies... [His] strategy is to build pride in his pupils... by promoting sport and cultural activities and updating the uniform.

...[yesterday the US President] launched a campaign, aimed at school districts in the U[S], to encourage the wearing of school uniforms to foster unity... contribute... to a sense of pride... improve... attendance... and to stop children killing each other over expensive jackets and shoes.

...THE trouble with [guys] appears early: at school. Though [guys] take up half or more university places in most countries, at primary and secondary school girls are increasingly out-performing boys. In... the U[S] boys are much more likely than girls to be held back a grade and twice as likely to drop out of high school... In... England and Wales girls score higher than boys in tests conducted at ages five, seven, nine and 11... In some subjects at some ages boys do better than girls, for example, mathematics at the 16-year-old level. Traditionally, boys have done less well than girls before puberty, but have caught up. What is new is that boys are no longer catching up... A standard measurement is the percentage of children who achieve grades A, B, or C in five or more... GCSE... subjects; 48.1[%] of girls achieve this compared with 39[%] of boys. The pattern is repeated throughout Europe. Because jobs are increasingly "knowledge based," this disparity is bound to be reflected in employment once today's schoolchildren become adults... Moreover, the job market is already moving the girls' way. Western surveys show that for the foreseeable future job growth will be in work typically done by... [gals -] residential care, computer and data processing, health services, child care, and business services... [(t)heir share of employment in them ranges from 51 to 79[%]].

...BOYS do less well than girls in N[Z] schools because they "muck about in class," says... [the] director of a recently completed study which followed 1250 Christchurch children from birth to 18 years. The study, carried out at the Christchurch School of Medicine with funding from the Health Research Council, measured students' reading abilities, their academic achievements and the ages at which they left school. The results show that there is no point in their school career where boys do as well as girls, and they have twice the rate of reading delays. But the report makes it clear that these differences cannot be explained by intelligence because boys and girls had very similar IQ test scores. Gender, [the professor] emphasises, is not the issue – it's behaviour in the classroom. Boys are much more likely to be inattentive and disruptive. The results of the Christchurch study also reveal another anomaly: the persistence of a concept that girls are disadvantaged in education – despite the reality that they do better than boys. "It is of concern... that we've gone for a decade without acknowledging what was happening." While these differences exist, they are not large. "We don't need another social revolution," [the professor] says, referring to the influence of feminism during the 1970s and 1980s. Data collected by the Ministry of Education shows the same evidence as the Christchurch study... [The p]rofessor... will present the findings of the Christchurch study at a seminar at the Auckland Institute of Technology on Thursday. Titled "The Shaping of N[Z] Boys," it will look at gender differences in violence and antisocial behaviour, childhood sexual abuse as well as gender and educational achievement... • [Despite their]... academic success, disparity in the status and income of [gals]... in the labour force continues. Many of the growing occupations – sales and service workers – offer low rates of pay ([gals] earn about 20[%] less than guys), poor job security, and little opportunity for advancement. But a different pattern is emerging in some professions. At the Auckland Medical School this year's intake of first-year students has 46 [guys and 67 gals], and throughout the school's six-year course there are 326... and 321 [respectively]. The nursing profession is still largely one for [gals], though, with... only about 4[%] of them being guys]. The discrepancy is also strong in teaching: at the College of Education where teacher training takes place the proportion of [gal students to guys] is 80 to 19.2. - 1996

Primary school pupils are at least four times more likely to have a [gal] for a teacher than a [guy]... Although the number of primary school teachers has increased by more than 2000 in the past seven years, the number of [guys] teaching dropped by... 6.7[%]. Guys] make up just over 20[%] of all teachers, when the large number of [guys] in principal or deputy-principal positions is included... [However,] a lot of schools were now staffed entirely by... [gals] and even had [gal] caretakers. But at a time of increasing social problems, children often went through their young lives with no positive [guy] role models... The Minister of Education... said highly publicised sexual abuse cases had generated "dreadful PR" for [guy] teachers of younger children, and many told him that the social stigma was one of the biggest issues they faced... [T]he Principals' Federation... president... said low pay was the main reason keeping [guys] away... There are [now 7.2% fewer guys] teaching secondary school students... than in 1991...

ONE of the great mysteries of N[Z] education over recent years is closer to being solved: Why girls do so much better than boys in the crucial area of reading and general literacy... The last major... survey of N[Z]'s reading performance comparing 32 countries was carried out by the International Association for Educational Achievement in 1990. When the results were published in 1993, N[Z]'s overall average was good. Fourteen-year-olds ranked fourth in the survey and nine-year-olds sixth, but... NZ had the second largest "gender gap" between boys and girls in the 9 to 14-year age group... "Two-thirds of pupils who attend reading recovery are boys, and when they get to secondary school, reduced reading skills are obviously a debilitating factor in learning," says [the person] who supervised the IAEA survey in this country. At the time... [the] educational researcher at Auckland University... suggested the large gender gap might be partly attributed to the fact that 76% of primary teachers were [gals], and young boys often don't identify with them at the crucial first stages of learning to read... Now... [the researcher has] come up with some hard research data explaining... that the gender gap in reading and literacy isn't worse in classes taught by [gal] teachers. It is in fact smaller... [R]esources and books in the classroom... are vital. But ironically classes which were well resourced often showed the biggest gender gap. [The researcher] believes this shows girls are more mature and more adept at using what is available and more willing to read. "Teachers just have to concentrate more on getting boys into reading,"... There were also concerns that NZ started teaching boys reading too early at five when most other countries started at six or later... However, [the researcher]... says there is still much we don't know about why girls do so much better than

boys in language learning... [□ In '1982 the outgoing president of the NZ Federation of University Gals believed girls needed to be given more opportunity in science. "NZ can't continue to ignore the potential of 50% of the population."'] However, the] **large number of girls who made it to the finals of [NZ's] school science and technology fair... suggests science will not be a [guy's] world for much longer. Of the 35 finalists from schools across the country, 21 are [girls]... The overall winners of the annual event, which is sponsored by the Electricity Corporation, will be announced tonight... The two premier awards offered are educational scholarships and trips to the First Youth Science Festival of Asia Pacific Economic Cooperation in Korea.**

...Girls can do anything, but boys are still just being boys – so much so that the nation's teachers are starting to worry about their lack of aspiration and inspiration. The gender gap is so obvious in schools that teachers are looking at ways to turn around the negative attitudes some boys exhibit... [M]uch research had been done overseas on boys' achievement and one factor was that schooling was seen as "feminine." ...An associate professor with the [Auckland U]niversity... education department... said... "There is a huge emphasis on how we can meet the needs of girls and [gals] in society and in that climate it is very difficult to ask what's best for boys." [Editor's note: Anecdotal evidence suggests that 'girls do better in single-sex classes (because they aren't distracted from their studies by boys'), whereas boys tend to do better in unisex classes (either because they dominate the teacher's attention while girls are more submissive, or because they want to impress the girls) – although it is also said that a 'boy + after-school job = car; boy + car = girlfriend; boy + girlfriend = distraction, no homework done, under-achievement'!]

...Girls will be accepted into Mt Albert Grammar School, but its staunch... tradition means mingling in the classrooms is out. The school board of trustees has approved the establishment of a complementary girls' secondary school on the site, almost four years after the Ministry of Education asked the board to consider taking girls... If it proceeds, the girls' school will be controlled by the same board but run separately... [I]t was yet to be decided if there would be a principal for each school or one central principal and an assistant in charge of each school... Sports facilities, playgrounds, the library and hall would be shared... [The board chairperson] said the school was anxious to build on its 75-year-old, single-sex tradition, rather than "impact" on it by making the school unisex... New buildings would be built on a field below existing buildings... Nothing will be built before 1999. Senior boys are on study leave and unaware of the decision... [However, the] president of the old boys' association... said the old boys backed the decision.

...CHILDREN were once judged on the intellectual prowess of their families and treated accordingly at school. Bright parents were thought likely to produce clever children: the offspring of dim parents were never expected to be high-flyers. For years, the gifted few were creamed off the top of classroom rolls and nurtured in special programmes to reach their maximum potential. But a new book by... a Christchurch teacher of 40 years, explores the theory that every child is gifted and it is up to parents and teachers to unlock their potential through creative teaching. "All children deserve a programme of gifted education... I strongly object to these programmes being made available to only the chosen few. Gifted programmes should be the norm." *Every Child is a Gifted Child* is based on the concept that children want to achieve, both for themselves and to be parent pleasers. "They can always do far more than we think they can. But because they want to please us, children often achieve at the level we expect of them." ...her... book... explains... [that the ways] children learn and develop may be just as varied as their personalities. Patterns of learning, behaviour and personality are directly related to how an individual's brain is laid out and how effectively the brain's chemistry allows messages to be conveyed... [Y]our child... will... [either be] more right or left-brain dominant... Brain dominance helps us identify each child's learning style and develop a learning environment that best suits that child... Many gifted children go unrecognised simply because they are operating with a brain dominance at odds with their parents and teachers... Logical, verbal, organised left-brain dominants (many of our teachers) find many right-brain characteristics are sloppy, careless, irrational and unfocused. So thousands of highly gifted, creative, original, very clever children are labelled as lazy, limited and "just average". For really effective learning and living, we need to use the functions of both sides of our brain, integrated and working together. We know that the left brain organises information in clear, logical fashion so that the right brain can then explore relationships and patterns leading to an expansion of thinking. The left brain then organises the expanded information and so the process goes on... In the early years, while language and muscle control are still developing, children operate mainly through their right-brain talents, which means they need plenty of visual and active learning. Getting the brain "up and working" in this way inevitably leads to the above-mentioned information swap between the two brains... We can support brain linkage development with fun activities. You and your children will get a lot of enjoyment from exercise sessions... Exercising both sides of the body... fosters healthy brain linkage because each side of the brain controls movement in the opposite side of the body... This becomes particularly significant for children who have sight or hearing problems with one eye or ear. For instance, left-ear information goes into the right side of the brain and gets processed first. I wonder if repeated ear infections in one ear can influence brain dominance? Motor development and brain linkage go hand in hand... Each child needs to move through the stages that precede some stage of motor development, such as walking... Parents often encourage babies to walk as soon as possible and use walker trainers to speed the process, but I do not support this. Walker trainers cut short the crawling activities essential to your gifted children's very important stage of brain linkage development. Good brain linkage is strengthened by the appropriate physical cross-movements (left, right; left, right) that babies do naturally when crawling... GIRLS tend to have a heavier brain linkage system than boys. Thus girls relay more messages back and forth between right and left brain. Boys may not express their feelings or ideas so readily in words, because they... tend to focus an activity on one side of the brain – right or left – at one time. Many little... boys... like to move a lot (they have trouble sitting still)... but very few classrooms accommodate such behaviour... However, [some]... little girls are always on the go... [while some] little boys speak early and fluently... and [boys] have a well developed area of spatial understanding which enhances maths ability.

...['Sex-role typing is the process by which children acquire the values, motives, and behaviors viewed as appropriate to either guys or gals in a specific culture. Systematic attempts to communicate sex-role standards and to shape different behaviors in boys and girls begin in earliest infancy and have been described as follows: "Sex-role differentiation usually commences immediately after birth, when the baby is named and both the infant and the nursery are given the blue or pink treatment depending on the sex of the child. Thereafter, indoctrination into masculinity and femininity is diligently promulgated by adorning children with distinctive clothes and hair styles, selecting sex-appropriate play material and recreational activities, promoting associations with same-sex playmates, and through non-permissive parental reactions to deviant sex-role behavior". Some mothers and fathers and other adults are quick to discourage such behaviors. Nevertheless, boys and girls do develop distinctive patterns of interest that are consistent with sex-role stereotypes. A 1985 study of 2000 US children from 7 to 11 years old found boys like guns, boxing, wrestling and karate, team sports, and fixing and making things more than do girls. In contrast, girls prefer dolls, sewing, cooking, dancing, and looking after younger children more than do boys. Many psychologists believe that traditional ideas of masculinity and femininity have been socially and psychologically destructive. We have been speaking almost as if people are either masculine or feminine in their interests, attitudes, and behaviors when we know in reality that most people possess a combination of characteristics viewed as masculine or feminine. Any person, guy or gal, can be tender and nurturant with children, a competitive terror on the tennis court, professionally successful, and a good cook. Many people are *androgynous*; they possess both masculine and feminine psychological characteristics. However, it is important to recognize that not only do gender-related traits such as expressiveness, nurturance, instrumentality, or assertiveness vary across individuals of both sexes but individuals will vary across situations, settings, and tasks in the extent to which they display these characteristics. It would seem constructive to facilitate the development of desirable characteristics such as social sensitivity, nurturance, open expression of positive feelings, appropriate assertiveness, and independence in both sexes. Some contemporary parents are working toward this goal and some schools have effectively reduced the degree of sex typing. In open preschools where the staff consciously attempts to minimize sex stereotyping, children spend more time in mixed-sex groups

and less time in conventional sex-typed activities than children in traditional schools. Attitudes towards sex roles and acceptable behavior for guys and gals are slowly changing, but it is clear that there is no single formula for the appropriate behaviors for either sex. Individuals, families, and cultures vary widely and no single script for sex roles will suit these many variations.' Yet now n]ewspapers are claiming research explains differences between the behaviour of [guys and gals].

...The co-discoverer of the structure of DNA... has much to answer for... Stop collecting insects and fish, [the co-discoverer] ordained – only molecular biology, the study of DNA, can teach us about life. We must learn about animals from genes, not vice versa. It was a mighty imperative. "...having risen to historic fame at an early age, [the co-discoverer] became the Caligula of biology," says [a]Harvard biologist... in his biography *Naturalist*. "[It] was given licence to say anything that came to his mind and expect to be taken seriously." Serious is not the word. Molecular biology has become an intellectual steamroller that threatens to flatten all before it. This month good sense became its latest victim. Researchers reported finding behavioural differences between Turner syndrome patients who carry a piece of their father's DNA and those who inherit their mother's. One group was found to display less "social cognition" – an ability to measure nuances in other people's voices and behaviour – than the other. The team hoped their work might explain symptom variations in sufferers of this chromosomal aberration, but they added a tentative remark that it might also account for some social differences between [guys and gals] in general. That was enough. "[Guys] are born lacking a factor responsible for [feminine] intuition," reported the *Telegraph* newspaper. "Boys are born with no social skills at all," claimed the *Mirror*. "It's the gene that explains feminine intuition." "It's the gene that explains why you can persuade adolescent [guys] to attack a machine-gun emplacement," said the *Independent*. "In fact it's absolute crap," said [a]Cambridge University psychologist... [who was] one of the researchers. "We didn't say a word about fem[inine] intuition." So I told her how a *Telegraph* hack had been greeted with waves from friendly London schoolgirls but with unfriendly gestures by building workers – thus demonstrating [guys'] innate nastiness. "Oh, God, what twaddle," [the researcher] moaned. (Being innately intuitive, I decided [to] not tell her the *Telegraph* also thought [they] had found the gene that shows why [guys, not gals], light barbecues.) To be fair, journalists were merely following a lead set by [a]Professor... of London's Institute of Child Health. "Being rather less empathetic is an advantage if you are going out to kill someone," [the professor] told a press conference. "If you wanted to recruit boys into an army, hunting party or a football team, it is an advantage to have those boys socially unskilled so the dominant [guy] in the group can impose a set of social mores." Thus [guys] let themselves be slaughtered at Gallipoli, whereas [gals] gain protection through their instinctive social skills. It is, of course, a vast edifice of nonsense, an intellectual enterprise that holds together the way a brick floats. For a start, the research concerned Turner syndrome patients, individuals who lack an entire X chromosome. "All sorts of other abnormalities associated with this condition could be skewing results,"[an] Oxford University geneticist... pointed out. "It is dangerous to make links between it and normal individuals." Then there is the existence of "the gene" that was so hyped by the *Independent*. No gene of any kind has been discovered, or even traced. It is utter fiction. All we have is a chunk of chromosome that seems to produce slight behavioural modifications within a condition that itself produces profound behavioural problems... Having traced genes for cystic fibrosis, breast cancer, and other conditions... too many geneticists... think they can do the same for human behaviour just as easily. Didn't [the co-discoverer] tell them that they could? Well, they can't – not when dealing with the complexities of the human brain and the intellect of Homo sapiens. Yes, our behaviour has a strong genetic component; but, no, it will not reveal itself in such simplistic ways... The whole business is a farrago of half-baked assumptions that discredits an otherwise sound research report. It is reminiscent of the claims made two years ago on equally unsupportable evidence that geneticists had discovered "the gene for homosexuality."

...['intelligent guys get their brains from their mothers. If a guy wants to have smart sons, the guy should marry an intelligent gal, said an AUSn geneticist in the medical journal *The Lancet*. Her research says that intelligence-determining genes are on the X chromosome – the only chromosome a guy inherits from his mother. It is paired with the much smaller Y chromosomes from his father. Therefore an intelligence-enhancing X gene has more of a chance of becoming the predominant gene, determining the guy's basic intelligence, looks and character. It also works the other way. If the predominant gene is not as strong as it should be, the guy is more likely to suffer mental retardation. The AUSn concludes: "If the gene is the one that increases intelligence then its full effect will be seen in guys, while in gals the benefit is less pronounced. This explains why some guys are extraordinarily intelligent." "Guys should temper hormones with logic when choosing mothers for their children and go for brains rather than good looks but gals are free to choose mates on their looks as they can be assured the brains come from' themselves. By the way, s]chool terms and holidays at [NZ']s]state schools are to be standardised nationally this year. Primary schools will have four terms of about 10 weeks, while the fourth term for secondary schools will be seven days shorter.

...I'm going on holiday for two days. Before you laugh cynically and say, "And the rest of it!" remember that principals are on employment contracts, just like other managers, and four weeks' annual leave will be specified in most of those contracts. (After 40 years working, and 25 in managerial positions, I don't think that's excessive, myself.) But what about teachers in general? Well, the problem is they don't have employment contracts which guarantee them annual leave, or even restrict the number of hours they can work in a week. Consequently they can be called on to work 60 hours a week or more, including evenings and weekends and so-called "holiday" times, and get no credit whatsoever for their labour, let alone overtime pay. I know teachers who haven't taken a proper week's holiday in years, because the needs of their students are so great that they often spend most of their waking hours (often at the expense of relationships and family commitments, as well as their own health) trying to create new resources, offer out-of-school and holiday programmes, and visit families. Needless to say, such teachers burn out, eventually, and the profession loses them. Of course there are teachers who disappear at 3.30 pm some days (when there is no compulsory staff meeting, that is) and even go away with their children during their children's holidays. But many of them work till midnight most nights, and clock up several hundred hours a year beyond the normal 40 hours a week for 49 weeks. As for those teachers who are at school only when they have to be, do little outside school hours, or are cynical or bullies or incompetent, they don't last long with today's young people, or today's performance management systems, competency proceedings and the E[RO]. And a good thing too. No, my main concern is not the number of lazy or incompetent teachers in the profession. My concern is the number of exhausted, poorly paid teachers working their guts out for young people and being reviled by ignorant or stupid non-teachers who judge today's teachers by what they experienced themselves at school 20, 30 or 40 years ago.

...A just released report shows that principals' administrative work has increased substantially since the Tomorrows' Schools reforms of 1989... [While t]eachers report an average working week of 48.3 hours, up two and a half hours since the reforms were introduced... [p]rimary principals' workloads have increased by an average 10 hours a week to 59 hours, according to the Council of Educational Research. Teaching principals work an average of five hours longer a week in an attempt to balance the different parts of their role. Many schools are not adequately funded to allow the principal to delegate this work, and rely heavily on voluntary work by their boards. While many principals enjoy the challenge, only half of those interviewed described their morale as good or high. Of those surveyed just 16[%] expected to still be at the same school in five years. Another 24[%] said they would probably retire... or change careers. The report says the increased workload and paperwork, combined with inadequate support, may be discouraging people from the job. Just 9[%] of the teachers surveyed said they were interested in becoming principals. Only half the deputy principals wanted promotion... This study also... points to the urgency of an independent review of the reviewers[(the ERO)].

...About 10 years ago a school principal took up his first major appointment in an Auckland city school. On his first day [the new principal] was visited by the inspector of schools. "You have real problems here," commented the inspector. "We need a youngish person like you to resolve these." The new principal was then given a description of all the staff in the school, including one who was shifted from another school because [the

teacher] shouted excessively at children and “mentally harassed them.” ...One staff member was placed in [her] classroom... to induce a “fishbowl” effect so that [the teacher] would not be tempted to hit or shout at the children. Some weeks afterwards the young principal began competency proceedings against one of the teachers. It was clear from class observations that the teacher’s class programmes were not up to a reasonable standard and that [the teacher] had a bad influence on children. Although the principal was able to bring competency proceedings, [it] was unable to dismiss that teacher. At that time, before Tomorrow’s Schools, a teacher was appointed by the education boards. The education board called on the school’s inspector to make a recommendation on the future of the teacher, and asked for the view of the principal... The teachers’ union was also invited to enter the debate. After some months of this approach it was agreed by the inspector that it might be better to find another school for this teacher because [the teacher] obviously was not fitting in well... It was felt that another school could give that teacher a further opportunity with a new group of children and parents to start afresh without the problems which had been shown at her present school. Over time that young principal removed many teachers from that school, most of them shifting to other schools. At no point was a teacher dismissed, although clearly there was abundant incompetence within the school as correctly diagnosed by the inspector on the first day. There were no differing views on that point: only differing views on what should be done. Two major flaws emerge from the pre-1989 accountability systems. The first was the powerlessness of the principals and the community to carry out any disciplinary action against someone on the staff. The education board, as employer, was the only body that could sack a teacher and it was rare that it did. Education boards were reluctant to act because their members were not teaching professionals and they found it difficult to comment on a teacher. In most cases they did not even know the teacher by sight. There was, in short, no line of accountability. A second issue was the “moving around” of teachers. It was common practice before 1989 to give teachers another chance and it was known that there were instances of teachers who... [were given third, fourth and more chances]. There was also a recorded case of a paedophile being moved to another school in order to be given a fresh start... Tomorrow’s Schools... brought with it new accountabilities and new responsibilities. Central to this was the school’s responsibility for the employment of staff. School boards and principals were therefore responsible totally for all that happened within their schools, including the work of all staff. The E[RO] was founded in order to inspect the schools. The office reported on its findings of the effectiveness of the board, principal and staff and reported these findings to the community of that school. These public documents have been frequently aired in the local media... [Consequently, t]here has been a purge [of bad teachers] over the past eight years... Children are the big winners in these reforms. Although criticised, it is nevertheless true that the E[RO] is responsible for reporting on the effectiveness of learning programmes in schools according to national education and administration guidelines. These guidelines are law and it is right and proper that schools should be obliged to comply with them. Over recent years there has been a growing awareness in schools of effective teaching practices. There has been a huge improvement in teaching and in the measurement and reporting of progress. This is a direct result of the changed employment practices and the reporting procedures of the E[RO]. Schools exist solely for children. Children who are to shape the world in the future for themselves, their families and for the nation deserve the very best that can be provided for them. N[Z] has an international reputation in education which must be preserved at all costs... The strength of the nation’s education system depends on the review office’s ability to maintain critical, intelligent analysis of the work in our schools today.

...Students at Marcellin College are suffering because of poor teaching and management, says the... [ERO. School Certificate] pass rates were “significantly” below the national average[(‘for a pass each candidate is required only to obtain 30% in the compulsory subject of English and a total of 200 marks in four subjects including English, scores of under 30 in any other subject – there are 31 optional subjects – not being counted’)], with students falling up to 18[%] behind in some subjects... It has given the management six months to fix “longstanding problems” at the integrated Catholic College... [which has] had six principals in seven years... The office said it was concerned that issues raised in its 1995 report... were not resolved... [T]he board chair[person] rejected criticism of the board[, claiming]... many of the problems arose because the board’s relationship with [last year’s] principal had been inadequate when the principal had been off work sick much of the time.

...More than one in 10 schools reviewed last year had bad teachers and bad management, the E[RO] said yesterday... Last week... [after being c]hallenged to put figures on how many teachers were good, bad or indifferent... the office chief... said [her office] did not have such statistics. Teachers were not assessed individually.

...Figures from an analysis of 350 people granted a limited authority to teach by the Teacher Registration Board show at least 30[%] of them have no qualifications, a number have skills only in coaching sports and a small number have no relevant skills or experience... The national president... said... [every] parent should have confidence in their child being taught by a properly trained and qualified teacher... [Yet] some school boards had no option but to employ whoever was available... The board director... said 855 applications had been approved up to the end of last week.

...The Minister of Education... has conceded some teachers are incompetent but says it would be “heroic” to expect perfection. His comments follow a claim by the head of the E[RO]... that significant numbers of school teachers are incompetent. [The head] told Parliament’s education select committee this week that... “There are some very good teachers and there are a large number of reasonably competent teachers, whatever that means, and there are a large number of... teachers who should not continue to be employed at schools.” ...and schools would be better off not hiring anyone to fill vacancies... Angry teacher unions challenged [the ERO head] to prove her claims. The acting president of the NZ[EI]... said: “By making such unsubstantiated and sweeping claims [the ERO head] casts a slur on the whole teaching profession.” The P[PTA] laid the blame for the problem with the Government[, which]... caused the teacher shortage by failing to plan adequately for a population bulge moving through schools.

...Secondary school teachers fear a generation of young New Zealanders is at risk because of new proposals which aim to change the way staff are trained... The proposals are contained in a Government green paper “Quality Teachers for Quality Learning” released yesterday... The paper envisaged the establishment of a professional body – separate from teachers’ unions – responsible for the development of nationally agreed standards and the registration of teachers... It also recommended... that schools should be bulk-funded for teachers’ in-service training... If the proposal is adopted, schools will be able to pick and choose between training courses. Previously the Ministry of Education entered into contracts for in-service training with colleges of education. The president of the trustees’ association... said some schools might want to put money meant for teacher training into other areas. “Whenever money goes into the pot, and it has to be prioritised... there is always a risk [of that happening]...” ... The president of the P[PTA]... said: “Kids deserve more than experiments. The Government must provide hands-on quality teachers in front of classes each year.” ...a wave of 80,000 extra students[is] expected to hit secondary schools during the next 10 years.

...High-quality education for all students is seen as “unrealistic”... says the E[RO]. In its annual report the office says many... educators and members of the public... feel the standard set by the office is unattainable, especially where students are socially or economically disadvantaged... Some schools appear to have low expectations of students from disadvantaged family backgrounds... Schools are often reluctant to help students whose problems fall outside the expertise of teaching staff, and there is resentment that other agencies have failed to help schools with those problems... The debate over how involved schools should be in the welfare and emotional support of their students is not helped by a lack of clear specifications from the Government on what schooling is there for... While dealing with the barriers students have to learning is a specific responsibility of boards of trustees, there is no definition of what those barriers are or the extent of the board’s responsibility. The... report describes barriers as factors within the school, such as inadequate curriculum planning or bad classroom management, or those brought in from beyond the school gates. However, it says, regardless of the type of barriers, schools have a responsibility to address them so all students have equal educational opportunities... The office says it has previously avoided defining “such critical elements in education” because it is not part of its responsibility, but greater definition is needed to improve schools’ performances... [Incidentally, NZ s]chools will have 16,000 more students this

year, taking the total to 712,000, says the Ministry of Education... There are 18,000 primary teachers and 15,000 secondary teachers... About 10,800 of the year's 65,000 new entrants start next week.

...Schools which are short of teachers may turn away... new entrants [or] call in parents to take classes when the new term begins... People untrained and unqualified to teach could be employed with "limited authority" for up to a year... classes could... also... be combined, and principals returned to the classroom... Schools would be closed only as a last resort. The Ministry of Education estimates 200 primary teachers are needed for Auckland schools before school resumes on January 28. Firm figures will be available when principals return from holidays... but the 404 teachers needed last month has been halved by overseas recruits. The Minister of Education... yesterday played down the shortage, saying it was "not greatly at odds with what happens each year." ...[the minister] would not comment on what options were open to schools with too few teachers. A spokes[person] for the ministry... was "hopeful" enough teachers would be found to effectively staff schools... [The spokesperson] said schools usually began each year with extra teachers because new entrants trickled in during the year as they turned five... [T]he head of the Auckland School Trustees' Association, last night... warned that... [it was] illegal... to... turn... away... new pupils... and... close... schools... but said schools might have little choice... The N[ZEI] Auckland council chair[person]... hoped parents would not be needed in schools. "...However, the options of children staying at home aren't that palatable either."

...Figures obtained by Labour's education spokes[person] show 44%... of Auckland secondary schools now have enrolment schemes. Forty primary and intermediate schools in Auckland – or 42[%] – had schemes which determined which students were accepted or rejected. This compared with a national average of just 18[%] of primary and intermediate schools using such schemes to prevent overcrowding. Official figures show 14 schools in the Auckland area have adopted enrolment schemes in the past year, while three have abandoned them. Zoning was abolished in 1990 to let parents choose freely. As a result, popular schools had applications from more students than they could take. In the past year, students turned away from schools in Auckland or living... between zones have hit the headlines... [while at] least two colleges have caught parents supplying false addresses to meet enrolment criteria... [The Labour MP] said... the latest figures showed the use of such schemes was "getting out of control"... [-] schools were using... [them] to pick students who were intelligent or good sportspeople and turning local children away... The Government has promised to change the law... but... [the] Minister of Education... said the election stalled draft amendments to the Education Act... [The minister also] said the planned legislation would not amount to a return to zoning. No children would be denied access to their local school, but parents would [still] be entitled to send their children to another school if they wished. That decision was made at a Government caucus meeting in early 1995... [In related news, s]tate schools are illegally charging fees and threatening to turn away students who cannot pay. Lawyers from the Youth Law Project in Auckland say they have fielded 10 complaints in recent weeks from parents facing fee bills of up to \$254... State and integrated schools ['in the period 1973-75, discussions and conferences were held on the issue of state aid to private schools; from these, a working party produced a report which, it believed, "provided an acceptable formula for the integration into the state system of private schools which wish to integrate" – most private schools have chosen to integrate, thus gaining access to some government financial support')]could only legally ask parents for a donation... [However,] a lawyer with the project, said... school[s] could legally require parents to pay part of the fee – \$34 attendance dues – but the remainder was illegal. Integrated schools can legally charge attendance dues to bring buildings up to standard and all schools can require fees for extracurricular activities... A parent... [who faces] fees of \$68 a term for each of her two children... said facilities at the[ir] school were not good enough to justify paying fees. It had no swimming pool and the grassed areas were "like a wilderness."

...A flying squad of teachers will fill shortages at Auckland schools as part of a \$230,000 Government rescue package announced yesterday... [40] primary school teachers from A[US and NZ] will be flown in this week, ready to cover... 200... vacancies when school resumes on Monday... The teachers would stand in for up to four weeks in schools that could not find enough staff, or where overseas teachers were expected to arrive late... The Government would foot the bill for the groups' accommodation... and for transport, meals and "other support" until February 21... but the money [will come] from the existing teacher supply budget... Meanwhile, the... Ministry of Education... [has] issued advice to principals who might return to work today to find that a teacher had quit unexpectedly. It urged them to try regular relievers, contact teachers' colleges, ask colleagues for help, advertise or contact agents and the ministry. Uncertified teachers should be considered until a certified one was found and staff could be "reorganised" to cover any gaps... Each year one in four young primary school teachers downs his or her duster and leaves the chalkface behind.

...trained and qualified primary teachers... say they cannot find jobs in Auckland, despite an apparent shortage in the city. The Ministry of Education has a list of 33 job seekers, many of whom have just moved to Auckland or have recently returned from overseas... Two teachers who contacted the *Herald* claimed they had been told by a major recruitment agency that the only job on its books was in Westport... [A f]ormer primary principal... would go "door to door" today to find work after moving to Auckland from Palmerston North. [The former principal] had applied for only six jobs since last November but... had had a "fairly laissez-faire attitude" because of the supposed shortage... However, [the former principal] has been offered just one scale A position – a basic teaching job. [The former principal] only applied for jobs in central Auckland but thought with her experience and the shortage [it was possible to] be "picky." "I'm sure if I went and tapped on a door at Mangere I would have had a job yesterday,"... A Waikato teacher with 24 years' experience... resigned from Raglan Area School last year after deciding [his life] needed a change... [and thought that finding] another job... would... [be easy], but after applying for 200 jobs... now believes [that change could mean becoming] unemployed... it was cheaper for schools to hire newly graduated overseas teachers rather than him because of his higher grading. "A... school has to pay \$47,000 for me, but probably only \$30,000 for them." [A]Ministry of Education spokes[person] disagreed money was behind the appointment of overseas teachers... Meanwhile, the Maori Principals Association has launched a recruitment campaign in a bid to reduce the Maori teacher shortages faced by kura kaupapa, or Maori immersion schools, and other schools. [The association's p]resident... said it hoped to attract up to 600 people into teacher training and would target senior secondary school students later this year.

...[last year's] school-leavers keeping a sharp eye on the mail for examination results this week are probably under no illusions that the grades they get represent more than a doctored approximation of their real scores. Until a dozen or so years ago the education authorities did not often admit that they falsified public examination results. Since about the mid-1980s they have been downright lyrical in confessing the fact at every opportunity. The change came when education was seized by the idea that formal written examinations were just a memory test and altogether less informative for all concerned than a school's assessment of a pupil. Exams as we knew them became easily attacked on the score of the outrageous method of marking them. It did not seem to matter that those leading the attack were the very people who insisted on marking them that way. They want pupils' results to show a consistent spread around a predetermined median across subjects and from year to year. If the actual scores awarded by the markers do not fall into the desired range, the reason is assumed to be that the exam was too difficult or easy that year, or the marking was too tough or lenient. So the results are "scaled" to order. The marks finally given thus have meaning only for ranking pupils against others in their year. They give no objective measure of any individual or of educational standards overall. By the mid-1980s educationalists, parents, employers, unions, National, Labour, academics, curmudgeons had all joined in condemnation of a system that was designed to fail a fixed proportion of pupils every year. The Opposition education spokes[person]... used to say that if 100 of the world's best mathematicians sat the [5th form School Certificate (SC)] paper half of them would have to fail. By the same token, of course, if our mathematics standard had seriously declined (as a recent study suggests) we would never know. Half the [SC] candidates would still be passed. About that time the Minister of Education... had lunch with a couple of Auckland journalists to explain why [it] was trying to abolish failure. We readily agreed that the school system should not turn out youngsters with nothing to show employers or nothing to take to further education. But the system, we thought, should

be honest with pupils, employers, tertiary institutions and itself. Why not abolish scaling, let subject teachers agree on internationally respectable standards and give pupils honest marks? Could it be done? [The minister] did not know off-hand. [The minister] asked his education adviser sitting alongside. It was not that easy, [the adviser] replied. Within a few years [the minister had abolished 6th form University Entrance (UE)] and scholarship exams and [the adviser] was heading a newly established Qualifications Authority which set out to define standards that schools could recognise without the need of national examinations. After 10 years trying it has not succeeded. Unenthusiastically it continues to administer [SC and 7th form] bursary, though it has been ordered to cease scaling [SC] results. The practice persists for bursary, evidently because universities want pupils ranked for selection to restricted courses. Beats me why they could not use genuine scores for that purpose.

...A blunder in processing last year's bursary biology marks meant some students failed when they had actually passed... The errors caused some students to change their tertiary plans, thinking they did not meet the required entry scores for the courses they had hoped to enter... The headmaster of Auckland Grammar... said [3 students] were significantly affected, including a sixth form student who went up from 38[% to 78%...

I – the] headmaster of Auckland Grammar School... – ...was delighted that the acting chief executive of the N[Z] Qualifications Authority... has declared in print that “exams are here to stay” as part of the new national qualifications... However I have sat through enough NZQA information sessions to know that what might seem a clear statement of position by the authority may be modified and amended many times within a short period. I am not a cynic by nature, but constant contact with the qualifications authority over three years has taught me to carefully analyse and question whatever is said by it. For example, it may well be Government policy to have two external examinations but their role and influence in the framework is not clear. Initially, while claiming to retain exams, the authority tried to marginalise them by placing both [SC] and university bursary outside the framework. Neither exam counted as credits on the framework and there would be little incentive for most students to sit them. There was also talk of reducing the number of subjects examined. Now the authority is working on some “credit exemption” scheme for exams. Until we see details of this it is impossible to pass judgment. It is however easier to pass judgment on standards-based assessment, which amounts to an educational revolution because it represents a fundamental and far-reaching shift in what counts as knowledge. Knowledge is no longer viewed as an end in itself but is reduced to a set of exchangeable credits or a currency of skills. [The acting chief executive of the NZQA] talks of parallel developments in other countries. It is worth noting that there is no successful model of standards-based assessment as a main form of assessment anywhere in the world. The experiment in N[Z] is more far-reaching than any overseas because it attempts to unify all academic and vocational assessment methods. The authority believes that there should be no difference between the way a student studies, learns and is awarded qualifications in hairdressing, horticulture, history or other disciplines. I believe there are fundamental distinctions between vocational and academic studies which carry important implications for learning, teaching and assessment. It is a major concern that the experiment uses the U[S] “new standards” project as an example of a parallel development. There is no doubting that public examination in the U[S] is in a bad way. It was reported in September, for example, that “almost half the entering fresh[persons] in the California state university system in 1994 required remedial instruction in reading or maths or both – the fifth straight year in which this number [h]as increased.” Our youngsters deserve better than that. Like all education reform movements the world over NZQA says that they are reforming the system to help raise standards... Like all revolutionary movements there is no doubt that the new order will turn out to have as many or more problems than the old. The only way to really improve education significantly is with a more powerful curriculum in the hands of very good teachers who are trained to teach better.

...“Those who can, do,” runs the old saying, “and those who can’t, teach.” When I was training to be a teacher we used to chuckle at our training course lecturers by developing a third line for the maxim. “Those who can’t teach, teach teachers,” it ran, and made us feel fearfully clever and superior, which is the main purpose of life when you are young. It took me a few years to realise that the nation’s children would be better off if I wasn’t in their way. Now I gaze with unalloyed admiration at most teachers, but particularly at those who seem genuinely to enjoy the daily challenge of scraping the crust of adolescent disgruntlement off teenagers and trying to uncover the gleam of potential beneath. One of these is a[n]... acquaintance... of mine... Her students include trainee teachers most of whom will (soon, chillingly soon) be standing in front of the nation’s primary schoolchildren. [My friend] devotes some of her time to remonstrating with her students about their essay-writing: [and] is sometimes close to tears after hours of reading sentences uncomplicated by punctuation marks, untrammelled by the rules of syntax and with spelling most charitably described as inventive. When time permits [my friend] will give a brief unsolicited lesson in, say, the use of the apostrophe. The students roll their eyes and sigh in exasperation. In a “course assessment,” one student concluded that my friend had “a personal problem” with spelling, punctuation and grammar and... “should not bring her personal baggage into class.” The assumption underlying the comment is that clear thinking and self-expression are obscure irrelevancies, even when you’re about to embark on a teaching career. That is scary in the present environment. Central to Government proposals for education reform... is the idea that students, and not institutions, should attract funding. In this model, the students can spend their education entitlement wherever they want. The inescapable corollary is that they can withdraw it from teachers who make demands on them. If you believe that the customer is always... right, you should look at the essays my teacher friend has to mark. It is worth wondering whether the customer in education does know best... When students can dismiss a teacher’s requirement as personal baggage... it makes you wonder why they want to have teachers at all.

...Auckland schools may not have enough teachers again next year, after half of the teacher training courses in the city failed to fill first-year places. Five of the six rival courses were offered for the first time this year after the Government funded an extra 1500 equivalent fulltime student places... Figures showed... that 957 students enrolled for 1075 first-year places offered by Auckland trainers[, including]... a maximum of 630 new students... [at t]he country’s biggest trainer, the Auckland College of Education... Nationwide, just 1736 of 2015 extra teacher training places were taken... [Furthermore, e]xtra secondary school teacher trainees may not meet demand in some subjects... [– which] include Maori language... [(the subject experienced a 400% increase, but) the total number of trainees was still only 20...[)], maths, sciences, and some technical subjects... [–] and could create gluts in others... The number of English teachers being trained... this year[had increased by 155%], yet there was no real shortage of English teachers. Trainee numbers in social studies increased 146[%] and history and geography 129[%] – also areas where there are no shortages... [M]oves to attract former teachers back to the profession could be stepped up... and... [m]ore overseas teachers could be brought in...

A group of overseas teachers say schools are discriminating against them because of their accents and names – and colleges of education are backing up the claims... Principals claim they have to refuse applicants jobs if their accent makes it difficult for pupils to understand classes... The Race Relations Conciliator... said principals could reject applicants who could not be understood but could not refuse people jobs simply because they had an accent... This week the Immigrant Teachers’ Association will discuss its fears about racism with the Auckland College of Education.

...The principal of Avondale College... says that last year a sixth form student competed against the school’s head girl to gain entry into the Auckland College of Education. The sixth former, who had one pass in dance studies, got into the college but the head girl, with passes in several bursary subjects, did not... [The principal] said it indicated selection boards did not see academic ability as important for teachers... [O]ther principals had rung him yesterday to discuss similar cases of bright students not getting into teachers’ college; a common theme was that students from white middle-class backgrounds had not been offered a place. The headmaster of Auckland Grammar School... knew of a case involving a student who wanted to become a physical education teacher. The student was refused entry into teachers’ college after saying that pupils from Pacific Island and Maori communities should not get extra help unless it was needed. Every pupil should get help if they needed it, no matter what race they were, the applicant had said. “That did not go down very well at the interviews... I would love to know who is on the interview panel... I’ve certainly never been invited.”

...teachers... would be better at their jobs if they learned their craft in school rooms instead of at teachers' colleges, says the Education Forum... An apprenticeship system... modelled on similar schemes in Britain... – whereby trainee teachers learn their skills in the classroom – is being promoted by the chair[person] of the... group of businesspeople and educators who want more input into education policies... [The chairperson], who is also the principal of Avondale College... said senior teachers were keen to teach student teachers in the classroom. The courses would... concentrate on practical experience... [S]enior teachers would act as mentors for the trainees and that feedback would be emphasised so trainees learned how they could have improved classes. "The thing that really teaches a teacher to be a teacher is to be in the classroom." But the director for secondary education at the Auckland College of Education... said teachers' college courses allowed teachers to gain practical experience in a variety of schools. A spokes[person] for the Ministry of Education said schools would need accreditation from... the Teacher Registration [Board]... and... the N[ZQA]... before they could offer classroom training.

...The N[ZQA] is plagued with internal staffing conflicts over policy and is losing support from educationalists, an independent review has found. The review has also drawn attention to tension between the authority's board and the Minister of Education, and the potential conflict of interest between its accreditation and audit functions... The review recommended that staff be made fully aware of the reasons for the Government's education policies.

...The Government yesterday signalled a move back to basics for the country's qualifications system... from the hard ideological line pushed by the N[ZQA]... Universities, polytechnics and school examinations have not hooked up with the [NZQA qualifications] framework because it was viewed as too rigid. But some secondary schools, industry groups, Maori and private providers had embraced it, believing it enhanced courses on offer to students and courses which matched the needs of employers... In releasing a discussion document on the framework yesterday, the Minister of Education... said the future role of the N[ZQA] would be as guardians of the quality of the country's qualifications, and of an increasing "internationalisation" of [NZ's] qualifications. "□ The academic performance of NZ students has generally been very good in international comparison, with high standards of literacy and numeracy throughout the school-age years, while about 30% of the population have attained some tertiary education (NZ is in the top four OECD countries in this respect). NZ belongs to a number of international agencies working in the field of cross-national indicators in education. It co-operates closely with various overseas ministries of education, though the closest links are with those in other English-speaking countries.]

...Bad luck, kids. It turns out your parents may know more than you do, after all. A senior tutor at the University of Auckland... said this year's batch of [5th form] English students would flunk the 1966 [SC] exam. The exam of yesteryear was a rigorous test of the basics – grammar, spelling, punctuation and vocabulary... "Kids now have a very, very different experience of what English is, it's being redefined,"... The paper their parents may have sat began with a warning: "Neatness, spelling, handwriting and setting out are all important." ...Comprehension passages left students to decipher phrases such as a "chaos of rock" and "a tangle of foliage." "They had to chew through some pretty dense stuff there... I know a lot of our stage one students at university wouldn't have a clue." In 1966, however, [SC] was not necessary to get a job. Only the academic students sat the national exam and it was tailored for them. Today, it was an "absolute minimum" qualification, so students who were less able, and those from lower socio-economic backgrounds took the exam. Also, an increase in immigration in the past 30 years meant more students with English as their second language were sitting... [SC. F]luency now seemed to be more important than accuracy. The 1996 exam also steered away from directly testing the "mechanics" such as grammar and punctuation, and included more colloquial vocabulary. It stretched the boundaries by including a production and critical awareness section in which students can choose to write about film or video production, newspapers, radio, debates and speeches. Students were also asked to comment on a piece of spoken language – a transcript of an interview with [a contemporary] movie star. So any 1966 [SC] students "stuck in a time warp" would probably struggle with last year's exam paper, [the tutor admits. But it]... is convinced that the new philosophy driving [SC] is asking students to run before they can walk... [A] lot of the students who pass [SC] arrive at university two years later unable to spell or punctuate properly. "I am convinced that they haven't been taught those things. And do they need to be taught? Well, yes I think. Without... punctuation and good spelling strategies you can be misunderstood. I'm not a prescriptivist, but I do like good communication."

...[School starts tomorrow for our latest batch of new entrants. The] Parents Centre national director... says preparing children for school is a huge issue for parents. [The director] advises getting children into a pattern of attending a preschool, playgroup or kohanga reo regularly in the months leading up to their fifth birthday. "I've known a number of kids who think, after they've been to school for a day, that's it, that's school, they've done it. They don't want to go back for a second day. [However, t]hrough regular, organised activity, they accept this is going to be a regular part of their lives. You should make sure your child has a regular, early bedtime and is used to getting up in plenty of time so there's no great rush in the morning." But... parents should relax about trying to teach their children to read and write before they start school. "People get really hung up about reading and writing and put a lot of pressure on their children to get them off to a head start. [Yet s]chools use quite specialised methods of teaching these days and, more likely than not, your child will have to unlearn what you've taught them. If you want to teach children something before they start school, teach them skills like being responsible for their own clothes and belongings... Don't condemn their first days to failure by promising they'll learn to read and write. Children often expect to pick it all up on their first day and are disappointed if they can't read to Mum when they get home... And remember, don't sabotage your child's success by horrifying them with stories about how dreadful your own school days were..." ...In general, children are ready for school if they: *Educationally* ✓ Can draw people with three or four recognisable features. ✓ Can write or almost write their own first name. ✓ Can talk in sentences, using understandable speech. ✓ Can remember parts of favourite books. ✓ Can repeat some nursery rhymes and songs. ✓ Enjoy looking at pictures and listening to stories. ✓ Can count their own fingers. ✓ Know basic colours and shapes. ✓ Can follow two simple instructions given together. *Socially* ✓ Mix happily with friends at preschool. ✓ Can go to preschool or parties without tears. ✓ Can stay within boundaries. ✓ Can share and take turns. ✓ Have friends and talk about them in conversation. ✓ Can talk to adults other than parents and family members. ✓ Are toilet trained. ✓ Can dress themselves, including doing up their buttons. ✓ Can open food packets and unwrap plastic-wrapped lunches.

...Remember your first day at school? Mine... was in the 1970s when there was no shopping around for schools – I went to the one down the road. Parents and caregivers have more choice in the 90s. With zoning stripped away... parents are able to consider a wider range of schools to find the one that best suits their child's needs. The E[RO] has helped to make the decision easier with the release of a booklet titled *Choosing a School for a Five Year Old*. The booklet suggests parents start with a list of possible schools their child could attend, taking into account transport arrangements, proximity to home or parents' workplaces, how safe it is to walk there from home, and where the child's siblings and friends go to school... Other factors when assessing different schools include what sort of classes the school has for new entrants – purely new entrants, for instance, or a composite class of five and six-year-olds. Smaller schools could see five-year-olds in classes with six, seven and eight-year-olds, and in one-teacher schools new entrants could be part of a class of students aged from five to 12. The report encourages parents to ask questions of principals, staff, and board of trustees members, and to read any material available on the school, including prospectus, charter, and any E[RO] reports. Parents should also talk to prospective schools about what their child will be learning, and what objectives are set for pupils. Other key questions to ask include what fees or donations the school asks for, how the school day is structured, what will happen if the child is sick, and what action parents should take if they are worried about their child's progress. However, the report points out that choosing the best school for your child does not automatically mean there will be a place for them...

Two primary schools in west Mt Albert will be bulging at the seams and having to turn pupils away unless a new school is built. One of them is already the largest primary school in the country... Gladstone School's roll of 731 pupils was well above the... Ministry of Education[']s... preferred maximum of 520... and its roll is expected to mushroom to more than 830 by the end of the year... Two kilometres away, Owairaka Primary School is close to the maximum, with a role of 512... [B]oth schools have enrolment policies... "You've really got to question whether it's good to have so many children in a school..."... said... the... MP for Owairaka, [who is the leader of the Opposition. On a positive note, a]... Ministry of Education survey released yesterday... said... 98.3% of the country's primary classes will be fully staffed... The P[PTA] president... said... an injection of overseas teachers seemed to have had some effect on teacher supply. But... warned that this could be a short-term result. "...our concerns are about quality and quantity of teacher supply in the longer term..."

...Schools with high concentrations of Maori students also have the highest percentages of overseas teachers, the... N[ZEI] said last night... "Of the 1190 overseas teachers in our schools, 576 are teaching in schools where the rolls are between 20 and 80[%] Maori,"... said... the NZEI... national president... "Regardless of their competence in other areas, overseas teachers simply haven't got the cultural background to enable them to be effective teachers of Maori students. Using young, inexperienced overseas teachers will do nothing to lift Maori achievement in our schools..."

...Teachers from overseas are set to become an on-going fixture in N[Z] schools... Of 1100 overseas teachers surveyed by the Ministry of Education, 37[%] had already gained residency, and a number of others said they planned to apply. Government estimates show a further 3851 overseas teachers will be needed during the next three years.

...More Asian teacher trainees are needed to keep up with the influx of Asian students in [NZ]. More than 60,000 Asian students study in [NZ – or 5% of the school population]... But the Ministry of Education... said Asians made up just 2[%] of teacher trainees... [By the way, s]econdary school teachers will decide on a campaign of action at stopwork meetings this month over their claim for 1000 extra teachers.

...Threats of strike action by secondary school teachers have "perplexed and disappointed" the Minister of Education... Teachers have voted "overwhelmingly" to authorise the P[PTA] to call two days of strike action next [term].

...I love to teach more than anything in the world... [so] I returned to secondary teaching late last year after some two years' absence... What did I find? Unit standards have arrived. "Fine," I thought "just another variation; I should be able to teach basically the same." How wrong I was. First I was given two large volumes for my subject full of the most revolting gobbledygook I have ever read. It could have been translated into plain English and condensed to 10 pages. Each subject is divided into units which roughly correspond with the old [SC] syllabus. However, there is no guidance as to how long a unit should take; it could be two hours up to several weeks. The crux comes in the testing. Now 30 years of teaching experience does not fit me to give a test. Oh no! Nor does the fact that I was one of the group which originally wrote the syllabuses for fifth, sixth and seventh form. (In fact the fifth form economics course ultimately emerged from a programme devised by [another teacher] and myself at Rotorua Girls High School to improve on the then inadequate commercial practice course.) Our principal, bless her, not only trusted our judgment but encouraged us to be innovative – which is more than can be said for the N[ZQA. Anyway], back to my test. Six weeks before I intend to give it I must send it off to a moderator here in Auckland who... will keep returning it to be altered... if [the moderator] does not like what I have written... Then, because head office does not trust [either of] us, everything must be further moderated in Wellington. Or, of course, I can give the example test in the big fat volume... So they sit the test and here comes the fun: I must not write on the students' papers, not tell them where they have gone wrong, just that they have not achieved the standard. The poor souls do not even know what the standard is. It is an axiom of all teaching and learning that one does not waste time learning what one already knows but concentrates on those things one does not understand. Of course the students cannot do this because they do not know what they don't know... In a normal class probably four students will have achieved the standard, the rest have failed... even... [if they have made] only one small error... Oh, I must not call it "failed"; they have just not achieved. But we must move on to the next unit because time is of the essence and we will not cover the course in time... I can see disillusionment setting in very quickly. A 15-year-old who has... not achieved[for] three units in succession will not have faith in the system or the teacher... So we have a class with everyone at different stages and no one, including the teacher, making any real progress... [T]his is a recipe for disaster... It seems to me as a practical teacher, coming back with clear eyes, that the... concept [of] unit standards is flawed... A... lecturer at polytech used the example of hammering in a nail: A hits the nail three blows and lo it is hammered in, neat and true. B has about 25 hits and only succeeds in bending the nail into a half loop. After much effort and 10 wasted nails, one is finally hammered in, a bit crooked maybe, but still in. Both have achieved the standard, but who would you want to build your house...? [● NZ]... had the highest percentage of discontented teachers in the 26 countries of an international... study.

...teachers aren't losing their desire to educate the next generation. But they are losing something just as important – the time in which to do it properly. A teacher's day used to be devoted mainly to lesson preparation, classroom teaching and marking – the necessities. Then on top of that, most teachers would also volunteer to take a sports team or a drama-group or some other extra-curricular activity. That's not happening any more. A number of recent developments have been robbing teachers of the hours needed to do justice to essential tasks. One of these changes is the endless succession of meetings and administrative duties that have been thrust on teachers by Tomorrow's Schools and the Curriculum and Qualifications reforms. Another is the increasing number of disruptive students that are entering our schools. Still another is the fact that, while most other OECD countries have reduced their required number of classroom teaching hours the opposite has occurred in this country. N[Z] currently has the third highest statutory requirement for student contact in the OECD. Does it make... sense to stretch our teachers' workloads to new limits? Only if you think it makes... sense to put limits on what our children can get out of school.

...A national search for a "lost generation" of schoolchildren has found more than 100 not enrolled at school... Figures obtained by Labour show that the Ministry of Education was told of 1071 children who were believed to be "missing" in eight months last year. The ministry's truancy service – launched last May – found half enrolled in other schools, exempt from attending school, or living overseas. A further 110 who were illegally not attending school have since been enrolled or properly exempted from doing so. Files on 169 children missing for more than a year where the "trail has gone cold" have been closed... [– some files] were up to eight years old... [–] and the search continues for 141 more... [In international news, the] State of the Union speech... [by the US] President... said yesterday that improving education would get top priority. The televised address before the House of Congress... appealed for a "national crusade" to raise education standards to a level competitive with other [First World] nations. "The greatest step of all – the high threshold to the future we now must cross – ...is to ensure that Americans have the best education in the world..." [The President] proposed... a 20[%] increase over current... education... spending, to pay for... [his crusade. But hi]s speech was thin on grand, large-scale initiatives...

[The US President] will have struck a chord worldwide when [it] puts a priority on education. But [it] will have also struck a less positive one in the U[S]. Presidents before him have set their sights on achieving high standards of learning. That[this] President... feels the need to do the same is a measure of their lack of success. And the idea inherent in his proposed 20[%] increase in education spending next year, that money is the answer to education ills, is a sign that [this President] will struggle to achieve much more than his predecessors. [The President] has a problem when... address[ing] education issues with almost religious zeal. His call for a "national crusade..." bears a depressing similarity to his intended pursuit of medical reform signalled at the beginning of his... term. At least in setting his new target the President is challenging less powerful vested interests than when [it] set out to change the healthcare system. However, even in his priority redirection [the President] is expected to have to confront teacher unions identified as opposed to changes in a system that worldwide comparisons frequently suggest has not done the U[S] proud. ■ The heir

to the British throne]... caused outrage yesterday when [it] criticised the country's "failed" education system and said his charity had to bail out students who were victims of trendy teaching methods. In a BBC television interview to mark the 21st birthday of his Prince's Trust charity, [the Prince of Wales]... spoke about the discipline needed to succeed in life and which seemed to be lacking in[modern] education. "I... don't believe it's served young people well at all... [E]ducation needs to rediscover those important features which have been abandoned in the last 30 or 40 years..." His comments angered education officials, who claimed... the king-in-waiting... had not got his facts right and that members of the royal family should not be meddling in political matters.

...[the British] Opposition... leader... left state school at 16 and leads a Conservative party run by an elite educated in private academies... [The Labour PM] went to Fettes College, the select Edinburgh school known as Scotland's Eton, and then to Oxford University – the classic route to establishment power – before taking control of a party committed to equality in education. Given this, it is hardly surprising that differences between Labour and the Conservatives on education have shrunk... "Labour is trying to be as much like the Conservatives as it can," said... a former head of research at the Labour-affiliated Fabian Society think-tank who quit after a row over school policy... In a country whose middle-class grew wealthier in the 1980s, only to be gripped by insecurity about the future in the 1990s, education has become a key political battleground. [The Labour PM] has vowed to make education his priority... [and] told BBC television [it was his intention] to pursue education reform with the same vigour as that with which [the Conservative's Iron Maiden] overhauled Britain's union laws. After 18 years in the wilderness, Labour need[ed] the middle-class votes that ha[d] given the Conservatives four consecutive terms. To win them over [Labour's leader]... shredded old dogmas... by vowing not to kill off schools that select their pupils by competition. In another U-turn, [Labour's leader] agreed schools should have more control over their own affairs, an idea championed by... [the former Conservative PM. Even Labour's education spokesperson.] a left-winger dedicated to equal opportunity, fell into line. To wrest control of traditional Conservative rhetoric, [the Labour PM] has pledged to sack substandard teachers, close poor schools, set minimum homework requirements and punish parents who fail to control their children... [However, his] campaign on education has won him possibly more enemies than in any other policy area. They have homed in on his decision to send his son to a school which has opted out of local authority control... His political control did not waver when his social security spokes[person]... sent her son to a school with a competitive entrance policy... Her open defiance of party policy against pupil selection led to hundreds of Labour faithful sending back their membership cards. But... [the biggest] casualty has been Labour's traditional, cosy relationship with the teaching unions.

...The Government is responsible for the education of its citizens, including the very young, so the argument goes... However, there is another argument which has had little mileage here, in spite of extensive research overseas. In recent weeks, for example, both *The Age* in Melbourne and the *Sydney Morning Herald* have carried articles on the place of pre-school education and childcare in western culture. The claim can be made and supported that the success of the childcare industry, insofar as it attracts significant government support, relates less to the desire for good social practice than it does to pressure from ideological feminists and employers... that most [mothers] are needed in the workforce or that they want to be in the workforce... [T]hese claims are doubtful. Much of the paid work that [mothers] do is necessary to meet the family budget. Many of these jobs are low-skilled and could be done readily by young N[Z]ers who have no paid work at all and whose unemployment rate is three times the national average... [Furthermore,] there is mounting evidence there is no advantage – but certainly disadvantage – for infants being looked after by paid workers; certainly to the age of three and probably to five... For example, one exhaustive analysis of research in a range of countries during the period 1957-1993 was published recently by two Canadian researchers... Their findings said... young children... suffered... social... physical and psychological disadvantages... when deprived of continuous maternal care. According to an A[US]n child psychiatrist who summarised the Canadians' research... there is robust evidence of social-emotional and behaviour outcomes. These findings, "give no support for the belief that high quality day care is an acceptable substitute for parental care". [The psychiatrist] added "boys in particular are at risk"... Would not most children be better at home with their own parents? Should the state be helping to create an environment which is likely to be counter-productive to the welfare of children? What should a government do? S[upport]... programmes that separate children from their mothers, or... that help keep them together? ...institutionalised care of children under five is sold to parents as a means of teaching social skills. But the overwhelming evidence from research suggests that it might have the reverse effect. Children do not learn to socialise from contact with other children but from contact with adults, especially parents. Staff in institutions are less motivated than parents are and the children are in an environment where they have to compete for attention. According to one English researcher and writer... children do not learn the social skills necessary to resolve conflicts when exposed to large groups of other children. It is reasonable to suggest that a socially responsible government, in the light of considerable evidence, should examine ways to keep children under three under the care of their mothers.

...Mrs S... works about 50 hours a week, while Mr S... clocks up about 40 hours. This means [their young child] is in the care of a nanny for much of the day... [Mrs] S... readily admits [it] "didn't have a clue" about being a parent. The arrival of her son... has forced the finance director to balance childcare with a high-pressured job. Despite being well-educated and successful in her career, [Mrs S] said the birth of [her son] 19 months ago threw her into the realms of endless unknowns and uncertainties. "Looking back it's quite frightening what we didn't know." Her husband... said they did not have much experience with children, as many friends were yet to have families. This made the Ponsonby couple feel even less secure about their parenting skills. A friend told [her] about... the Government's... Parents As First Teachers programme... when [Mrs S] was about to return to work full-time... The monthly visits and developmental checks by a programme educator offered much-needed reassurance that their son was making correct progress... "Every time they come round there's an expectancy that you are going to move on to something new and you see the progress... Without PAFT we would have left it all up to the nanny and probably would have always wondered if [our son] was doing okay." [● Little Miss Five was driving her mum to distraction with her constant questions. Finally mum could stand it no longer and asked her, "Why are you always asking so many questions?" The daughter replied, "Because I'm only five and I haven't been around long enough to know the answers."]

...First-time parents are to get more help in child rearing through a growth spurt planned for the Parents As First Teachers programme. The pet Government programme, launched as a pilot in 1992 to encourage better parenting, will this year put on weight from 6000 places to 9000. Auckland will get most of the new places, allowing up to 1000 new families to join the programme. The Ministry of Education, which funds the programme, expects to spend about \$9 million on the scheme this year through the massive expansion... Quarterly satisfaction surveys will also be done to ensure that public money is spent soundly... "Parental skills are not dependent on income or education. We are getting [new mothers], 40 to 45 years old, who have been incredibly successful business people, who are absolutely quaking in their shoes with a baby[.]" says the[... programme's national co-ordinator... "It's a really scary thing to walk into, and older mums haven't got the same energy levels as our teenage mums." Key parts of the programme include: ● Monthly visits by parent educators and developmental checks on the child. ● Monthly parent group meetings to discuss experiences and concerns. ● A link to health agencies for formal screening of overall development.

...Do you believe the ages of three to five are vital to a child's development? The [NZ] Government obviously doesn't... [–] it rammed through legislation that removed kindergartens from the State Sector Act. In effect, the Government has stepped back and washed its hands of its only real commitment to quality early childhood education. Kindergarten is where public education begins. Our kindergartens are the only early childhood institutions that are uniformly run by trained teachers. The legislation was introduced without warning... No one was consulted. The Government has just decided that dismantling the public education system is what's best for N[Z]... This latest development is the next step along the path our health system has already been down... The... Government's action is not simply hurting a small, underpaid group of teachers. Anything that damages the development of N[Z] children will be felt by every school in the country.

...Until two and a half years ago... the... Auckland... kindergarten association... had its teacher's contract negotiated for it by the State Services Commission and its teachers were treated like primary and secondary school teachers are today – that is, no differently whether they worked in Auckland or Ashburton. Auckland left when the talks broke down... We received delegated authority from the commission to negotiate our teacher's contract directly. As a result, last year when we faced a severe teacher shortage we were able to offer substantially better pay. The Auckland association gave its teachers pay parity with primary school teachers and had the best-paid kindergarten teachers in the country. We had to do this... We were short of more than 55 teachers whereas today we are about 18 short. We had to compete or face closing kindergartens though waiting lists were, and still are, at an all-time high. Auckland should be treated differently from the rest of the country. The teacher shortage was caused partly by the fact that, because of the Government subsidy on all preschool education facilities, our qualified and skilled teachers were in demand in the private sector. Because these other subsidised organisations charged fees, some of their patrons could claim an Income Support benefit and many teachers left for the better pay. Auckland is a very competitive labour market and let us not forget that living expenses in Auckland are far greater than elsewhere. Our teachers have also had to cope with a number of problems caused mainly by the Government's immigration policy. In the past two years more children, now 23[%], are arriving at kindergarten speaking little or no English. Less than half the children at kindergarten today are of Pakeha descent: 18[%] are Polynesian, 11[%] Asian and 10[%] Maori. Over 90[%] of Auckland kindergartens have eight or more nationalities. Just under 50 languages are represented... The real issue is that the Government does not want to be involved in kindergarten. This latest action is a chance to distance itself further and to ensure that kindergarten never becomes part of the compulsory education sector... If the Government is heading towards a system in which all children pay fees to get a preschool education, the biggest losers will be the children... Is an early education a child's right which should not be limited by ability to pay? If so, the Government must be urged to support kindergarten and build new sites so that the 6000 children in Auckland on waiting lists get the chance they deserve...

More state help for children with severe disabilities and "hardcore" behaviour problems has been cautiously welcomed by schools. Plans for specialist teams to work in classrooms with students with severe behaviour problems were announced yesterday by the Minister of Education... Where the specialists failed, students would be sent to special centres for short-term programmes geared towards children with behaviour problems. New programmes for students with speech or language difficulties and extra help for special needs children at preschools were also outlined. But... [kindergartens] in some low-income and rural areas may be forced to close as a result of [a] bill rushed through Parliament last week, says a senior researcher at the N[Z] Council of Educational Research. The bill, which infuriated kindergarten teachers, removed the State Services Commission from any role in negotiating employment contracts with kindergartens and was passed without public consultation... Critics say because negotiations will now be in the hands of more than 30 associations, the Government has divested itself of any responsibility over regional differences in quality which will result from the move... The bill was a retrograde step because a feature of the service kindergartens had offered was their ability to improve the educational opportunities of socio-economically disadvantaged children through quality education by quality teachers. This was ironic because it was the group the Government said it wanted to help.

...Parents trying to get their children into overcrowded nearby schools will have a better chance under new legislation introduced in Parliament this week... The Education Legislation Amendment Act is the most significant piece of education legislation since 1993... The bill also aims to make suspensions fairer and to give boards and principals more flexibility when disciplining students... Other areas addressed by the bill include... [affirming the ERO's] power to review home schools. Reviews of home schools, which catered for 5151 children in 1996, will begin next month... Students with special needs will get more funding next year but the IHC says... that while the organisation wanted vastly improved education for students with disabilities all the scheme would deliver was more teacher aide time and not the specialist teacher support called for.

...The theme of this year's Deaf Awareness week is fairness of educational access for all those who are deaf or hearing-impaired. There is no fairness at the moment, says... [the] chief executive officer of the National Foundation For the Deaf. N[Z] lacks the services and facilities widely available in countries with a similar standard of living. "The deaf and hearing-impaired are normally intelligent people who must be given the same opportunities as every other member of society." ...Being deaf really does set you apart, says... one of 8000 profoundly deaf N[Z]ers (410,000 are hearing-impaired). "I try my best to get involved in a range of interests and I see a lot of deaf mates at the weekend," [the]... 23-year-old art student... said. But after nearly four years at Auckland University's Elam School of Fine Arts, there is still no easy rapport with fellow students. [The 23-year-old] is the only deaf one among them... – ...[it] is one of only a handful of deaf people who go to tertiary studies[(d)eaf students need interpreters and note-takers to be able to take part in lectures and tutorials, and there are... only 20... available... in the Auckland region() –] ...and perhaps that makes them feel uncomfortable. "I have never gone out with them to cafes like other university students. We talk with pen and paper." [The student] got used to this as a child. "My hearing friends couldn't do sign language so they wrote to me, and it's stuck." The frustration with writing everything down is the time it takes. "I can say everything I want to and it is no problem to understand. But my thoughts go much faster than I can write. It's rather a disadvantage that I can't lip read that well... But the Elam staff are great people. They are used to communicating with more than speech, they understand there are other ways than speech to show what you are thinking." So does her family... With family and deaf friends [the student] uses a combination of Signed English, N[Z] Sign Language and other gestures to communicate.

...DEAF kids used to learn their language behind the bike sheds. For 100 years, N[Z] Sign Language was stigmatised and suppressed. Hearing people called it a variety of names: Deaf English, Pidgin English, Pantomime, even Monkey Talk. It was a second-class tongue, like Maori. Now the deaf have their own taonga, *A Dictionary of N[Z] Sign Language*. This elegant tome, with its 755 pages and 4000 signs, codifies and celebrates a unique indigenous language. It also represents a triumph of human communication over officialdom. The official policy in N[Z]'s deaf schools was to teach lip-reading and spoken English. Sign language, the natural means of communicating between deaf people... was deemed inferior. The parallel with Maori, says the dictionary's general editor... is clear. English was best both for the deaf and the tangata whenua. "This wasn't evil or bad, it was benevolent paternalism. It was thought that they would do better if they knew English. And so you get the... stories – and you'd have to say some of them were apocryphal – of children having their hands tied behind their backs at school so they couldn't sign. In the same way Maori children were supposedly strapped at school for speaking in Maori instead of English." ...Signing is at least as old as human speech; Plato writes about sign language in ancient Greece. But learning to speak is agonisingly difficult for the deaf, and lip-reading is wildly inefficient. "Lip-readers make a lot of mistakes – they confuse '15' and '50' because these words have the same lip movements... There's a... lot of potential ambiguity, and you have to sort of get by by guessing." Lip-reading depends on prediction... on being able to guess what is coming next... But if you don't know the language, you can't guess the word. "When you're born deaf, how can you possibly learn to lip-read a language...?" ...[N[Z]'s] policy was developed by Julius Vogel... who in 1880, as N[Z]'s agent-general in London, attended an international conference in Milan on deaf education. This state-of-the-art meeting of experts deemed that speech and lipreading were best, and Vogel was duly impressed... The hearing have always been ready to treat the deaf as "dumb"; for Vogel, the language of the deaf was only for the stupid. So N[Z]'s deaf schools, started in the 1880s, were committed to... [teaching] "deaf children... a language they could not hear, through a medium which created the maximum difficulty for them." The result was an educational disaster: Generations of deaf children who did poorly at school. It is only in the past 10-15 years that signing has taken its proper place in the education of the deaf... The deaf have borrowed the kohanga reo idea from Maori. In Wellington this year, the first Deaf Nest opened. Here, sign language rules. Parents often feel bad about their child's deafness... and may be reluctant to learn sign. "But even if the parents learn only a little bit, it makes a huge difference to the child. 'They're trying to... communicate with me and it's okay for me to sign.'"

...[an AUSn] academic has attacked N[Z] teachers' colleges for promoting left-wing courses and says children's education will suffer because of teachers' biases... "A very disturbing feature of teacher education in N[Z] is the extent of ideological capture by groups holding views which are almost certainly not shared by the majority of the population." ...The... research fellow at Flinders University in Adelaide... also draws attention to the problem of how complaints about courses – especially those in Maori... – are dealt with by lecturers.

...*Kohanga Reo* (language nests)... provide a fun, home-like environment for children under the age of five, where they are intensively exposed to the Maori language. Paid staff are a mix of elderly Maori speakers, usually grandparents, and younger teachers.

...['Some Kohanga Reo aren't doing their job, according to the ERO. It found more than a quarter aren't meeting the language standards. Some aren't teaching Maori at all.' Editor's note: *Maori* is an 'Eastern Polynesian sub-group of the Eastern Austronesian (Oceanic) languages, spoken in the Cook Islands and NZ. Since the Maori Language Act of 1987, it has been one of the two official languages of NZ. Estimates of the number of Maori speakers range from 100,000 to 150,000. As one of the marginal eastern Polynesian islands, NZ was one of the last of the Polynesian islands to be settled (about AD 800). Since that time the Maori language has developed independently of other Polynesian languages. European Christian missionaries developed Maori as a written language, and the first printed material in Maori was published in 1815. The language contains 5 vowels (each of which can be either short or long) and 10 consonants (h, k, m, n, ng, p, r, t, w, and wh). Reduplication is frequently used, generally as a modification of intensity. Prefixes and suffixes are relatively rare, and the plurality of nouns and verb tenses is usually indicated by the syntax of a statement.']

...WILL the Maori language[– which is currently spoken by '4.45% of the NZ population' –] survive? Even Latin, with its great history and literature, became a dead language after it lost its economic usefulness.

...According to the first Global Language Register... a 1600-page tome by [a]linguist... more than 10,000 languages are being spoken in the world today... Papua New Guinea is the nation with the greatest number of languages... it has 750... [The] study... put Nigeria second with 400... The Register includes all languages in the world this century. Some have died out and others, especially among Aborigines in A[US], now only have one speaker left.

...A [GROUP] WITH A DOZEN MEMBERS OF the native American Tlingit (pronounced klink-it) tribe... is gathered at the community center in Klawock, a town of some 800 people on the eastern fringe of Prince of Wales Island. In the Gulf of Alaska, some 40 km off the Alaskan coast, Prince of Wales Island still survives in a state of pristine natural beauty. But this idyllic stretch of land is home to at least one endangered species: the Tlingit language... [A] 33-year-old schoolteacher... and his fellow tribes[people] meet every other week in sessions like this to learn their native tongue before the last fluent tribal elder dies... Forty years ago, the entire tribe was fluent in the language, a guttural tongue that relies heavily on accompanying gesture for its meaning. Now it is spoken by only a handful of people throughout southern Alaska and portions of Canada, nearly all of whom are over the age of 60. Since Tlingit was not originally a written language, [the schoolteacher] and company are trying to record as much of it as possible by translating just about anything they can get their hands on into Tlingit, from Christmas carols like *Jingle Bells* to nursery rhymes such as *Hickory Dickory Dock*. The plight of Tlingit is a small page in the modern version of the Tower of Babel story – with the plot reversed. The Old Testament describes the first, mythical humans as "of one language and of one speech." They built a city on a plain with a tower whose peak reached into heaven. God, offended by their impudence in building something to rival [God's] own creation, punished them by scattering their single language into many tongues and scattered the speakers. Today... telecommunications technology and the Internet are providing people from Peru to Pennsylvania with access to identical information and entertainment, while consumers from Bangkok to Brussels go to the same shops to purchase the same products from the same multinational corporations. All are conversant in the universal language of popular culture and commercial advertising. Much of the world, it seems, is coming to resemble a... cozy little global village of common understanding. And there is hard evidence that the number of languages in the world is shrinking: of the roughly 6,500 languages now spoken, up to half are already endangered or on the brink of extinction. Linguists estimate that a language dies somewhere in the world every two weeks... Languages, like all living things, depend on their environment to survive. When they die out, it is for reasons analogous to those that cause the extinction of plant and animal species: they are consumed by predator tongues, deprived of their natural habitats or displaced by more successful competitors. In this type of linguistic natural selection, though, the survival of the fittest is not determined by intrinsic merits and adaptability alone; the economic might, military muscle and cultural prestige of the country in which a language is spoken play a decisive role. A language's star rises and falls with the fortunes of its speakers. As the only remaining superpower, the U[S] is now at the zenith of its economic and cultural hegemony. English therefore thrives as the world's *lingua franca* while minority languages – like Tlingit – succumb... But the death of a language such as Tlingit means more than simply the loss of another obscure, incomprehensible tongue. It marks the loss of an entire culture. "Just as the extinction of any animal species diminishes our world, so does the extinction of any language," argues... an expert on endangered languages at the University of Alaska at Fairbanks... [The expert] says that "Unless we wake up to the problem, we stand to lose up to 95% of our languages in the coming century." ...The European empire-building expeditions of the 16th and 17th centuries heralded the beginning of the end for thousands of languages in North and South America. As the continents were colonized by the European powers and their original inhabitants marginalized, indigenous languages vanished along with their native speakers. In Brazil, for example, an estimated 75% of all the languages once spoken in the country have perished since the arrival of the Portuguese in 1500. Of the 180 native tongues that remain, only one is spoken by more than 10,000 people, out of a population of 160 million... Among the Krenak in southeastern Brazil, only a handful of elders among the 70 or so tribes[people] still speak their mother tongue. Originally a tribe of hunter-gatherers, the Krenak were expelled from their land and herded into reserves by government agents intent on making more space for farming. Up until the 1950s, Catholic missionaries forbade them to perform rituals or speak their own language... But languages can be remarkably resilient. When empires crumble, suppressed tongues have a way of sprouting up again through the cracks. The dissolution of the Soviet Union in 1991 provided the Krenak with an unexpected opportunity to mend some of the broken links in their oral tradition... In 1993, during the period of *glasnost*[, a]... Hungarian linguist... stumbled across the manuscripts of... a Russian anthropologist who trekked across Brazil at the turn of the century, in the archives of the Ethnography Institute of the Russian Academy of Sciences in St. Petersburg. During his travels, [the anthropologist] recorded traditional Krenak narratives, rituals and songs in both Russian and the native Krenak, thereby preserving a trove of words, expressions and stories the Krenak believed were gone for good. By translating from Russian into Portuguese, and then cross-checking with... [the anthropologist's Krenak, a Krenak] tribal member and head of the Nucleus of Indian Culture, a Sao Paulo-based organization that promotes Brazil's cultural diversity... is working to recover more of the tribe's lost language and return it to his people. "Discovering these words, stories [and] songs is to recover the path of... our dream." ...In... the 1950s... the... Soviet Union... program of "Russification" for indigenous populations scattered along the southern, northern and Pacific borders... inculcate[d] native children with Russian culture[via] boarding schools, or *internats*... where children as young as two years old lived in a completely Russian environment for nine months of the year. *Internat* students routinely lost interest – and proficiency – in their native tongues. This policy of linguistic and cultural repression created a generation estranged from its own language and traditional way of life. One branch of the Nenets tribe, a group of some 20,000 reindeer herders living in the Yamal-Nenets Autonomous Region in the Arctic Circle, has been luckier than most. Although they were subjected to the *internat* regime and lost their pasture lands on the Novaya Zemlya to the Soviet nuclear testing program in the 1950s, they were spared the first Siberian oil and gas boom in[the] 1970s, which ravaged the lands and traditions of neighboring tribes. In the treeless expanse beyond the wooden barracks of Salekhard, a town founded by Russian fur traders 400 years ago, the Nentsi lifestyle hasn't changed much for hundreds of years... But with the discovery in the late 1980s of huge natural gas beds on the Yamal Peninsula, the Nentsi way is threatened. Foreign companies are lining

up to exploit the fabulous wealth lying below what has come to be known as the “Nentsi Emirates.” ...even if ecological destruction is averted, many Nentsi might be tempted to trade their traditional lifestyles and language for jobs with the gas companies. Why should young Nentsi bother with their mother tongue when their futures will depend on being able to speak Russian? ...When white settlers first arrived in A[US] in 1788, the continent supported some 250 Aboriginal tongues. Today, only 20 are considered still viable[(‘the 2000-strong Martu people – that Western AUS’s Government has agreed to hand back a slice of desert more than four times the size of Belgium 50 years after they were driven out; the 136,000sq kms of mainly arid sand dunes and scrubland is the biggest piece of land to be returned to Aborigines – speak up to 12 distinct languages within their small group, which follows a traditional lifestyle, hunting kangaroos and bush turkeys’). AUS]n Aborigines endured a policy of cultural and linguistic assimilation similar to that of the Nentsi... To make sure Aboriginal children are not deprived of their linguistic heritage... a language coordinator at the bilingual Yaporinya school in Alice Springs... helps organize a program through which students... spend two days a week on cultural excursions into the surrounding area with local tribal elders. Aboriginal languages are distinctive for the rich vocabularies they use to describe the natural world... But the value of Aboriginal languages does not lie in their poetic beauty alone... Botanists are discovering new species of flora by researching the different Aboriginal names given to seemingly identical plants. The study of these languages can also shed new light on the migrations of early populations and the origins of cultural innovations... For much of this century in N[Z], the decline in fluent Maori speakers was drastic and seemingly irreversible. From an estimated 64,000 in the early 1970s, the number fell to around 10,000 in 1995. There was almost no language transmission from Maori parents to their children during the 1960s and 1970s. But since the first [Kohanga Reo]... were established in 1982, this downward spiral has been halted... There are now over 800 language nests across the country, which have introduced more than 100,000 Maori children to their native tongue. Maori was made an official language of N[Z], alongside English, in 1987... Today, almost 60% of all [NZ] schoolchildren – Maori and non-Maori alike – study the language to some extent. But an even surer sign of Maori’s renewed vigor is the fact that N[Z] English is dotted with Maori words and expressions. The most common, *kia ora*, an all-purpose salutation, is generally used instead of “hello” both in general conversation and when answering the telephone... “The more Maori is used to pepper N[Z] speech, the more it becomes a unique language to... [NZ,” says the] head of the Maori Language Commission... In the coming struggle for linguistic survival, native peoples like the Maori may yet have the last word... THE WORLD’S... TOP TEN LANGUAGES... [ARE (IN MILLIONS):] 1. Mandarin Chinese 726 2. English 427 3. Spanish 266 4. Hindi 182 5. Arabic 181 6. Portuguese 165 7. Bengali 162 8. Russian 158 9. Japanese 124 10. German 121... [HOWEVER,] BY THE YEAR 2000, AN ESTIMATED ONE-AND-A-HALF-BILLION PEOPLE – A quarter of the world’s population – will speak English... [as] their first... second or third language... English is increasingly becoming entrenched as the language of choice for business, science and popular culture... In 1898, when Otto von Bismarck was asked what in his opinion was the most decisive event in modern history, the German states[perso]n replied: “The fact that the North Americans speak English.” ...But why is English rising so far above the babble of the world’s other tongues? There are no clear linguistic reasons for English’s global dominance. The grammar is complicated, the pronunciation eccentric, and the spelling peculiar, to say the least. But, as... [the] author of the *Cambridge Encyclopedia of the English Language* and the just released *English as a global language*... points out, logic does not necessarily apply when building a lingua franca... “Wave dollar bills in front of someone... and they will learn complicated spellings and grammar.” Another key factor is flexibility... “English is a kind of vacuum cleaner of language – it sucks in vocabulary from any language it can get.” [The author] estimates that there are now words from more than 150 other languages incorporated into standard English. Spelling and pronunciation are so capricious – and so frustrating for non-native speakers – precisely because the language has been quick to take on these foreign influences... But English may yet be suckered by its own success. As the language spreads among non-native speakers, it... could fragment into mutually unintelligible spoken forms, the way Latin fragmented into French, Spanish and other languages some 1,500 years ago.

...An A[US]n university is heading back to the books after setting too easy an English exam... The University of N[SW] Educational Testing Centre yesterday admitted that the exam... was too easy for the 9 and 10-year-olds who took it. A... spokes[perso]n said the centre had also sent out a “badly worded letter” telling pupils that they were the top of the class, but failing to mention that hundreds of other children also got top marks... About 70 N[Z]... and 100 N[SW] children scored 100[%]... Almost half a million pupils in N[Z, AUS] and the Asia-Pacific region took the test.

...Hong Kong’s new Chinese administration is pushing the territory’s schools to teach Cantonese[. But] parents are still so convinced their children should learn in English – the language of their former rulers – that 100 schools have had to be exempted from a new Chinese language teaching policy. Soon after Hong Kong was handed back to China... the new administration announced a policy aimed at seeing all local schools teach their students in Cantonese, the first language of more than 95[%] of people. But parents... swamped the few schools determined to continue teaching in English with applications for places. Although the education policy is threatening fines, loss of subsidies and other sanctions against schools defying the change in language of instruction, 124 schools applied to continue teaching in English. However, 24 of those schools were refused permission. They were told their students “did not have the ability to learn effectively in English” and would thus have to switch to studying all subjects in Cantonese. This was probably a sensible move. At many schools students struggle so much to understand complex subjects being explained in English that their teachers, who may also have poor English skills, resort to a varying mix of English and Cantonese. But parents and teachers see the rejection of those schools as a move toward an elitist system where the top schools teach in English while poorer quality schools are forced to teach in Cantonese, making parents and teachers devalue their own language.

...Quebec’s so-called language police usually keep busy fighting the spread of English in the French-speaking province, but a new target has been added: Chinese signs on businesses in Montreal’s Chinatown. Letters have been sent to Chinatown merchants and restaurant owners alleging that many signs violate a provincial law requiring that French be the dominant language on outdoor commercial signs. Earlier this month, language inspectors issued a warning to a Jewish gravestone maker because five Hebrew characters on his business sign were too big. The warning was withdrawn after news accounts portrayed the inspectors as overzealous.

...IN LAOS they held a French spelling competition. In Minsk they showed French films. In Moldova they hosted a tribute to... [a French] writer and states[perso]n, and in Belgrade there was a week of French plays. From Phnom Penh to Dar es Salaam, France went on a cultural offensive last week designed to bolster its standing around the world. Behind the celebration of the language is anxiety in Paris that even in the Francophone world where the tricolore was once revered, French values are under threat. It is a source of horror to French officials that in some former colonies French is no longer spoken. What has caused such a sad decline of Frenchness in France’s equivalent of the British Commonwealth? According to the most extreme exponents of French cultural superiority, there is only one target for blame: America. And a passionate desire to thwart the spread of American values is pushing the French to ever greater international efforts. “What have they brought the world apart from B-movies, Coca-Cola and those dreadful clothes?” asks... a French aristocrat and former civil servant who... wears a bow tie and... wholeheartedly embraces campaigns such as the *semaine de Francophonie* as an opportunity to take on America... [The aristocrat] is the founder of the Centre for European Study and Action, a Francophone lobby group famed for floating the idea that the U[N] should move from New York to Paris, the “centre of the world”. [The aristocrat] speaks nine languages, including Danish and Russian, but not English – “It’s too difficult,” [the aristocrat] claims. A more likely explanation is his hatred for America. Arguing that French should be the single official language of the E[U], the aristocrat rejects English on the grounds that “we cannot build Europe around the language of America.” [The aristocrat] sees America not as an ally but as a competitor... The French see language as the tool for defending their interests and like to quote[a former French] President... on the subject: “It is through our language that we exist in the world other than just as another country.” The amount being spent by the foreign ministry on teachers, educational

aids, textbooks and student grants around the world proves the point, surpassing the total sums spent by many western countries on development aid. However, the enormous expenditure on the 49 countries that make up the Francophone community, most of them former colonies in Africa and the South Pacific, does not make them immune from America's cultural encroachment. France may be looking for strength in numbers... [-] the minister for overseas territories, proudly announced this month that Albania had applied to join the Francophone club. There were sniggers. Albania's problems make it desperate to be a member of any international club prepared to accept it. Albania's application will be voted on at the Francophone summit in Hanoi in November. Armenia is also considering joining. The only country to be refused membership was Israel, which has one million French speakers. Its application was vetoed by Lebanon. There was great excitement recently at the foreign ministry when Nigeria announced it would make French a compulsory subject in schools on the grounds that so many of its neighbours and trading partners are former French-speaking colonies. Another reason may have been an attempt to get back at the Americans and the British who have complained about the country's human rights record. One blot on the Francophone landscape is Belgium, where there have been growing calls for a boycott of French produce following the closure of a Renault factory with the loss of 3000 jobs. The dispute cast doubt over events that had been planned there for last week's celebrations, including... fake telephone booths in which people can listen to recordings of French jokes. Another serious concern for France is the insidious invasion of the English language through the Internet. The overseas territories department recently hired 10 staff to develop French Web sites and newsletters. Young French-speaking people all over the world were asked to take part in an Internet quiz featuring questions about the Francophone world. The lucky winner will get a free trip to one of the furthest parts of the French empire, Guyana – a little corner of the Latin American rainforest that will be for ever France.

...“OH, my goodness, look at that SPOON! It's such a big blue SPOON! It's almost as big as you are!” the mother says to her baby, holding up the spoon. This kind of baby talk... is not merely a cute way to address an infant. When a mother speaks like this, [the mother is]... using speech that gives her baby the building blocks of language. And this kind of talk is used by parents in the U[S], Russia... and possibly the world over. That's the conclusion of a study headed by... a University of Washington speech researcher who has spent 30 years examining how we learn to talk. The study expands knowledge of how we acquire language: in particular, the importance of “parentese,” the exaggerated, sing-song language used to talk to babies... The mothers stretch... out the vowel sounds, which [the researcher] described as “hyperarticulated.” With the vowels more clearly enunciated, it was simpler for the babies to understand speech. The parents did not use exaggerated vowel sounds in ordinary adult conversation. Infants are so attuned to this type of speech that by 20 weeks of age they produce their own versions of the three vowel... sounds: the “ee” sound in bead, the “ah” sound in part and the “uu” in boot. Those vowel sounds are found in all languages... The infants figure out how to articulate vowel sounds because parentese provides them with many instances of the same vowel... A baby's vocal tract is only about one-quarter the size of an adult's and lacks the same frequency range... To reproduce the sounds that parents make, an infant must experiment with his or her voice and find ways to transform adult sounds to frequencies a child can use. How do we learn to speak parentese? [The researcher] believes it evolved along with human communication, and is instinctive... [A] professor of brain and cognitive studies at the University of Rochester, New York, said [the] study is especially interesting because it shows that parentese is apparently a universal language. Just how important it is at teaching an infant his family's language is still unknown... because “no one has done a study to determine whether this actually makes a difference.” It would also be next to impossible to design a study that would show whether we learn to speak parentese from others or whether it has instinctive, biological roots, [the professor added. Incidentally, since]... adopting their controversial Ebonics policy last month, Oakland school officials have been blasted on radio talk shows, grilled by reporters across the country, and shocked to hear some of the most respected black leaders in the country label their decision “a travesty” and “a cruel joke.” But there is an up side to the furore over the district's acknowledgment of black English: it has focused nationwide attention on the failure of the [US] school system to meet the needs of thousands of African-American children – and has fuelled debate over how to improve the students' performance... The disheartening statistics in Oakland – most black students are in special education classes, have been held back a year and have been truants or suspended – are mirrored in inner-city schools across the nation. A report by the Department of Education found 17-year-old black students had the reading level of 13-year-old whites. The average scores for blacks in 1993 were far lower than those of whites in verbal skills and even worse in mathematics... The study concluded that minority students were more likely to attend impoverished and segregated schools, learn from ill-prepared teachers and take less challenging courses... [The] outgoing president of the African-American Parent Coalition at Silver Creek High School... conducted a study of the East Side Union High School District in San Jose and found that of all the grades handed out to African-American students in the 1995-96 school year in the core subjects of English, maths, science, foreign language and social studies, 49[%] were Ds and Fs. Only 8[%] got an A grade and 17[%] got a B. Latinos fared only slightly better, with 48[%] Ds and Fs and 28[%] As and Bs. By contrast, 42[%] of the grades received by whites were As and Bs, with 32[%] Ds and Fs. But the biggest gap was with Asian students. [60%] of the grades they received were As and Bs... “Something is going on culturally and academically within the Asian community that is not going on in the Caucasian, African-American and Hispanic community,”... an educational consultant who works with the [coalition]... said. “Those kids who are succeeding know the game and probably have a lot more parent involvement.” ...Although some black leaders fear the Ebonics policy will lower standards and allow the teaching of street slang, Oakland district officials want to train teachers in the unique language patterns of black students so they can use that language – without denigrating students – to help students learn standard English.

...Some momma... writes me and ax why I don't write no column in Ebonics. I tells the hoe that be wack because I Don't know how to talk Ebonics. I talks Honkyonics. But I wisht I do know Ebonics because I likes hearin' it. It be cool. And it saves words. Like if you see a car. And it be a car that belong to Joseph. Most honky peeps say: Look, there is Joseph's car. Or there is a car that belongs to Joseph... But in Ebonics, you... says: “Dat Joseph car.” Or “Dat Joseph wheels.” See? You digz? So what be so bad talkin' so you saves words. A word save be a word earn. Now these teachers who be in Oakland and Los Angeles, they no fools. They wanna ax the gov'ment for bread so's they can learn how to talk Ebonics. Then when they learns to talk Ebonics, they gonna teach the bro from the hood to talk like the anchor dudes on the TV. Then the bro from the hood get job. But everybody gets mad. They says it be bad. White folks, black folks, they say Ebonics ain't no fit language. What they know? They don't know squat, that what they don't know. Even... [a famed black preacher (r:p1106, lns15 & 26 + p1413, ln66)] say it just gutter talk... Then some teaching mommas in Oakland, they talk sense to [him]. They tells him, “Preacher, we knows you a leader. But you dissin' us. And what you sayin' is just wack.” And [the preacher] think on all that bread and... say, Yo, maybe these Oakland mommas know sump'n. So all the peeps who been dissin' Ebonics gotsta chill. If they smart, they ax the government for some bread to have their own onics. You go some hoods in ChiTown and you hears the homies there talking in Polonics. That be the way some Polish honkies talk... And down South, the rednecks gots their onics. Everywhere you goes, peeps talkin' in some kind of onics. Now, if'n all the peeps doin' the moanin' weren't ignorant, dey'd know that lotsa great stuff been writ in Ebonics. Like Shakespeare. When that Hamlet dude... say: To be or not to be? That be the question. It be Ebonics. And lotsa peeps pay good bread to hear some English dude talk it. So if Hamlet can talk Ebonics, why's the squawk about Oakland? I knows why. Cuz peeps are all bored... with Croatia and Serbia. Peeps are all bored with the regular news. But Ebonics give em' somethin' talk about, even if they don't know nothin' 'bout what they talkin' 'bout... Don't make no sense to me. Can't nobody learn nothin' 'cept they understands what each other's sayin'. Yo, dat's dope.

...The bitter debate over whether Ebonics... is a language that should be used to teach urban black children has reached the Senate. Members of the Oakland... school system testified in defence of the decision... to embrace Ebonics... which one senator at an appropriations subcommittee hearing called an example of political correctness run amok... [The North Carolina senator] said Ebonics was just one more foolish plan by educators

who should know better... A resolution has been introduced in the House of Representatives to deny federal funds for Ebonics programmes, which... are also offered in several other school districts... [A] Pennsylvania Republican who chairs the sub-committee... recalled... [growing] up in a Yiddish-speaking home, adding "and I have been trying to lose my Kansas accent all my life." Some linguists trace the speech patterns of inner city blacks to languages spoken in West Africa, others to English and Irish dialects and others to Caribbean or Creole dialects. Linguists also differ on whether these patterns are a distinct language or merely a dialect.

...If you're the sort of person who might say "between you and I," look out. [A US] newspaper columnist... is spearheading a campaign to help stop "personal-pronoun abuse," which may not be as serious a problem as, say, drug abuse, but which has ramifications nevertheless. "The situation has gotten out of hand," [the columnist] writes on her Web page Stamp Out Bad Grammar. "If we don't stop it now, this travesty will become part of the standard language." If [the columnist] and her fellow grammar cops seem a little touchy these days, they've got good reason. People are out to get them – or at least ignore them. "Most of the grammar rules are already dead or dying," says... a professor of English and linguistics at the University of Chicago. Students' language skills in general seem to be on the downswing... "I used to say that every year, but I never really meant it until the last few years." ...[the] executive director of a chapter of the American Modern Language Association, predicts the demise of the apostrophe within 50 years. Today's students... can not get the rules straight. "It's incomprehensible to them where and when to use them," [the executive] says. Traditionalists will wring their hands but if standard English mutates beyond recognition in the new millennium, not everyone will mourn it. "A lot of rules governing good standard English are just folklore," says [the professor]. Many of today's grammatical conventions are relatively recent inventions, anyway. Shakespeare's name, for instance, used to be spelled a variety of ways with little fuss. After all, language is not like physics – there are no incontrovertible natural laws that govern it... Complaints about the erosion of grammar are "really tiresome,"... says... a retired UCLA English professor... Even so, [the retired professor] cannot suppress wonder at the fact that... students manage to "use 'like' between every third word." ...It is hard to accept, perhaps, but someday such verbal tics may enter even the written language. In years to come, the two strongest forces for change in English – as in just about everything else – will be globalization and technology. Around the world, English is already the Windows of languages – you need to have it because everybody else does. And as English continues to spread, it will inevitably develop new wrinkles. Already, says [a] University of Georgia professor emeritus... 90[%] of the words in an unabridged dictionary are "loans" from other tongues. As Emerson put it, "The English language is the sea which receives tributaries from every region under heaven." The Internet... is not only increasing the flow of those tributaries; it is also a driving force behind the colloquialism that purists detest. E-mail begs for a less formal style than traditional written communication and is blurring the distinction between writing and speech... [C]onsider what might happen over the next decade or so, as computers become more adept at transcribing speech. Suppose we dictate everything? "The English community is totally unprepared for this," says... a Georgia Tech professor who studies the role of technology in language change. "This will make it much more difficult to teach writing." And perhaps impossible to police it.

...this entire column is really just a note to [my son's] English teacher to say: please excuse [my son for being] unprepared... I BELIEVE that we must encourage our children to become educated, so they can get into a good college that we cannot afford. I try to help my son... with his schooling, but over the years this has become more difficult. Back when [my son] was dealing with basic educational issues such as... what a duck says, I always knew the correct answers... But when [my son] got into the higher grades, [his class] started dealing with complex concepts such as the "hypotenuse," which had yet to be invented when I was a student. So these days I'm useless as an educational resource, except on those rare occasions when [my son] is studying a topic I'm familiar with. For example, last year, in history class, [my son] studied The Sixties. That's right: The Sixties are now considered a historical period, just like the Roman Empire, except that as far as modern kids are concerned, The Sixties featured stupider haircuts... "What did you do during The Sixties?" [my son] asked. "None of your business," I informed him. Other than that, my main contribution to his education is to provide encouragement. For example, the other day I asked him if [his class had been given] any homework, and [my son told me they] had to read *Beowulf*. "Yuck!" I said, encouragingly. I was exposed to *Beowulf* when I was a student. If my memory serves me correctly (and I believe it does, because I am copying this directly from the encyclopedia), *Beowulf* is an Old English epic poem concerning a hero who freed the court of the Danish king Hrothgar from the ravages of the ogre Grendel and Grendel's mother and thus became king of the Geats. This raises some questions, including: who are "the Geats?" ...Nevertheless, I stressed to [my son that my son] should make his homework his absolute highest priority, allowing nothing to come ahead of it, but that first we would go out for Italian food. I like to do this with [my son because my son] always orders pizza. I am not allowed to eat this because it contains cholesterol, but it is a scientific fact that your body will not absorb cholesterol if you take it from another person's plate. [My son] drove us to the restaurant. I like to let him drive because it improves my circulation by causing my heart to beat 175,000 times a minute, although this particular trip was fairly relaxing right up until [my son] made the rookie error of actually stopping at a red light, rather than accelerating through it as is customary in Miami, the result being that we were rammed by the car behind us. The other driver, as required by local law, was uninsured and spoke no English. This gave us an educational opportunity to brush up on our Spanish by engaging in a dialogue with the other driver, which went like this: US (pointing to the light): Rojo! (Red!?) OTHER DRIVER: No! Amarillo! (No! Yellow!?) US: Like heck-o! ("We disagree!") OTHER DRIVER: Que son? Guitos? ("What are you? Geats?") It took two hours and two police officers to sort it out, with the outcome being that the other driver was given a ticket-o. Fortunately, my car sustained only superficial damage... [However, b]ecause of this delay, we were late getting back from the restaurant, but [my son] would have had time to do his homework, except that – this is true – the police had set up roadblocks around our neighbourhood and were not letting anybody in. An officer told us there had been several reports of shots fired, and police were going house-to-house with dogs... [My son] took it well. I think [my son] was hoping that one of the dogs would eat his copy of *Beowulf*. The police never found the source of the shots... But we had to wait at the roadblock for over an hour, which meant that [my son] did not start reading *Beowulf* until after midnight.

...IT'S never too early to start reading to your children. Even babies, who may not understand the stories, love the sound of your voice as you show them bright pictures. They will gain a love of books if they're read to from their earliest days. There are some beautiful collections out... that will bring youngsters pleasure for years to come. They are of such quality they could become family heirlooms for future generations.

...A new study finds that 20[% of NZ] school pupils have reading problems... [but] a visiting educator... claims to have part of the answer... Sandwiches are common fare for schoolchildren, but with glue in them? [A v]isiting education psychologist... uses the recipe as a successful method for teaching reading and spelling. [The psychologist] presented the programme, called Wordwork, to a School of Educational Psychological Studies seminar last month as part of his programme as a University of Auckland Foundation Visitor. The glue sandwich is part of what [the psychologist] calls the brand-new, high-tech terminology of reading... The method has three components. The first is a set of tools for helping children understand that words are sandwiches made up of consonant/vowel/consonant. What [the psychologist] calls "articulatory instructions" enable them to analyse how they produce consonant sounds, and they spend 15 to 20 minutes three or four times a week practising and exploring tongue and lip positions. A bonus is that the exercises enable children from linguistically impoverished backgrounds to learn to articulate sounds and pronounce words correctly. "Numerous studies have shown that students are more likely to become competent spellers if they have an awareness of speech sounds,"... Research also shows that students learn consonants with little difficulty; the vowels are the challenge, but they become more comprehensible when their function as glue letters are explained. There's nothing fundamentally new in all this. Generations learned to read using similar phonics-based methods. The difference is in the presentation and in the move away from rote-learning... In the second stage of the programme... children each become a letter, with cards around their necks showing the letter they represent[, and]... simple words are built as the

children stand next to each other. In the third part, children gradually learn a list of about 150 frequently used, irregularly spelled words, called “handy words,” such as “done,” “come.” Later they learn to recognise idiosyncratic groups of spellings, such as words ending in “ight.” [The psychologist] has been researching reading for more than 30 years and is Professor of Education and Psychology at Stanford University. [It describes NZ]’s... reading methods... particularly the “whole language” method, as having a “particular influence” in California. [The] approach gave children a rich involvement with literature which replaced reading materials that until then were typically dull and sterile. One of its drawbacks was that it left some children unable to spell. What they wrote was not only not conventional spelling... it was also unreadable. His research led him to develop Wordwork, which takes... the most useful aspects of whole language learning and combines them with phonetic learning.

...Few educational issues generate as much heat as children’s reading. This is entirely understandable because... language skills, and particularly reading skills, are basic to all learning. Unfortunately the heat generates much smoke, and flames are notoriously indiscriminate about what they singe. Journalists and editors show a singular mathematical ignorance in their headlining of statistics about the proportion of students “below the norm.” Surely it is obvious that wherever you establish norms you do it by dividing results into groups and ranking those groups from highest to lowest. You can’t have a norm-referenced system without, by definition, having some students below and some above a notional midpoint. The Ministry of Education affirms the high levels of reading ability in N[Z], against international standards, and it is right. But I am one who believes that our standards are not high enough and that we are capable of ensuring that all our children are capable readers, not just a proportion... Some of those deemed “below average” for their age are in fact only “below the average for their age in English” and have substantial skills in their first language... These students... [could] be superior bilingual academics in due course. However... the... majority of these students are not functionally literate when they enter secondary school – [and] many are certainly not sufficiently literate in English to cope with the curricular demands and texts needed for successful secondary and tertiary education. There is a great deal of knowledge now available on how to extend the English skills of such students, but most of the teachers working with the[m]... were trained before the knowledge was widely available... All good teacher education programmes emphasise the need for using a wide range of methods, including the sounds and structures of words as well as shape and context clues, in helping children to learn reading. And all would benefit from a systematic involvement of family in supporting children’s reading development... at every step... But what is really needed is a systematic programme of research to establish the actual language skills (in English and their other languages) of our students at each age level... Moreover, there must be a coordinated and sustained professional development programme for all teachers in multilingual settings, using the best of international knowledge as well as our considerable local expertise.

...[last week the ERO] criticised the teaching of reading in primary schools... While we need to address the problem of literacy in schools we have to recognise that schools are not the only place where solutions are required. Many businesses in N[Z] have serious difficulties as a result of low literacy and poor English language among their workforce – people who have been educated in N[Z] as well as migrant workers... While some larger companies may be able to provide literacy and language training, many small and medium-sized companies find it a complex and costly task with little assistance... Partnerships of the Government and business, education and employment are required... [□ T]he Ministry of Education is... participating in an international study which will produce the first national data about the literacy skill levels of the [NZ] adult population.

...In the mid-1970s when... the now-defunct National Coalition of Adult Education calculated that between 50,000 and 100,000 [NZ] adults had reading ages of less than 9.5 years, [their] estimates were publicly and privately scorned. Now we learn that, in the words of a research report on adult literacy just released by the Ministry of Education, “over a million adults are below the minimum level of competence in each of the three domains (prose, document and quantitative literacy tasks) required to meet the demands of everyday life. Within this group, 20[% of NZ]’s adult population was found to have poor literacy skills.” Even those figures are probably well on the conservative side, given the 75[%] response. Refusals usually include a disproportionately higher number of literacy difficulties. The report’s findings are important because they confirm what adult literacy practitioners have long known: the issue is real and extensive. People in the field have long been hamstrung by a lack of hard-nosed data on the nature and number of adults who experience literacy difficulties in their everyday lives. Unlike their colleagues across the Tasman and in most other western countries, N[Z] specialists in adult literacy have had to rely on hearsay and a few small-scale studies (on untypical populations such as prisoners and the unemployed) to try to convince successive ministers of education of the issue. The lack of policy and low levels of funding are testimony to how ineffective that has been... So what are the implications of the study? While we still await the full report, due in the middle of next year, it will be useful to encourage a full public debate, especially one that can avoid slipping into a school-bashing and school-defending exercise. In the interim, there are a number of obvious implications from the report. First, while the question of how literacy is tackled in schools is undoubtedly important, the adults who have these difficulties have already left school. They are parents, workers, citizens. The solution(s) therefore lie in... adult education. While there is some contribution from the Government, employers and the community (especially in thousands of voluntary hours given to running literacy programmes), their efforts do not make even a modest dent in the problem. At best, there are probably about 20,000 to 25,000 adults in literacy programmes provided by community providers, employers and training schemes. So the gap between the need and the provision is vast. Adult literacy merits explicit recognition on the educational map, where it has been woefully absent to date. Secondly, a wide range of groups need to scrutinise the report for its implications for the groups they represent. People working with the elderly, for example, should be concerned about that group’s very low levels of performance in document literacy tasks and work for more user-friendly documentation and awareness of the issue among those issuing forms.

...Imagine going into a panic every time you have to write, every time you try to read something. Routine trips to the bank or the doctor become a nightmare; filling out a job application, sitting a driver’s licence[, reading]... a bus timetable... the price tag on a piece of clothing... or writing a letter, impossible. Yet this is reality for thousands of adult N[Z]ers – and these are English speakers, not migrants struggling with a foreign language. “If someone says, ‘here, read this form,’ it’s a panic situation,” says [a 29-year-old... “And as soon as I panic I can’t do anything.” [The 29-year-old] has struggled with – and hidden – problems with literacy since primary school. “You work so hard to cover up. I’ve had a complex since I was 10 and a teacher really had a go at me about the way I had written something down; and once you’ve got a complex you’ve got a problem.” At high school [the illiterate] just sat quietly at the back of the class. “As long as you weren’t disruptive you got away with not doing the work.” [The illiterate] sat English, maths and clothing for... [SC.] passed only clothing, left school, and worked as a seamstress. Her brother “flew through school,” but her father, who built up a highly successful business, “couldn’t even fill out his own chequebook... Mum became the company secretary.” Now a mother herself, and into the second year of a part-time pattern-making course at AIT, [the 29-year-old] wants to improve her literacy skills. Writing and spelling are especially difficult... [but the 29-year-old] wants to do other courses... “And I want to be able to help... [my son, who] will be two in February... I don’t want always to have to say, ‘Wait until daddy gets home’.” [The 29-year-old thought about doing] a programme through a high-school. “But there was nothing there for me – only classes teaching foreigners. Then one school told me about this course at WEA.” It is three weeks since [the 29-year-old] went to her first night class with the Waitakere WEA Adult Literacy Centre. “It’s great. All of a sudden you don’t feel alone. You don’t need to feel embarrassed or ashamed. There are people high up in business, people with average jobs and people with no jobs and we are all in the same situation.” ...The Waitakere WEA adult literacy classes, like many of those run throughout the country, come under the umbrella of ARLA, the Adult Reading and Learning Assistance Federation. ARLA’s 2000 voluntary tutors work with more than 6500 adults. “This is a major issue which the country as a whole needs to wake up to,” says [a spokesperson for] ARLA.

...The International Adult Literacy Survey results released this week show that more than a million... [NZers] have insufficient English skills... While this figure included people for whom English was a foreign language, English was the first language of most respondents... Only about half of the adult population made level three – regarded internationally as the minimum required for individuals to meet the complex demands of everyday life and work... only 20[%] demonstrated a high level of literacy, with another 20[%] lacking basic skills... However, N[Z] is not too far out of step with countries like A[US, the US] and Britain. We are better than most at reading prose, but fall behind when it comes to deciphering a document... Contrary to popular opinion, our literacy standards are not slipping, the report says. Those under 50 performed better than those over 50... Yet... learning... to read is as easy as learning to speak... And a baby, of course... will both learn to speak and read at the same time... English has more words than any other language – about 550,000. Fortunately, as with most languages, only around 2000 make up 90% of most speech. And amazingly only around 400 make up most written books... About half the words in English are phonetic – you spell them roughly as they sound... Only about 70 sounds make up all the languages in the world. Every baby babbles in all those sounds – that's where language comes from. But English uses only 44 of them. If a baby hears only those 44 sounds, [it] will quickly learn to speak English, but has great difficulty later in learning a new language... So try to expose your infant to as many foreign languages as possible...

ALMOST everyone can learn almost anything... I've videotaped children around the world who can speak three languages, read fluently, write well, do basic mathematics and develop perfect music pitch – well before starting school at five or six. And I've taped... primary school children up to five years behind in their reading who have caught up in only 10 weeks; others at secondary school who have compressed a three-year French course into eight weeks. But now, major breakthroughs in two fields should make these achievements commonplace. • We now know how to store most of the world's knowledge and make it available instantly to almost anyone anywhere. • ...we also know much more about how the human brain works. And that shows we are using only a small part of our potential ability to learn... This dual revolution has the potential to turn most schooling upside down and inside out.

...Ingenuity has always been an asset to teachers; in many schools it has now become a necessity... [While] primary and intermediate schools' spending... rose from \$25.53 per pupil in 1989 to \$28.71 in 1995 – an increase of 12[% – s]pending by secondary schools on books has declined significantly since the introduction of Tomorrow's Schools... [I]n 1989 the total average spending per pupil on library books and for books used in the classroom was \$59... by 1995 it had declined to \$43.20 – a 27[% decrease. Even]... secondary schools in more affluent areas can't always afford to update textbooks... The state of flux of the... curriculum, and uncertainties as to how the qualifications framework will be worked out, have also contributed to schools' reluctance to invest large sums in books which may quickly become inappropriate... Even foreign language departments – an area less subject to change than others – no longer buy the large textbooks which used to form the basis of teaching.

...a leading children's publisher says... the Government ha[s] whipped the funding away from information technology programmes for primary schools, and without that, only the rich schools could prepare their pupils for high-tech... jobs. "Our politicians go on about wanting a skilled workforce, but if you don't actually... create the skills you're not going to have a skilled workforce. And there's no use starting when these kids are in high school. If you wait till then it's a total waste of time." [The publisher], whose Sunshine learn-to-read programmes are in classrooms of more than 23 countries, said Singapore and the US... are... committed... to the task of teaching primary children to become computer literate because otherwise they will not be employable in future. Both countries have targeted children from less affluent families... [S]chools in less affluent areas were the ones who most urgently needed assistance b[ecause] they could not afford computers. "Children at the richer schools mostly have computers at home anyway. But at the lower socio-economic schools, some kids don't even know how to turn a computer on." The Ministry of Education funded an information technology contract for three years, halving the available funds after the first year and then halving them again after the second year. [The]Associate Education Minister... said the Government was working on a policy on computer literacy but it was unlikely that would surface within the next year.

...A NEW generation of schools is being built with the latest technology. The Ministry of Education has plans for up to 40 new schools over the next decade... These schools of the future are linked to the world with fibre optic cables... The latest to open is Hibiscus Coast Intermediate... north of Auckland. Each of the 16 classrooms has at least two computers, which can access the Internet and communicate with each other via e-mail. Each class also has a telephone on the teacher's desk... In the information technology classes, the teacher plugs a laptop computer into a machine which projects the work on to a large screen for all the class to see.

...Expect a bold vision for the use of information technology in schools... this Thursday... In hushed tones, [the]Treasurer... will speak of the dawn of a new revolution in education, and unveil an ambitious plan to have every school connected to the Internet and its vast world of knowledge by the end of 1998... A 1996 Ministry of Education survey shows that only 32[%] of our schools are connected to the Internet and the ratio... is... one computer for every 10 high school students and one for every 19 primary school students. The 1996 survey did not, however, discriminate between computers used by pupils and those used by teachers and administrative staff... A ratio of 1:5 is... [needed for NZ] to "become one of the most highly skilled nations in the world"... [The Treasurer will] stress that technological literacy is a must for our children – how preparing them for a lifetime of computer use is as essential as teaching them reading, writing and 'rithmetic... that using a computer should be as natural for a 5-year-old as reading a book... There will be other noble goals too: equality of access for all... technology training for teachers and a national infrastructure to administer the curriculum and educational resources... The House will give... a standing ovation. Sorry, just kidding. Don't expect any of the above.

...Parents worried about their children missing out on the three Rs at school are turning to educational software to fill the gaps. Sales of computer learning programmes for youngsters are leaping ahead as disgruntled mums and dads take on the role of teacher. "The family computer is playing an increasingly important role in early childhood education," said... [the] Asia-Pacific managing director of The Learning Company. "There is a growing dissatisfaction with education systems around the world. Parents are not confident their children are gaining basic learning skills. They want to take some control... Parents buy education software for two reasons... Their child is falling behind at school and needs help with reading or maths, or the parents are highly motivated to make sure their child achieves his or her full potential." The... Learning Company claims to be the largest independent education software company in the world. It has more than 500 software products... Top of the pile is the *Reader Rabbit's* CD-Rom series (\$59.95 each) which caters for tots as young as 18 months through to preschoolers and early primary school years... The Learning Company's education titles... are researched for six months before development begins. Two cameras – one focused on a youngster and the other on the computer screen – record reactions during child testing. Programs in development are constantly revised to improve segments where a child might get bored or frustrated. Children find software easier to use than adults, [the managing director] said. "They have more patience to explore, are very methodical and have no concept of making a mistake."

...All fifth form[ers]... will be sent a card this month setting out a study programme for [SC], and the Internet address to download an interactive revision programme. Passing Potential is the brain-child of... [the] managing director of Birkenhead-based Textus Publishing... A team of teachers and writers was put together to prepare revision modules on the most popular subjects... "They needed to write with the mind set they were in a class talking to kids, second guessing the kids' responses, even... silly ones, and having a back-up explanation." The initial subjects downloadable... [ar]e English, math, science and accounting, with a special course available on Macbeth. They include questions, answers, background explanations and a copy of last year's exam paper for students to work through... access to discussion groups for teachers and students, and quick repair of any mistake or omissions... Courses on history, geography and economics should be ready by early next year, and Textus is considering more senior

titles, business training and life skills topics... [- but] it was not economic to design revision packages for subjects taken by fewer than 10,000 students... [However, while the immediate market is N[Z], “much of what we have produced will be internationally applicable. The science could be picked up in A[US], Britain and the U[S]... We just don’t know how big this can get.” ...[Textus] has been unable to find any similar products on-line... The software is stored on a Florida-based server because of the relative costs. Downloading will take an hour for each subject, and students will be advised to wait for off-peak times. Each subject costs \$45, payable on-line by credit card. That buys the password, specific to the PC onto which the encrypted software has been downloaded. Users will need Windows 95 or Windows 3.1. A Macintosh version was considered but dropped because some graphical question formats weren’t supported... [In related news, i]nteractive video-conferencing lectures could save... time and money by reducing travel costs and bringing remote expertise into the classroom... [says the] director of Caltech Capital Partners... – [who] recently gave his first remote lecture on venture capital from the boardroom at ECNZ in Auckland to a class at the School of Management at Waikato University in Hamilton... [However, e]vidence is accumulating in the U[S] that high-tech classrooms cause more harm than good...

Across America, school districts have been cutting traditional programmes to lavish scarce time and money on computer education. In New Jersey, the state cut school aid then spent \$15 million on classroom computers. “Shop classes,” where the exercise of making things out of real objects has long taught important building and creative-thinking skills, have been almost entirely replaced by “technology education programmes.” Music classes have been computerised. In Massachusetts, a school district dropped proposed teaching positions in art, music and physical education, then spent \$500,000 on computers. (Ironically, a half-dozen scientific studies have suggested that music and art classes build the physical size of a child’s brain and its powers for subjects such as language, maths, science and engineering... far more than computer work.) Schools in many communities consider themselves backward unless their computer gear is state-of-the-art, causing them to not only invest in costly multimedia computers but also in fancy devices such as video-conferencing systems. While such equipment is often donated[(e.g., some companies give their old computers to a local school after purchasing new computers)], schools are left with the long-term responsibilities – system maintenance, constant teacher training and software upgrades[(‘the Year 2000 bug is a “back breaker”’)] – which generally costs far more than the initial hardware and software combined. A widely-circulated business study has concluded that, over time, these burdens account for 86[%] of a computer system’s costs. And that’s before the thefts... [Yet the] majority of educational... programmes encourage laziness. [In addition, students] often spend hours adorning papers with glitzy computer graphics or haphazardly grab material from the Internet that is seriously flawed and that neither teachers nor students have the skill or time to evaluate... A few sophisticated programmes, particularly for older students, can stimulate learning but... most programmes... [especially those for] the very young... are little more than video games. Reader Rabbit, [which is]... used in more than 100,000 schools, was found to cause a 50[%] decline in children’s ability to think creatively. Older students often end up racing through computerised maths drills and other exercises in a guessing frenzy. As teachers rush about attending to computer glitches, the lessons at hand can be ignored. Some teachers mourn the move away from “hands-on” learning materials, such as beans or coloured blocks. This is the stuff, child-development experts believe, that deeply imprints knowledge into a child’s brain by transmitting the lessons of experience through sensory pathways. Some developmentalists are further concerned that the computer screen’s flat, mechanistic nature overly stresses the brain’s left half, where sequential thinking occurs, while the right brain, engine of impressionistic thinking and creative analysis, gets short shrift... The notion that computers boost teaching and learning grows out of a ream of studies compiled by [the US President]’s technology task force. The problem is that the bulk are highly unreliable. Study conditions were artificial and not easily repeated; negative findings weren’t included; or, most frequently, subtle but important biases polluted the attempt at scientific control... Arguments that classroom IT is vital for tomorrow’s high-tech job market are even hollower. I’ve spoken with employers in a broad array of firms including high-tech businesses. All of them said that when new employees arrive they can be taught the necessary computer skills in a matter of weeks. What employers want... is a broad base in liberal arts and in real-world experience. As a dean at the Iowa school of engineering used to say: “The best engineers were the farm boys” – because they knew how machinery really worked. There is a move away from the educational traditions that encouraged students to rely on their brains and five senses, and developed their abilities to communicate with people. And it’s a move toward reliance on a machine, which too often dumbs down children’s thinking rather than expand it. Computer promoters argue that they don’t want to lessen attention to fundamentals and real-world creativity; they’re simply adding one more skill. In the real world, however, this vision is unrealistic... But schools have been down this road with educational technology many times before. In 1922, Thomas Edison predicted that “the motion picture is destined to revolutionise our educational system and... in a few years it will supplant largely, if not entirely, the use of textbooks.” Decades later, similar hopes were floated for the portable radio, then again for “teaching machines” in the late 1950s. Each round of technology was backed... with research proving its academic value. When each failed to deliver, it was blamed on teacher resistance, or school bureaucracy, then finally on the machines themselves. Schools were then sold on the next generation of technology, as is occurring today, and the lucrative cycle started all over again.

...Computers will not hinder learning for N[Z] school pupils providing there is a balance between their use and other lessons. That is the message from those involved in teaching, most of whom felt N[Z]’s experience differed enormously from the U[S]. A lecturer at the University of Auckland’s School of Education... said... Kiwi teachers tended to have a “pedagogical” approach to the use of computers – making pupils use them as part of an overall learning process... Computers had been relatively scarce in our schools until recently... and that had allowed the use of computers to be integrated into the rest of the school curriculum... The principal of the Auckland College of Education... said the rate of technological change had forced the College to alter the way it teaches computers skills to its own trainees[, while a] Christchurch College of Education lecturer... said teachers needed to keep up with technology or students would outgrow them.

...A new generation of “haves” and “have-nots” could result if students’ access to computers in schools remains uneven. An E[RO] report on the use of [IT] in schools said it had the potential to improve student performance but only if well managed... Those who missed out on the “increasingly essential” knowledge and information skills were less likely to find jobs, which could add to the cycle of disadvantage for some families. However, the report said there was no apparent link between the use of [IT] and a school’s socio-economic status, with the barriers more likely to be with the board and staff understanding of and commitment to computers. While some of the country’s schools had had computer equipment since the mid-1970s, many boards still did not feel confident or knowledgeable enough to choose and invest in the technology.

...Schools must upgrade classroom furniture to prevent a legacy of neck and back pain for students, say medical experts. Some pupils, particularly those taller than average for their age, experience discomfort with standard chairs and desks... A study by [a] Tauranga osteopath... of children at a Bay of Plenty high school found 95% complained of back pain. A survey of 500 Hamilton students discovered 50% of boys and 30% of girls showed signs of a degenerative spinal cord before leaving school. “There were no sporting factors. It was because of their sitting positions at school... These people have an increase in more serious back problems later in life.” ...At least one school, Carey College Christian School in Auckland, has children measured twice a year and furniture modified accordingly. A physiotherapist also spoke to the 50 students about sitting correctly... An Ergonomics Society taskforce had succeeded in stalling a new standard for school furniture, saying it was already outdated... [The osteopath] challenged the Education Ministry to take responsibility and provide more money to improve furniture... [Currently, boards of trustees] decided what priorities they spent [school] budgets on.

...School boards of trustees say they will fight any move by the Government to strip them of their powers and effectively make them the school committees of old... At present the school board is the employer of all staff, but under rumoured changes boards would employ only the principal,

who would then be responsible for the hiring and firing of other staff... However, many... principals also taught and would not be able to cope with the extra workload the suspected changes would create.

...THERE is a certain quiet evangelical air about [the]Timaru Girls' High School principal[, who]... has a clear idea of the professional role of a secondary principal, a role that is all about seizing the moral high ground. [The principal] stepped down from the top job last week, four years after refusing to do so in one of the most bitter public educational rows the country has seen. But [the principal] has no regrets. Even in retrospect, [the principal says it] would not have veered from the determined path [it] trod in 1993 after being dismissed by the then Board of Trustees, which sacked her after a series of intense internal wrangles over how the school should be run. The slightly built and quietly spoken principal fought back, taking the board to the Employment Court for unjustified dismissal. It was one of the longest hearings in the court's history, running for 45 days, and made headlines across the nation. The June 1994 decision by [the court] was overwhelmingly in [the principal]'s favour, awarding her \$62,500 in compensation and reinstating her position. The board promptly resigned, a temporary commissioner was appointed and the school was left with legal costs of \$400,000. That has been paid off from school reserves and a suspended loan courtesy of the Ministry of Education.

...The playing fields stretch away from the classroom blocks... It's possible to see where the tall wire fence previously separated two schools; a concrete line through the grass marks the boundary. Little kids in bare feet run past groups of teenagers... a trio of girls walks past: "Kia ora, welcome to Southern Cross." Te Taki O Autahi, the Southern Cross Campus, is a collection of three schools, the former Nga Tapuwae College, Mangere Intermediate, and Southern Cross Primary. Since the beginning of the year they have co-operated as one... to provide education... for... 1100... [students while] calling themselves Southern Cross junior, middle and senior schools. It has been a quiet, behind-the-scenes amalgamation. The schools agreed there had to be a better way to deliver education in Mangere. Two of the schools had hit rock bottom. Nga Tapuwae was rocketed into public attention in 1994 when it received a scathing report from the E[RO] suggesting it be closed. It is 21 years since the Mangere high school opened to cater for a rapidly expanding population. For at least half of its existence the school had been split by in-fighting, reports of violence and threats, power struggles, communication breakdowns, poor educational achievements, and truancy. At the beginning of 1995 the board of trustees was dismissed and the school was handed over to a commissioner, [a]former Auckland Grammar School principal... who was given six months to prove why the school should stay open. [The commissioner] said the issues [the former principal] was sent to resolve involved massive exaggeration, perceived problems and personal agendas. Once the communication lines were re-established, it became obvious the factions within the school wanted the same things, especially when it was pointed out that the school was there for young people, not as a grandstand for personalities... [The commissioner] said while his teaching career had never taken him to South Auckland that was an advantage, allowing him to look at situations in an independent way... Staff at the school were asked to think laterally, brainstorm and come up with ideas of how education could be delivered in the area. The campus idea was born. Originally staff had envisaged combining with neighbouring Mangere Intermediate School and going from form one to seven but just down the road at Southern Cross Primary another commissioner... was also looking at the challenge of education in South Auckland. The grandfather, former business[person] and chief executive officer of the Spirit of Adventure Trust... knew little about education but believed strongly in young people. After all [the second commissioner] was one of the children people had written off – a kid from a solo-mother home, who found school boring, failed [SC] and spent PE classes smoking in the bush. It was through his work with the ARK Trust for at-risk children that [the second commissioner] began to formulate the ideas that would lead him to his role at Southern Cross... As with Nga Tapuwae the situation at Southern Cross had degenerated to a power play between personalities, to the point where there were numerous personal grievance claims against the board when it was dismissed by [the]Education Minister... The... [second commissioner] says Tomorrow's Schools was doomed to fail in South Auckland. "It is a recipe for disaster. Schools are educational businesses with multi-million-dollar budgets." Schools in the area have smaller pools of parents with financial expertise than their counterparts in other parts of the country... Three schools combining on one campus had never been attempted before, and the [Education]ministry did not have systems in place to deal with the nuts and bolts... A facilitator... is credited with doing a lot of hard and tedious work... "There are no simple solutions but it will work. That's the bottom line, not what will happen if it doesn't work – it has to work." ... "One school, no excuses" is the philosophy. When children enter the school at age 5 and don't leave until they finish seventh form teachers cannot pass onto other schools students who have not met the educational requirements... There is educational continuity and less chance for kids to fall through the cracks during the transitions from one level of education to the next. There is also a whanau feeling, where big brothers and sisters can look out for their siblings and where families can develop loyalty, commitment and pride in one school... [The former Auckland Grammar principal believes that c]urriculum, outstanding teachers, structural discipline, a caring environment and pastoral care lead to a quality time in the classroom. "If you make that your number one priority, curriculum and quality of delivery resolves most of the problems, but if that is boring then all the behavioural negatives kids bring to the class are made worse. Get that right and 80[%] of the youngsters are fine; they don't need counselling and constant care. Having said that there are some very sad youngsters who get massive help from Southern Cross... but... the solution is quality teaching and curriculum." ...Getting a consistent curriculum in place for five-year-olds through to seventh formers is under way in each subject, and for the first time the schools have firm statistics on where the students' abilities and weaknesses lie... [The commissioner] agrees with comments by [the]Chief Education Review Officer... that there are some incompetent teachers in most schools... and those who can't be upskilled should be persuaded to look at a career change... But... says the majority of teachers at the three schools have devoted their careers to teaching in South Auckland and... that the staff work "hard as hell." "I've always believed in the X factor and teaching going the extra-distance and I've seen the results of that time and time again." [Editor's note: The commissioner wasn't seeing too well the day the then 'principal criticised another school for the unruly behaviour of its students at an Auckland University performance of Shakespeare. The offenders were Auckland Grammar students who had told concerned officials that they were from Green Bay High School'!]

...Parents have demanded the resignation of the board of trustees at a... school which has had five chair[persons]... in six months. If board members at Island Bay School refuse to go, the parents... will petition the Minister of Education... to appoint a commissioner to run the school.

...The chair[perso]n of the Tolaga Bay Area School board of trustees... said Tomorrow's Schools and self-management had not done the... East Coast... any favours... [His comments follow those of] a teaching professional... [who] says... Tomorrow's Schools had left schools with little support, and the idea they should be self-managing had not worked on the coast[, where some]... schools may have to close if education in the area is to improve... While an E[RO] report highlights the dismal education received by the coast's 1350 students, it does not suggest closing schools. But the former principal of Ruatoria's Ngata College... who is now an educational consultant and a member of the panel reviewing the review office, said... some schools [were] within 10 minutes of each other and while communities were deeply parochial about their schools, sometimes it was at the expense of their children's education. The E[RO] report, released this week, says that at least 65[%] of the coast's 20 schools are failing and the Government needs to take urgent action to improve the situation... [In related news, p]rimary and secondary teachers are pushing for school boards to be given the power to dump trouble-making trustees. The [NZEI and the PPTA] want the trustees' code of conduct given teeth so that boards can discipline members who breach it. The unions have received numerous reports of trustees escaping any action after causing major problems in schools. The Minister of Education can sack an entire board, but no one has power over individual trustees... "If a teacher or principal does something wrong, the board can discipline and fire them. Board members should also be in this position,"... said... the president of the [NZEI].

...Rathkeale College's practice of hard labour as a method of discipline has won the support of several Auckland schools. Boys transgressing Rathkeale's rules have had to hump rocks from a local river into the school grounds, where they are used for landscaping, since the private Wairarapa school was founded in 1964. But the practice has recently raised parental ire and the families of two pupils forced to invest 90 minutes

of adolescent muscle power in the rock-lifting exercise, have complained to the Commissioner for Children and the E[RO]. "I can't see any problem," says... [the] principal of Glenfield College. "It's good healthy exercise. It depends on the spirit in which the punishment is given. But if it is done in an avuncular way and not as a public humiliation, then no one's tender sensibilities should be damaged." ...Students are no worse now than they have ever been, [the principal] says... but they do have a new attitude to rights – especially their own... [The] principal of Avondale College, declares that Rathkeale is "on the right path with the rocks" and "the only thing to fear about discipline is the lack of it." Avondale College pupils who break their school's behaviour standards with a serious misdemeanour also find themselves facing tasks involving physical labour. Verbal or physical abuse, for example, earns a three-day suspension from lessons in favour of a work detail, lasting from 8 am to 4 pm for each of those days. Trimming edges, weeding and digging over gardens or a spot of painting and common activities, carried out under the watchful eye of the school caretaker. "One of the most amazing results is that the kids feel very positive about completing physical and necessary work... [S]ending pupils home for a period of suspension is just a waste of everyone's time." ...Work projects within the school grounds also play a part in the disciplinary process at Massey High School... At St Stephen's School for Maori boys, in Bombay... [- where, a]gain, the end result for an erring pupil is physical work and odd jobs... [-] considerable work has been done on discipline since a disastrous ERO report in 1995... [By the way, t]he principal of Te Kao Area School... has defended her professional leadership and denied verbally abusing teachers in the wake of a damning report on the isolated Far North... composite area school (new entrants to form seven)...

Te Kao Area School does not look "unsafe." Two huge palm trees at its entrance give the spacious, clean school the appearance of a tropical resort. Tucked among rolling green hills in a valley just 46km from Cape Reinga, the school is adorned with students' vibrant art work. They seem happily engrossed in their class work and the lunchtime scene seems much like that at any other school in N[Z]. But the ERO... says it found evidence of adults physically and verbally abusing students, low levels of literacy and exam pass rates, poor attendance and bullying... Its principal... said: "We're still in shock. We can't believe the report... our education standards are adequate." ...However, some members of the Far North community agree with the concerns highlighted in the report and believe the ministry should intervene... Senior students complained to review officers about disruptive classmates, cancellation of classes, inconsistent delivery and a lack of challenge in the school's learning programmes... At least two of its... 76... students think the school lacks discipline. The [NZ] *Herald* found them joy-riding around a local beach instead of sitting [in a class. The]... twin brothers... say students see the school as a free ride. "If you don't want to go, you just stay home. If they were a bit tougher we'd probably try a bit harder,"... Both boys, whom a teacher described as once "extremely bright and full of potential," now plan to drop out and go on the dole as soon as they are old enough. "Our younger brother is doing all right, though... Mum sent him to Mt Albert Grammar in Auckland to get a better education." Other students are also bypassing Te Kao. Some take the... hour... long bus trip daily to Kaitaia College... A Far North educator, who did not want to be named, said many parents put money aside so they could afford to send their children to other schools. "Te Kao's main problem is that it[s]... small roll makes it hard to get subjects that the children want, so they go elsewhere."

...A Northland principal says [it] is prepared to go to jail to stop the Ministry of Education removing eight "surplus" classrooms from his school. But the ministry believes that Bay of Islands College in Kawakawa actually has more than 20 surplus classrooms and that the school is lucky not to be losing more. "The school has 537 students and 51 classrooms," said the ministry's Northland district property manager... "...all we want is eight to give to other Northland schools that desperately need them."

...A Northland school sent a class home for three days last week because of a teacher shortage... despite a warning from the Ministry of Education that such moves were illegal... About six parents rang up concerned about the situation, but they were supportive of the school stand... A teacher aide supervised one pupil who could not stay home... [T]he 239-pupil school was one short of its entitlement of 12 teachers which, combined with winter illnesses, had put the school under pressure.

...Schools are facing a severe shortage of relief staff – particularly in South Auckland... The president of the N[ZEI]... said the shortage was worsening as... winter illnesses took their toll... Bairds Mainfreight School, in Otara, was forced to double up classes and cancel remedial lessons when it could not find a relief teacher this week. The principal... said the pool of 30 relievers regularly used by the school had dried up as many had found long-term work or permanent positions... But the Ministry of Education says it has 700 unemployed teachers on its books and not enough schools are applying for incentives to attract staff.

...Aussies are being invited to teach Kiwis a thing or two, in a move to entice more... teachers across the ditch. "New Zealand" needs "Six Hundred More Teachers" at both primary and secondary level, say Ministry of Education advertisements placed in big A[US]n papers at the weekend... The... ads played on the light-hearted rivalry between the countries... The difference in accents has long been a source of amusement, with "Sex" being the word most Kiwis hear when A[US]ns count past five. Graffiti on a Bondi overbridge stated "N[Z] sux," and someone had added "A[US] nil." While A[US]n teachers are paid more than their N[Z] counterparts, a survey shows that for A[US]ns already teaching here, the chance to travel and gain experience, and a lack of positions at home are stronger motivators than money. About 200 A[US]n teachers joined N[Z] schools in the 18 months to April... The ads are the first in a \$100,000 campaign also targeting teachers in Britain and Canada.

...Two Auckland schools were left in the lurch by overseas teachers breaking contracts to take up teaching jobs back home. The Northern Hemisphere new school year starts about this time... The principal of Matipo School in Te Atatu... said a Canadian teacher at his school gave 3 1/2 weeks' notice before leaving to take a job in Canada. The school... felt ripped off given the time and effort staff had put into the teacher's professional development. [The principal] has acted as a recruitment officer for Canadian teachers and said six of the 46 teachers [it] signed up had already returned. Overseas teachers are reimbursed up to \$3000 for their costs when they arrive and provided they stay longer than 20 weeks do not have to pay the money back... Te Atatu Intermediate also had a teacher leave at short notice recently to return to work in Canada. The principal... said the teacher was caring and enthusiastic during his time there but his premature leaving had created a lot of headaches. "Of course we wish him the best but [the teacher] really did suit himself." [The principals] questioned whether the Government should hold over part of the teachers' relocation expenses until they completed the contracted time. However... the senior manager for TeachNZ at the Ministry of Education, said that would not work because not all teachers are guaranteed a year's work by schools.

...The appeal of home is being sweetened by a \$3000 grant in a bid to lure back N[Z] teachers travelling in wintry Europe. As the Northern Hemisphere days get colder... the Ministry of Education is hoping more teachers will succumb to the temptation of a fully paid trip home... The Ministry of Education will [also] spend about \$50,000 in the next two days to bring South Island teaching graduates to the North Island. Seventy-three teaching graduates will fly to Auckland today and meet school principals keen to lure them into a job.

... "I wish they needed teachers so badly in Christchurch," said [a teaching graduate while scanning] a map of Auckland to find Bucklands Beach. Other graduate teachers from the South Island echoed the feeling as they booked in for interviews with principals from 35 Auckland schools yesterday... Many spoken to viewed Auckland as a last resort if they could not get work on the Mainland... [P]rincipals at the recruitment fair were confident that the teacher shortage was easing. Unlike last year, the graduates outnumbered the principals two to one... There were 320 vacancies in Auckland schools last week, 200 fewer than at the same time last year... The manager of... TeachNZ... said teacher recruitment was under control[, and] attributed it largely to foreigners, particularly Canadians, staying longer than expected... [But one] principal who was looking for four teachers... preferred to hire N[Z]ers because it was a waste of the country's resources to train them and not give them a job.

...a[n] a]cademic expert says N[Z]ers are becoming numerically inept because of a chronic shortage of math[s]... teachers... Concern about N[Z]ers' poor abilities at maths... come as the... Ministry of Education... prepares to release more details about the third International Maths and

Science Study. Initial details of the study, released this year, showed that N[Z] 9-year-olds were only average in maths... The director of the University of Auckland's School of Mathematics and Information Sciences... said the shortage was causing difficulties in schools. "Many principals are... putting anyone in front of their [maths] classes." An associate professor at Victoria University's Mathematics and Science Education Centre... said... "If it's your child in the third form getting the PE teacher for maths, then you're not pleased. Some replacements are wonderful but some see it as a real drag and that's when kids start switching off." ...The shortage was partly caused by private-sector employers nabbing maths scholars as they graduated... [M]aths was becoming more important, especially in the manufacturing and processing industries, which had become computerised.

...AUCKLAND University's Medical School has changed its entry criteria for school leavers. From next year the school will drop its minimum entry level from 400 to 385 bursary marks and... all school leavers will be required to have studied at least one arts subject at bursary level... The decision... [is] in response to concerns that incoming students to all faculties were not competent in English and were specialising too early at secondary school... [A] study noted that in 1993 only 48 of 115 medical students enrolled at... [the medical s]chool had completed English to bursary level... [T]he change in criteria... means some students with poor communication skills will not get into medical school despite having higher marks.

...In N[Z], where students are now taking loans to finance their tertiary education and arguably finding those a deterrent to tertiary education participation... and where there are unemployed graduates... employers are resorting to immigration to meet skill shortages... We have a crude labour market where prospective employers and employees use little more than the spot market of newspaper ads to meet their needs, while tertiary institutions churn out graduates irrespective of market needs... [They should, instead, be d]elivering graduates the market really wants... An example from a country where funding of education comes from the ultimate customers might illuminate. In Japan it is common for employers to reach agreement with education providers, even at high school level, to deliver certain numbers of graduates in specific courses this year and over a number of years into the future. The employer guarantees these graduates further training and ultimately employment. The high school gets funding for the year from this source... [Incidentally, a]n education lobby group is pushing for changes to legislation that dictates how schools run their day. The Education Accord said the 70-year-old half-day system was out of date and should be replaced by an hourly one to give schools more flexibility in how they ran their classes. Schools at present have to operate classes for at least two hours in the morning and two hours in the afternoon to constitute a full school day. The accord wants this changed to a minimum four-hour teaching day. [■ Since '1996, students have had a six-week summer holiday and three two-week breaks between each of the four terms – whose lengths vary between 9 and 11 weeks. Some schools may have Ministry of Education agreement to vary their term dates.']

...Despite secondary school teacher pressure to change school term dates, the Minister of Education... has announced school terms for next year that differ little from this year's. [The minister] said... the secondary teachers' union had pushed for the dates of all terms to be set to fit the needs of the senior stage of schooling where preparing students for exams was important. "To design the whole system to suit just one subsection would be unfair to others..." [the minister] said... Next year primary schools must be open for 394 half-days and secondary schools for 380 half days... Meanwhile, [the Act Party]... has set up an education taskforce to... tour the country seeking ways to reverse the "tumbling of standards..." ...in 1972 N[Z] topped the world in reading. "Since then, we have toppled from first to fifth, sixth, eighth... in maths and science we are now around 24th..." ...New maths and science curriculums had been introduced since 1993 [so] it was not yet known whether they had improved the standard.

...It has been more than 35 years since the last social studies curriculum was introduced to primary schools. Yesterday its replacement, which will cover from primary through to secondary, was launched by the Minister of Education... It has taken five years to develop, been through two drafts, was on hold for 15 months and has been the subject of 370 submissions... The curriculum is broken into five strands of learning: social organisation; culture and heritage; place and environment; time, continuity and change; resources and economic activities. The processes used in the learning are inquiry, values exploration and social decision making. Students will look at issues in the settings of N[Z], the Pacific, Europe, Asia and other locations. They will also examine topics from bicultural, multicultural, and gender inclusive perspectives, and examine current events and future issues. The curriculum will be introduced over the next two years... One of the main changes in the new curriculum is to state clearly what students should learn at school and what they should achieve. "Students will be taught to critically question the world and the way it works. They are not asked to memorise dates and capital cities, but are instead taught skills and processes of thinking through issues and understanding the reasons for doing things." The curriculum would also allow students to examine their own values and the collective values of society.

...When people start talking about turning the core focus of schooling to "values education," it might be considered woolly stuff. Begin suggesting that the traditional subjects like maths, science and English each give up a period to make room for it and you are asking for opposition. But that's what the country's private schools are hoping to do as they... seek half a million dollars in sponsorships and donations... to introduce a values curriculum over the next three years... The values education envisaged would be more than human development, sex education, drug and alcohol education and health studies rolled into one. It would teach the core values of the school's community... The director of the Independent Schools Council... said that while many of the independent schools had a church focus, the values would be those at the heart of the world's different religions and cultures – "things like honesty, integrity, loyalty and love." ...The initial conference on constructing a values education programme was held last weekend... Key speakers included... a British expert in youth and education policy, and... a clinical psychologist at the Centre for Adolescent Health at the Melbourne Royal Children's Hospital[– who]... linked values education with the prevention of youth suicide, saying schools needed to equip young people with skills to help them "survive on life's battlefield." ...[the British expert's] main message was that as well as teaching the traditional "three R's," schools should add a fourth, relationships. "Schools should be about teaching young people to construct a life, not just to get qualifications. Although those things are important, there is no point in having all the degrees in the world if you are lonely or can't form a stable relationship with anyone else or can't communicate with your parents or kids or can't be a good neighbour." [The British expert] said if schools were prepared to allocate 15[%] of curriculum time to serious human relations and values education by taking time from the traditional subjects, the achievement in those traditional subjects would also improve... [T]he productivity of the nation depended on the "personal sanity" of citizens. If people felt they knew themselves and were valued, they would make informed decisions on what they studied, the areas they worked in and the people with whom they chose to have relationships.

...interactive [IT], especially the Internet, has totally deregulated teaching and learning on a global scale. The result is that much of what is happening now is downright confusing for teachers, students and parents... Meanwhile... the market force madness in the tertiary sector[means] universities, polytechs and colleges of education [are] chasing each other's tails without any sign of Government intervention... As chair[per]son of the Education Forum until this year I have strongly supported choice, independence and deregulation in education but never the total abdication of the state in strategic leadership and sensible intervention where necessary. In the midst of this massive, often confusing, change there is a greater search for the meaning and principle in life. Having been to independent school conferences in A[US and NZ] this year I am more than ever convinced that one word, "values," will be a key word of the future in education... Let me give two examples of what I am getting at, because "values" can so easily equate with vagueness... One prime educational value is vigour of learning. I take my example for that from a study released this year by the Public Agenda Foundation in New York entitled "Getting By – What [US] Teenagers Really Think About Their Schools." It is clear from that study that most youngsters – black, white, Hispanic – agreed that the public schools demand little of them and that they had a hunger for structure, discipline and more rigorous standards. Many felt insulted with the minimal demands placed on them; many stated unequivocally that they would work harder if more were expected of them. By contrast, students in independent schools had a far more positive

attitude about their schools and were far less likely to complain about the absence of challenge. A key reason for that is parental support... A second prime educational value is clarity of moral guidelines. My example here comes from a story told by the Governor-General... in a speech in August this year. At a New Jersey High School, a [girl] student found \$1000 in a purse and turned it in. The next day a guidance counsellor led a discussion of the incident with a group of students. The counsellor asked them what they thought of the girl's actions. They concluded that the girl had been foolish to turn in the money. The students then asked... what... the counsellor... thought of the girl's action. [The counsellor] told them that [it] believed the girl had done the right thing, but... would not try to "force his values on them." [The counsellor] later commented: "If I come from the position of what is right and what is wrong, then I am not their counsellor." That is a grotesque example of the philosophy of moral relativism which has bedevilled the last third of this century. As the Governor-General said: "This philosophy asserts that what is right and what is wrong is a matter of private taste and individual opinion only. We cannot be judgmental." Plainly that philosophy needs to be exposed up and down the country for what it is – rubbish! ...Education deals with adolescents' hearts as well as their minds and society at large is sending out too many mixed messages. If the family is in trouble, who is going to teach the importance of good parenting? ...As [a]Professor... said at the recent N[Z] Herald-sponsored independent schools conference on values education: if core values are not taught in schools we shall merely be producing "clever devils" – people who are high achievers but lack the values framework for their personal development.

...[I have a mantra borrowed from the Governor-General's speech to the Values in Education summit. "Adults must not ask young people to do what they do not do themselves, nor can you ask a school to stand for values the wider society ignores – history is built around the gap between what we claim and how we act." Values education in schools enables children to understand their own values and the values of others, and to develop a meaningful and positive code for living. The aim is to show that all of us, adults and children, make our values conscious and examined and live our lives by these. This is living with integrity. And integrity is an extremely powerful partner in life's journey. In an ideal world, our children would grow up surrounded by teachers and parents – indeed every adult they come in contact with – who would consistently and lovingly model truly positive values. Nurtured thus, our children would develop into confident, courageous, compassionate citizens, contributing to their family, community and society in responsible and constructive ways. A noble vision this for our imperfect world. Values education, like every other type of education, is a journey towards improving our human condition. How do we get real about it? How do we quit wishing that our children can jump in the car and drive without lessons because they've sat in the passenger's seat and watched one or two good drivers? Let's stop the wishing and hoping that good citizenship will come out of the children's environment that includes superb adult role models. This is fantasy. Values education will not happen in our schools without deliberate planning, the widest possible sharing of ideas, experiences and knowledge, and without the obvious commitment of curriculum time, teacher training and resources. The Living Values Project, which provides schools with planning models, takes inspiration from the Unesco report that recommended the direction education must take in the 21st century.'

...the 'teacher bursts into the library of Te Papapa School in Onehunga, her blue eyes bright with enthusiasm, her hands clutching a dozen stamped orange slips. These are powerful pieces of paper, indicating a shift in attitude at the school that is beginning to influence the way our education system works. They are called "chances" and they are given to children whose behaviour embodies the values of the school – "be kind to ourselves, be kind to our environment, be kind to each other and be in the right place." It's a simple idea that has the children hooked – as much for the books they have a chance of winning at the end of each week as for the encouragement and recognition. Schools have always taught values, most of them implicitly and with varying success. But like dozens of others, Te Papapa School has decided they are too important to leave to chance. It is one of 20 public and private schools testing the Living Values Project, which helps schools to determine the values children need to learn so they know how to live together. Teachers are too busy to decipher vague school instructions about good values, educationists say. While schools are required by law to teach subjects and skills, it is not mandatory to promote values. But the ERO wants a clear series of statements on values teachers can use. Since 1993, the Ministry of Education's curriculum framework has instructed schools to reinforce values such as honesty, respect and non-racism. The Education Minister supports incorporating values in education but is making no promises yet of further support for programmes such as LVP, which is running out of money. The debate for incorporating values into schooling has been around for decades. Its supporters believe the idea's time has come – they just need to convince the lawmakers and the rest of the country.'

...The headmaster of King's College writes that "values" will become a key word in the education system in the future – that students should be taught that some things in life are right and others plainly wrong. [However, someone] who has studied philosophy for many years, doubts that schools can impart clear moral values to their pupils: "Determining right from wrong is too hard and irrelevant." ...The curriculum review of 1986 states: "Some of the desirable attitudes and values the community mentioned most frequently in their responses were: A sense of fairness, concern for truth, honesty, self-respect, self-discipline, respect for other people and their cultures, beliefs, opinions and property, responsibility for one's own actions, trust in other people, love (aroha), hospitality (manaakitanga), spirituality (wairua), tolerance and adaptability." These do not sound too hard, too complicated, or irrelevant. I have been engaged in "values" teaching for nearly 20 years to form 1 and 2 classes[(11 to 12-year-olds)]. Children are very practical and logical. They have a strong sense of justice and can very quickly see the concept of cause and effect when it is applied to everyday situations. I have always been amazed at their ability to grasp the logic of a situation and reach their own conclusions as to what is right and what is wrong... *The Religious Experience of [Hum]ankind* states: "The great faiths display considerable agreement on what is right and wrong..."... Very basically, "wrong" can be seen as any action that harms people or their environment, and "right" as an action that helps people and their environment without harming others... A few years ago I sent an article to the school journal for possible publication... [The article was about] Dietrich Bonhoeffer, a... pastor hanged by the Nazis... for his part in plotting the assassination of Hitler[. Dietrich had been] questioned about his violence by some of his religious contemporaries. His answer was along these lines: "If you saw a drunken driver endangering a crowd of people, would you wrench the wheel out of his hand, or stand by to comfort the bereaved and bury the dead?" ...It was a modern fable (a short story which attempts to convey a lesson in, or observation on, manners, behaviour or morals). It was returned with the usual regrets, the specified reason being that "the children would feel it had been written to teach them something." ...but fables have been used for thousands of years to "teach something." ...There are truths about human behaviour and its consequences that do not change. A good teacher is not dogmatic, but presents relevant facts in an interesting manner and encourages the pupils to think for themselves. The biggest problem in teaching in this area is that after weighing up the arguments, and considering the probable consequences of the various choices of actions, children reach a conclusion as to what is right or wrong in a certain situation – then realise that the actions of their parents, neighbours, teachers or community leaders may not measure up. This is confusing for them... especially when they see clearly actions which are harming people or their environment... How much tolerance can our generations expect from them? ...To avoid teaching any guidelines, or aiming at any standards because we are not perfect ourselves, or because credit is not specifically given to our culture or religion, may be the easy way out, but this... lets... children... make mistakes which could have been avoided, and allows the general standards of society gradually to become lower and lower... Children are happier when they know where reasonable guidelines are, and happier still when their friends recognise the same guidelines. Will experts go on arguing over shades of "right" and "wrong" while our children are in danger? Or can we agree on simple principles, standards and guidelines that will keep them safe until they have enough experience of life to choose for themselves, and to accept the consequences of their actions? ...I suspect human nature will always be like mercury, a puzzle to grasp. No matter how much of the physical universe we fathom, what makes us quintessentially human eludes us to some degree, because it's impossible for a system to observe itself with much objectivity.

...[someone who] claims to have studied philosophy for many years... suggests... that there is no definitive answer to what is right or wrong... [This someone] speaks of force-feeding a student with values and antiquated concepts of right and wrong but fails to inform us what those antiquated concepts might be, except that what is within the law and what is outside it is straightforward enough, a view that I find difficult to accept since it would seem to preclude him from saying as I do, that sometimes the law is an ass... One doesn't need to be a student of philosophy to... [be] able to detect that... children who come from an environment of neglect and abuse are likely to be abusive and cruel themselves. If determining right from wrong in that situation is too hard or irrelevant then I hope that [this someone] will excuse my temerity in suggesting that that is nonsense.

...Two twenty-something [guys] – one with blue hair, the other purple – live on top of... [a 6-year-old's] house and get about in a jumbo jet-powered car. The “little friends,” who are less than 30cm tall, moved in several years ago and have been playing with... [the] 6-year-old... since, visiting him at school and parking themselves at his dinner table... Only [the boy] can see them. But his mother, through regular conversations with her son, has come to know them pretty well too... A third member of the troupe... was also on the scene but, according to the boy who knew her best... has now gone. Still around, however, are the little friends' pets – sharks, mice and dolphins. Enter the world of imaginary friends, where someone is always there to play with, to talk to and just hang around with. Make-believe mates are not the rare creatures they may seem to adults – studies show that as many [as 65%] of preschoolers can have them. And grown-ups who can remember their imaginary friends do so with fondness. [A NZ] *Herald* writer... won't hear a word against Tommy Wilson, the concocted friend [it] played with when... his family were living in a caravan in Scotland. Looking back, [the writer] reckons the fact that his family moved around may have had something to do with Tommy's appearance. Once they settled in N[Z when the writer] was 7 or 8, [it] can't remember Tommy being there. Seems [Tommy] never emigrated, was possibly no longer required. His family were relaxed about Tommy's presence, never had a problem with him, and years on the Wilson boy became a bit of a family joke. Another *Herald* staffer, who preferred not to be named, admitted to two imaginary friends: Widdling By and Boo. [The actor] who plays Chandler in television's *Friends*, once reportedly [confessed to having] had an imaginary friend who his parents preferred to him. In some homes, however, a companion created in a child's mind is scorned and many have been kept secret from parents and siblings. But contrary to a once-held misconception that the appearance of imaginary friends could be an indicator of problems, children with them have been found to be more sociable, less shy and have more real friends. They are also thought to be more creative and to participate in more family activities. Just because an adult cannot remember a relationship with a make-believe friend doesn't mean... [it] didn't once banter away to someone that no one else could see. There could be about 20[%] of young adults who can't recall having such mates, according to [an] Associate Professor... of Auckland University, who has surveyed students on their childhood companions... [The associate professor], who can't recall having a little friend himself, is not entirely sure why companions emerge and become such an important part of some children's lives[, but generally]... first children or only offspring have such mates... Imaginary friends tend to arrive when a child is two or three and last for a few years but they can hang around until teenage... [The associate professor] cautions parents not to be alarmed when an imaginary friend moves in. Be aware of the friend... but don't panic. “Kids seem very happy to talk about imaginary friends... Go along with it, accept it.” That, of course, may mean setting an extra place or two at the table... “Some [of those surveyed] said that at a certain point, their imaginary friend decided it was time to leave. They were all getting a bit too old and not having so much fun...” They appear to take two forms: invisible people, or the assumed personalities of stuffed animals... Imaginary friends are no strangers to literature, song and film. Remember *Drop Dead Fred*, a movie about the make-believe mayhem-maker... who returned to a young [gal]'s life when real-life people were no help? ...[While on the topic of children's playthings, look] away from the mainstream toys and you'll find a fascinating array of more educationally-based p[roduct]s that are still fun and often cheaper... [The owner of the] Auckland store, Mainly Toys... is a member of Educational Experience, a group of independently-owned toy stores throughout the North Island. A mother of two and a former kindergarten teacher, [the store owner] can offer advice on what sorts of toys provide the most fun and learning for children of different age groups. Toys are important tools of learning from a child's earliest weeks. “From 6 weeks of age babies start focusing on objects and following them... Black and white toys appeal because of the contrast... They also find music soothing and relaxing...” From 4 months of age babies start to grasp toys and put them in their mouths. “Mobiles are good for visual stimulation and hand-eye coordination and rattles and toys strung across a cot or pram help to develop the manipulative skills of reaching, grasping and swiping. They also encourage sound discrimination and develop the sense of touch.” The introduction of bath toys from 6 to 8 months of age helps your baby learn about water properties... This is also the age at which lightweight balls and rolling toys will help to develop manipulative skills such as... picking up. If the toys make a sound, children can also learn about controlling noise... Between 8 and 10 months babies' fine motor skills develop rapidly and they start to learn about cause and effect. Activity centres help develop hand-eye coordination and the fine motor skills of pressing, twisting, sliding and winding. The 10-12 month stage sees children learning to walk... Stacking cups are good to introduce at this age as children start to learn mass concepts such as size discrimination and colour variation... A build up peg board... is a great first birthday present – at first the child will have fun simply grasping the pegs and pulling them out of their holes. Then they learn to stack them on top of each other and to create sets and patterns with the different colours. It can also be used like an abacus to introduce counting. From 18 months to 2 years a child's vocabulary develops so books and tapes or toys that play songs are helpful. They also encourage listening skills and concentration... Children aged about 3 years will start to enjoy art and craft activities such as drawing, painting, dough playing and constructing shapes. Sand and water play with buckets and spades becomes fun, as do games with cars, dolls, train sets, tea sets and dress up... From ages 4 or 5 children accept the concept of taking turns, so board games such as Snakes-and-ladders are good to introduce to them. Five and 6-year-olds are developing their coordination, reasoning and abstract thinking, so will enjoy toys such as a gyroscope... which works with gravity and balance; the Orbiter... spinning toy that creates visual and audible effects; and the Odyssey Scope kaleidoscope... into which users can insert their own objects. The creativity of 7 to 9-year-olds develops in leaps and bounds, so provide them with art equipment and musical instruments. They will also gain a lot from games that require logic and strategy, such as chess and card games... Ten to 12-year-olds love science equipment such as microscopes and chemistry sets... Juggling is great for coordination, balance, and using both... sides of the brain...

TEACHING the music of Mozart or Beethoven to children as young as three can improve their academic performance, new research has revealed. Scientists have proved children who practice for as little as 10 minutes a day on the piano score dramatically higher results in intelligence tests. The researchers have shown that playing music at this age, when brain connections are formed more easily, produces a long-term improvement in how a child reasons and thinks. The... Professor of Physics at the University of California, Irvine... tested the abilities of 78 children aged three and four by recording the speed and accuracy with which they put together a four-part jigsaw of a camel. The children were then divided into three groups. One group was given piano lessons, the second had computer lessons and the third group received no training at all. After nine months, the children's abilities were tested again. The... scores... [of] children who had taken piano lessons... leapt 35% compared to little or no improvement in the other two groups. Although the benefits of teaching children music have long been suggested, this is the first evidence that music training actually improves intellectual ability... [However, at] Wells Cathedral school, in England, which educates children aged four to 18, teachers have noted that musicians show better exam results than other pupils. “In general, our musicians achieve a grade higher at A-level than those who are not studying it,” said[the school's] director of music... [But s]ome education psychologists [say that the public should be wary of generalisations made by people whose opinion may be biased, and the professor's research only proved that teaching music is better than teaching computer lessons or teaching nothing, while others even] dispute the conclusion... [“]There was no accepted proof that music training is hard-

wiring the brain,” said... a psychologist from Keele University. “I think it is much more likely that the increased motivation and confidence from being able to play an instrument is the reason for their improved test performances,”...

The N[ZQA] recently defended its performance by noting that, of some 1500 examinations since its inception in 1990, “...only two examinations have caused any significant public comment and debate.” I suspect that remarkable record was achieved because most people don’t read their children’s examination papers with any degree of critical acuity. Or people feel that there is little purpose in trying to object, insofar as little change appears to result from submissions to most government agencies. I wonder if the NZQA has ever actually asked for critical reviews from the public in the past? Let us take a critical look at one of the recent NZQA-set examinations papers – the 1997 modular science reference test sat in June for [SC] by Form 5/Year 11... [Because] this test has included material on earth science and astronomy consistent with the 1993 introduction of the new science curriculum, allowance may be made for possible examiners’ lack of competence in those fields. However, flaws go beyond the excusable. Earth scientists at the University of Canterbury looked at the test over morning tea and found problems with almost every question within the planet Earth and beyond section... Information provided in several questions was inaccurate. In Question 19 – N[Z] is NOT on the boundary of the Indian and Pacific Plates as stated and as sketched; it is the A[US]n or Indo-A[US]n Plate... Other questions are very poorly worded, if not misleading... A more fundamental flaw to the test, in my opinion, is that none of the questions actually appeared to require any prior knowledge of Earth science/astronomy... If one sets a test and it does not examine the knowledge of the student in the subject matter involved, what is the purpose of the test? The setting of such questions demeans not only the teaching of subjects, but the committed students who studied for the test – they might as well have played rugby. There are other problems with this particular test... Take the example of Question 22, where the resource material shows a pH scale from 1 to 14 with labels showing the acid, neutral, and basic ranges – the question asks students if a pH of 6 is acid, neutral or basic... I suspect that similar results would be apparent from critical analysis of other NZQA test papers; how many examples are necessary to demonstrate that there are major problems with the tests, particularly about the purpose of questions? It is pertinent to ask whether tests like these accord with the NZQA’s stated goals for “good assessment”: “Has a positive impact on learning; provides meaningful results; has a clear purpose; is fully understood by the students; is close to learning; provides students ample opportunity... to show their best work” (1995 “Standards’ Based Assessment for the National Qualifications Framework, Biology”, p.21)... [Incidentally, s]chools are lobbying for the E[RO] to stop sending its reports to the media because of the damaging nature of subsequent news articles... The School Trustees Association has asked that reports be supplied to the media only when requested... The president of the N[Z] Principals’ Federation... said principals also wanted reports to be held back from the media. One suggestion was giving schools a confidential copy of their reports before they were sent to the media so they could start making changes. However, the call to change the present practice does not sit well with the Commonwealth Press Union, which voices the editorial concerns of newspapers. Its honorary secretary... who also represents the Newspaper Publishers’ Association, said... [education] was one of the most important investments a country made and the public had a strong interest in how schools and early childhood centres were performing...

The Minister of Education... has told officials to get on with the job of evaluating the troubled... Auckland Metropolitan College, a small alternative school... The college is operating under the threat of closure after faring poorly in... [ERO assessments], which found students were skipping class, playing poker and studying beer-making and astrology... [However, a] senior ministry official said the review office would visit the school early next year... [T]he ministry’s manager of national operations, said the officials did not want to call on the school when students faced end-of-year examinations... The Mt Eden school, which takes students who feel misplaced in mainstream classes, has had its roll shrink to 90... [because] of... the threat of closure... [By the way, the] Correspondence School is quitting the airwaves after being bumped from its slot on National Radio. After 66 years, the radio institution will make its final broadcast next month. The associate director of the school... said it was decided to axe the broadcasts after R[NZ] said the weekday programme would have to shift from 1.07 pm to 6.40 pm and be revamped... [T]he school was unhappy with an early evening slot for a programme with a student-based audience. “It would be highly unlikely it would be much use.” The educational broadcasts... also attracted a casual adult audience who would probably be watching television at the later hour... The chief executive of R[NZ]... said the shift was necessary because research showed the programme was not reaching its target audience, causing core listeners to switch off... On latest survey figures, 85,000 people tuned in for at least eight minutes of the 1 pm to 1.30 pm slot over a week. Of those, 25,000 were aged over 70 and 1000 were between 10 and 18.

...the name Correspondence School is almost a misnomer, though students still receive posted packs of lessons... and occasionally hand-written notes from teachers. With a roll of more than 21,000 students and 558 staff, the school is not in decline. It even enjoys a small growth industry – the ever-swelling number of correspondence pupils who have been suspended or expelled from regular schools stands at 387... There are now only 5000 traditional, full-time, home-taught pupils. Most of the students are now part-time adult[s]... and school pupils taking correspondence courses in subjects not taught at their schools. Adult students can do school-level courses, special-need courses, or job qualifications courses. Most of them... live in urban areas; some opt for Correspondence School distance learning because they do not want to attend night classes or because the fees are modest. For school pupils who are forced to study at home (for reasons of geographical isolation, expulsion from school, disability or illness), new technology... [means s]tudents can communicate with teachers by fax or telephone (an 0800 number). Audio and video tapes accompany lessons. Interactive television programmes received by satellite or the Sky movie channel have been trialled. The teachers now have e-mail addresses, and next year classical studies and accountancy courses will be taught through the Internet. “We will encourage students to develop chat networks and chat rooms,” said... [the school’s] associate director... “Chat rooms,” for those mourning the imminent loss of radio broadcasts and not yet comfortable with cyberspace jargon, allow those logged on to the Internet to hold group conversations... and solve problems together... in “real time.” ...Many... older N[Z]ers... will miss the 1 pm 20-minute... daily radio broadcast... when it ends next month. The programmes have been a feature of our national airwaves since 1931, nine years after the Correspondence School was founded to cater for just 100 isolated primary school pupils. The first broadcasts were simply talks by the school’s teachers, but by the late 1930s these had become more closely integrated with the school’s courses. Eventually the broadcasts became lessons in themselves, with references to the pupils’ text books. Until the mid-1970s they were broadcast live, but in recent years they have been pre-recorded. Today’s broadcasts are no longer course-linked lessons... [–] the disadvantage of using radio for instructional purposes is that you cannot assume every student is tuned in... – ...but “enrichment programmes.”

...A group of kids is introducing one another to their new teacher. “This is Peter and [Peter’s] an alien,” says one. “Peter lives on Mars and his mother lives on Jupiter and they visit each other sometimes.” “That’s impossible!” pipes up another. “If [his mother] lived on Jupiter the gravitational force of the planet would make her completely flat.” Someone else points out that the planets are too far apart for visits to be feasible. “But within the theory of relativity there’s the possibility for a worm hole in space,” someone else triumphantly points out, “which would allow instantaneous travel across the dimensions so they could see each other.” This, obviously, is no ordinary classroom and these dozen kids are no ordinary 9- and 10-year-olds. They are very bright. Each Tuesday, instead of going to their regular schools all over central Auckland, they come to the One Day School... and learn voraciously... [The] director of the One Day School since it opened in May last year, is keen to dispel the accusations of elitism that plague most programmes dedicated to gifted children... But... they do have different needs which are rarely met in the classroom... “If the class work is too easy and they are not extended, they don’t develop good work skills like commitment, and they learn not to persevere.” ...One Day School also operates centres in Howick, Pukekohe, North Shore and Hamilton, with a total of 170 students this term. The North Shore branch[’s principal]... says there is a clear need for the [centres]... “There are a lot of bright kids around who rarely get the

opportunity to work with their peers. This increases their confidence because they're able to express themselves in an environment that's responsive, with kids who think along the same lines." ...settling back into normal school is not usually a problem, because the[y]... are happier, more confident and more able to cope... [with] managing their own time... [-] gifted children often finish their work before the rest of the class... – ...working without supervision, setting problems for themselves and evaluating their own work by their own standards... "There are no government subsidies: parents pay fees of \$45 a day..." [The director] has requested funding of \$150,000 a year (enough for one full-time teacher at each of the... centres; fees would be reduced and resources increased), but encouraging noises from the Ministry of Education have yet to be substantiated. - 1997

DEAR Nasa, wrote [the] six-year-old... please tell me what the sun is made of. I think it is made of molten rock like the Earth. The... space agency wrote back to the Glenfield youngster saying that the sun was made of gases. [The 6-year-old] doesn't believe them[, so is] sticking with his molten rock theory until someone proves [him] wrong. Like many gifted children, [the 6-year-old] will not accept something simply because [the 6-year-old has been] told it's so. It is a trait which could lead him to make a scientific discovery that alters our way of thinking. It is also one which could have him finishing school unable to read and write – and with little confidence in his abilities. Last year [his] parents were told that after 13 months of school [their son] could read only three words and could hardly write the alphabet. [Their son] was also difficult in the class, often refusing to obey the teacher's instructions, and spent hours in a dream world. His parents were stunned. [Their son had] never seemed to be a slow learner at home and [had] always read his school books to his mother. An assessment by an educational psychologist found that, rather than being slow, [their son] is gifted. But like many gifted children... has trouble learning by conventional methods. [Their son] is in the top 3[%] of the population when it comes to verbal skills – anything which involves listening, thinking and speaking... [A]s a toddler [their son w]as... able to understand complicated explanations about the world and is fascinated by anything to do with science, nature and engineering. His performance skills – involving solving problems without words, such as pictures and puzzles – while in the top 25[%] of the population, are slower. [The boy] becomes frustrated when his body can't keep up with his mind and is inclined to give up if [it] doesn't master a skill instantly... [Furthermore, the boy] refused to be bound by the rules of handwriting (who says e can't have a curly tail?) and was so thrown by the idea of thousands of silent letters lurking in the language that [it] found spelling nearly impossible. HIS artwork – more schematic drawings than picture-book likenesses – drew derision from other children. His picture of a car was unrecognisable until [the boy] explained that it was viewed from above, the circles were the tops of people's heads and the line through the middle was the driveshaft. [His] confidence crumbled and [the boy] retreated into the imaginary world of the Planet Steelin, where [the boy], as the Cat of Steel, didn't have to do reading or writing... [The boy] didn't have much success outside the classroom either. Few children his age could follow his reasoning, while [the boy] had trouble playing their physical games. Now, with [the boy] due to turn 7 in a few days, his school career has turned around. [The boy] was lucky enough to be assessed by an educational psychologist before too much damage had been done. His mother spent an hour a day for six months helping him to catch up with his reading, writing and spelling and his teachers now know how to deal with his abilities. But perhaps the most important thing for [him] is that the self-confidence which [the boy] lost in a year and a half of schooling is returning. The boy who used to say [it] wasn't the right sort of person to read, draw or even ride a bike spent much of the summer holiday telling his parents that [it] couldn't wait to get back to school. COMMONSENSE dictates that bright kids should do well at school. But hidden among some of the dropouts, the kids who fail school and leave without learning the basic skills of reading, writing and arithmetic, let alone the skills to hold down a job, are people who could be shining stars with the right education. Experts say the needs of the gifted have never been recognised in our education system. They put this down to the good old Kiwi knocking machine – if you're bright you don't need, let alone deserve, extra help... That may change. Intense lobbying by parents, professionals and a politician... [- who wants the Education Minister] to authorise the Special Education Service, which presently concentrates on the needs of children with learning disabilities, to extend its activities to the gifted... [- has prompted the] Education Minister... to order officials to assess the needs of the country's estimated 35,000 gifted children. No accurate figures are kept but experts believe about half these children... will leave the school system without having had their abilities recognised and developed... [A] Waikato University senior lecturer in education... says that children could be gifted in such a wide range of things that it was often difficult for teachers to recognise their talents and deal with their idiosyncrasies. Failure to recognise the gifts of these children and to develop their talents not only caused society the loss of their potential contribution, but could also severely damage the lives of the children. Research shows that people, in whatever walk of life, who fulfil their potential, lead fitter, healthier and more satisfied lives.

...a brilliant... cognitive psychologist and head of the International Centre for the Enhancement of Learning Potential in Israel, sits on the stage of the Centra Hotel ballroom, chic black beret firmly in place, smile twitching at the corners of his lips. Despite a thick Romanian accent, [the head] commands pin-drop attention from his audience of teachers and parents. At 76, [this]... teacher of a boy who had half his brain removed ("[it] now operates at IQ 120") and Down's syndrome children ("one of my students is now a doctor of dentistry") has transformed the worlds of thousands of so-called intellectually handicapped children. Without [his assistance], these kids would have been written-off as virtually unteachable. Instead they're now at university, in the Israeli Army, working with the elderly and infirm – solid, useful citizens. Just as exciting for parents who watch, disbelieving and impotent, as their obviously able offspring fail to learn to do basic things like read, is that [hi]s methods can transform difficult-to-teach kids into outstanding students. As [the head] says, "It's all in the way you teach them to think." ...His method lets children reason their way to knowledge, rather than relying on rote methods that merely feed their heads with often-unrelated facts. [The head] calls it "Instrumental Enrichment" and promises that... [hi]s 300-hour classroom-taught Instrumental Enrichment programme... will endow children with tools for learning... "to create, shape and modify their environment." [Hi]s genius, which won him the Humanitarian Award from Variety International a couple of years back, is rooted in his own early experience working with children of Holocaust victims transported to Israel after... W[W2]. A survivor of Nazi labour camps in Bucharest, from which [it]d escaped to Israel in 1944, [the head] knew what they'd been through. "These children had seen their parents exterminated. What they'd seen was indescribable... My question [was] how to help them? Would I indulge them with compassion or help them use their thought processes to try to make them think about themselves as being in control." Working for Youth Aliyah, a service run by the Jewish agency for children orphaned or separated from their parents by the Holocaust, [the head] deduced that these children had gaps in their cognitive abilities. They were virtually unable to make comparisons between different objects and events, particularly over any period of time; had poor spatial orientation to materials – they found it impossible to follow or give instructions either in a classroom exercise or in the outside world – and a complete failure to link, with any degree of sophistication, cause and effect. They were the passive victims of a disordered reality, rather than creative and effective users of information. The mass of different stimuli these children received from the world was not organised into any stream of experience which could be recalled to assess new situations and solve new problems. Their usual response to problems was blind impulsiveness or passivity... "I taught them philosophy, art, music and thinking, I taught them that by helping others they'd be much more helped than by crying with them... I developed a method – the learning potential assessment device – which enabled us to say 'Oh, this individual is functioning at a very low level, but... is able to change and I know how to change him.' ...The ability to change is not age-dependant... The brain is forever developing... it's a lifetime experience..." ...Problems that [hi]s methods can sidestep include chromosomal disorders, autism and brain damage, plus behavioural syndromes like dyslexia, attention deficit disorder, over-impulsiveness and low motivation. Barriers that prevent learning... can be overcome in two ways: first, by measuring intelligence (and therefore potential) differently; second, by teaching children to use the cognitive (that is, perceptive) abilities that have been disregarded in educational circles over the past several decades.

...the Institute for the Achievement of Human Potential[, which]... was founded 33 years ago by a physical therapist... has two quite distinct functions. Its programmes for well kids... are in fact a spin-off from its main business, which is treating brain-damaged (or hurt) children and helping them to lead normal lives... In the course of [his] work with hurt children, the [founder] made an astonishing discovery. Almost all the brain-damaged children whose parents had attended the education programme... entitled *What to do about Your Brain-Injured Child*... [– in which] brain-damaged children... were treated and educated at home... – ...were learning to read at a younger age than so-called well children. One was as young as eight months. If brain-damaged children were reading at such an early age, [the founder] wondered, what was wrong with well children? So, in 1976[, the founder] created a special sub-division of the institute... to teach the mothers of well children how to teach reading. Before long, [the founder] was providing well children with all sorts of fast-track education courses as well as physical fitness programmes (it is integral to the institute's philosophy that mental agility in young children depends on their being physically agile too). Finally, at the end of the '70s the [sub-division] – colloquially known as the Better Baby Institute – opened its own fully fledged school, a small fee-paying in-house establishment, which takes children from birth to 13... The teaching method for academic subjects is dead simple: it involves showing children endless bits of intelligence: words, numbers and pictures, all printed on white flashcards. As I watched... [a] few demonstrations, I couldn't help but think of my own three children back... [home]. What were they up to? Reading an encyclopedia? Or maybe indulging in a little French horn practice? Forget about it – more probably they were sitting in front of *Barney* on the television, eating cookies. [The first demonstration child] was... a cute 11-month-old... [who] had no trouble picking the card with 32 dots when his mother asked him to add 19 red dots to 13 red dots. Next came... [a 3-year-old who] accurately stuck the nine cardboard planets on to a large poster of the solar system... And then it was the turn of [a girl], aged five... Until her demonstration, I had been sitting there convinced that the whole performance was some kind of freakshow. [The girl] approached the stage carrying a large white card under her small chubby arm. "Today I am going to do a demonstration of conic sections and the Cartesian plane," chirped the little girl, her Barbie-blond hair glinting in the spotlight. People in the audience turned to their neighbours and mouthed, "What?" and "Seriously?" I struggle to describe her demonstration because, frankly, it was way above my head... I wouldn't have minded so much if [the girl had] been a brat. But [the girl] was a good kid. I watched her in the break. [The 5-year-old] lay on her tummy writing a story, and minding her sister... – who at two years old could already, needless to say, read and write. Talking to her mother... made the whole thing even harder to take... [Both girls] are educated by her at home. They come to the institute only on Fridays, when the girls attend specialist classes in Japanese, swimming, ballet, gym and etiquette, and [their mother] goes to "mother school"... Next year when [the 5-year-old] turns six – provided [the girl] can read, write in paragraphs, play a musical instrument and speak in a foreign language – [it] will be able to attend the institute's school... I refrained from suggesting that, after six years at home with mum, [the girl] was already prepped for Harvard. Of course, hothousing is nothing new in America. Yuppie mums here have long played their babies Mozart in the womb and stocked the nursery with challenging, eye-catching mobiles... Private tutors for children under eight have overtaken personal trainers as the status symbol of the '90s. To the experts, much of this effort by parents to accelerate their children's progress smacks of over-stimulation. [A spokesperson from] the Association for the Education of Young Children, says hothousing exploits children's natural desire to please... "At that age, we should be asking, 'Are they well adjusted? Do they have friends? Are they stressed out?' not putting them through early learning programmes." The sort of thing that goes on at the institute and other places devoted to the creation of a master-race leads... to "trophy kids who burn out, tune out and turn off." [The spokesperson] admits, however, that much recent academic research into the cognitive development of children's brains tends to confirm what the [founder has] said all along. Children can be made smarter and this can happen at an earlier age than usually considered possible. And as I watched [the 5-year-old girl], the pet phrase of [the founder] – "Every child born has, at the moment of birth, a greater potential intelligence than Leonardo da Vinci ever used" – rang tormentingly in my ears... I... headed to the Better Baby Bookshop to stock up on course materials. The key to the Better Baby, I worked out was a Truly Terrific Mother. I had wasted five years of mothering, and had a lot of ground to make up... HOME I went, lugging a *How To Teach Your Baby To Read* kit I'd bought. On the train back[to Washington], my head was buzzing with excitement. In just a few weeks, my three children would be reading! I couldn't wait till morning to get started. After a healthy breakfast of porridge I made the children sit in a circle on the floor. I opened the Better Baby box and started taking out bundles of flashcards... "Where's our presents? This isn't a present," said my five-year-old son. "When daddy comes home [daddy] always brings real presents." I started to explain that this was better than a present. I was going to spend all my time at home teaching them when they weren't at school... A look of horror crossed my son's face. [My son] stood up and kicked the box of flashcards across the room, then walked over to the television and turned on *Sesame Street*... Without looking at me, the other two children followed him, and the three of them sat in a row, rapt on the sofa. Over the next few days, I took out the flashcards twice a day, but my children never showed the rage to learn I'd heard about at the institute. Eventually, I gave up. Who was I kidding. This professional mother thing may play in Philadelphia, but it sure doesn't work for everybody.

...IT's a battle parents wage against recalcitrant teenagers every night. There's the sullen one stretched out on the bedroom floor, ghetto blaster booming centimetres from his ear, half-finished homework and junk food leftovers strewn from doorway to unmade bed. The parental response is predictably ugly... [An] Austrian-born, Auckland-based education expert... fought for years with her own academically gifted but underachieving daughter until [the Austrian] discovered "learning styles". Her message is simple: everyone has a distinctive way of learning, thinking and working. Trying to force people to adapt to a different style is a recipe for failure. Mother and daughter had a style mismatch... The same is true of couples – while opposites attract, the different styles can drive partners to distraction... Learning style differences used to be broadly categorised as "left brain" or "right brain" dominance. Until brain researchers got in on the act and pooch-pooched the description – and the theory. "It's not an organic thing... it was simply a way of labelling the differences." Now that label has become "analytics" and "holistics". Analytics, broadly speaking, are reticent, obsessively organised, accurate, competitive, perfectionist, stressed, logical, serious, single-minded individuals, while holistics are motormouths who are generally sloppy, easily distracted, easy going, untidy, intuitive, fun-loving, disorganised types who do a number of things at once but can never make up their minds. Preschools and primary classes tend to have the unstructured environment and slight air of chaos that holistics thrive in... The problems start in the more structured high school environment. Despite this, dozens of primary schools have already embraced the learning style analysis developed by [the Austrian]'s Creative Learning Company. A computer programme that assesses the styles of students and teachers... provides a computer generated personal profile which enables both to recognise and control how they work. It allows teachers and students with like styles to be grouped together... [The Austrian], who has been introducing learning styles to N[Z] schools for the last six years, has built on the research of [a couple of] New York-based educationalists... [who] identified eight different learning styles of underachievers compared to those who are successful at school... [The Austrian] believes learning styles are an important key to the underachievement of boys, who tend to be "tactile" learners. "Boys need to use their hands and body in learning and our school system doesn't allow it[, which makes boys use up]... their mental energy trying to suppress what they want to do... Girls can sit still for longer periods..." Girls are[also] more likely to do as they're told and often find other ways to learn while boys will rebel, switch off, and turn attention elsewhere – often to sport.

...*Movement is the key to learning* A high percentage of children underachieve at school. The critical years for gaining skills for learning are from birth to five years. Gymbaroo offers... education centres where parent and child from three months to five years attend a weekly 45 minute (age related) sessions under professional guidance. The role of Gymbaroo is the encouragement of Early Childhood Development through parent and community and the early identification and prevention of immaturities' in development which may interfere with later development and/or later learning... Gymbaroo has found that... children show clear indications of a looming [learning] difficulty at the age of three years, if not before...

Parents rarely have any idea of the influence restricted physical activity – a by product of modern living – has on the developing child. They do not know because they have not been told! At Gymbaroo centres, parents are not only taught about development, they experience with their child activities designed to promote these developments. The equipment at Gymbaroo is designed to provide a wide range of movement experiences which enhance body and space awareness, balance, directionality, gross and fine motor control – all important prerequisites for learning... Gymbaroo centres are for ALL children, as the ‘at risk’ for underachievement are rarely identified until they fail to learn at school.

...Two profoundly deaf students will be head prefects next year in a first for west Auckland... [One] will be head girl of Kelston Girls High and [the other will be head boy] of Lynfield College. The 17-year-olds say they’re humbled and surprised by the appointments. “I felt inadequate and blown away,” says [the boy]. “I was thinking it can’t be true, it can’t be me,” says [the girl]... Both students have spent some time at the Kelston Deaf Education Centre, which is delighted with their appointments. [A d]eaf teacher... says it shows deaf people can really lead and take on responsibility... There are about 20 students in the deaf unit at [KGHS and next year’s head girl] thinks it’s important their needs are recognised.

...Schools and parents have anxious months ahead as special needs units for disabled students face closure under new Government policy, an Auckland principal warns... [The] head of Manurewa Central School, said the Ministry of Education had closed his school’s unit, which catered for 25 children from the wider community... [and] another Auckland school, Belmont Primary on the North Shore, would close its unit... [in the next week or so. But the principal] disagreed with claims that severely disabled students were being kicked out of schools because of the forced closures and said many of the children would be mainstreamed at their local schools.

...[‘21 is normally a celebratory time for the able-bodied, but for anyone who is severely intellectually handicapped, the milestone brings pain and loss. Someone who was born with a virus similar to rubella and is a spastic quadriplegic, had to leave Green Bay High School last Friday because the Government stops funding special-needs students when they turn 21 – two years later than non-adult students in mainstream schools. The 21-year-old has spent the past six years in a special unit, Te Aratika (The Right Way), attached to the school, where the quadriplegic has made friends and participated in lessons with mainstream students. The quadriplegic, who was not expected to live beyond the age of 12, cannot speak and is confined to a wheelchair but his mainstream education has helped him make choices and learn non-verbal skills. His mother said the school was one of the only education facilities to offer inclusive education for students with severe intellectual disabilities. Backed by other parents, the mother is approaching health and welfare agencies for funding for a special unit to be set up on the site for severely disabled adults like her son, estimated to cost \$150,000-plus. “We parents feel that it’s hard enough having a child like this without having to continually battle for funds to give our children access to what others take for granted.” Yesterday the school received an IHC award for its programme in recognition of the opportunities it offered the 21-year-old and eight other students.’ ● T]he new Green Bay high student rep... [– chosen] from four candidates... [by] Year 10 to 13 students... [–] is a year 12 student with a keen interest in sport. Last year, [it] captained Auckland’s under-16 soccer team and trialled for the N[Z] under-16s. During the summer, [it] is a lifeguard at United North Piha. G[BHS] does not appoint prefects, instead all year 13 students are expected to set an example for younger students. The student rep’s job includes attending board of trustee meetings, chairing the school council and going to public functions which head prefects would usually attend.

...Last weekend I attended the 25th anniversary celebrations for G[BHS]... As a founding staff member, I was proud to be part of a team led by a principal with a vision for secondary education in N[Z] – a vision of schools as non-coercive, community learning centres, empowering all within them to become life-long learners, seeking excellence in every sphere of their lives. We had struggles in the early years with some children who saw the absence of uniforms as the absence of discipline, or the absence of the cane as a weakness. There were difficulties in later years, in an increasingly predatory social and educational climate, with families who thought that force equals discipline, or that examination league tables show leading-edge education. But... in spite of the pressure to succumb to the norm – the mediocre... [– GBHS] has continued to treat its students as people who matter and in doing so it has increased their competence, pride and compassion... Consequently, G[BHS] continues to be a school that makes a difference for the better in our society. Henderson High School, where the late Ian Kahurangi Mitchell was principal, is another West Auckland school where principles matter. Ian had a deep sense of justice, and a passionate personal commitment to making the world a better place. [Ian] was profoundly bitter about the failure of successive Governments to listen to the pain of the children and families with whom [Ian] worked, and for whom [Ian] cared so deeply. [Ian] did his best to build up... a school that was struggling, in spite of opposition from some of those responsible for its failure. [Ian] sought help from academics and the business community, and helped Henderson High School... [to become] a place where young people could learn to succeed, to take pride in themselves, and to care for others. Ian was the founding chairperson of Cave, the Campaign Against Violence in Education, which eventually succeeded in making it illegal to hit children in schools. [Ian] was also a leading member of the Citizen’s Association for Racial Equality... Ian died in Indonesia last week. [Ian] had sent me a card at the end of November, full of wickedly witty comments on N[Z] politics and politicians, and interesting reflections on East Timor. There was also a cry of deep pain and rage about the current state of N[Z]. “Those potentially great but actually nasty little islands are like an in-grown toenail turning the end of the earth septic,” [Ian] wrote. I have no doubt that one of the causes of his premature and tragic death was his grief at continuing poverty, racism and violence in a society that should, by now, know better... [Incidentally,] West Auckland’s biggest school is grappling with parking problems. Massey High School is overflowing with cars – and has nowhere to park them. The school has 2200 pupils and 100 teachers – seven of whom were employed at the start of the year to cope with the increase in enrolments... [I]t doesn’t help that the[school is situated] on Don Buck Rd – a no parking street... In a bid to beat cramped conditions the school laid concrete gobi blocks on the grass berm outside its English language Centre. The centre has a staff of 10 and no proper parking facilities. But this has put them offside with the Waitakere City Council – parking on grass berms is illegal. Council parking officers ticketed staff until the school called in the help of the Massey Community Board. The school has now turned to the council and the Ministry of Education for financial assistance with a proper carpark. But [its]principal... concedes the school will probably have to fork out for more carparking itself. “The language school is our business, so the ministry... probably won’t do anything,” [the principal] says... “Unless we get more land this will not improve.” A science lab, due to be completed at the end of the year, could make the problem even worse.

...West Auckland principals believe the case of a North Shore student threatening his school with legal action could set a dangerous precedent. The former Rangitoto College pupil claims [it] was unfairly disciplined and has gone to [the]Privacy Commissioner... to have his school records turned over... [T]he school has 21 days to produce the files... Kelston Boys High School[’s] principal... says... “It would be dangerous if schools were dragged into litigation. Our role is education, not going over things from the past. Basically we’re required to follow the law and this is an interpretation of how the law stands by the Privacy Commissioner. You certainly wouldn’t want children to have indiscriminate access to their files. But if there was a legitimate reason I wouldn’t be averse.” ...if the case makes it as far as court it could affect what information teachers put on a student’s record... Waitakere College[’s] principal... doesn’t have a problem with students accessing their files. But... says schools already have enough problems with compliance costs without the threat of legal compensation. “The more time schools have to spend dealing with this type of thing the less time they have to deal with lifting achievement. That is the concern – that a lot of energy would not be spent on our core business.”

...A centre to get at-risk west Auckland students back into schools has opened in Henderson. The Centre for Extra Support is the initiative of nine secondary school principals hoping to give a second chance to students with learning and behavioural problems. On Monday kaumatua from Te Whanau o Waipareira blessed the Pioneer St building which is the temporary home for the programme. [The centre’s] director... says they already have their first three students. “The next challenge is getting all the furniture, equipment and getting the staff on board... We need to work together for our young people and we need to ensure that we do our best to enable them to have a successful life.” Twenty short term places will be

available on the programme which is an extension of those already running in schools. The programme, based on education and therapy, will be tailored to meet individual needs and will take a holistic approach. The aim is to reintegrate students into school, although some may leave the programme to start work training or work. Massey High[']s principal... says the centre, one of the first of its kind, is a great model for the rest of N[Z]. "It's going to serve the needs of some of our students more appropriately than what we have been able to provide in the mainstream,"...

Long-term childcare is being blamed for bad behaviour of young children. A... study, which involved 1300 children throughout the US since 1991, found that 17[%] of children in childcare for 30 hours a week or more were aggressive and defiant... The... study also indicated children would probably develop future behavioural problems from long hours in childcare. Researchers said the results held true, regardless of gender, parental income or the type of daycare provided, including in-home long-term care from nannies... "...the nanny has less of a linkage with the child and may not give the [necessary] time to the children,"... said... [an] Auckland University education professor... [B]oth parents worked in 80[%] of N[Z] families, which suggested many N[Z] children were looked after outside the home. Social interaction was important for young children and more likely to occur with mum or dad who thought their child was "the most wonderful person in the world." A child would get less of that interest with one person responsible for many children because they would be competing for attention from the supervisor... But... the... director of the Children's Issues Centre in Dunedin... said... [local] teachers had not noticed a difference between children who had been in care and those who had not[, adding that]... the quality of childcare in the U[S] compared unfavourably with other countries. N[Z] research suggested that childcare out of the home – even during infancy – did not appear to harm children and could benefit them in some ways, such as improved performance in school.

...Children who are breast-fed longer do better in school and right through adolescence, according to a new study published... yesterday in the American *Pediatrics* journal... The report, from researchers at the Christchurch School of Medicine, was based on a survey of... 1000 children born in 1977[, and confirms research performed]... at the Norwegian University of Science and Technology... Some... had been breast-fed for less than four months, some for four to seven months and some for eight months or more. And some were not breast-fed at all... The authors said the findings proved valid, even considering that the breast-feeding mothers surveyed tended to be older, had above-average standards of living and did not smoke during pregnancy... [S]ome previous studies had suggested that fatty acids in breast milk improved children's cognitive abilities. In another article in the same journal, researchers at the University of Bristol in England reported that putting infants to sleep on their backs – as is recommended to avoid crib death – had no lasting impact on development. A study of 10,000 children born in 1991 and 1992 uncovered some evidence of reduced motor and social skills and diminished developmental scores at 6 months among back sleepers. But this effect had disappeared by 18 months.

...throwing beanbags in a circle all those years ago... [didn't] mean much to... [him]. "I was talking about it with a mate recently. We laughed when we remembered some... things they made us do." Now, four months short of his 26th birthday, [his]... understanding of what those tests were all about... [is clearer. Due to being] born in Dunedin's Queen Mary Hospital between April 1, 1972 and March 31, 1973, [the 25-year-old] is "one of the most studied people in the world." It's all [his] mum's fault. Shortly after [being]... welcomed into the city's only obstetric unit... [his mum volunteered him] for the Development Multidisciplinary Health and Development Research Unit study. "Some of the mothers were anxious. They thought they were being spied on... th[a]t they were judging our abilities as parents," says [his mum]... The parents of 1037 children born in the prescribed time period at what today is a scarfie hostel allowed their babies to become guinea pigs for a study that has been full of surprises for the medical world – if not the participants. "We get a newsletter about what they found after we're interviewed but I don't take much notice..." says [the 25-year-old]... While some of the participants may be vague on what they have actually contributed to... the unit's director... who started the study in 1972 is in no doubt... the major benefits have been in the form of publications and reports. [Ove]r... 181 authors have produced over 550 reports and publications detailing the progressions of children from birth to adulthood... contribut[ing] to a greater understanding of health and development issues affecting children and how their upbringing can be less traumatic... Research into blood pressure led to a recommendation against mass screening for hypertension during childhood after the study found screening would be fruitless given the lack of stability of high blood pressure in children. A study of childhood injuries preceded the establishment of the Injury Prevention Research Unit at the Otago Medical School and dental research confirmed the value of fluoride. An educational psychologist[, the unit director] launched the study to look for links between complicated births and later problems in childhood. But his researchers outgrew those early parameters long ago. A massive archive already exists that covers everything from the children's favourite soft toy to their academic results, from kindergarten tantrums to lost virginity. The study members were first examined at birth, followed up and assessed as three-year-olds then every two years until 15. They were next seen at 18, then 21 and now the intervals are carried out at five-year intervals. This month, Phase 26... begins. Over the next 14 months, at the rate of four a day, the[y]... will again have an eight-hour assessment at the research unit... Planning has already begun for the next phase... when the study members are 31. The beanbag throwing days are history but the study sample will again be asked about matters such as their emotional well-being and behaviour... Fewer than 20 participants have dropped out... or died. [The rest remain] happy to continue telling [their] life story, warts, allergies, drinking habits and all to interviewers or via computer when confronted with... personal questions – the stuff [they] wouldn't even tell [their mums]... The study's flow of fact and insight has gained international attention and praise. In 1993, the *Journal of the American Academy of Child and Adolescent Psychiatry* described the Dunedin researchers as "the pacesetters, the ones the world watches for innovation and enterprise"... and this year four of the study components are financed by the American National Institutes of Health... Much of the early literature focused on what influence the parents have in child-rearing... Among other things, the study has confirmed many common-sense elements of parenthood – such as the importance of love and affection. Nothing earth-shattering there but findings have also contradicted other long held beliefs of childhood development, reducing the oft-quoted Jesuit estimate of a child's formative period from seven years to three. In 1984, researchers... discovered many suspected causes of problems in latter life such as forceps deliveries, caesareans and premature birth actually had little long-term effect, contrary to opinion at the time. Instead, they found low birth weight in full-term babies had an adverse effect on later intellectual growth and behaviour, leading to new vigilance among doctors in the way they treated pregnant [people]. After nine years research the study team found breast-fed babies are no better adjusted than their bottle-fed counterparts, although they tended to be brighter... Thumb-sucking and bed-wetting, both thought to indicate anxiety, actually have no tangible effect on a child's progress. Also, the study debunked the popular myths that: • Children of working mothers suffer behavioural problems because of their mother's absence. • Left-handedness contributes to delinquency. • Children born later into large families have lower intelligence... Inconsistent discipline, they found, almost ensures problems in late childhood and teenage years. Children from broken homes (61% of the children grew up with both biological parents) are not necessarily disadvantaged, nor is wealth an important factor in raising a happy child... The study concluded, however, that children can struggle to overcome a poor start. This belief convinced the Government to launch Parents As First Teachers... in 1992. The scheme continues with educators visiting 8800 families of pre-schoolers once a month... So the parents of the guinea pig children have enabled future generations to take a smoother path between the school gates and beyond... As many of the participants are now parents themselves the study now explores the impact of parental knowledge, attitudes and behaviour of members on their own children. For the first time this year, study members will be asked to recount any unpleasant sexual experiences, outline how they have thought about physically hurting themselves... [- a] third of the [subjects] suffered a mental disorder between the ages of 15-18 with depression worryingly prevalent... [-] and give a blood sample to determine the extent of the herpes simplex virus in young N[Z]ers. Blood will also be requested to build a new DNA bank to be used for future scientific studies. Their backs will be photographed to assess

moles, and therefore better understand how melanoma develops. None of this daunts them... But... no one is looking forward to the dental check. Some things never change.

...*New book says old ways don't work* A NEW book about trouble-making teens says schools need to turn their entire discipline systems upside down – and detentions, time out of class and trips to the principal's office should be first to go... The book outlines a range of early-intervention options and finds that boot camps and the majority of school or family-based programmes are ineffective... The book, *Adolescent Reputations and Risk*, is a collation of hundreds of studies, including dozens conducted by the authors, in a 15-year investigation into what makes teenagers go off the rails and what can be done about it... The[authors'] key finding is that when children are in their early primary school years (or perhaps even at preschool) they make a decision that can shape the rest of their lives – to either follow the rules or break them. The book says as rule-breaking children grow up, it becomes increasingly difficult to change the trajectory they have chosen; and its authors are calling for further research to focus on what feeds into each child's decision in the first place. They have already isolated certain factors (including a high IQ and self-esteem, and a positive family climate) that predispose children to choose the conformers' ladder. The good news for parents is they can help keep children on track... [-] talking, listening, showing your child you are trustworthy and that they are loved unconditionally are crucial. The "conforming" children who follow the rules grow up striving to meet goals such as being nice, behaving and getting good marks. This is how they become more popular. The "non-conforming" children who decide to break the rules also strategise and set goals – but this time they aspire to things such as baiting the teacher in class, or stealing cars. They relish public punishments because this is how their "achievements" get noticed, and each time they are noticed they go up a rung on the "non-conforming" social ladder. Teens in the studies said detention helped them make new friends. Time out, or getting sent out of class, became a game of who could be sent out the quickest and stay there the longest. And they enjoyed being sent to the principal because other students saw them and knew they had done something bad... A worrying third group of children – loners – is also identified. Children in this relatively small group don't seem to care about having an audience and their rule-breaking tends to be more violent.

...A Glen Eden teacher has come up with an idea to help keep youngsters on the right side of the law. [The teacher] suggests expanding the Parents as First Teachers programme to include primary schools. The move would see teachers visit homes and show parents how to help their children read and write. [The teacher] believes schools would spend a lot less money on special programmes with a similar outcome and enhance relationships between home and school[('the education of the child is the joint responsibility of the home and school and for the best results there should always be the closest co-operation between' them)]. The suggestion was made to [the]Minister of Corrections... who visited Glen Eden Primary School as part of a national tour aimed at turning people away from crime and reducing reoffending... The minister says... prevention starts with children.

...N[Z] parents talk less to their teenagers compared to other OECD countries, says a newly released study. The Programme for International Assessment (Pisa)... study included research about the impact family has on 15-year-olds' reading, mathematics and scientific literacy. N[Z] was one of 32 countries that took part in the first triennial Pisa study... Results showed that both boys and girls in this country reported a level of social communication with their parents well below the OECD average... Avondale College[']s principal... says a parent group is starting at the school soon. [The principal] says family support is important to teenagers and can be seen in students' attitude to school. "There's a fine line[, however,] between being interested in your youngster and interrogating them. Most teenagers need more space..." Many Auckland schools hold seminars for parents throughout the year. Parenting with Confidence is a national organisation that organises such events. [The organisation's d]irector... says the highest barrier to parents' frequent communication with their children is stress and lack of time. [The director also] says parents need to reclaim their ground. "The... parent of the... new... millennium [will be] a coach. You've got to be passionate about your team."

...*Parenting: a job no one can perfect...* There is no such thing as the perfect parent and each year thousands of people decide they want to make a better job of it. Last year, more than 5000 people attended one of the 467 courses run at Parents Centres around the country. Most go of their own volition for a little help and support. Others are referred by Child, Youth and Family Services. Aside from teaching people the A to Z of what to expect with the birth of a child, the centres also explain how to cope when parents feel they are sliding out of control... [The] president of the voluntary organisation set up in the 1950s for parents by parents, says informing a couple of what to expect can take the heat off once the child arrives. Having no idea what to do – say, if a baby will not stop crying – can lead to situations a parent may regret... By empowering them and giving them control it gives them a really good start to life with the new baby..." □... Parents are being urged to swap their babywalkers for stairguards. Plunket's west Auckland safety co-ordinator... says babywalkers can cause injuries and limit children's physical development. "Children that use babywalkers are between four and nine months old... They can scoot round and reach power points, pot plants and hanging jug cords." ...Plunket threw its weight behind a major campaign to ban babywalkers earlier this year. Although unsuccessful... the campaign raised awareness of the dangers posed by babywalkers... On Friday, to mark the start of the fifth KidSafe Week, Plunket is giving away 30 free stairguards bought with a \$500 grant from the ACC. To get one, drop off a babywalker from 10am to 3pm at Plunket, 93... or 199 Lincoln Rd...

Children learn to speak more quickly when parents use single words in isolation, rather than in sentences, a study has discovered. The findings challenge theories that infants rely heavily on picking apart sentences into their individual words... [A] computer scientist at Washington University in St Louis, used portable tape recorders to analyse the conversations of eight mothers with their children in the home... "We found that mothers instinctively used quite a few words in isolation and that about 9[%] of their utterances are single words. Many of the words babies learn to use before the age of 15 months are words their mothers have said to them in isolation." Giving a child a basic grounding in simple words speeds up the learning process later when children have to learn how to break down sentences. [For example, a] child who knew the word "red" early on would be able to break down the phrase "red ball" into two words more easily, [the computer scientist] said. "However, this does not mean that parents should purely use monosyllabic speech to their babies."

...They seem helpless at birth, little more than a bundle of needs that is often ugly. But the apparently random waving of arms and gurgling of newborn babies represent a complex system of highly intelligent communication. What might seem an unseeing stare or inconsequential movement of the arms has been revealed as a highly deliberate... attempt to study their new world, understand it and interact with it. From the time they leave the womb, they have almost all the adult emotions and are actively communicating them. Their only problem is that most adults don't understand what they are saying or why... *The Social Baby*... (...which is... not available in N[Z] is)... the product of more than a year's research, documenting every movement of more than a dozen babies, from birth to three months. Within a minute of birth babies can identify their mother and are more comforted by her than by a stranger. Within two minutes they are straining their neck to study her face. Within 15 minutes, the baby is studying the father's face and actively imitating his facial movements. Within half an hour, the baby can recognise one abstract pattern of dots as more similar to a human face than another – and prefers to look at it. [The co-author, a] professor of developmental psychology at Reading University... says: "Infants are motivated to engage with other people from the moment they are born. There is a wired-in programme to help babies lock into those that are caring for them... Now we know the ability of a baby to communicate is extraordinary, and few people understand that. It's such a revelation." The book has proved an eye-opener for the parents who took part. "[Babies] know an awful lot more than we give them credit for," says [one parent]. "We feel far more in tune with [our latest baby], and feel more comfortable... [with] him... than with our other babies."

...we've always known that behind those solemn, unblinking eyes and blank expressions, babies' brains are racing along faster than at any other time in their 80-odd years ahead – absorbing experience like a fine sea sponge... [A] New Plymouth paediatrician with a passion for child

development, explains the incredible power of interaction, specifically new experience encountered in a safe environment, in her new book *Brainy Babies*. After 22 years of working with children and [raising] three – ...part-reared by a variety of nannies... – of her own, [the paediatrician]’s knowledge of her subject covers clinical, physiological and practical angles. [The paediatrician] brings a distinctly local approach to a subject that until *Brainy Babies* had not been covered in N[Z]. And, as... the... [paediatrician] says, the message is vitally important: simply, stimulation, love and nurture make a baby’s brain grow. “A touch, a cuddle, an embrace. In this wonderfully interactive dance of cues and responses, thousands of immature brain cells in the baby’s brain are provoked into action... The repeated, consistent, nurturing physical actions of the parent (or guardian) provide the sensory experiences for the baby, driving the repeated, consistent electrical activity of the brain cells needed to secure the pathways and the connections that will stay in place for the rest of life.” By eight months a toddler has around 500 trillion brain connections... By age 3, roughly 85[%] of the neurobiological structures for future functioning have been laid in place. They are also almost impossible to reactivate. “The experiences of these tiny children can add to their understanding and change behaviour, as they can at any age... But unlike any other time of life they are additionally charged with permanently wiring the brain... through this, influencing the boundaries of their capabilities, competence and coping skills as adults.” In other words, babies, aided by stimulation and protected by a nurturing environment, learn things. Fast. Which does not, assures [the paediatrician], mean that mothers must be the exclusive caregivers – and that working mothers equal brain atrophy. What [the paediatrician] does strongly recommend, however, is that babies get lots of regular, stimulating interaction, preferably with a one-on-one caregiver who has the time and experience to know about the importance of his or her role. Long periods of creche-style daycare with little time for cuddling and stimulation are a poor substitute. “Babies’ brains wither because they can’t go anywhere suitable but are parked in a corner in some awful creche,”... [The paediatrician] is especially disturbed by two factors. First, the large number of single mothers raising children, largely unsupported; second, the growing number of gaps in the care of children. “I see it more and more – kids who spend hours alone after school – and we can do nothing about it. That’s why people in power should understand the vital importance of early brain development. The country needs to sit up and provide the kind of quality daycare that’s needed. We’re dealing with a timebomb.” □ ...according to recent research... by two... British... psychologists... the quality and type of care given to young children was crucial to later development... [However, t]hey also found... [that c]hildren who attend childcare centres or pre-school are nearly five times more popular in later life than those cared for at home... [because] children who regularly mixed with other children and systematic learning activities developed better networking skills.

...Salvation angels are coming to the rescue of west pre-schoolers and their frazzled parents, by battling money woes and regulations to set up a licensed early childhood centre. Escalating childcare costs mean the Salvation Army’s centre is a godsend for solo and working parents struggling to cope. The... centre had been running as a creche for some time but couldn’t apply for a Ministry of Education licence until a new ablutions block – costing \$30,000 – was built. The Waitakere Licensing Trust came to the party and the centre can now run as a licensed premises for two-hour sessions. The... West MP and Minister of Youth and [Gal]’s Affairs... says the access to and affordability of early childhood education is an issue which needs attention in the west, given our large number of young families. “We know that children from Maori and Pacific families, sole parents and low income families have lower levels of education than other children, and they represent a significant chunk of west Auckland’s... growing population,”... Around 35[%] of Pacific three-year-olds miss out on early childhood education compared with only [10%] of non-Pacific youngsters.

...MANY Pacific Island preschoolers are missing out in vital early education. [The]Youth Affairs Minister... says most [NZ]children get early childhood education, but there’s a big gap for Pacific Island toddlers. Among Pacific Island children, about 20[%] aged four... don’t get any recognised early childhood education. That compares with just 2[%] of non-Pacific Island four-year-olds... [The minister] used an open day visit to Henderson’s Mafutaga Aoga Amata Centre... [– which] started in 1989 in a Henderson church hall before moving to its own building at Henderson High in 1992... [–] to highlight what Pacific Island children are missing. “Many have more family support than others but they’re missing out on education values from centres like this... One of the big issues with these centres is getting trained staff who are bilingual. The Government has provided 40 scholarships for Pacific Island language speakers to go to teachers training college to get early childhood diplomas... [■]Literacy experts are worried that teachers are not being properly trained to teach children to read and write. A group of academics and researchers advising the Government-appointed Literacy Taskforce wants more research into teacher training – to find out if graduates are up to the job.

...parents should be worried... [about some] teacher-training organisations... accepting substandard trainees... says the secondary school teachers’ union... [The PPTA] president... said a shortage of quality applicants was tempting trainers to take unsuitable candidates. Some were not even interviewed before being given a place. Last year, a third of trainees pulled out before the end of their course, a sign that some should not have been accepted... There are now 21 providers of... teacher training... compared with the original six colleges.

...Eight of west Auckland’s future teachers had their first day of training in... primary schools this week. They are among a record 35 students enrolled in the Massey University graduate primary teacher programme this year. As a part of the one year programme, the trainees will spend every Thursday in three... local... primary schools to gain practical experience. Marina View Primary is taking on 12 student teachers overall this year. [The school’s] co-ordinator... says they are looking forward to having trainees in the classroom. “We’ve taken them because it’s very good professional development for us as a school, but also to offer the school to students so they can get experience,”... says the c[o-ordinator, who adds that the c]hildren love having trainee teachers in the classroom... [One t]rainee teacher... from Helensville already has two degrees in education but is taking the Massey programme to help her move into the field of special education.

...Eight primary schools have employed novice teachers as principals and there is concern about the pressures they face. Two are straight out of teachers college and the other six have had a year’s teaching. [The]Principals Federation president... said it was sad to see beginning teachers employed as principals, which was probably a reflection of the difficulties of finding staff for some small schools... [(a)]l eight were employed in... schools, with between 6 and 93 pupils[)]... “They have a lot to learn in terms of straight teaching and curriculum delivery before taking on added responsibilities of community liaison and school governance.” ...[the]Auckland College of Education spokes[perso]n... said graduates of teacher-training courses were trained to be beginning teachers, not principals. [The spokesperson also] said first-year teachers would need a lot of support to make the jump to principal... A Ministry of Education... spokes[perso]n... said the principals were receiving one-on-one support from the ministry and mentoring or training. [● ‘While the department makes a substantial investment in initial and refresher teacher training at pre-school and school level, principals receive no more than a few days training on taking up their leadership role.’]

...This week the 34-year-old, youngest-ever Minister of Education effectively made his debut in the job, with a wide-ranging speech setting out his new agenda... [while giving] him a golden opportunity to repeat one of National’s favourite mantras – that Labour MPs in government will do whatever teachers tell them... [The minister] dumped the Government’s plans to test all primary school children in maths and English, attacked teachers’ colleges as “bastions of political correctness,” criticised mainstreaming policies that force schools to take severely disabled students and hinted at a significant boost for computer education. Not bad for starters, but still relatively low-key by his own standards... By his own admission... [the minister] is blunt, outspoken and sceptical about the ideological purity that has driven National for much of the past... [The minister] is also widely regarded as stubborn, unpredictable, quick-tempered and willing to scrap in public. Education is in for a boost in profile... [The minister] spent a day in the classroom during his first week in the education portfolio, in keeping with previous roles – [the minister] has tended to announce conservation policy at the foot of Mt Ruapehu or corrections policy outside Mt Eden Prison. In one bizarre radio interview, [the minister revealed it] was speaking from a kayak in Wellington Harbour, in preparation for a Cook Strait crossing attempt... But despite colleagues’ accusations of contrived headline grabbing and some hits on easy populist targets – such as his recent decision to tap prisoners’ phone calls – [the

minister] has never shied away from hard issues. In his nine years in Parliament, the Nelson MP has taken on some long-running tough causes, including a family's custody battle with members of the Exclusive Brethren church and the financial woes of the Druids Friendly Society. During last year's Lake Waikaremoana occupation [the minister] ignored coalition sensitivities and threatened to resign unless [the]Maori Affairs Minister... stopped negotiating with protesters over his head... This week's scene-setting speech was a typical... mix of pragmatism and cliché – “in the smorgasbord of education, this year's main courses are literacy and information technology,” and unexpected policy changes... [The minister has already said that it wants to scrap his predecessor's plan to introduce] national tests for primary school children because they would... be... too time-consuming for teachers and too inflexible for schools. [The minister] favours giving parents similar information through internal assessment, with checks to ensure national consistency, although [the minister] admits this could be challenging. The abrupt decision is a slap in the face for his predecessor... who launched the major policy change less than a year ago. And at first glance, [the new education minister] seems to have given up an easy political platform. Promising... to test children on the 3 Rs would be the educational equivalent of tougher sentences for home invasion – it may or may not work, but at least it looks like firm action. But a rare political consensus suggests that [the minister]'s description of testing as “a bureaucratic monster” is in touch with the public mood... [The minister]'s next big challenge could erupt from rising tension over bulk-funding... In the past few months a Hawkes Bay board and a Christchurch principal have resigned, amid claims of teacher intimidation when their schools agree to the system... which gives schools a total budget for all expenses... So far [the minister] has walked a fine line between condemning teachers who stop schools from adopting bulk-funding and avoiding... calls to make the system compulsory, which could tip public feeling against the Government. Despite some concern that it could be cast as the bully if this happens, National is confident on the bulk-funding row. It believes there will be limited public sympathy for teachers who make schools ungovernable... [The minister] has also signalled that improving teacher quality is one of his priorities. In a *Listener* interview last month [it] said: “My preliminary view is the teaching profession is not good enough and it's time it had a shake-up.” The new minister now claims [to have] a high opinion of teachers in general and that the quote was taken out of context... [Yet, i]ncompetent teachers at dozens of South Auckland schools are still hindering the learning of children, according to the E[RO –] which two years ago called for them to be removed... The office recommended in 1996 that schools get extra money to pay out bad staff, but specific money had not come through... The chief reviewer... said many school boards needed to bite the bullet and consider sacking incompetent staff... The... new report... found that some boards were devoting significant time and money marketing themselves. They generally felt the effort could better be put towards learning programmes but considered they had no choice... The Minister of Education... said... “We are addressing the problems that have developed over many, many years. They cannot be turned around overnight, but I am pleased with the overall progress being made.”

...TEN years ago this month, [a NZ Labour PM] and Education Minister... launched a 45-page yellow booklet. Seldom has so small a document promised so much for a public sector, a generation, and indeed a nation. According to [the PM], Tomorrow's Schools: The Reform of Education Administration in N[Z] was “one of the most important proposals for education reform ever announced by a N[Z] government.” Its aim was no less than to make all schools good schools. The booklet had its origins a year earlier... when... [someone who had gained] experience on the Auckland University Council, the Auckland Technical Institute Trust, and in social welfare... received a phone call asking him to head a task force to review the country's education system. [The receiver] was startled: “Hey, I'm just a grocer,” said the former head of Progressive Enterprises, owner of Foodtown. “I haven't got any university qualifications.” ...At the time, the education sector was in danger of sinking under the weight of its own bureaucracy. It was also being torn apart by a schism between liberal and conservative approaches to teaching. Some stressed the importance of traditional subjects and academic excellence; others pushed for social engineering topics and fostering self-esteem. The debate raged. Parents felt powerless, especially if they disapproved of the local school. Their only options were to move or go private. The bureaucracy was all powerful and cumbersome. [The grocer] recalls an “enormous amount of duplication.” ...In their 137-page report, *Administering For Excellence*, [his] task force recommended reducing central administration, giving schools more control over their own destinies and parents more control over schools. [The PM]'s Tomorrow's Schools did not adopt all of [the task force]'s report, but it promised “more immediate delivery of resources to schools, more parental and community involvement and greater teacher responsibility.” ...It created the E[RO] as education's police force, and it imposed business disciplines on principals... Significantly, it endorsed [the task force's] plans for self-management of schools. The Education Department (primary) and Education Board (secondary) were replaced by parent-dominated Boards of Trustees, one for each school... These days... [we] call them “Today's Schools.” So are they what was promised? ...What have been the costs? And, most importantly, is education now any better or worse than it was before the... revolution...? ...Every morning, [a]15-year-old... rises in time to cut through the back streets and catch an ageing school bus as it reaches Kingsland, having threaded its way through cafe-lined Mt Eden village, Balmoral and Sandringham. By the time [the 15-year-old] boards, the bus is almost full with “heaps of friends” who travel “out of zone” to Western Springs College on the other side of Auckland. Why make the trip when highly sought-after Auckland and Mt Roskill Grammar Schools are so close? ...“We like... the more liberal co-ed education of Western Springs more than the highly disciplined all-[boy] culture at Auckland[and Mt Roskill] Grammar.” ...This is a fragment of the picture made up by Today's Schools in action. Eight years ago, before the Education Amendment Act... removed the zoning that forced parents to send their children to local schools, [the girls on the bus would have gone to Auckland Girls High or Epsom Grammar while the boys] would have been at Mt Roskill, Mt Albert or Auckland grammars. Now they are part of a snakes-and-ladders-like process that takes place every school day as children commute to the school of their choice. Abolishing zones was supposed to create a perfect education market... [Instead, it has created] a lopsided, sometimes ugly picture. A system that was supposed to give parents absolute choice to pick good schools has instead given good schools the choice of clientele... Typically, schools in the richer areas have enrolment schemes. Those schools which the buses bypass don't... Most, but not all... enrolment schemes... include a proximity clause. Those that don't have sparked headlines when children living next to the school gate have been turned away, prompting [the current]Education Minister... to draft a loosely worded bill which, if passed, will give children the right to attend a conveniently close state school. While the top schools flourish, those catering for the poorest and most disadvantaged children in the country are struggling... Look no further than Auckland's Tangaroa, Tamaki and Mangere colleges and their single-figure [SC] passes. They are under enormous threat as families bypass them for their slightly more affluent neighbours... More than 3000 local students went to schools outside the area... What is the reality in the “sink” schools they leave behind? ...[a] former principal of Tamaki College and a passionate spokes[person] for equality in education, talks about potential damage to society as a whole if we allow polarisation to continue. “Education is not a business but a community activity in which we're all vitally involved... education [is] a force for social cohesion [not division.” The]... energetic former principal of Western Springs College, spent three years trying to work his magic on Tangaroa. Despite “the most dedicated, excellent teachers” the roll is still under pressure as students who can afford the bus fare bypass it... and remember that funding is tied to student numbers – once the downward spiral begins, change comes hard... Many of the mostly Maori or Pacific Island students... don't have anywhere to study when they get home – let alone reference books, computers or educated parents to help... [T]heir parents want them to be educated but do not understand the requirements of high school, such as having to study at home at night. Looking after younger children, cooking, working for money or fulfilling their duties for the church often consume all the teenagers' after-school time... Pacific Island children are also taught not to question authority, so they do not ask questions in class. When something goes wrong their parents do not front up at the school demanding action, because that would be disrespectful... Often families cannot afford even minimal school fees, and are unlikely to have the time or expertise to sit on the school board either.

...Nationally, while Pacific Islanders make up 7[%] of students, their parents comprise only 2[%] of trustees... Maori make up 20[%] of the students, [but] their parents represent only 13[%] of board members, and a large number of those have been coopted rather than elected. Not only

are they outnumbered on boards, but they tend to lack the professional skills required to have an effective voice... When they do speak out, they feel they are not listened to... As a result, two reports this month from Te Puni Kokiri (the Ministry of Maori Development) record a distressing level of failure and alienation among Maori students and their families... The second report from the consultation process that followed last year's discussion paper, Making Education Work for Maori, describes how [adult] Maori continue to feel that because their own experience of school was demeaning they are reluctant to become involved as parents... [A] senior lecturer in Auckland University's Maori education unit... believes Maori are best educated whe[n] their culture is valued. Which is why [the lecturer] is a founder of the... immersion units where Maori are taught in their own language and English is taught as a second language. Although they predate the reforms, the new policy has encouraged the[se units. The lecturer]... attributes the success of kura kaupapa Maori in part to culturally sensitive teaching and parents being given autonomy. INSTILLING pride in their Maori identity fosters in children a willingness to learn and achieve, [the lecturer] says, and because the system works as a whanau the economically advantaged help the disadvantaged. Less enamoured with the kura kaupapa Maori is the head of the E[RO]... who has "a conspicuous number of concerns" about the level of professional and managerial training among the people running them... The... reforms have failed to address these complex but fundamental issues, [but] they have in a sense freed... committed educationalists... to find local solutions, without the interference of rigid bureaucracy... [However, under] the old system... schools and boards were better supported... [Furthermore,] self-management means there is no structure for the lessons from... successes and failures to be shared locally or nationally.

...[until now, a SC] result in the mailbox was the first indication parents had of how their children were doing on a national level. The announcement by the [previous] Minister of Education... of national tests for 9- and 11-year-olds may have thrown teachers and principals into a spin, but [the minister insisted] that the tests are what parents want. A pilot scheme involving 10[%] of schools will see the two age groups undergo three tests – in reading, writing and numeracy – next year. Schools will be asked to volunteer for the pilot study... half will get the new national tests, while the rest will use existing information to assess children's skills. Next term, all parents will be sent a pamphlet explaining the system, based largely on one in Victoria. There, parents receive a report showing how their child compares with others in the same age group from around the state... [However, NZ parents] wanting to see at a glance how their child's school compares with the one down the road will be disappointed, as [the minister] ruled out such comparisons, as well as the publication of league tables ranking schools... The president of the School Trustees Association... was aware that assessment varied across schools. "Parents notice... the different standards... if they've lived in one area, and then shifted, and the kids go to another school..." A Ministry of Education report found that schools were hiding underachievement from parents, in some cases to protect both parents' and children's self-esteem... Critics say the tests will measure a meaningless aggregation of skills and knowledge on a particular day, and will not tell parents how their child has improved. Some teachers are concerned about children suffering stress. In Canada, some needed tranquillisers, and school boards handed out guidelines on alleviating stress. The primary teachers' union said there had been international opposition from parents. In Scotland, England and Victoria, parents refused to send their children to school to sit the tests.

...A new, independent proposal to test schoolchildren could salvage a widely unpopular Government testing plan that teachers have threatened to boycott. The E[RO] today launches its own proposal to nationally check and compare children's progress at primary level... The review office said national testing would provide much-needed information for parents who often did not know what standard their child had reached during primary years... The review office suggests pupils between the ages of 7 and 10 be tested at three curriculum levels, rather than at three class or age levels... Although teachers and principals said it was a vast improvement on the Government's model... most remained extremely sceptical about testing limited aspects of early learning... Tests would focus on elements of reading, writing and mathematics.

...After her son failed his mid-year maths exam... Mrs J. G. asked The NumberWorks if they could help "bring him up to speed". We heard from her again the following year, by way of a letter in which... [the parent commented: "Before my son] came to you [it] had a real 'block' with his maths. You helped him turn the corner and become really confident. Many many thanks." ...We learn best when the learning experience is fun and when rewards are immediate. This is the message from... [the] Professor of Human Development and Education at the University of Chicago, who also serves on the Child Labor Advisory Committee of the US Department of Labor, and the Centre for Giftedness of the Federal Department of Education. These findings come as no surprise to the creators of The NumberWorks, the rapidly expanding after-school maths learning programme that is sweeping N[Z, AUS] and now rapidly moving into Europe. Developed over a decade ago and proven by the success rates of thousands of children, boys and girls, from Year 1 through to Year 11, NumberWorks aims to make maths learning fun... The NumberWorks concept is so powerful that students often try to stay on well after their weekly one-hour lesson has finished. Anticipation is high for their next class also... The combination of the conventional school classroom maths teaching and NumberWorks coaching support has proven to be a very effective method of maximising learning and minimising the risk of failure... Call your nearest NumberWorks centre to arrange a free introductory lesson.

...*Improve your recall ability*... Have you ever been introduced to someone and immediately forgotten their name? It's embarrassing isn't it? ...According to [the creator of]... *Mega Memory*... there is no such thing as a good or bad memory, only a trained or an untrained memory. With *Mega Memory*, you learn to access the part of the brain that never forgets, the same place that stores your phone number, or the alphabet. After just a few short hours with this program, your memory dramatically improves. Just imagine how an improved memory will provide you with an amazing advantage in both your personal and professional lives... A better memory will improve everything you do. But it isn't taught at school or work... it's up to you, and *Mega Memory* is the revolutionary program that will get you started. *Mega memory* is based on techniques first discovered in working with blind and mentally handicapped children. [The creator] adapted these techniques so anyone can release their own instant recall ability. Over one million people have already benefited from this home study system! and it's suitable for all ages from students to the retired... Only \$129... "If your memory hasn't sufficiently improved within 30 days, return for a full refund"

Learn to read at record speed! With revolutionary techniques, *Mega Speed Reading* can double or triple your reading speed... Developed by... the world's fastest reader, the... \$129... programme contains 6 audio cassettes and 1 video tape plus a workbook... [The developer wa]s joined by [the creator] of *Mega Memory* fame and together they've provided] the expertise which elevates *Mega Speed Reading* above all other similar products! ...*Mega Speed Reading* only takes a few hours to learn unlike many other speed reading courses that can take weeks or even months to master.

...Now ReadingMaster is here, a superior sequential learning programme, devised to help your child read before they reach school. But it's more than that. It will also teach them about the world and build learning skills... [in 'just 10 minutes a day'. The devisers] researched the teaching methods of leading educators and fine-tuned them into a practical, step-by-step learning system, specifically for N[Z] children... Education professionals are impressed... "This system is a unique blend of effective methods produced in an outstanding format. The quality of the information and the lovely illustrations... [- commissioned from an] award-winning artist... [-] make these books a must." ...If you want the best for your children call now... and ask about receiving ReadingMaster at a great price[of just under \$300]...

If you want the best for your son, daughter or grandchild, then now is the time to act. You'll dramatically increase your child's chances of success in education and life when you give them the gift of reading. It's your child's first step in receiving the best education, getting the best job opportunities and achieving their unlimited potential... You can start your child on the road to success with ReadingMaster. This simple to use system has already helped children right across N[Z] learn to read before they've even started school... "...now five, [my son]'s just started school... and they're surprised at his general knowledge." "Most of my friends... aren't aware that you could actually teach your child. And I didn't actually teach her, it's the programme that actually teaches them." When you order your ReadingMaster system you'll receive 5 SOUNDS FLASHBOOKS. They introduce all the basic sounds of English, enabling your child to easily sound out words. Plus... 10 SOUND READERS. These stories contain

colour-coded sounds for super-quick recognition. You get 8 FLASHBOOKS with clear, uncluttered pictures, that are packed with information about your child's world. There are also 4 FLASHBOOK READERS. This set of special stories are ideal for parents to read with their children. In all, the set consists of 27 easy to learn books, all beautifully illustrated... But there's more! You'll also get the 3 ReadingMaster videos. They bring the whole system to life in your home. There's also the CD-Rom to turn your ReadingMaster system into a truly extraordinary multi-media event.

...If you are a fluent reader, you have probably never given a thought to the typeface in which your printed material is delivered. But for dyslexics, everything from the font size to the colour and quality of the paper can make a difference. They frequently experience visual distortion when reading... [T]his month... se[es]... the launch... of Read Regular, a typeface designed... for [the 1-in-30] people with dyslexia... ■ Today is national dyspraxia day... Dyspraxia is when some of the connections in the brain are not working properly. That makes it hard for your body to do what your brain tells it to... About 7[%] of children have dyspraxia... It shows up as having trouble speaking clearly, writing, concentrating... Try to teach [kids with dyspraxia] something new and [they] will struggle. But give [them] a chance to practise and [they] can learn.

...The reading debate is back under the spotlight... An international back-to-basics swing in education has... [governments] pondering what to do about children who do not learn to read... The British Government has introduced a... programme in schools this term[that gets pupils to] spend a "literacy hour" each day on reading and writing tasks... [T]he British Education and Employment Secretary, said it was the first time in a generation that "tried-and-tested" methods for teaching literacy and numeracy were being used in all primary schools... While areas like California and Texas have turned literacy teaching on its head by bringing in a system of extreme phonics, in N[Z] we are anxious not to throw the baby out with the bath water. Before the 1970s phonics was the way we learned to read in N[Z]... The '70s and '80s brought a revolution towards the whole language or holistic approach... [Now] researchers at Massey University are saying that we have the balance wrong and it could be causing reading problems that see between 20 and 25[%] of students enter Reading Recovery at age 6... But overseas we are still seen as "a lighthouse for the teaching of reading across the world." Teachers from the US still stream to N[Z] to do courses; so do Scandinavians, Swiss, and Canadians, and in 2000 N[Z] will host the International Reading Association world congress.

...N[Z] programmes for literacy, reading recovery, and junior science and mathematics have created a lot of interest overseas and our children's books are in hot demand... At least 445,000 children have gained benefits from the Reading Recovery programme since it was introduced to the U[S] in 1985... Reading Recovery... has [also] been adopted in A[US, Britain]... and Canada... This month, a group of 20 teachers, principals and administrators... [from] Denver, Colorado... is visiting our schools to observe and teach literacy the N[Z] way. While the system in Colorado allows teachers to teach literacy any way they see fit... the visiting educators are blown away by the strong, consistent model in N[Z] schools. They say our common philosophy on what is taught, high expectations of all students and our national English curriculum are enviable... "N[Z]'s system emphasises teaching for meaning... they encourage children to become independent readers, and they use brilliant literature." ...Teaching individual students at the level they are at, rather than at their year level, is another factor that has the Americans hooked... The situation was different in Denver where students at each year-level were given the same book to analyse "day after day," whether they had read it two years ago or could not read it at all, leaving students feeling bored or frustrated... [In related news, t]wo high profile members of West Auckland's "immigrant community" are at loggerheads over a tough new stance on English language entry requirements. Those seeking entry in the general skills category are now required to speak English well enough to study at university. Government lifted the standard from 5 to 6.5 last week. A language test now applies to longterm business visa applicants as well. Their level of English competence has risen from four to five. [A] Massey Community Board member and Chinese business[person]... says the new tough measures was a hasty response to comments by an irresponsible politician, [the] NZ First leader... But [the] Waitakere Indian Association president... says the changes are good as N[Z] will now attract only immigrants of the highest calibre... Waitakere City's Asian population is 11[%], compared with the rest of N[Z] at 6.6, according to census results.

...the highest court of British lexicography has finally delivered a verdict on "pants." The new online supplement of the... *Oxford English Dictionary*... dates the contemporary slang definition of the word, as meaning "rubbish or nonsense," to 1994. "Pants" joins "bad hair day,"... "six-pack" (of muscles), "clubbing" and "ladette" in the quarterly update of the electronic OED... [The] chief editor of the dictionary, commented: "My job is the perfect excuse for watching action films, soaps, quiz programmes where the language is busy just now." Yet "clubbing" in its modern form turns out to have started in the World Cup summer of 1966, when the Kinks' *Sunny Afternoon* stood at the top of the "hit parade." ...Oxford University Press also trumpets the "huge file of correspondence, queries and attributions" that lie behind the new OED online discussion of "the full monty." The dictionary agrees with most of its competitors in stressing three likely origins for the phrase that, after the 1997 film, came to signify total nudity. They are the 45-card version of a Spanish card game, monte; the full breakfasts scoffed during... W[W2] by Field Marshal Montgomery; and (favourite among language experts) the three-piece, Sunday-best suits made by tailors Montague Burton... For subscribers to the electronic OED, the full monty consists of an annual subscription of £350... plus VAT. Each quarterly update contains more than 1000 new terms and revised entries... Behind the lexicographers' eagerness to show off a knowledge of street argot lies a tough battle for command of the multimillion-pound global trade in English dictionaries, where the OED is traditionally the market leader... But... competition in recent years from rivals such as Chambers, Collins and Encarta... has [become] fiercer... These houses have been fighting hard for a larger share of the lucrative lexicographical action. Hence the regular, media-friendly parade of today's colloquialisms... Edited for decades by the great Victorian word-hound James Murray, [the OED] was finally completed in 1928 after almost 50 years of research. The second edition came out in 1989... The constant labours of a 50-strong staff (as well as an army of volunteers) means that OUP will probably not release a new printed edition until at least 2015.

...With what is probably the first product to quit cyberspace and move into the real world, the universe's richest [person] is making a bid to join the pantheon of great lexicographers. And it's all our idea. Three years ago, a dynamic London-based Kiwi... proposed that the billionaire release the *Encarta Dictionary*, part of Microsoft's encyclopaedia software suite, in hard covers. Since then, more than 320 editors and consultants in 22 nations have not been getting a lot of sleep. Due shortly, *Encarta World English* is the first... dictionary... to use the Net to research, compile and edit its definitions. "Microwave," "e-mail" and "Internet" itself will officially exist at last. The result is intended as a complete guide to global English. It tries to pin down the protean nature of our language, its subtle shifts as it moves from one shade of meaning to another in different parts of the world... A project so ambitious would have been almost impossible before the electronic revolution... Mind you, the labour of compiling a dictionary tends to tell on the lexicographer. Dr Johnson's behaviour was downright bizarre (<http://neuro-www2.mgh.harvard.edu/TSA/AboutTS/johnson.html>), and [the head of Microsoft] is already known to rock obsessively to and fro in times of stress. One can only hope that the strain of *Encarta World English* doesn't push him over the brink... [T]he *Oxford English Dictionary* (291,500 references to *Encarta's* 400,000) may no longer seem an authority but a relic... Seemingly blind to its peril... the *Oxford English Dictionary*... tries to enforce the morocco-bound subscription model with which *Encyclopaedia Britannica* (www.ebig.com) almost destroyed itself. There will soon be nowhere for its weighty tomes to rest – as furniture, the bookshelf is doomed... Gorgeous graphics notwithstanding, the Net has become a Web of words, a natural theatre for the quirks of human speech. At www.facstaff.bucknell.edu/rbeard/diction.html, a Web of Online Dictionaries, you will find languages you've probably never heard of – Mandinka, Warlpiri, Vulcan – and the links to specialised categories are even better... There are dictionaries for space... rhetoric... *Star Wars*... even trainbraking... while the cyber-challenged will need Net-Lingo... to make sense of everything.

...a... new edition of the *Oxford English Dictionary* [is on its way]. Lexicographers are completely revising the 20-volume authority on the English language – which contains 500,000 entries... – and are appealing to English speakers around the globe to offer contributions. An Oxford spokes[person]... says new words, including the language of the Internet, have yet to be included, while other words, phrases and descriptions have

become antiquated... [The] editor of the *Oxford Dictionary of N[Z] English*, says one of his favourite local expressions is “electric puha,” used in Northland to describe cannabis[, because]... it is witty and combines Maori and English nicely. [The editor] hopes the *OED* also considers including “chateau cardboard” – cheap, boxed wine – and “chocolate fish,” which has gone beyond its culinary meaning to encompass any sort of booby-prize. [An orator and former NZ Labour PM] says one of his favourite obscure words is “solipsistic,” used to describe people who believe the solar system revolves around them[– but adds that] it may not be adequate to describe [a former AUSn PM]... who believes the universe revolves around him.

...[after taking ‘6 years to produce’, the] *New Oxford Dictionary of English* arrived recently in a torrent of populism, lashing out in defence of the split infinitive and political correctness, announcing itself as “the most important new English dictionary for 100 years” and gaining plaudits even in the tabloid *Sun* newspaper. And, for once the publicity is justified. This is an important book. It breaks traditions. It is a political act. Cultural conservatives will find it very unsettling; the rest of us should cavort through its story. It may seem odd to describe a dictionary as political, or as telling a story, but almost all of them have been. The great lexicographers set out to change the world, not merely to clarify language. And, mostly, their history has been about national self-consciousness. Samuel Johnson’s heroic task between 1746 and 1755, when [Samuel] completed from a cramped garret off Fleet St his famous *Dictionary*, happened in the aftermath of the Jacobite rebellion, at a time when British self-consciousness was being forged in opposition to France. His dictionary was intended to bring stability and order, based on a mass of native literary quotation, to the English language... Noah Webster, the father of American English, is another obvious example. From his best-selling *American Speller* of 1783 to his final *American Dictionary* of 1828, Webster was engaged in rebellion, using philology instead of artillery... The Philological Society of London decided that a great empire needed a great, scientifically-based dictionary. James Murray eventually got going in 1879 on what would become the *Oxford English Dictionary*, thinking it would take his team 10 years. Five years on, they had got to “ant.” The project long outlasted poor Murray... Language had to be purified and corruption eradicated. For two centuries nationalism and lexicography, blood and spelling, marched together. Until now. Whatever the *New Oxford Dictionary*... is about, it isn’t purification. It is being marketed on the neologians now incorporated – Prozac, coolth, ebonics... saddy – which are heavily American in origin; and on its political correctness (“spinster” is offensive, avoid “handicapped”) which is also an American phenomenon. But that’s just the start. As one delves into it, this ceases to look like an English dictionary at all. Gherao is a form of Indian workers’ protest, you learn, before flicking up to Gheg, an Albanian tribe, or down to... ghibli, a North African wind. There’s mestiza, which is South American Spanish for a [gal] of mixed race, and shikar, which is an Urdu word for hunting... There’s also jachcha, chup, doek, picong, kahuna and tchotchke. Oxford used a worldwide team of compilers; and dictionaries have always had foreign words, including slang. But the proportion here is new, the effect radical. This isn’t really an English dictionary. It’s the first draft of a world language dictionary. There is a commercial decision here, no doubt, but a political one, too. This is a book that leans out, almost recklessly, into the future. Its publication marks a moment when “English” is no longer primarily the language of the English... By accident of history, we have been spared the fate of millions of minority language speakers. English is the language of world politics, big business,[air traffic.] science, the Internet. Ambitious Chinese spend their meagre savings to learn it; it has colonised Japanese and French. In a worldwide race, it has won. This dictionary describes a language eaten into from all sides, a turbulent, mongrel language changing shape at great speed... in another century it may be barely recognisable.

...A Titirangi language fanatic has finished a dictionary with a difference – N[Z and AUS]n words translated into esperanto, a manufactured ‘international’ language... Esperanto sounds like Spanish, is about 60[% Latin, 30%] Germanic languages, and 10[% Slavic languages. The fanatic, aged 70, who]... started the project eight years ago... has spoken Esperanto for well over 50 years, and used to wear a little green star to identify himself as one of the estimated 100,000 people who speak it worldwide... However, a little like the language, the badge has gone out of fashion.

...What is the real value of teaching Maori language? As often happens with educational proposals, supporters of compulsory Maori communicate enthusiastic good intentions rather than convincing, detailed answers to the usual questions: Who benefits, in what ways and by how much? Will the intended means achieve the intended ends? Are the means proportional to the ends? Are the same ends achievable by other, more efficient means? How and when will we know... this policy has achieved these ends? What happens if it does not? Benefits recently suggested... include our national identity, racial harmony, bilingual communication, cultural survival and identity, self-esteem... and mental development... Of course, we should encourage mental development, but what will Maori offer which is now missing from the existing curriculum, or other languages spoken by N[Z]ers? Obviously, knowledge of the Maori language, but how much is needed to be able “to think beyond the bounds of an English vocabulary” – a course in key Maori concepts or full language competence? A five-year secondary school language option takes about 550 hours of teaching time... National identity inspires some, but... it is also the first refuge of the scant-of-argument... Perhaps no particular language should be compulsory and we, not the state, should choose our languages as we choose our religions or our music. Of course, it would be a poor education which left us entirely ignorant of all languages, religions and music other than our own. A correspondent linked compulsory Gaelic in Ireland with national pride. In fact, the policy is so unpopular that after decades of persuasion, compulsion and inducement, the 1991 census returned only 32.5[%] of the... population as Irish-speaking. Small-scale studies suggest that many who claim Irish as a language are neither regular nor proficient users. Yet Irish culture flourishes. Are language and culture as inseparable as some believe? If the Irish experience has a message for N[Z], it might be that people who do not strongly value a language for affective or instrumental reasons are unlikely to learn it, despite compulsion and high-minded moralising by the righteous and enlightened... Compulsory Maori does have benefits but it is no panacea; its proponents are overselling it with dubious evidence, a distorted vision of our society and extravagant claims. [■ In order ‘to maintain the purity of the French language, France has an academy which meets each year to make up new words to replace any English words which have been adopted by its media or population’!]

...AS a giant clock on the Eiffel Tower ticks away the remaining days of the 20th century, French lobbyists are scrambling to ensure that cyberspace doesn’t leave their language in the dustbin of history... [The] vice-president of Defence of the French Language[, which]... has successfully sued companies for using English while advertising in France, maintains that the laws aimed at preserving the French language should apply to Internet sites as well. Though his group has been involved in only one Internet-related court case... – ...when they brought a 1997 lawsuit against the Georgia Institute of Technology’s campus in Metz... for creating an English-language Website... [– the] retired technologist... foresees further action... [His] group taps into a common sentiment in France... But some people feel his group is going too far. “The Internet is accessed by people around the world and to impose a language on it would be stupid and a pity,” says... a Website designer for Accriens Productions in Paris. Many people also point to a need to be practical, noting that English is the dominant language on the Internet and that [the group’s] approach risks isolating France. The... past decade has seen a slew of legislation intended to protect the French language and entertainment industry. In 1994 a law made the use of French mandatory for advertising, labelling and instruction manuals for all products and services sold in France. TV and radio commercials cannot be aired in a foreign language... Government commissions also preside over an ever-growing list – now almost 120,000 – of English words or terms that are not allowed in official French documents. Rather than “fax,” for example, the word “telecopie” must be used. At least 40[%] of TV programmes must be of French origin, and a... minimum of 40[%] of songs played on the radio must be in French, 20[%] of which must be fresh talent. On both TV and radio the ratio must be maintained at prime time... [Incidentally,] Clark Gable opened Hollywood’s door to profanity in 1939 by declaring, “Frankly, my dear, I don’t give a damn.” Now... [a word that] starts with “f” and ends with “k” and [which] most people still think of... as the ultimate expletive in the English language... is as commonplace in the cinema as any other swear-word. Maybe

more so. And not just in gangster movies. It's become the casual coin of the realm in action flicks, thrillers, dramas, coming-of-age movies. Even in romantic comedies, you're a lot more likely to hear the F-word than "I love you." Why? The answer used to be shock value. But for most regular filmgoers, the shock has worn off. Something else seems to be going on. Where profanity is concerned, there's a generation gap between young people and their elders. Teens and 20-somethings frequently use language their parents seldom used – except in private – or that their grandparents never used at all... So Hollywood presents characters who talk the way many young people talk. It uses the F-word as a sort of signal to attract the audience it wants: The 15-to-25-year-olds who rush out to opening weekends and put a movie on the map. If these films also attract older folk who like to think they're young, so much the better. That's certainly the case with Oscar-nominated *Good Will Hunting*, the popular comedy-drama. Made by, about and for young people, its screenplay features the F-word 85 times... *Kissing a Fool*, a lightweight romance that would have aimed for a PG or PG-13 film a few years ago, features F-words galore... Then there's *The Big Lebowski*... in which the F-word shows up more than "the" or "and." ...This film goes a step further by poking fun at the profanity. As its cowboy narrator... pointedly asks [the film's leading character], "Why do you have to use so many cuss words?" ...The F-word has a long and, in recent years, studied history. "It's our worst word, at least of one syllable, and maybe our strongest," writes [a commentator] in his foreword to *The F Word*, a scholarly 1995 book... "It's one of the best things we can do with someone, and one of the worse to someone," notes [the foreword]. The word, which has German roots, first surfaced in the 15th century. But it was considered such a taboo that it "was never written down in the Middle Ages", writes [the *The F Word's* author]... It's been suggested that the F-word's new acceptance may, in part, relate to its universality: It's not associated with a single cultural or ethnic group... [and is understood] by everyone... Interestingly, ethnic slurs – particularly the N-word (nigger) – have replaced profanity as the taboo words of today.

...All right, so the Tao Te Ching says that a journey of a thousand miles must begin with a single step. But if 91 years went by and you could see where you'd started by looking over your shoulder... wouldn't you wonder whether it was time to rethink the expedition? Not if you belong to the Simplified Spelling Society, whose newly appointed N[Z] representative... wrote seeking our support for his organisation's campaign to "upgrade" English spelling... [His] letter was judiciously sprinkled with rather cute simplifications of our system of recording words on paper: ..."fonics"... leaped out of the page, which had his "fone" number at the top. [The representative] told us that [it] edited the group's newsletter, which rejoices in the title *Simpl Speling*. But his concern about the inconsistencies of spelling was, well, inconsistent. [The representative] was happy to use the word campaign (which, presumably, wants simplification along with reign, rain, rein and mane) and to allow the last syllables of committee and society to be spelled differently, even though they sound the same. [The representative] says the society, founded in England in 1908, has a N[Z] membership of six and rising and that its adherents worldwide number some 140. They believe that English spelling is a "major barrier to literacy learning" and that we all need to get behind a reform of the spelling system so that we don't bequeath to posterity the legacy of failure we inherited from our linguistic forebears. Given the manifest terrors of English spelling, I find it easy to sympathise with [the society]'s concerns. Any language that can spell rough, cough, bough, through and though as if they rhyme deserves ridicule... But ridicule is a long way from reform... A dozen simplified spelling systems (with names like Spelriet and NuSpel) are to be found on a quick brouse through the Internet and they are not notable for having arrived at... solutions to problems. How could they? If cough is better spelt cof, why not... kof or koff? Who would decide? And who would make anybody take notice? [The representative] rightly points out that we don't use shew as a verb any more and we don't spell fantasy phantasy as we once did. But these are changes that have occurred organically, not by decree. The plan of reform touches on a deeper matter, though, which has to do with a uniquely modern fear of the difficult. If we are failing to teach our kids to spell properly – and there is good evidence we are – we let superstition take the place of science if we start blaming the stuff they have to learn. To propose a reform of spelling is... a betrayal of the polyglot heritage of every English word we speak and write. [The representative] attached a league table of the literacy levels of 13 countries. It showed that, after Poland, five of the bottom six were the major English speaking countries. Funny thing is, the table alongside showed an almost identical ranking for numeracy skills. Is anyone planning a campaign for an overhaul of the way we count?

...Those teachers who advocate a drastically simplified spelling system, take note! The E[U] Commissioners have announced that agreement has finally been reached to adopt English as the preferred language for European communication, rather than German, which was the other possibility. As part of the final negotiations however, Her Majesty's Government conceded that English spelling had some room for improvement and has accepted a five-year phased plan for what will be known as EuroEnglish (Euro for short). In the first year, "s" will be used instead of the soft "c." Certainly, sivil servants will resieve this news with joy. Also, the hard "c" will be replaced with "k." Not only will this kleanup konfusion, but type-writers can have one letter less.

...[a simplified speller] advocates, among other thoughts, omitting the "u" from "quack." I have no qalms about making spelling easier; this is a good start. Qantas, of course, led the way... Let's go American and then we won't shudder at "cheep sox 4 sale" and U can C it saves time... But why just gravitate to American spelling? Why not follow the well-known song *Anything Goes*? Then we will never have spelling errors...

N[Z] children write vivid and creative stories – full of spelling mistakes... [While] many students' attempts at writing were impressive... [their] inability to spell has been identified as a major concern, after just 2[%] of 8-year-olds spotted all 12 mistakes in a piece of prose in a national writing test. [6%] spotted none of the 12 errors, while 60[%] spotted between 4 and 9. [21%] corrected mistakes that were not even there. And of a group of 12-year-olds asked to punctuate a piece of writing with commas, full-stops and speech marks, at least half inserted less than half the 16 corrections. More than half made incorrect changes. The research... [was] part of the National Education Monitoring Project[(NEMP)]... The first round of tests – on art, science, and graphs, tables, and maps – was carried out in 1995... The new set of results completes the first cycle of monitoring reports... The project team issued three reports – on writing, listening and viewing, and physical education and health.

...Research shows... 12-year-olds in our schools are not coming to grips with techniques of "viewing" – while they can extract basic meaning from a visual image, they cannot, in the main, explain ideas or justify their meaning. Nearly 70[%] of 12-year-olds who watched a soft-drink advertisement could give only a vague or limited answer to the question of how they were being persuaded. This lack of success in looking beyond the obvious has disturbed a national forum of educational experts analysing the results of surveys carried out under the N[EMP]... This month... a... Professor... of the University of London Institute of Education, visited N[Z] and said teachers of English had to move with the times. Images were becoming increasingly dominant, and the lines between visual and written communication blurred. More attention should be paid to the "banal messages" of life, which influenced people's taste. Young people should be able to understand these messages and the way they connected with each other. The president of the N[Z] Association for the Teaching of English... agreed... [children] need to develop skills that help them to absorb details.

...Burning the midnight oil before exams or interviews can drive knowledge away, says research that suggests sleep is needed to allow memories to be "downloaded" into the brain. A good night's sleep within 30 hours of trying to remember a new task is necessary for effective recall in subsequent weeks, scientists have found... "We think that getting that first night's sleep starts the process of memory consolidation," said... a sleep researcher at Harvard Medical School, who conducted the study. "It seems that memories normally wash out of the brain unless some process nails them down. My suspicion is that sleep is one of those things that does the nailing down." About one in five people say they are so short of sleep that it affects their daily life. But the study highlights a less understood side-effect of insufficient sleep, serious memory impairment. Volunteers found it easier to remember a task if they were allowed to sleep. For others who were kept awake, no amount of subsequent sleep made up for the initial loss... Other research at the Medical University at Lubeck in Germany showed that memories are laid down in two stages during the night, first in

the deep “slow wave” sleep that occurs in the first half of the night, then in the less important stage of dreaming, or “rapid eye movement”... If people are deprived of sleep during the first half of the night, their capacity for memory consolidation appears to be almost the same as if they had had no sleep at all. Being deprived of REM was found to be less detrimental to memory, yet important in “implicit learning,” in which performance does not depend just on the ability to remember.

...European researchers say dreaming may be the brain’s way of replaying experiences and lessons so that they are fixed in the memory for use later on. The[y]... used advanced imaging technology and found that the same regions of the brain that are buzzing while we learn a new task are also active while we dream. This heightened activity was observed during the brief but active stage known as... REM, sleep... However, [the]... team could not identify the precise cellular mechanisms involved. Nor were all memories consolidated only during REM sleep... [By the way, h]aving class in a cafe is all part of the educational menu for Laingholm Primary pupils. Kidz Cafe... [- where the pupils] devise menus, buy groceries... cook and serve food for staff every Tuesday lunchtime, at a reasonable price... [- was] organised by... a pupil’s mother, [and] is part of the school’s expanded curriculum designed to capitalise on children’s special interests. This year’s classes range from cooking and crafts to languages and fishing – all topics picked jointly by pupils, staff and the community. [The p]rincipal... says the interest classes... are becoming very popular. “Most schools look at children’s weak points and spend a lot of time addressing them, but schools should look at their talents and abilities and promote them,”...

“Children need goals and ambitions to achieve. To have the opportunity to venture out into the wider world is an exceptional adventure[,” says a Rangeview Intermediate teaching]... co-ordinator... Earlier this year... Asian students discovered how the Te Atatu school worked and stayed with Kiwi families... There was a renewal of friendships when... 23 Rangeview students and four teachers... visited Singapore and Japan[last month]... Singaporean and Japanese schools are planning a return visit to Rangeview next year.

...[a] Henderson artist... was shocked by the standard of education in N[Z when it] arrived here from Colombo, Sri Lanka four years ago... “N[Z] has all the facilities for children to have a good education, but some children are still lacking. I come from Sri Lanka so I know how hard the children there are struggling to do well... Auckland could be the best [educational centre] in the world, because you have all the different cultures here...” ...A desire to promote learning inspired her award-winning entry to this year’s Telecom art awards... Her multi-cultural painting features a young[ster] with a pile of books, being encouraged by his parents... ■ [A]... new book argues that the extent to which children resemble their parents is determined by genes not upbringing.

...PARENTS are about to be made redundant. According to *The Nurture Assumption*... psychologists have had it wrong for 100 years – a child’s character is influenced not by parents but by other children... Children do not see their parents as mirror or model because they are looking the other way. [The book’s author] is not a trained psychologist. [The author] is a grandmother from Middletown, New Jersey, a writer of textbooks with no PhD. [However, the author] sent her theory... to America’s most respected academic journal in the field, *Psychological Review*, and it accepted it. Most parents would recognise that there is something in what [the author] says and concede that children are influenced by their friends, but usually not before they hit their teens. [The author’s] controversial idea is that parents themselves have little impact at any stage of a child’s life... [J]ust look at their behaviour... says... [the author]. Children always seek out other children in a social setting, even as toddlers. Their interactions in school can be profoundly different from their behaviour at home. How often do parents hear a teacher’s report on their child and wonder aloud: “Are we talking about the same kid?” ...Many parents will see [the author’s] theory as a welcome let-out clause. But her theory may be part of a backlash, since parents have got the flak for their children’s problems. [The author thinks that her book reassures adults who] fear the responsibility... but... [whose genes] “could be contributing very useful and fine children... If they knew that it was OK to have a child and let it be reared by a nanny or put it in a day-care centre, or even to send it to a boarding school, maybe they’d believe that it would be OK to have a kid. You can have a kid without having to devote your entire life – your entire emotional expenditure – to this child for the next 20 years.”

...TO the guilty parent who frets over the latest advice about quality time, instilling values or toilet training, [a US] author... offers this relief: mum and dad, you don’t matter that much. Hmmm, is that good news or bad? It’s certainly controversial, and... a northern New Jersey grandmother, is already feeling the heat from psychologists and child development experts outraged by her views. “I seem to have hit a nerve,” says... [the] textbook writer kicked out of Harvard’s psychology department four decades ago because the chair[perso]n thought her graduate work lacked originality and independence... With no academic affiliation or doctorate beside her name, her ideas might be easily dismissed, but [grannie] has done some serious research in psychology, sociology and anthropology, backing her theory with dozens of articles and studies. (Her reference list takes up 31 of the book’s 460 pages.) ...“My position is that teenagers belong to the same species as the rest of us,” [grannie] writes on adolescents in one chapter. “But one cannot help but wonder. If they are equipped with the same sort of brain as the rest of us, why do they so often give the impression of having forgotten how to use it?” ...Her own daughters behaved so differently from each other when they were growing up, it made her question her own influence on them. Her oldest... was an achiever. The younger... who was adopted, dropped out of high school. [Grannie] spent much of her [own] teen years stuck in bed, disabled by an autoimmune disease that has systematically attacked her internal organs, leaving her weakened and often homebound. But [grannie] (60) is adamant her own experience, while instructive, was not the basis for her theory, and... resents how some writers have already exaggerated her ideas and dissected her own life... Despite the controversy, [grannie]’s ideas have received some impressive endorsements, most notably from... a well-regarded Massachusetts Institute of Technology psychology professor who writes in the book’s forew[or]d: “I predict it will come to be seen as a turning point in the history of psychology.” The book’s release coincided with the American Psychological Association AGM last month in San Francisco, where [grannie] was honoured for a recent paper. It included an irony [grannie] savours: her award was named after the Harvard professor who kicked her out so long ago. But even [grannie] concedes that in her parents-v-peers argument, [it] has overstated her case at times with some “extreme statements”. [Grannie] calls them partly a “literary device” to draw in lay readers... [The] director of child and adolescent psychiatry at the Johns Hopkins Children’s Centre in Baltimore, says her all-or-nothing stance on parental influence is reminiscent of nature-v-nurture arguments over IQ. Almost everyone in the child-development field believes the truth lies between the extremes. “Yes, some theorists have placed too much emphasis on parenting... It’s also true [that grannie has] placed too much emphasis on peer groups.” [Grannie] brushes aside most of the criticism of the academic establishment – if only because most of them have not read her book[, which, since]... it landed in [US] bookstores last month... has sold more than 50,000 copies and should soon make it to the best-seller list... [- but grannie also brushes aside any problems with her theory, and society, by saying:] “Parents are provided by nature with instinctive behaviour on how to raise children. We did it for hundreds of thousands of generations without guidance from experts, and they turned out OK.”

...Moments after giving birth, concerned well-wishers were advising me to “put her name down at Dio.” “You have to put her name down now!” they cried. I was bewildered. Not only had I never set foot in the school, I was still trying to get the hang of breastfeeding. Surely the thought of schooling was years away. But every couple of months it would happen again. “What are you zoned for? ...Don’t leave it any later...” ...It’s the new middle-class obsession – getting your kids into a good school. And the obsession is not just reserved for high schools; the primary school dilemma is just as serious. What constitutes a good school seems fairly debatable. Most go on word of mouth, like the selection of a good restaurant. They get the application forms without having visited the school or meeting the principal. They know, and sometimes talk about, the... ERO reports but don’t get around to getting a copy to read. Simple rule of thumb: private is good, religious is good (Clayton’s private schools), and then there are a smattering of state schools with the coveted “good reputation” – all based on word of mouth and unread ERO reports. Families regularly shift houses to get in zone for one of the few state schools that have been deemed a chosen one. And if that’s not extreme enough, I heard of a family who

had quickie baptisms, changing faith in the progress, to improve their chances of getting into a pseudo-private Catholic school (“Hop in the car kids; I’ll tell you about the Pope on the way”). Then there’s the reference fiasco: which referees will impress the judges? Usually it is a mix of a famous rich person met once at a dinner party and a neighbour’s brother-in-law with old-school connections – obliging strangers who are faxed details of the kid in question. Our parents didn’t face the schooling dilemma. They never questioned the system of sending their kids to the school they were zoned for. And if the kids didn’t like it, guess whose problem it was? Certainly not the parents’. So survival and social skills developed naturally. Were kids tougher back then or are things just out of hand today? A mixture of both, but we can’t ignore a third factor – parental angst. Although teenagers are often miserable creatures anyway, middle-class parents have a determination to make sure they are consistently happy at their chosen school. If their teen is a little sullen, the solution is simple – “the school just wasn’t him” and the surly teen is moved elsewhere. One wonders if some teens’ progress would improve using the good old clip around the earhole strategy. While some kids do indeed blossom at other schools, often the real issue is skirted. The “good school” obsession could be devaluing the quality of some of our solid and dependable state schools by default. My sister seems to classify all people on whether they got into Macleans College or not (“I am seeing my friend Cheryl-whose-daughter-got-into-Macleans tonight”; and “you know John-whose-son-didn’t-get-into-Macleans”). What happens to the poor kids-who-don’t-get-into-Macleans? Do they turn into axe murderers at some other school? We’re caught between complaining about the competitiveness and pressure on teens, yet wanting to prepare them for the inevitable ratrace. Which parent will deny their child “the best education that there is around” and “a natural head start in life”? But somewhere lurking underneath all of this is parental guilt. So many parents feel they might be falling short on the parenting stakes, so the least they can do is send the kids to the best school they can. They want these schools not just to teach but to discipline, teach lifeskills and provide a sense of belonging and security. If the kid turns out a loser, the parents can say, “We did all we could, we sent him to the best schools, blah, blah, blah,” which is interpreted, “Well, I did my bit.” We all want our kids to get into a great school. And the best way for this to happen is to help them to be great kids. And that’s our job as parents. I tell a friend about the column I’m going to write: “What! Are you crazy? You’ll jeopardise your chances of getting her in to a good school.”

...New zoning rules are preventing two Manurewa brothers from going to the same school, despite anecdotal evidence that splitting siblings up in such a way could be harmful. [The younger brother], who... attends a kindergarten next to the school... [and] will be five in September, wants to join his six-year-old brother... at Clayton Park Primary School. But under... enforced... zoning regulations... Clayton Park has created a “home zone” for new entrants. It ends one street away from the... family’s Mahia Rd home. Out-of-zoners wanting to attend the school must submit to a ballot process. However, the school principal... said a ballot, which would give priority to siblings, was unlikely to happen because the school was full. The boys’ mother... was angry and frustrated that appeals to the Ministry of Education had got her nowhere. “The attitude was that there was nothing they could do,”... It was important that the children were schooled together for practical and safety reasons. The only options... [the parents] could see were... to move the family from its rented house to another in the home zone... or... to pull [the older brother] from a school where [it] was happy to send him elsewhere with [his sibling]... Educationalists say that such a situation could be harmful in terms of both socialisation and education.

...*Failure dogs pupils who swap schools*... Hundreds of primary school pupils are failing because they switch schools too often – in some cases five times a year. Principals say children from poor families are set up to fail because their parents shunt them through too many schools... [Some] students were enrolled for as little as two weeks, before their parents withdrew them, often without warning. The Ministry of Education has no way of tracking the students, leaving teachers to phone around schools in search of them... The problem mostly affects cities, where families may be more likely to move around seeking work or to avoid being caught for benefit fraud or overdue rent... Families with children aged 5 to 7 were the most likely to be transient, especially those who lived in caravan parks... Six South Auckland principals the *Herald* spoke to said families had become more transient, causing children to fall behind. Manurewa East Primary [School’s] principal... said it was the number one problem affecting learning at primary schools. Seventy per cent of transient pupils were thought to fail. [The principal], a member of the Auckland Primary Principals Association... had spoken to at least 50 principals from a wide range of schools who had complained of the “horrendous problem,” especially in low-income areas. Manurewa East has had 129 new enrolments since the start of the year. But during that time 80 students have left the school, which has a roll of 260... The high turnover of pupils also affected staff, who had to spend more time processing enrolments and settling new entrants in... Papatoetoe South Primary [School’s] principal... said a 6-year-old pupil had attended eight schools in the past two years.

...An Auckland boy attended 23 primary schools and 36 pupils swapped schools more than 10 times in eight years, a study on transient children has found. The study’s author... a... learning and behaviour resource teacher, found... such children often had major behavioural problems and learning disabilities. This week, six Auckland principals said it was the number one problem affecting student learning... The study, paid for by the NZ Educational Institute, found that Maori children were the most transient. Twenty per cent of them had attended more than three schools in any one year... [Overall, 10%] of boys and 16[%] of girls had attended three or more schools in any one year by the time they finished primary school.

...Single-sex state schools fear that education law changes will force them to take students of the opposite sex. They believe that the special character of single-sex schools – among the oldest and best-known in the country – could disappear if schools have less power to refuse entry to boys or girls they do not want... The topic was one of the main subjects of discussion at the secondary principals’ conference in Wellington... More than 100 principals have signed a letter to [the] Education Minister... seeking clarification of proposed changes to the Education Act which would remove protection for single-sex schools. But [the minister] says schools would still have the right to refuse entry to students of the opposite sex despite the law change... [They can call] on an exemption in the Human Rights Act 1993 – section 58 – to stop students of the opposite sex enrolling.

...The recent *Herald* article on how single-sex state schools fear that education law changes will force them to take students of the opposite sex reminded me of... *The Snark Syndrome*. The title was inspired by the Lewis Carroll poem *The Hunting of the Snark*, which contains the words “I have said it three times, so it’s true.” The article quoted the principal of an Auckland girls’ school as saying that research showed girls did better academically in single-sex schools. The Snark syndrome, of course, means that everybody knows that. In other words, if something is repeated often enough, it becomes true... As [the author of *The Snark Syndrome*] has pointed out, most of this received wisdom has no empirical base, the substantive primary literature does not support it, and some of it isn’t even common sense. [The author – who] was brought to N[Z] in 1994 by the Ministry of [Gals’] Affairs in recognition of her involvement in a major, federally funded A[US]n study of [gals’] access to and progress in science and technology in higher education... [–] came with a background of long participation in education and gender issues, including work as a full-time consultant to the E[U], in which capacity [it] prepared the first research-based report on sex equality in education. One of the Snark myths which [the author] has sought to expose is that single-sex schools advantage girls. [The author] examined assertions such as the one that [all-girl] schools produce more... physicists, and revealed that the evidence came from Britain, the U[S, AUS], France... and Ireland, where all of the single-sex schools surveyed were private, elite, fee-paying... and academically selective. The fact that such outcomes are a function of class and ability, not a function of single sex, has been upheld by subsequent major N[Z] research... Given that the conventional wisdom is so clearly false, it is interesting to consider the issue of other reasons some families might feel compelled to encourage girls to flee from coeducation. It certainly seems to be strange that it is still occurring... Our own experience at Western Springs College is that girls not only sustain an academic focus throughout their coeducational years at secondary school but also develop a very important set of personal and social skills during their time here. The result is that they are better equipped for living and working with [guy] counterparts, whether as fellow plumbers... or physicists. Parents who intend to protect their daughters by sending them to a girls’ school are misconceiving the situation. Certainly, adolescents are put under enormous pressure

by the constant media barrage of messages about sexuality. Yet surely the absence of members of the opposite sex in everyday situations serves only to increase anxiety for young people about contact when it does occur and about the nature of appropriate relating. At our school, I see strong, assertive girls mixing easily and confidently with students of different ages, races, socio-economic backgrounds and with boys. They enjoy friendships with many boys and girls; very few are isolated in relationships. Every day in a coeducational setting, students get to know each other beyond the skin-deep level of superficial stereotypes. They are able to expand their sense of what it means to be [a boy or a girl]. When our girls are asked if they think our college is a good school for girls, they respond with an enthusiastic "Yes." They point... [out] that everyone has an equal chance in the classroom. They argue that dominant personalities are just as likely to be fem[inine as masculin]e, and that the vast majority of boys do not dominate... For us, coeducation is all about providing a natural and healthy learning environment where girls and boys are given the opportunity to develop mutual respect under the influence of excellent same-sex and opposite-sex role models. Any remaining sceptics should scan the academic results achieved by... coeducational schools in N[Z – w]hether... large or small, high or low decile, rural or urban...

After 20 years in girls-only schools, none of which was "private, elite, fee-paying... or academically selective," I spent last year in a co-educational secondary school. I concluded that girls are disadvantaged, especially if they are less able, and particularly in Years 9 and 10. These classes are often disrupted by boys and the teacher spends much time on the behavioural management of the boys, to the detriment of the learning of the girls. Yes, the girls learn the skills that make them "better equipped for living and working with [opposite-sex] counterparts." They learn to be quiet, ignore the boys and to accept [guy-dominating behaviour. Although "repeated studies in NZ, AUS and England show that students from co-ed schools do better at university than those from single-sex schools (and students from state schools do better than those from private schools'), p]ast pupils of the school I t[ought] in, who attend university, tell me they notice girls from co-ed schools are more willing to bow to [guys' opinions] while they are more forthright. Behaviours that would be considered bullying in a single-sex school are accepted by girls in co-ed schools since they are viewed as a form of sexual interplay. In particular, the level of inappropriate language between students is much greater... The advantages of single-sex education are underrated... The physical environment of a girls' school is more pleasant because it is not being destroyed by testosterone-filled [boy]s displaying their mating skills to the opposite sex.

...The talented teen topped last year's bursary and scholarship exams for accounting with 96[%]. Now the[... accounting whiz... 17, is at Otago University studying for two degrees – in science and commerce. [The 17-year-old] is one of thousands of Kiwi girls beating the boys in subjects they traditionally topped. More [girl] students are graduating head of the class in medicine, law and science. But researchers say behaviour, not brains, is turning Kiwi girls into A-grade students. A 21-year study of more than 1200 Christchurch kids has revealed girls are increasingly doing better at school than boys. [The h]ead researcher... said... because girls... concentrate... in class... they learn better... [The researcher added that] tests on kids at eight and nine years old showed boys had higher IQs... [The 17-year-old] reckons gender has little to do with doing well at school. But... admits that, having attended single-sex Carmel College in Auckland, her last experience of a mixed class was at primary. "But there are disruptive girls at school too,"... [The researcher] said boys tended to catch up with girls at university...

Boys are not the perennial underachievers they have been made out to be. New research shows ethnicity and the socio-economic status of a school have more influence on student achievement than gender. In a major review of 450 N[Z] and international studies, Wellington researchers... found there were more similarities than differences and what was good for girls was good for boys. The study contradicts the prevailing view that boys lag behind girls in academic achievement. Last year, the E[RO] promoted special measures to improve the achievement of boys and recommended that schools run boys-only classes. But [one of the researchers] said while boys-only classes were not always a bad idea, the review did not support the need to do things differently for boys and girls. The Ministry of Education plans to use the information as part of a "stock-take" of the curriculum.

...FROM the moment a child is born, the cry of "It's a boy" or "It's a girl" marks its most basic label of personal identity. But our understanding of sex and gender is undergoing profound and surprising changes thanks to insights gained from biology, sociology, medicine and technology. When it comes to the differences between [boys and girls], what once seemed black and white – or pink and blue – now seems a shifting zone of confusion. For starters, there's evidence that [boys and girls] are hard-wired from birth to differ in subtle and intriguing ways when it comes to behaviour. In effect, children may be born sexist. More than a few feminist mothers, for example, have been forced to concede defeat in trying to deter their own sons from rough play, wanting toy guns and risk-taking. It is well documented that boys and girls segregate themselves and learn different ways of interacting socially early in their lives. [A] distinguished American developmental psychologist... contends that nature usually gets too little credit for that process of separation. While [the American] agrees that gender is largely a product of cultural forces, [it] argues that ma[sculine-feminine] distinctions come into play so early in childhood and are so universal that they must be deeply grounded in our biology. The tendency to prefer same-sex playmates becomes progressively stronger through the preschool years, until by primary-school age it is powerful indeed, says [the American] in her landmark book, *The Two Sexes: Growing up Apart, Coming Together*. Tellingly, this happens in societies across the world, virtually regardless of individuals' social experience, family background and the degree of gender segregation that happens in the adult world around them... Children raised by single parents and lesbians or consciously raised in a gender-neutral way from birth exhibit the same gender stereotype. Most children can distinguish the sexes by the time they start learning to walk and talk, within a year of birth... [The American] believes that gender is not so much an individual trait as a property of social groups. When individual boys and girls are alone, their behaviour does not observably differ all that much... but when they gather in same-sex groups they differ radically. Boys in groups focus on competition and pecking orders, with lots of shows of bravado and confrontations, whereas girls in groups tend to collaborate as equals, with more empathy and cooperation and, often, more talk of feelings. Boys who try to socialise with girls are quickly noticed and pressured not to do so by other boys, who monitor the boundaries of their groups. Girls who try to socialise with boys are often repelled by rough, self-centred ma[sculine] play styles. They may learn at least some of their gender segregation from older children. Adults seem to have little initial influence, although parents, teachers and popular culture can probably temper or reinforce these trends as children grow older. If it sounds far-fetched to suggest that children may have a special sexist culture to match their sexist biology... a contrary message is emerging from genetic studies: they suggest that [boys and girls] have much more in common than they have differences. So far as we know, out of the estimated 31,000 genes in the human [body], the only genetic differences between [the sexes]... are found in the two sex chromosomes – known as X and Y – and even then only a few dozen genes seem involved.

...WHAT are little girls made of? Some of the brightest minds in the West seem to be devoted to discovering the exact recipes for combining sugar and spice and all things nice, or, on the other hand, for slugs and snails and puppy-dogs' tails. Flick through the latest issue of *New Scientist*, for instance, and you see page after page of the sugar'n'slugs brand of scientific inquiry. Each one purports to uncover some eternal truth about why boys must be boys, or why girls must be girls. One claims to show that gossiping is more important to [gals] than it is to [guys]; and so suggests that... gossiping originated in "prehistoric times." Another claims to show that [gals] feel prettier when they are ovulating than at any other time of the month; and so suggests that attractiveness is all to do with fertility... The methods of these researchers aren't always the most impressive thing about them. The research on whether [gals] feel more attractive at the time of the month that they ovulate is based on dairies kept by just 27 American [gals]; not a particularly impressive sample, given that such studies tend to be used to support the idea that gender behaviour remains static across cultures and epochs. And none of these studies will silence doubters by the sheer force of their arguments. Take the study on gossip... The researchers discovered that... [guys] would not back off if they were threatened with violence unless it was by a group, whereas [gals] would back off if they were threatened by just one violent person. They also discovered that [guys] were fearful of a lone gossip, while [gals] were only

scared of gossip if threatened by a group. Still with me? This difference exists, so the researcher claimed, because, in those much-quoted prehistoric times, while [guys] relied on violent confrontations, [gals] used gossip as “a powerful weapon that could be used to out-compete their rivals for precious resources,” and so [they] forged their alliances based on gossip. It remains a little obscure why this survey provides a direct link to prehistoric times rather than just showing how [guys and gals] feel right now. This fuzzy logic is a constant in these sorts of studies. In so many of them, evidence drawn from a survey now – often the sort of survey that reminds me of the quizzes I used to fill up in *Cosmopolitan* in school breaks – is seen as proof, not of some obvious practical explanation, but of some reproductive advantage that such behaviour would have given [guys and gals] in millennia gone by. And this unquestioned link between our responses now and in previous millennia produces a vision of human behaviour as something unchanging, written in stone long ago... Nothing is too trivial for the evolutionary psychologists, who have managed to study everything from why [guys], apparently, can't find butter in a fridge (because they evolved tunnel vision on their hunting forays) to why [gals], apparently, can't read maps (because they always sat in the caves). But anything that might kick against the basic tenets of evolutionary psychology is ignored. And the basic tenets tend to belong to the most banally conservative mindset; that [gals want good guys] who stick around, while [guys] want to sow their seed and run; that [gals] are cave-dwellers and nurturers, while [guys] are hunters and fighters. Nothing bears this out more strongly than a study published last month that tries to prove that an act of rape is more likely to result in a pregnancy than consensual sex. For their study, the researchers deliberately chose [gals] who had been raped between the ages of 12 and 45, and compared rates of pregnancy resulting from their experiences with rates of pregnancy among a group... who had one-night stands. From these samples, they found that the raped [gals] were more than twice as likely to become pregnant as the consenting [ones], and so could conclude that rape might be seen as a “successful reproductive strategy in evolutionary terms.” Once this conclusion is reached, rape begins to look like just part of the masculine genetic inheritance. And that makes the idea that [guys] can change, and that [gals] should try to change them, seem hopelessly over-optimistic. Yet a study of rape as a survival strategy that deliberately excludes the prevalence of rape of pre-pubescent girls and post-menopausal [gals] is clearly looking for a particular answer. These researchers are not just interested in the bewildering number of [guys who rape gals] who have no possibility of bearing children. Nor do they choose to look at [guys] who rape... in gangs, who would be, in their terms, providing competition for their own genes. No, they are clearly looking to define rape as a behaviour that confers survival advantage on [guys], in order to suggest that rape is laid down in ma[sculin]e genes. This is bad science used in the service of prejudice. Maybe all this wouldn't matter so much if evolutionary psychology were confined to the dottier realms of academe. But, on the contrary, this is the boom area of contemporary psychology. The old ideas of how we came to be as we are – Freudian ideas about the power of childhood experience, or feminist ideas about social conditioning – have been jettisoned in favour of ideas that emphasise the power of the genetic inheritance. It's odd, isn't it, that just as [gals] are escaping from the most restrictive patterns of femininity and just as [guys] are beginning to feel fine about admitting to behaviour that their fathers might have found curious, this cultural backlash is trying to squeeze [guys and gals] back into little boxes marked “sugar” and “puppy-dogs' tails” all over again. All those popular tomes on relationships – [*Guys are from Mars, The Rules, The Surrendered Wife* – rely on the ideas of the evolutionary psychologists... It's a far cry from the heady days of the 70s, or even the 80s, when sex roles seemed fluid and there was an optimism about how [guys and gals] might be able to try on, and even enjoy, one another's clothes. “Boys will be boys,” say the evolutionary psychologists with a shrug, and almost everyone in the media, politics, education and television seems to be joining in, “and girls will be girls”. Welcome to the new Victorianism.

...[Guys are being targeted by a] \$250,000 advertising campaign to lure [them] to primary teaching... Newspaper and television adverts beginning in [two months] will emphasise the rewards of teaching and the important contribution that [guys] can make... The... Education Minister... said [guy] teachers sent a message to boys that education was not sissy... [The minister] was buoyed that [gal] teachers had raised the concern that 55,000 boys were growing up in households without a ma[sculin]e role model, and being taught only by... [gals. In another development, t]he length of the school day and school year is under review. The Government has formed an independent working party... to consider the issue, including the appropriate times for learning the curriculum... A discussion paper would be sent to schools at the beginning of next month... [and the working party] will make its final report to the Government late this year... The length of the school day might change but the working party had not yet seen any evidence to justify making it longer... [– although the person chosen to head the working party says:] “It's about maximising learning time to get the best quality education.” The review is a response to three factors... • Last year's E[RO] report, Open for Instruction, which showed substantial variations in the length of the school day and year. • A ministerial survey in 1996 that resulted in the implementation of the four-term year... • A drive by some primary schools to synchronise their school year to that of secondary schools... [Last year 39] primary and intermediate schools... [were] given approval to run for longer hours but fewer days, bringing them in line with secondary schools. The schools, mostly in rural areas... open between 10 and 30 minutes longer each day, a move backed by parents and teachers... One... school was Manurewa Intermediate. Its principal... said starting the day 30 minutes earlier, at 8.30 am, would shave a week off the school year. By matching term dates with the two local high schools, parents would be able to plan holidays with ease... A further 529 schools are eager to follow suit. However, the Ministry of Education says they have failed to meet its requirements, which include having the support of 75[%] of parents.

...The review of the school day and school year is a farce based on contrived and biased research, the secondary teachers' union says. P[PTA] leaders have called for the dismissal of the working party conducting the review because of “serious flaws” with the research used in its discussion paper, which the public have been asked to respond to through a questionnaire... One of the more contentious aspects for teachers was the suggestion that their work time, preparation time and holidays be specifically defined, with the report citing three overseas examples of countries where teachers have five or six weeks' annual leave. N[Z] teachers have around 12 weeks' holiday, but unions say most already use time off for professional development and course planning.

...TEACHERS everywhere claim they're overworked, underpaid and not appreciated. Their critics claim they have it sweet – look at the holidays – and if the namby pambys running the system just brought back daily thrashings then young people would come out of school better citizens than the flabby lot being produced now. There's nothing new in the PPTA bemoaning the lot of teachers. What is new... is that they now have an authoritative study that proves our teachers carry a heavier workload than any other country in the [First W]orld... The report also shows that brand new teachers are paid less than the OECD average and that our teachers teach for the longest hours. Pretty damning reading. If, as the report says, student to teacher ratios are an indicator of the resources devoted to education, we're only paying lip service to the idea that educating our kids equips them with the best chance of making the most of their lives. Before another retired soldier calls for the cane to be introduced, how about introducing more teachers. [• ‘Teach NZ has introduced \$10,000 grants to encourage NZers to train as teachers.’]

...A survey by the... PPTA... found... [o]ne-third of all... new secondary school teachers [employed at the beginning of last year] had either quit teaching... for other careers or... left the country by the start of this year... “We're really worried that new teachers are being put off teaching, especially when we're at the beginning of a roll bulge,” says... [the] president of the PPTA. The [president]... said the country was facing a teacher supply crisis and secondary schools could not afford to lose any more new graduates. Overseas schools were “aggressively” recruiting N[Z] teachers, offering them better wages and working conditions. But Teach N[Z]'s national manager... said new graduates had always travelled overseas to gain work experience. This applied especially to secondary teachers who wanted to work in the UK.

...The UK is... below average for the number of children staying on at school after the age of 16, with 82[%] going on to higher education... [(in the EU, o]nly Luxembourg and Portugal are worse)] a)... research institute report sa[ys]... And in terms of what children learn at school, the report

found that while Britain's 14-year-olds scored well in sciences, in maths just under half achieved the basic national average, with mental arithmetic seen as the biggest problem. About half of British 13-year-olds could not calculate 6000 minus 2369 and their average results lagged significantly behind those of their peers in Austria, Belgium, France and the Netherlands... [C]hild welfare campaigners were hoping that next week's budget would bring more family-friendly policies and cited both Germany and France, where measures to improve the lives of both children and their parents were well established.

...British parents disillusioned with the state education system are subjecting their children to selective testing at an increasingly young age... [In further news from Britain, m]ore than three-quarters of a million children... could be given drugs to control their behaviour – against their wishes and those of their parents. The spectre is raised by legislation planned by the Government to give increased powers to psychiatrists. Mental health workers are warning that the new legislation is being drawn so widely that doctors will be given the right to drug children just because they have a difficulty with maths or spelling. The concern over the legislation follows alarming evidence that tens of thousands of schoolchildren with mild behavioural problems are being given the mind-drug Ritalin... In England, the number of prescriptions... has shot up from just 3500 in 1993 to 126,500 in 1998. A report last week in the U[S] showed that... one in 30... children... were now... given Ritalin, with [some]... being... as young as 2...

Too many losers in [New York] schools... It wasn't the metal detector at the school door, or the uniformed guards, or even the unintended irony of the ill-worded sign that proclaimed "No weapons policy." Nor was it the knot of teenagers milling beneath a cloud of smoke in the park down the block, or the spectacle of a 16-year-old mum kissing her babies goodbye on the front steps. No, this is New York, where schoolyard violence, teen pregnancy and a little reefer before class don't raise too many eyebrows. The real shock for this visitor came a... few minutes after the bell when... 23-odd kids, all around 15, were slouched in plastic seats for the first class of the day in their Brooklyn high school. I was their teacher's guest, an emissary from the grown-up world who had come to deliver a little talk about the business of newspapers. It was an easy invitation for a reporter to accept. Over the past year, through a series of front-page scandals, the woes that beset New York's schools have come to seem absolutely hopeless. No sooner has one shocking incident or act of mayhem defined the wretchedness of an educational system that swallows one million kids every day than another outrage comes along to top it. "So," I begin: "Who has read a newspaper today?" No response. Try another tack. "Did you know this town once had seven daily newspapers, not three like... today?" Still nothing. Push ahead. "That was back before TV, when... W[W2] was going on and everybody wanted to read about the fight against Hitler and Japan." The silence remains unbroken. "So, who can tell me when the war was?" An arm uncurls, rising slowly to a point, the first shy sprout in a silent garden. It belongs to a girl who wears a beaming grin beneath a mat of corn-rows, each thin plait tipped with its own rainbow of ceramic beads. "The Sixties!" [the girl] announces with confidence, adding quickly that her daddy "went off to fight in it." As the class progressed the students were a revelation. On the one hand, there seemed to be almost no sense of history and timelines, of how all of us got here from there. But on the other hand, there was not the slightest suggestion of the horror stories that have figured so prominently on New York's front pages these past few months. The kids were polite, if uninvolved. And while only one or two bothered to express an opinion, the rest remained orderly and relatively quiet. I had expected something rather different – a glimpse of the blackboard jungle. To judge by the headlines, entire squads of detectives must be constantly arresting teachers for molesting their pupils. More than a dozen have been led away in handcuffs in... the past six months alone. Incidents of teachers being punched, slashed or threatened with guns occur every two weeks or so, which might explain why some teachers have taken to repaying the terror in kind. One was arrested recently for packing a handgun, two for beating students with chairs, and a 50-year-old [gal] for bending a child's finger until the bone cracked. School officials generally make light of those and other incidents. What they haven't been able to dismiss so glibly, however, is the very latest scandal to rock the 400-strong school system – a widespread cheating scam. Except it wasn't the kids who were breaking the rules but their teachers. Two years ago, when New York's Governor... imposed a series of standardised tests on every school in the state, the results for New York City's students were appalling. Almost 90pc of high schoolers failed mathematics, and the figures for English and science were only slightly less dire. [While some people joke that teachers tell their students: 'Remember class, the worse you do on this standardised test the more funding the school gets, so don't knock yourselves out', t]his year, the test results underwent an almost miraculous improvement. In fact the rise was so sharp that a squad of former police detectives attached to New York City's board of education decided to take a closer look. In less than a week they discovered that teachers in at least 54 of the worst schools had improved their pupils' scores by rubbing out incorrect answers and pencilling in the right ones. "You expect some students to cheat on exams," said... the education board's chief investigator. "But for teachers to do it just so they can look good is a betrayal of a scared trust." Not that it has been the only betrayal. [The detectives] also learned that many schools have been padding their attendance rolls with phantom pupils in order to get more funds. In one Bronx school, a boy dead for almost three years was listed not only as a current pupil but also as one of the school's most promising students... "It costs an average of \$US14,000... per year to educate a child in a New York Public school," a mayoral aide lamented. "That is... four times more than it costs to send a child to a comparable Catholic school, so the teachers' union argument that city schools are starved for funds doesn't fly." [The state's new senator] disagrees. When... officially announc[ing] her Senate candidacy, it was in front of an invited audience of teachers' union shop stewards. "You are doing a great job," [the former First Wife] said... "And we'll do much better when we send more people to Washington who will make sure that our schools have all the financial support they need for every child to excel." Just so long as nobody takes an attendance roll, or gets too hung up about teaching the events that shaped our modern world, it should be a piece of cake.

...A [gal] who rescued two violent and failing schools in Harlem and the Bronx has been advising N[Z] principals on leadership... for two weeks... One of the schools, in Harlem, had closed because of underachievement and violence, but [the gal] turned it into one of the most successful schools in New York... [The]Harlem-raised principal... believes N[Z] schools can learn from her experiences in some of the toughest parts of New York... [The adviser] said schools in Harlem and the Bronx were not always as violent and drug-ridden as they were portrayed, but "some are." "A lot of good things happen, but not enough to rescue all the schools that need rescuing." ...it was important to improve opportunities for disadvantaged children, whether they were from Harlem or South Auckland. "I come from a background very similar to children at the bottom of the achievement ladder, here and everywhere in this world. A good school in Tanzania looks like a good school in South Auckland. A bad school is a bad school anywhere. You can smell it, you can taste it, you can tell as soon as you walk in the door." [The adviser] said schools in the U[S] and N[Z] faced similar challenges. Raising literacy was crucial, teaching needed to be made more attractive, principals needed more professional development and N[Z] businesses should give schools more support. "Important groups in the N[Z] education system are consistently underachieving, and changes need to be made if the country is to turn these areas around... The clock is ticking on children's lives, and every minute counts." Schools could change children's lives for the better, and it was up to principals to create an environment of disciplined creativity.

...Only nine in 100 children at N[Z]'s poorest schools get a satisfactory mark in S[C] – and zoning rules are blamed for their underachievement. The statistics have been revealed by the Minister of Education in response to a parliamentary question from [an]Act MP... who said the figures were proof that the zoning scheme... stopped parents from seeking a better-performing school elsewhere. "Nine out of 100 [kids] at decile one... schools got an A or B pass... last year... At the richest schools, half the children got an A or B mark. S[C] is the bare minimum our children need to succeed. And yet at the poorest schools, 70[%] of the kids are destined to get a D grade." Zoning... was "robbing bright kids of any future by forcing them to go to poor schools that perpetuate a cycle of failure. What hope do they have?" Maori and Pacific Island students were particularly disadvantaged because one in five Maori and four in 10 Pacific Islanders attended decile one schools. In contrast, one in 100 Europeans attend decile one schools.

...New Lynn Primary School[’s]... new principal, back in a teaching role after working in the U[S] as an educational consultant... says inequalities in US schools made him realise how good N[Z]’s education system is. “Children will get as good an education in this system as they will in any system... I think sometimes teachers in N[Z] get a lot of flak for what is seen as not working hard enough.” But [the principal] says the criticism is unwarranted. [The former consultant] says being New Lynn Primary School’s principal gives him a challenge. “This job is an opportunity for me to work in a low decile school that is strong, with a strong history. I’m proud of the school and I’m proud of the community.” ...[the new principal believes his school] will have one of the most modern computer systems in the region by the end of the year... The project... [to] upgrade... its computers... is an example of his vision for the school. “We’re not going for mediocrity, we’re going for the very best... We’re getting state-of-the-art computers throughout the school...”

Rutherford College[’s] principal... says the school will have to look at increasing its use of computers if a teacher shortage worsens. “I believe good teachers in the future will have to teach more kids and will have to rely on things such as computer-assisted learning,”... Computer-assisted learning sees students given a subject overview by teachers before being left to pursue the topic with the help of a supervisor and computers. Teachers will then shift their focus to other students in other classrooms... [The PPTA regional chairperson]... agrees there is a shortage of teachers. But the fact that [Rutherford College’s principal] is looking at increased use of computer-assisted learning is disturbing, [the chairperson] says.

...PUPILS in three South Island schools [have] this year be[en] studying bursary economics with Kings College students through computer-based training and the internet. The scheme is a pilot for a wider offering of internet-based courses which Kings plans as part of its new academy, due to start in 2001. [The h]eadmaster... says interactive learning will suit smaller or remote schools which want to offer classes in subjects for which they would not be able to get enough suitable students to hire a specialised teacher. The scheme was piloted last year by three pupils at Amuri Area School in Canterbury. Five students from Diocesan School in Auckland also used the course material to extend their classroom studies... Students receive a CD-Rom containing a study guide, a complete set of notes with exercises and model answers, tests and a glossary... This year it will be picked up by two Otago schools, Oxford Area School and Catlins Area School. Kings intends to charge schools \$1000 for the service. “That’s a 50th the cost of a teacher,” says [the person] who teaches economics as well as looks after Kings’ IT programme... Kings has had computers... since 1990 and all senior students have had Apple laptops since 1996. That has meant staff have built up considerable knowledge on how computers can be used effectively in the classroom... When the academy is developed, students will be able to stay at Kings during school holidays for face-to-face contact... The material will also be available on line... The CD includes links to the course home page on the Kings web site, where students can get class news, e-mail other students, contribute questions or answers to class discussions... read about the state of the N[Z] economy... or... find links to internet sites which relate to the bursary economics syllabus...

Teachers beware. [The]Education Minister... is driving the new e-Government initiative and... wants you to log on. Launching the strategy in Parliament this week, [the minister] lamented that thousands of teachers were replicating preparation for classes rather than dialling up Te Kete Ipurangi – the ministry’s resource-rich website. [The minister] had even jested with PPTA negotiators that teachers have their pay docked unless they log on to the site three times a week. Those keen on keeping their pay packets might like to check out: www.tki.org.nz □... This year’s NetDay... could be the last, with the programme’s success making such a focused effort unnecessary. Since it started as an initiative by the 2020 Trust and 30 Wellington area schools five years ago, more than 500 schools have been wired up with computer cabling during NetDays. Sponsors – led by Telecom and equipment supplier Tyco Electronics – have come on board and the Education Ministry subsidises networking activity... “The majority of schools now say they have networks or are on that path,”... the Telecom NetDay... national coordinator... says. “Last year 600 schools did some form of networking, but only 140 of those did it on NetDay. That’s giving us the signal it’s time to move on. We’ve succeeded in raising awareness and giving people confidence to get started. We’ve also been able to put a bit more information into schools, so they are able to manage the quality of what other contractors are doing outside of NetDay.” ...The NetDay model is being applied to other 2020 Trust initiatives, starting with the Computers in Homes scheme being piloted in Panmure Bridge and Cannons Creek, where 25 families in low-decile school communities have been given recycled computers and internet connections for six months.

...We have free visits to the doctor for toddlers, free immunisation against disease, and CYF... to protect kids from physical and emotional harm or neglect, but the Government continues to allow the infestation of headlice. When I was at school 20 years ago, a health nurse visited regularly to check our heads. If pests were found, our parents were alerted and we were sent home with treatment information. By the time parents get wind of the problem these days, their kids are badly infested and have already passed on the lice to classmates and siblings. Schools can only warn against headlice and give out information, as the Human Rights Act prevents them from taking further action. Treatment is costly, so parents should check their kids’ hair every day. Parents, kindergartens and schools should hold fundraisers then negotiate a bulk-buy discount for headlice treatment.

...It looks more like the head office of a girly magazine than a teenage boy’s bedroom. Pictures of [models] in bikinis, about 20 of them, decorate the walls... And at the centre of them all, the 15-year-old high school student sits at his desk each night tackling homework. “Um, they help me study,” says... [the] fifth-former at Rosmini College, of his inspirational glamour gallery. Despite [hi]s preferred study aid, his North Shore school would no doubt be pleased to hear that, as recommended by his teachers, [the budding voyeur] knuckles down to two hours’ homework each night. But if [the 15-year-old] were to enrol at Mangere College, a secondary school in South Auckland, two hours of homework just wouldn’t cut it. There, fifth-formers are expected to complete around three hours of study a night. A... survey of more than 50 North Island secondary schools has revealed wide variations in the amount of homework schools expect from their students each night. Students could be expected to juggle from 30 minutes to more than three hours’ homework a night with after-school jobs, sporting commitments, family obligations and social lives, depending on their school’s study policy... Kaitaia College[’s] principal... said getting students to do their homework was an uphill battle. Rural students often had to travel long distances to get to school, and some left home at 6.30 am. The Ministry of Education’s senior manager of learning and evaluation policy... said there was no point in teachers setting homework unless the work was relevant to what students were learning in the classroom. It was vital that teachers also checked the work and gave students feedback. “We know that homework that is not checked is not worth the doing.” The ministry has no policy on homework, although it does receive correspondence from parents, about their children’s homework... [The manager] had received letters from families worried that schools expected them to provide computers and offer tutoring support when they were not able to do so. But is homework a help for children or a sop to parents eager to see them getting ahead? The debate about whether homework does, in fact, improve children’s performances has raged for more than 30 years. One educationalist who is convinced of its importance is the director of the Christchurch College of Education’s secondary programme... “Classrooms are useful for being introduced to new ideas with support from experts and interaction with peers... But students also need time for personal reflection. Well-set homework requires a child to rethink ideas, fit new information into current ways of thinking and practise skills which they can then become confident with. To achieve that, it has to stimulate the kids and have a creative element so students are motivated to complete it.” While homework might be a worry for some parents, it affects students – like [the 15-year-old from Rosmini College] – the most. “It’s a bit of a drag really... I just do it so I don’t get blasted by the teachers.”

...Up to \$2 million will go into homework centres next year, in primary and intermediate schools in poorer areas. Mountain View Primary School[’s] co-principal... said the centres would help to target education needs in poorer areas, but... stressed there would need to be adequate resourcing and staffing. The Mangere Bridge school has run for a year an after-school programme, which includes homework. It is financed mainly by parents and has some Government funding. “Some of our children come from homes that they share with the wider family and so quiet space can be a problem for them.” In [related news, a]... new classroom at St Mary’s School in Avondale is the answer to a prayer. After steady roll

growth... the building was needed. Special guests, students, parents and staff shared in opening and blessing celebrations for the classroom last week... "The children... are really enjoying the space and extra comforts of the room," [their]... teacher... says. "It is great to work in a class... where the architect has asked for input from teachers, resulting in a room very conducive to learning." Year 1... children were the first occupants...

Thousands of [NZ] children... went to school for the first time... this [year]... But in some European countries, [those children] would have a further year at home. In N[Z], children are not legally bound to begin school until they turn 6, but there is, says... [the] principal of Portland House Montessori School, strong social pressure for them to add their name to the classroom roll the moment they hit the big 5. If [a child] had attended a Montessori preschool, [it would] be... moved into the new-entrants classroom "at the time of readiness" based on an emotional and academic assessment rather than a birthday. The Montessori method of education (it emphasises free but guided learning with tools designed to encourage sense perception and mental stimulus) is an advocate for what they term "multi-aged" classrooms. While a Montessori education adheres to the National Curriculum, [it] is loathe to place emphasis on a path where "bench marks" are the only indications of a child's progress. The point of a place of learning where individual tuition is balanced with a wider grouping of ages is... to enable a child to "see the whole process", according to the principal. "Many children need more time to repeat certain activities; others can move quickly ahead. There's nobody saying, 'You can't do that, you're not old enough,' or 'That's baby stuff.'"

...From A to Z – an Auckland teacher and a Zambian teacher are swapping notes in a bid to help students in their classrooms... [The] teacher at West Auckland's Massey High School, visited Zambia in April with seven other Kiwi teachers as part of the ChildFund Global Schools programme. Under the scheme... a group of teachers from N[Z] travels to developing countries, where they offer local teachers different teaching techniques, then those teachers come to N[Z] to see Kiwi classrooms first-hand. [The Zambian] is a teacher at Shimbizhi School and is now being hosted by [the Aucklander] at Massey High School this week. Yesterday, [the Zambian] spoke to a group of year 9 students, acknowledging the many privileges which pupils in N[Z] have, but take for granted. "You are lucky here. Each student has his[or her] own chair. But in Zambia, it's different. Up to 60 or 70 students have to sit on the floor, no matter how cold it is... [and] the floors are broken. Here you have enough and different materials... If you go to Zambia... the main teaching aid is the chalkboard – at times the teacher has to sacrifice to buy books,"... [The Zambian], who teaches history, mathematics, English, social development studies, creative art, civics and physical education, said [it] worked up to 17 hours a day planning and teaching. [The Zambian] acknowledged the hardships that many children in her country have to go through, but said all were determined to learn... "They're dedicated, they're eager to learn because they recognise that this is the way they'll get out of the situation they're in. They have huge... pride and... respect... At times they come and they're hungry, they're tired and there's a loss of concentration... you force a child to learn with no concentration – it's hard." [The Zambian] said being able to see the situation that other students in the world were in, was heartwarming and heartbreaking... "I want the children here to compare themselves to the other children who do not have as much as they do..." ...Massey High School is now helping to raise \$15,000 to go towards improving the quality of education in developing countries... [Incidentally, approximately] 275 million children worldwide are not in class or will leave school unable to read or write, says the global relief agency Oxfam.

...figures, issued yesterday in response to a written parliamentary question, show that 1818 15-year-olds got a certificate exempting them from having to stay at school until they turned 16... last year because it had been decided there was little point in their staying... The previous year 2049 were allowed to leave early... [By the way, 17% of our kids st]ill leave school without a qualification – though that's nearly half the number in 1980.

...Over the next two weeks more than 90,000 students will sit 49... school certificate or bursary exams... at nearly 500 locations, including overseas centres, prisons and hospitals... But the process to get the[exams] to students' desks began 16 months ago and will not finish until certificates are issued next April. In August last year, the Qualifications Authority appointed subject experts as examiners... In some subjects there is also an assistant examiner, and the number of specialist people in the team may vary depending on the subject, such as science, which has biology, chemistry and physics strands. At [SC] level the examiners are generally specialist teachers and at bursary level a mix of teachers and university lecturers. All have training in the processes for setting exams. The examiners, who have a three-year cycle, look at past exam papers to set a similar style, format and level... [assisted by] a prescription of what can and cannot be tested... Throughout the writing of the exam a moderator, who may be a former examiner, looks at its appropriateness... Between March and May the exams are submitted on computer discs, transferred to the [NZQA] computer system and editors go over the paper looking at grammar, spelling and for ambiguous language or sections that may offend different groups... The first proof is sent back to the examiner and the moderator for checking. The paper is then sat by a checker, who tries to do it as a student would. Checkers suggest improvements to the examiner and moderator, who generally act on most points. The exam then goes through a number of proof-reading stages and is set out in a way that should make it easier to sit... In bursary, however, the exam sorts students for tertiary study and the paper must include more difficult parts to achieve that... A proof copy is printed and examiners are given a final chance to check that nothing is wrong before the presses roll. The papers, some of which have print-runs of more than 60,000, are printed between July and September and stored in a secure, secret location until they are sent out to schools and exam centres[in November]. Mistakes discovered after printing are dealt with in a number of ways. In severe cases, or if there are several mistakes, the paper might be reprinted. That would cost a further \$25,000 for an exam such as [SC] maths, which is this year's biggest exam... If it is realised that a word in a paper can be interpreted two ways, then markers are instructed to recognise both. A less-preferred option is for exam supervisors to tell students of the changes before they start the test. About 3650 managers and supervisors run the exam centres. Arrangements are made for students needing special conditions, such as readers or writers. Last year, 2500 students required such help. The centre managers report to the [NZQA] on any issues that may have affected the performance of students, such as suspected cheating, a fire alarm going off or the death of a schoolmate. After the exams, more than 1000 markers swing into action. Typically, the markers, experienced teachers or lecturers, receive about 350 papers each to mark against a detailed schedule. The idea is to have all markers thinking like the chief marker, who is often the examiner who set the paper. Papers are labelled with code numbers rather than names so that students are anonymous. Teachers cannot mark their own school's papers. On five occasions the markers send in samples of their answer booklets for the chief marker to check... From there, the markers have until just before Christmas to finish their task. Over Christmas and the New Year [NZQA] staff collate marks and scale results for bursary... After the results are processed, internally assessed marks and exam marks are combined and the result notices are printed. This year they should be with students by January 22. The marked answer booklets go back to students to give them a last check. They can ask for a review, which is basically a recount and free of charge, or a re-mark, done by the chief marker and costing \$25. Once the appeals are over, certificates are issued.

...The [NZQA] has defended a decision not to pass on any of its \$11 million surplus last year to parents through lower school examination fees. The Government decided in November [last year] to make the authority replay the surplus but did not cut fees the authority collected for this year's [SC] and bursary exams. At the time, [the] Education Minister... accepted arguments that the money was needed to run a new qualifications system, which starts in 2001... The authority's communications manager... said it was normal for the authority to budget for a surplus in school examinations, in case of extra costs. This had happened in 1991, when a major mistake in the English bursary exam meant many papers had to be remarked. It could also be argued that any savings should be refunded to last year's students, which could be difficult, rather than given out as discounts on this year's exam fees. Last year, 64,320 students sat school certificate, paying up to \$187 for six subjects, and 27,399 sat bursary, at an average cost of \$137 for four subjects.

...Students will no longer pull [SC] or bursary certificates from their letterboxes... The exams will stay in name but will change in format and become levels one and three on the new four-level National Certificate of Educational Achievement. Very able students will be offered a new

scholarship tier at level four, while sixth-form certificate will be axed and replaced by a combination of internal assessment and nationally set tasks, such as a portfolio of work and research[for level two]... The move will do away with the unpopular way of assigning schools the number of sixth-form certificate grades they can give students based on the [SC] grades students achieved the year before... Scaling of bursary exams is... out... bringing it in line with [SC]... Higher school certificate is also out... The new system, dubbed Achievement 2001, will restrict unit standards to non-conventional subjects and bring in new achievement standards for the traditional subjects... The Minister of Education... says the system is a “well-constructed middle pathway.” However, schools that banked on the Government’s dumping the old exam system for a total credits-based qualification scheme say years of work have been wasted.

...WEST Auckland secondary school teachers will follow up a national strike [next week] with industrial action... The protest surrounds increased workloads brought on by government plans to introduce a National Certificate of Educational Achievement (NCEA)... The P[TA] is claiming a \$2500 pay increase for each teacher for each of the next three years, to compensate for extra workload anticipated... It [also] wants a clause in teachers’ contracts to guarantee staff work time outside of the classroom. Until then, teachers say they will refuse to take classes for one hour a week in a bid to catch up with the extra work they say is already starting to accumulate. “Members are telling us quite clearly that one of the things they need to implement the NCEA is time,” says [the] association junior vice president... “If the Government won’t provide it, we’ll take it.”

...[A] READER... has come up with a reasonable justification for the cruel and unusual punishment that is NCEA. “It is simply a way of stopping the brain drain. By ensuring that we have no recognised qualification, the Government is guaranteeing that we will not be able to be employed in any professional job overseas – no one will want us. As a result, more ex-students will stay in the country... My apologies if parts of this note don’t quite make sense to you, but I am a student... and am not being properly motivated or academically challenged at school.”

...A University of Auckland plan could turn south Auckland schools into “ghettos”, Otahuhu College[’s] principal... fears... There are two types of N[CEA] qualification, unit standards and achievement standards. Schools can offer either qualification or both. Auckland University says students with unit standard qualifications applying for “oversubscribed courses” like medicine, law, engineering and architecture may be rejected.

...The headmaster of Auckland Grammar School [has] been an outspoken critic of the proposed... NCEA... which is to replace S[C] and Bursary in 2002. [The headmaster], who also chairs the Education Forum – the educational equivalent of the Business Roundtable – says it will result in the dumbing down of academic standards and create a system that “eradicates challenge and demotivates effort.” [The headmaster] has gone further, revealing that Grammar has signed an agreement with Cambridge University in England to offer its A-level entry qualification to students who wish to sit it. [The headmaster has] written to 35 other schools about the plan – 24 have expressed interest. Surprisingly, perhaps, his idea came under fire this week from three [gals] one might have expected to be among his stauncher allies. The principals of three elite girls’ schools, Epsom Girls Grammar, St Cuthberts College and Diocesan School for Girls, jointly backed the new national assessment in a piece on the *Herald’s* Dialogue page... If [the headmaster] is galled that the principals of what might be seen as Grammar’s sister schools have broken ranks... the goalkeeper... [who played in] 14 internationals for the All Whites... in the 1970s... shows no sign of it. [The headmaster] remarks, without naming names, that two of the three have asked to be kept informed of how the Cambridge proposal develops, and says their opposition has “at least brought this matter into public debate.” “It’s never been debated... We believe in externality, national standards, accountability, consistency. It works for us. I’ve never said it should work for everyone, but the whole tenet of Tomorrow’s Schools was diversity and choice, and now we have a... Government trying to take us back to a ‘one-size-fits-all’ mentality.” Critics of Grammar’s announcement have ridiculed the notion of N[Z] kids sitting English A-level exams designed by blazered, upper-class twits in boaters. But, [the headmaster] explains, the exam concerned is the International A-level, which is administered throughout the world. It will cost students \$45 to \$60 a paper and will, [the headmaster] says, be an improvement on the alternatives: the N[Z] Education and Scholarship Trust, a privately funded exam set up when the University Scholarship exam was abolished, and the International Baccalaureate, which imposes compliance costs of up to \$100,000 a year on schools and entry fees of up to \$1000 for each child. [The headmaster] admits that the “Englishness” of the Cambridge exam will pose some problems, but says there is “potential” for teaching local content; local courses, validated in Cambridge, would be marked here and sent across the world for validation. [The headmaster] takes issue with criticism that it sounds a lot like the internal assessment model being used on an international scale...

The noisy education rumpus over the Auckland Grammar plan to adopt the Cambridge A-level exam system is a reminder. With it comes recall of what I regard as a significant exchange during a spell of fulltime journalism tertiary teaching some years ago. It was a board of studies briefing on a new definition of “outcomes” – what teachers should aim to achieve from students. A previously sought-after level of mastery of a subject had been changed, we were told. (I suggested downgraded.) Among the illogical reasons, “mastery” was a sexist term...! (This despite the fact that students on graduation would carry bachelor or masters degrees.) No more mastery. Instead, teachers should aim for student “competency” in their subject. No amount of argument from me on the obvious difference between mastery of a subject and mere competence in it swayed the discussion. Mastery was out. Competency was in. Perhaps, in some ways, deep teacher and parent concerns over this difference in theory and practice lies behind the planned introduction of A-level exams... Its advocates see... this as a necessary grounding for students in a small country at the edge of the world, an education for the young with ambitions to become major players in world commerce, politics and the arts. Or simply better educated adults. The Cambridge system is advocated to provide a global and internationally competitive, recognised education. Allowing its graduates to see the entire world as a source of knowledge, to operate in a world environment – or at the very least remain here and still be conscious of what it involves... Advocates... describe it as a step forward into the 21st... [century. Critics] label it a step back to the 19th century.

...It is one of the biggest days of anyone’s life. Months of anxious waiting finally come to an end as school exam results pop through the letterbox. Tears or celebrations follow. But in Scotland this summer there have been mainly tears. And anger. Many certificates did not arrive on time. Then it got worse. Pupils were given pass marks for exams they did not sit, while others got no results for tests they had taken. More than a week later some teenagers are still waiting for their certificates. And as universities start filling courses, their places are under threat. Today every one of the 147,000 Scots pupils who sat this year’s Standard Grade and Higher Still exams doubts the validity of their results... An inquiry has been launched to check the validity of marks, with Scotland’s Education Minister... pledging unlimited resources to sort out the fiasco. However, Opposition parties and teachers unions want him sacked... It has been branded the biggest crisis in the history of Scottish education, and has come after this year’s introduction of the Higher Still exams which are the main qualifications Scots need to get into university. Teachers and exam officials have been warning for more than a year that the system was not ready to cope with the new tests.

...Changes... to... [NZ] school examinations should mean the end of a confusing and mismatched system of external exams and internally assessed standards... Schools have been waiting five years for a decision and would have to wait until 2001 for the system to get under way, but it would give them time to adapt... Schools are expecting a compromise which would see the best of both programmes. It would align [SC] and bursary exams within a four-tiered system that will accommodate unit standards and recognise excellence... “There is no doubt that employers and parents still want to know how their child, or the person they are considering employing, stands up against others throughout the country. These two groups are not going to accept that there will no longer be any kind of national exam to give them comparison rates,” said... a senior lecturer at Massey University’s College of Education... But as times have changed so have employers’ reliance on exams such as [SC] to tell them what prospective employees can do... “On the whole, the idea of an outcomes-based set of qualifications which actually give some meaningful reporting on what a student has achieved and can do has got to be better than what we have traditionally relied on.” ...the education spokes[person] for the Employers and Manufacturers Association, said employers hired few school leavers these days as the levels of experience, maturity, skills and qualifications

required at entry-level positions were higher... Groups such as polytechnics and trade organisations have established unit standards for courses, the idea being that students have a seamless system of assessment at school and tertiary level, going on to get further units after they leave school.

...Students will be steered away from subjects such as accounting and law as the Government tries to increase the number of science and maths graduates. [The]Tertiary Minister... said the country's economic development was at risk because at present it relied on the choices of tertiary students... 30[%] of tertiary students [a]re enrolled in business, commercial and legal courses, causing an oversupply of graduates. As part of an overhaul of tertiary education to be announced this week, the Government plans to take a role in determining the number of graduates across a range of courses... On Wednesday, the Tertiary Education Advisory Commission (Teac) will release a report recommending... that funding is withdrawn from some tertiary education providers to cut course duplication[, and suggests there also be]... a cap on the number of courses available to students in areas where graduate numbers vastly exceed local industry demand.

...Drop in on a meeting of manufacturers and you will quickly get a chorus of: "We can't find people with the skills." Who is to blame? A variety of factors, says... an A[US]n consultant on workplace training, speaking at a conference... organised by Skill N[Z], the Government agency that administers what is now called "workplace learning" (industry training) and sponsored by Business N[Z] and the Council of Trade Unions... It's not just the Government, even if you could sometimes be forgiven for concluding from the perennial business grumbles that manufacturers – and a lot of other employers – think the taxpayer owes them trained workers, much as the unemployed think the taxpayer owes them a living. Perhaps it does, in a sense. A constant refrain at the... conference was that schools are not turning out pupils with the "soft", "generic" skills business needs – most important among them the indispensable ability to read, write and calculate but also a keenness to learn. The... chair[person] of the Industry Training Federation, put it bluntly at the conference: "The faster the rate of change, the more advanced our fundamental and generic knowledge skills need to be. Young people leaving our schools, polytechnics and universities need a robust knowledge base and a generic set of skills to make lifelong learning possible and if this comes at some cost to some of the vocational curriculum it is not an unacceptable trade-off when you look at the long-term benefit." But what can teachers do if bored or unmotivated students sentenced to the classroom till their late teens simply won't ingest the generic skills [the federation] wants? How do you motivate them? Over coffee a secondary school principal at the conference told me at length of the success of a programme that sends his school students out to work a day a week. Seeing what's needed in the workplace brings home to them the relevance of the generic skills and they become more willing classroom students. The Government's Gateways programme is aimed at that and evaluation of the pilot suggests it is working... ■ [West Auckland schools are participating]... in a fledgling project, Partners Waitakere, [which]... aims to close the gap between what is taught in schools and skills needed in the business world... Partners N[Z]'s national co-ordinator... says businesses and schools are in the same community, but have different languages and cultures. By bringing these two together there will be a greater understanding of the needs of each community?... Eight schools are teamed up with west Auckland businesses.

...West Auckland sixth formers got the chance to... ask... role model[s]... about making smart career choices... last Tuesday... Around 74,000 students in Auckland, Wellington and Christchurch have taken part in TMP Workchoice Day since the event was launched in 1995. The one day expo helps them learn about different careers by visiting up to 450 companies in action... Today's young career[-minded student] can't help but look up to [a]retired Silver Ferns captain... After holding down a job as a full-time teacher, leading her country on the netball court, and becoming fluent in three languages, [it]'s certainly qualified to give advice... [A TV] personality and sports[person who]... is another... role model... says there are some things about growing up that you don't get told at school, and these things are often learnt the hard way. Workchoice Day helps students to avoid some of those pitfalls by giving them relevant information... • [It has now been two years since]... the National Government unveiled its plans to corporatise the country's universities and polytechnics and force them to compete within a consumer-driven tertiary education marketplace. Millions of dollars were wasted on developing a policy that those who understood tertiary education knew was fundamentally flawed. Last month the Minister of Tertiary Education... announced that the proposed legislation will not proceed, effectively conceding that the market cannot be relied on to deliver tertiary education needs in the 21st century... Ministerial speeches now insist that the country's future rests on bringing together education, science and industry... For opponents of the policy, this is a bitter-sweet victory. The mantra of the market has been replaced by the equally vacuous notion of the "knowledge economy."

...[the] Government's plans for a "knowledge economy" have been cautiously welcomed by business but panned by most education groups. A line-up of 10 ministers in five cities... launched National's "five steps ahead" package – optimistically renamed Bright Future – with all the razzmatazz of a Budget presentation or election campaign launch. But the Government kicked for touch... long-delayed reforms of the tertiary education system... The main focus was on a range of new scholarships from school bursary student to post-doctorate level... The Government's plan has been criticised by university students and academics as piecemeal[, while science teachers say the]... package... is missing a crucial element – a way to plug gaps in their numbers... Auckland secondary school students... say that... a \$500 [scholarship]... to encourage those with the most potential to study science and maths at tertiary level is no incentive to switch career paths.

...Bright Future... is... [a] strategy... to convert N[Z] into a "knowledge economy." Ireland and Finland are seen as pioneering models... [but the] concept of a knowledge economy is ambiguous and [political]... strategists are probably fully aware of that. It is difficult for potential critics to oppose a knowledge economy. Few of us would own up to preferring an "economy of ignorance." ...Political proposals to create a "knowledge economy"... however, are as much attempts to privatise knowledge as to expand it. This is to happen on two dimensions. The first is the creation of a "knowledge elite" within N[Z]. Knowledge is to be rationed to those most equipped to profit from it. This is not a matter of creating scientists instead of entrepreneurs... [T]he Minister for Enterprise and Commerce... wants to create applied scientists who sell for high prices the products of patented knowledge. Creating a knowledge elite is a matter of picking winners, which means picking losers. [The minister] would like four of our seven universities and all of our institutes of technology to do less research, not more. Those outside the elite three, as "teaching universities," would be spoon-fed only the knowledge that is deemed good for them. The second dimension of the policy to exploit privatised knowledge is for N[Z] Incorporated to gain market share in the world economy by being more knowledge-rich than are N[Z]'s rivals. This view – of the opportunistic nation state – fails to appreciate the nature of globalisation... The solution that is best for the world as a whole, and therefore best for each nation in the world, is to treat knowledge as a free public resource. Knowledge creation would be understood as a component of social investment...

N[Z] is trailing other [First World] countries in the number of people with university qualifications... [11% of NZers] aged 25 to 64 have university qualifications, compared with an average of 13[%] for countries in the OECD... More than a quarter of people in that[age] group in the US have graduated from university... and 15[% of AUSns. A]... University of Auckland pro vice-chancellor, said the figures were alarming and low university participation would hinder the Government's plans for a knowledge economy... [(u)niversity vice-chancellors threatening fee increases next year have reaped pay increases of more than 40[%] since 1997... State Services Commission figures show[])... However, the number of N[Z]ers with other tertiary qualifications was slightly above the OECD average and ahead of A[US], Britain and the US.

...A NORTHLAND chemistry teacher is facing two charges for allegedly using bogus qualifications. And police say there could be more charges... The right of [the unqualified teacher], a Fijian-Indian immigrant, to stay in N[Z] would be assessed if [a conviction was forthcoming. Universities]... in Delhi, Suva and Auckland... have denied awarding him with masters and bachelor degrees in science and education. In 1989, [the immigrant] began teaching at Auckland's Penrose High School and later taught at Mt Roskill Grammar and Glenfield College before moving to... Bream Bay College, 25km south of Whangarei... in 1995. [The immigrant] was on a salary of \$47,100. [The immigrant] was sacked from Bream Bay after...

fail[ing] to show at two disciplinary meetings which were convened after [it] failed to respond to requests to authenticate his qualifications... “[This imposter has] robbed hundreds of students of their education... and has also fleeced the taxpayer...,” said... the... Minister of Education...

AN ESTIMATED 50 teachers are working in schools illegally because they do not have a teaching licence. Last week it was revealed [that the]... Teacher Registration Board... had no record of... [a] teacher... working at Northland’s Broadwood Area School... being registered. Teachers must register every three years, at a cost of \$60, so the board can check they are of good character... [The board’s] interim director... said the E[RO] discovered about two unregistered teachers a month, sometimes more... “But it’s almost always an oversight rather than a deliberate act,” said [the interim director], who had just written to a “prestigious” school to tell them they had two unregistered teachers. Meanwhile, [the interim director] has written a “please explain” letter to Broadwood Area School asking why it had not checked [the registration of the 26-year-old teacher – who]... was sacked for allegedly having a... mutual sexual... relationship with a 17-year-old... pupil... [The interim director] said the problem appeared to fall on the principal... because [it] did not make sure [the 26-year-old was registered. The principal said it knew the 26-year-old] was not registered and had asked her to register. But [it] had not made sure [the 26-year-old] had done so. “I was remiss,” said [the principal, who added that it] had just found out a part-time junior school teacher at the school was also not registered and was putting in her application. [The interim director] said the board could not deregister [the 26-year-old because it] was not registered as a teacher. The school could face a \$2000 maximum fine for having an unregistered teacher. Under the new Teachers Council brought in next year it will be \$5000. However, the board has never fined a school for having an unregistered teacher. Schools in the past have been sent a warning. [The]School Trustees Association president... said schools must be meticulous and ensure their teachers are registered. “But in country schools that’s an easy statement to make. The reality of actually finding someone who will teach out there is another story,”... [The] Secondary Schools Principals’ Association president... said [it felt sorry] for schools caught out with unregistered teachers. “It’s easy to forget. With the best will in the world this can [still] happen,”...

If the Education industry was united in its efforts, individuals holding false teaching qualifications would only be employed with the collaboration of corrupt officials – but, if the ministry was properly organised, and administrative staff were carefully selected, it should be impossible for unqualified people to deceive the system. If each district had one teachers training college, which was directly linked to the rest of the education industry within that district, it should not only be possible to ensure that only qualified (and competent) people are employed as teachers, the college could also stream course numbers to meet the district’s teaching needs (e.g. it can prevent there being more language teachers than required while there aren’t enough maths teachers). Until every district has its own teachers training college, trainees may be sent out of their home district to study; and, until every district has enough qualified teachers of its own, there will continue to be a need for teachers to be traded between districts (qualified single people might volunteer to temporarily, or permanently, move from a district if it has an excess of teachers). However, wherever possible, communications technology (in particular, TV, radio, Internet or video-conferencing) ought to be utilised instead of sending some teachers to train or work outside their home district.

To assist its management process, the Education Ministry could, for example, contain the following departments: preschools – catering for pupils aged 0-5; primary (or elementary) schools; secondary (high or senior) schools; teachers – handling teacher training, placement and related activities; one that handles curricula development (or maintenance) on behalf of those departments, and special activities (e.g., educational research); and a department that stores and distributes material resources. If the Education Ministry was united worldwide, it could access the various teaching methods being used in schools in order to identify and eliminate the least successful methods, and promote the most successful ones (including, perhaps: speed-reading, Mega-Memory and systems that teach children mathematical shortcuts or ‘to type without looking at the keys in an hour’ – if it is as easy to improve a person’s keyboard, maths, reading or memory skills as advertisements proclaim, then every child should be given the opportunity to benefit from them).

Excluding humans and domesticated animals, the offspring of earthling species are either born with all of the innate knowledge they need in order to survive in the wild, or they are born with some innate knowledge while their parents and personal mistakes teach them the remainder. If the parents of the second group fail to teach their offspring properly (i.e., if their offspring predominantly learn by making personal mistakes), those offspring – or the next generation – are unlikely to survive in the wild. Fortunately for most earthling species, their existence is so unsophisticated that their offspring don’t need to learn a lot. A human could survive in the wild without having much knowledge – as long as that knowledge is relevant to living in the wild – but, in order to survive in modern human society, young humans have to learn a lot more (after all, innate human knowledge is only likely to be relevant to living in a society that is no different to previous societies). Humans are born with some innate knowledge and, in addition to their parents and personal mistakes, can also be taught by schools, books, TV, research, etc.

According to one source: ‘Lamarck proposed that characteristics acquired by parents during life could be passed on to their offspring, and Darwin too believed that this was possible, although it is now known not to be the case.’ However, if ‘at the moment of conception a baby inherits a unique combination of its parents’ personalities’ in addition to their physical attributes, why aren’t ‘inherited memories passed down generationally at a genetic level’ (r:p945, ln27 + p1708, ln9 + p1867, ln8 + p1868, lns23-4 + b, p1869, ln4 + p1875, lns43-6)? ‘When a gal is born her ovaries contain about 400,000 eggs, all that the gal will ever have in her life (although only about 400 will ever be released’), which means a mother can only pass on the innate knowledge that it (and its mother, grandmother, great-grandmother, etc.) was born with – but sperm have a chance to be programmed with new knowledge and skills (note that the younger a father is, the less innate knowledge or skills its sperm would deliver; ‘our brains aren’t fully developed until the age of 25’). If sperm can provide additional innate knowledge and skills, human children could be expected to quickly understand much of what their natural fathers try to teach them, and easily imitate many of their natural father’s skills – because they are simply being reminded of things they already know (although, if after the time when its body produced the successful sperm the father had learnt anything that caused it to modify its beliefs, this might cause personality clashes between the father and child). Ironically, this theory implies that if a father’s brain contained every piece of human knowledge a month or so prior to the time of conception, the resulting child would subconsciously know whatever the father knew even if it never gets to meet its father! The theory suggests that human society should predominantly focus on teaching children the knowledge acquired by present generations – because they should already know most of what was learnt in the past. If most of the members of current generations appear to be unaware of what their species learnt in the past, that could be attributed to the lack of proper education received by the majority of foreparents: their having lived in the past doesn’t mean that they knew anything about it! The theory also suggests an explanation for alleged recollections of past lives (i.e., the person has accessed the memories of ancestors stored inside its own genetic makeup).

It would be a shame if the knowledge and skills (or characteristics) acquired by fathers prior to conception can’t be passed on to their offspring, because recent history suggests human society has accumulated so much knowledge that it isn’t just extremely difficult – if not impossible – for human parents to teach their children all of it, the same goes for the education system. However, some information can be classified as ESSENTIAL for every human to know, and the rest classified as INCIDENTAL (or TRIVIAL). The aim of the Education Ministry should be to concentrate on teaching pupils the information and skills which are basic or important to the human species (and to avoid teaching inappropriate information and skills: note that while performing fitness exercises during an episode of the preschoolers’ TV programme *Teletubbies*, one of the main characters properly touched the floor by bending at its knees while the other three touched the floor by bending at their hips – a practice that can cause sore backs; ‘don’t use your back as a crane’; *Teletubbies* is made in Britain – where ‘back pain brings misery to millions of sufferers and is the cause of a staggering 150 million days off work each year’), which would also mean that once a course’s curriculum has been worked out – according to the new emphasis (curricula ought to be standardised worldwide, but there can be latitude for each district to include information which is only relevant to their own citizens) – it will only require minor alterations, if any, in future. The ministry can’t control what young humans learn outside of school hours, but if it is confident that pupils are learning what

they should while at school, it wouldn't have to be too concerned about what they are learning (or recollecting) at home – with the exception of what they are taught during their preschool years.

It is advantageous for their classmates, teachers and themselves if a child is able to communicate and socialise adequately, and understands the basic concepts of reading, writing and mathematics, before commencing school. The Education Ministry should be informed of births so that it can offer parents assistance with their child's early development. The ministry can store a supply of age-related learning materials which parents could borrow then return when their child is ready to move on to the next level. The main concern of the Education Ministry at this stage should be to identify children who don't perform to an acceptable standard, thereby enabling the industry to provide additional assistance to their parents or attempt to identify and deal with any learning problems that the child may have. Each child should attend a local (i.e., the nearest) preschool at about the age of 3 – depending on its development at that age (a child could commence preschool at a later age if deemed necessary – e.g., if it still isn't toilet-trained – but, regardless of its level of development, there shouldn't be any justification for a child to attend before turning 3) – even if they only attend for one day a week. Preschools should only be the size of one classroom, so there could be a number of them spread evenly within each suburb. The primary purpose of attending preschool would be to familiarise children with the classroom environment. It will also present an opportunity for the industry to check the development of individual children so it has another chance to correct any problems before a child moves on to school at the age of 5 or 6 (preferably, a child should commence school on the first day of the new school year following its 5th birthday – instead of joining a class during the year, and missing classwork).

Educational resources – be they teachers or equipment – should be distributed evenly between pupils (i.e., if two schools have an equal roll, they should be allocated the same amount of resources; larger schools should receive a proportionately larger allocation of resources than smaller schools), although some pupils may require extra resources if they have a disability. When commencing a united Education industry, each district would have to find out what resources its schools currently have, and arrange to collect a portion from schools that have an abundance of resources so they can be transferred to under-resourced schools within that district. Educational equipment should only be sent out of a district if every pupil within the district has what the industry deems that it needs and the district has equipment to spare (in the early 1990s, because 'their under-15 populations were in decline, China and India had classrooms in excess', which suggests that they also had other school equipment in excess – it might be impractical to transfer classrooms and anything written in Mandarin or Hindi to other parts of the world, but the same does not apply to desks, chairs, writing implements, etc.). When every district in the world has enough educational resources, each could accumulate a slight excess of its material educational needs so that lost or damaged items can be quickly replaced. This would also allow the industry to periodically check that every pupil is using a correctly proportioned chair, and replace it if not – which, hopefully, would assist in reducing the incidence of back problems they suffer as adults.

In a moneyless society, principals wouldn't have to devote any of their time to accounting or fundraising activities (which means they can devote all of their energy to fulfilling their roles as Education Ministry organisers or managers). More importantly, there would be no financial barrier to how many teachers the industry could employ – the only barrier would be how many workers the district can afford to employ as teachers (with a primary consideration being how many workers are required by other industries). Having more teachers could enable classes to be made smaller than the current NZ average (e.g., each teacher would look after less children in a more intimate space). Alternatively, the recommended class size of about 25 to 30 pupils could be maintained but each classroom would have two or more teachers. Three teachers per class might be an ideal ratio: it would allow each class to have one senior teacher and two assistants; or each teacher could be a subject specialist (e.g., one handles language studies, another maths, and the 3rd something else) and hold seniority whenever its subject is being taught. Having more teachers in a class would not only increase the knowledge base available to the children of each class, it will mean that if, for example, two students are having problems with an exercise and stick their hand up at the same time, each can simultaneously receive personal assistance instead of having to wait their turn – which should also enable the class to move from one exercise to the next in less time (meaning schools could operate for less hours annually than now but still cover the same territory as current curriculums, or they could operate for a similar total of hours as now but cover more territory). Trainee teachers should still spend time in classes as part of their college courses (and would also benefit from having more than one practicing teacher to observe or gain personal assistance from). Another advantage of having more than one teacher per class is that it would be easier to maintain educational standards – because each teacher can observe the skill level and classroom behaviour of the other two (which should also mean that the industry no longer has to employ classroom inspectors) – and keep the pupils under control (i.e., teachers wouldn't need to have 'eyes in the back of their heads').

A moneyless society would still need to be able to differentiate between school-leavers for employment purposes (especially when selecting candidates for specialised training), so classes should contain pupils who are of the same age – give or take a year. This practice gives pupils a chance to be surrounded by people their own age (pupils generally get to mix with differently-aged children – e.g., siblings, cousins or neighbours – while not at school, and they can mix with differently-aged children in the school's playground during breaks). It also allows the industry to produce age-related study programmes in video form, which can be viewed separately by classes (i.e., when one class or school finishes with a video, it passes the video to another class or school) or simultaneously (e.g., the industry could broadcast the video via a TV channel so every class of the target age-group can tune in to it).

Most primary schools arrange for pupils to have new teachers each year while some make teachers remain with a class from new-entrants until their last year of primary school – then start over with another class of new-entrants the following year. The first practice enables teachers to specialise in teaching children of set ages, while the second practice means that teachers are more familiar with the needs and abilities of individual pupils. The second one also means that teachers are more familiar with what each class is due to be taught in future years (and what each class has been taught in the past), which should be more advantageous than if they only know what a particular age-group is being taught – so it ought to be the preferred practice.

The aim of primary school education should be to develop a pupil's language and maths skills from preschool level to a proficient level (i.e., a level that enables a human to cope with living and working in a modern society). If children understood the basics of these subjects before commencing primary school, it should be possible to construct primary school curricula which enable the ground currently covered between the years 5-17 to be compressed into fewer years – especially if unnecessary exercises are eliminated. This is especially relevant for maths – because the majority of humans will never need to use most of the information they are taught in maths classes. It might not be possible for every 9-year-old to be able to master university-level calculus, but anyone who understands the major mathematical concepts before leaving primary school should be able to cope with learning more complicated maths if they eventually train to become an engineer or physicist, for example – and any pupil who is proficient and has an ambition to work in an industry that uses complicated maths could undertake extra-curricular studies during normal maths classes or outside of school hours. Learning a second language could also be classified as an extra-curricular, or outside of school hours, activity – unless that second language is one which has been designated as UNIVERSAL.

Nothing has ever united the young of the world so firmly as pop. Mention Elvis Presley... Beatles or Beach Boys, Who or Led Zeppelin to a Russian youth, a Japanese girl... an Eskimo or a Zulu, and each one of them will have some knowledge of them... It has also made the English language a universal language, because pop music magazines the world over print the words of the most popular songs in the language they originated in – English. Although each country may have its own version of the hit songs in their own language, the original English version is usually more acceptable. Even songs originating in other languages become more popular in English. It is also significant that in many international song contests, singers from... European countries often sing in English. Popular vocalists in Germany, Japan, Italy, Yugoslavia and other countries are all expected to sing in English and mostly do so perfectly.

The Indian nation is... insecurely united, divided on many lines of ethnic, religious, linguistic, and even persisting tribal identity... The Hindu 65[%] of the population is divided into numerous language communities. Some shed blood to reverse the adoption in 1964 of Hindi, spoken by 30[%] of the people, as the national language. To bring peace and unity, the government of India undertook, in 1967, to publish its documents in each of the 13 languages spoken by more than 10 million Indians – including English, the nation's *lingua franca*.

Among all available literatures, the Sanskrit *Vedas* of India are the oldest on earth...

'Hundreds of alphabets exist today and have existed in the past.' The oldest letters are said to be the 'ancient Egyptian hieroglyphs, from which developed Sinai script, that split into Ethiopic (south Semitic branch) and early Phoenician (north Semitic branch). The latter split into 4 groups; one producing Arabic and modern Hebrew, another Samaritan, the 3rd Sanskrit and the 4th archaic Greek, which evolved into the modern Greek, Slavonic and Roman alphabets.'

Among the most significant offshoots of [the 24-letter Greek alphabet] were the Cyrillic and Etruscan alphabets. The Cyrillic became the script of the Russian[which has 31 letters plus a 'hard sign' and 'soft sign'], Ukrainian, Bulgarian, Serbian, and Belorussian peoples, while the Etruscan evolved into the Latin alphabet. Originally, the Romans borrowed 21 of the 26 Etruscan letters. Two more, the *y* and the *z*, were absorbed following Rome's conquest of Greece in the first century BC. The *j* and the *v*, which had previously been written interchangeably with *i* and *u*, respectively, came into being during the Middle Ages. With the addition of the *w* from a Norman source, the Latin alphabet was brought up to its present complement of 26... The Hebrew alphabet is read from right to left. It has no vowel graphemes, although 4 of the 22 letters are used to indicate long vowels. The remaining vowel sounds are represented by the use of 16 diacritical marks placed above, below, or to the left of a consonant... Like the Hebrew alphabet, the Arabic is virtually vowelless. Only 3 of its 28 letters are used for long vowels, with 14 diacritical marks supplying not only other vowels but distinguishing between consonants and serving as noun and verb modifiers... [In] Chinese... each word is graphically represented by a separate individual symbol or character or by a sequence of two or more such characters... Character writing is laborious to learn and imposes a burden on the memory. Alternatives to it, in addition to alphabetic writing, include scripts that employ separate symbols for the syllable sequences of consonants and vowels in a language, with graphic devices to indicate consonants not followed by a vowel... There have been several attempts at a perfect alphabet which would ideally use one and only one symbol for each sound of a language. The most notable of these efforts resulted in the International Phonetic Alphabet, invented at the close of the 19th century.

Alphabetic script developed as a consonantal system in the Levant during the second millennium BC and had assumed a linear form composed of twenty-two signs, known as 'Phoenician', by the 11th c. BC, before it was transmitted to Greece. With the introduction of the first full vocalic system, the earliest Greek alphabet of c.750 BC achieved the final structural development of writing which passed back to the Semites and thence to the rest of the world, remaining principally unaltered to the present day. The alphabet is the most flexible method of writing ever invented, passing from one language to another with minimal difficulty; it is hard to over-estimate its importance... Chinese script is ideographic; the characters were in origin pictographic, with each sign standing for an object, and they gradually gave way to non-pictorial ideographs representing not only tangible objects but also abstract concepts. Despite its complexity the script makes written communication possible between people speaking mutually incomprehensible dialects... There are many dialects, including Mandarin (based on the pronunciation of Peking), and Cantonese (spoken in the south-east and in Hong Kong)... Traditionally Chinese books were arranged in vertical columns and read from right to left, but they are now usually composed horizontally. Until the beginning of the 20th c. the greater part of written Chinese was in a style which imitated that of the Chinese classics, most of which were written before 200 BC, and this written style became far removed from current speech. A reform movement was started to make the literature available to the masses, and many simplified characters were introduced. A system of spelling (*Pinyin*) using the Roman alphabet has been officially adopted, in stages, since 1958... Chinese... a tonal language with no inflection, declension, or conjugations... is a member of the Sino-Tibetan language group... French is... a Romance language which has developed from the version of the Latin spoken in Gaul after its conquest in 58-51 BC. A number of dialects arose, but... since Paris became the French capital, the northern dialects have gained ascendancy... In 1635 the French Academy was founded... determining what should be considered correct French... Its functions include the compilation and periodic revision of a definitive dictionary in the French language... [The academy has] a constant membership of 40... membership is accounted a high literary honour and is coveted even by unorthodox writers who continue to experiment with the language... A feature of French which began in the Middle Ages is the nasal pronunciation of certain vowels, found in no other living West European speeches except Portuguese. From the 11th to the 14th c. France was the leading country in Europe. Its influence and language spread, and in most European countries it became customary for the upper classes to learn French. From the 13th c. until well into the 20th c. it was the language of diplomacy, used for international negotiations... French is the international postal language (whence the use of *aerogramme* on air-letter forms) – a status that it has held since a decision of the Universal Postal Union on its foundation in 1875... Despite the influence of French, the Germanic nature of English has been maintained in its syntax and morphology... Its history can be divided into three stages: Old English (up to 1150), Middle English (1150-1500), and Modern English... Old English is usually said to have begun with the settlement of Germanic-speaking tribes... in Britain in the mid-5th c... Old English was essentially a spoken language, but by the time of Alfred the Great something like a standard literary language was emerging... [T]he primitive (unrecorded) language of the Germanic peoples[was] a branch of the Indo-European family of languages... These different languages reflect an original dialectal split into West Germanic (English and German), North Germanic (the Scandinavian languages for which the oldest evidence is that of Old Norse) and East Germanic, which has died out but for which Gothic provided the oldest evidence... The name [*Indo-European*] has become established as a technical term, but it must not be supposed to include all the languages of India and Europe... Considerably before 2000 BC there must have existed a relatively small tribe speaking a language which we may call 'Proto-Indo-European'. No records of it survive, nor is there any evidence that it could ever have been written, but its existence can be inferred from a comparison of its daughter languages, and most of its phonology and morphology and some of its vocabulary can be reconstructed with some degree of certainty... [Apart from] the Germanic languages... [the] main divisions into which it split up, in the course of time, are the Indo-Iranian... group, the Hellenic group... the Italic group... the Celtic group, the Baltic languages and the closely related Slavonic languages. In addition to these, Albanian forms a distinct member of the family and so does Armenian. Two important discoveries of the 20th c. have added to the family the ancient Anatolian languages (from the 2nd millennium BC: Hittite is the oldest attested Indo-European language), and Tocharian, which flourished in Chinese Turkestan more than 1,000 years ago. Recognition of the breadth of this language family is only relatively recent and was first reached when a number of European scholars started studying Sanskrit in the late 18th and early 19th c... *lingua franca* [refers to] a language used by speakers whose native languages are different; a system for mutual understanding.

international language, sometimes called universal language, a language intended to be used by people of different linguistic backgrounds to facilitate communication among them and, incidentally, to reduce the misunderstandings and antagonisms caused by language differences. An international language is usually intended not to supplant existing mother tongues but to play a secondary or auxiliary role as it furthers

international communication. There are several kinds of international languages. These include artificial tongues... An artificial tongue is an idiom that has not developed in a speech community like a natural language but has been constructed by human agents from various materials, such as devised signs... It has been estimated that since the 17th cent. several hundred efforts have been made to create... artificial languages. Some philosophers of the 17th cent., among them Francis Bacon... Descartes, and... Leibniz, proposed the construction of a so-called philosophical language that would consist of a system of communication based on classification according to logic rather than on human speech. It would therefore use signs to represent matters to be communicated. Several such systems were subsequently devised, but they turned out to be too difficult for most people to use and had, as well, the serious handicap of being unsuited to conversation. Another type of artificial language that has had more popular success is the kind formed from elements or modified elements of existing natural languages. The first artificial language of this kind to have some prominence was Volapuk. Introduced in 1880, it was created by... a Roman Catholic priest of German extraction. Schleyer worked out for Volapuk an alphabet, a grammar, and a vocabulary based chiefly on Latin, the Romance languages, and the Germanic languages. Although Volapuk had a great vogue at first, it rapidly lost ground when it proved to be difficult to learn and use. ESPERANTO, another artificial language, was... first presented to the public in 1887. It has enjoyed some recognition as an international language, often being used, for example, at international meetings and conferences. In fact, an estimated 8 million people are said to speak it. The vocabulary of Esperanto is formed by adding various affixes to individual roots and is derived chiefly from Latin, Greek, the Romance languages, and the Germanic languages. The grammar is based on that of European languages but is greatly simplified and regular. Esperanto has a phonetic spelling. It uses the symbols of the Roman alphabet, each one standing for only one sound. A simplified version of Esperanto is Ido, [which]... was introduced in 1907... but it failed to replace Esperanto. Still another artificial language, known as INTERLINGUA, was created in 1951 by the International Auxiliary Language Association. Interlingua is derived from English and the Romance languages in both grammar and vocabulary. It has been used at medical and science meetings. Since so many artificial languages have their vocabulary and grammar based on those of the Indo-European tongues, speakers of non-Indo-European idioms find them difficult and even distasteful... A modified, greatly simplified form of an existing national language has also been suggested as a possibility for an international language. One noteworthy example is *Latino Sine Flexione* ("Latin without inflection")... Also called Interlingua, it is essentially a very simplified form of Latin... Latin... was a universal language in Europe during the Middle Ages and Renaissance. French was once known as the universal language of diplomacy, and English today is often said to fill such a role in world commerce... More recently, Basic English, a dramatically simplified form of English, has been proposed as an international secondary tongue. Developed between 1925 and 1932... it has a reduced vocabulary of 850 words and an uncomplicated grammar. The vocabulary is composed of 600 nouns, 150 adjectives, and 100 other words that include verbs, adverbs, prepositions and pronouns. Basic English has several features that make it suitable as an international auxiliary tongue. It is easy to learn[('reasons English is so hard to learn: the bandage was wound around the wound; the farm was used to produce produce; the dump was so full it had to refuse more refuse; the soldier decided to desert his dessert in the desert; when shot at the dove dove into the bushes; I had to subject the subject to a series of tests; they were too close to the door to close it; after a number of injections my jaw got number'; row – as in argue – roe, row your boat)] and adequate for satisfactory communication; in addition, it is a simplified form of a widely used, and therefore very familiar, world language... Like other languages, English has changed greatly, albeit imperceptibly, so that an English[person] of 1300 would not have understood the English of 500, or... that of today... French words, such as *castle*, began to come into English shortly before the Norman conquest. After the conquest, Norman French became the language of the court and of official life, and it remained so until the end of the 14th cent. During these 300 or more years English remained the language of the common people, but an increasingly large number of French words found their way into the language, so that when the 14th-century vernacular revival, dominated by Chaucer and Wyclif, restored English to its old place as the speech of all classes, the French element in the English vocabulary was very considerable... Since nearly all of these French words [were] ultimately derived from Late Latin, they may be regarded as an indirect influence of the classical languages on the English vocabulary. The direct influence of the classical languages began with the Renaissance and... Latin and Greek roots are the chief source for English words in science and technology... During the last 300 years the borrowing of words from foreign languages has continued unchecked, so that now most of the languages of the world are represented to some extent in the vocabulary. English vocabulary has also been greatly expanded by the blending of existing words (e.g., *smog* from *smoke* and *fog*) and by back-formations... whereby a segment of an existing word is treated as an affix and dropped, resulting in a new word, usually with a related meaning... (e.g., *burglar* from *burglar*)...

During the period of exploration and the spread of English to the colonies (including America), and with the rise of international trade, many new objects were encountered for which the language offered no name. It became the pattern to adopt the native word, in anglicized form. From India come "bungalow, pariah, pyjamas"; from Arabic, "algebra, alcohol, zero"; from the A[US]n aborigines, "kangaroo, boomerang"; from the American Indians, "tomahawk, teepee"... American English, which has come to be recognized as a separate language since [WW2], is richer in vocabulary than its counterpart in England, but its grammatical structure has weakened considerably during the 20th century. Despite modern communications, it is impossible to keep two even so closely related languages from developing in their distinct ways... Since the dawn of history, the origin of language has been a matter of conjecture, and as there is yet no way of proving any hypothesis beyond a reasonable doubt, it continues to remain so... The many scientific and pseudo-scientific experiments, such as rearing new-born children in silence to observe their speech development, or studying the noises of anthropoid apes, have all netted inconclusive results. Languages may generally be classified as being one of three kinds: agglutinative, isolating, or inflecting. Agglutinative languages, like Turkish or Eskimo, build relatively long words by the compounding of root words that undergo little or no change of either form or meaning. Isolating languages are those, like Chinese, whose words are strung together in the sentence without change of form; the use to which the word is put (subject, object, verb, etc.) depends upon a strict, prearranged order... Inflecting languages are those, like Latin, employing roots of words, to which are added prefixes, suffixes or infixes, none of which would normally be found in isolation... Most languages are not clearly examples of one or the other type, but rather a combination of two or more, and display an over-all tendency to one type... English is a composite of all three types, but most nearly conforms to the isolating structure... Many languages have lived and died and were never recorded. This is particularly true of the unwritten languages of history which we call today the proto-languages, or parent languages of extant tongues. It is to the great credit of modern scholars... that many of these proto-languages have been virtually reconstructed... It has been estimated that nearly half of the languages of the world... are still unrecorded. Many governments, including that of the U.S., are presently actively engaged in assuring that these languages do not die out without a trace.

HBs see themselves as being members of tribes whose cultures and uncommon languages must be maintained in order to preserve their personal identities; humans see themselves as being members of a species and, therefore, support the notion of establishing and teaching a common language. Although it isn't essential for every human to understand a common language, it would be ideal and practical (e.g., news and information can be assimilated faster, because it can be transferred around the world without having to wait for translations, which also eliminates a field of employment – translators; Educational books, videos, etc., only have to be produced in one language, which also reduces the amount of raw materials that need to be used in producing such items – i.e., one video will suffice instead of two or more). It is impractical to create a new worldwide language because, apart from the fact that, initially, no one would be able to use and understand the new language, new teaching resources would have to be produced for that language – whereas, if an existing language is

adopted as the language of humanity, most if not all of existing human knowledge and literature would already have been written in it, or translated into it, and a large volume of teaching resources will already be available.

According to many US movies and TV programmes, English is spoken throughout the Universe! There are, however, plenty of genuine reasons for why English should be the *language of humanity* – the most obvious one being that it virtually is already, with the next best reason being the ability to use Basic English as a means of introducing the language to non-speakers. But before the English language becomes the Human language it needs to be thoroughly revised. The Education Ministry ought to go through the latest edition of the most authoritative English dictionary and eliminate anything that is superfluous. A word should be considered superfluous if other words or phrases can be used to mean the same thing (e.g., *superfluous* could be deleted from the language because people can say ‘beyond what is enough: unnecessary’ or ‘more than is required; not needed’). Deleting everything that can be replaced by an alternative word or phrase would, perhaps, be overzealous, but there is no need for one word to have more than one meaning (e.g., *abode* means ‘past of *abide*’ and ‘a dwelling-place’ – the first description might be worth maintaining but, because of the existence of words such as home, house, etc., not the second; *right* doesn’t need to be used to mean both ‘the opposite of *left*’ and ‘the opposite of wrong’ – because the latter phrase can be described by *correct*); for two or more words to be pronounced the same but be spelt differently (homophones); for a word to be pronounced in different ways to give different meanings; or for one word to mean different things in different parts of the world (e.g., in the US *fanny* is used to mean ‘buttocks’ but elsewhere it is used to mean ‘a girl’s genitals’ – although there is no reason for the word to be used as either because when the *f* is capitalised it becomes a girl’s name). Furthermore, spellings should be standardised (e.g., it shouldn’t be possible to write either *standardised* or *standardized*; everyone should write *center* instead of *centre* – because, after all, the second spelling is correctly pronounced as *sen-tree* or *sent-ree*). While the English language is being condensed in the above fashion, other languages should be checked for words that don’t have an English equivalent. Non-English words can also be added to the language if an English word has been used to mean more than one thing but some of those meanings can’t automatically be deleted because no other English words have the same meanings. When adding non-English words, the Education Ministry could try to use those which will increase the range of phonetic sounds that English uses. If this isn’t possible – because no combination of Roman letters can be formed to make the sound – the ministry could get young children to practise the 26 non-English sounds (r:p1892, lns10-1) as vocal development exercises. If the whole world was to refer to the same dictionary – instead of having multiple companies publish their own version – it may be possible to keep the language *from developing in distinct ways* in different parts of the world.

It is harder for children to learn English if their families and neighbours are non-English-speaking. However, if all of their peers are learning English, those children will be able to practise on each other, and they will be able to help their own offspring learn it. Schools in non-English-speaking districts can initially continue to teach their native language as a 1st language and use it as a medium for teaching non-language subjects. Basic English should be taught as a 2nd language, although pupils could opt out of such classes if they refuse to learn English – in which case the pupil would study a 2nd language of its choice (e.g., the 1st language of its parents if that is neither English or the district’s 1st language), as long as the pupil is able to work without direct supervision (although one of its parents, or a relative – e.g., grandparent – might be able to go to the school to act as its tutor while its teachers are preoccupied with giving Basic English lessons); or undertake other studies (e.g., extra-curricular maths). In a couple of generations it might be possible for those districts to teach non-language subjects in English and their native language (or other languages) as a 2nd language, or not teach non-English languages at all (i.e., if a parent wants its child to learn a 2nd language, it can do so outside of school hours). Schools in English-speaking districts could continue to teach a 2nd language (e.g., Maori in NZ schools) but, alternatively, they could insist that 2nd languages be taught *outside of school hours*. It is often pointed out that learning two or more languages helps develop a child’s mental abilities. However, if the time devoted to a non-English language was instead used to teach history, science, social studies, art or music, etc., the child’s mental abilities are unlikely to be less developed. The 3rd teacher (r:p1921, lns31-2) may be responsible for all of these extra subjects; or, if classes have just two permanent teachers, whenever the class is studying another subject a specialist teacher would join it (then go to a different class after the lesson – perhaps wheeling a suitably-equipped desk between each class). Alternatively, the extra subjects can be taught via TV (r:p1921, ln47; TV could serve as the *3rd teacher*) – using pre-recorded material or live footage.

If curricula are well-structured, and class-time well-organised, it shouldn’t be necessary for schools to set homework. This would enable pupils to use their spare time in whichever way they see fit – be that pursuing extra-curricular studies or couch-warming. In addition, it shouldn’t be necessary to allocate any class-time to sporting activities – especially if school playgrounds have facilities that pupils can use before school, during breaks and, perhaps, after school (e.g., jungle-gyms, fields and basic sports equipment – such as balls and bats). Ensuring that children get proper exercise is a parental responsibility. But if parents want to reinforce what their children have learnt at school each day – by asking them what they studied and getting them to discuss different applications of the knowledge to those raised in class, to ensure they understand what they’ve been taught – that would be an ideal substitute for homework.

A varied and well-organised school day should be able to prevent pupils from becoming bored and, if pupils expect to learn something interesting every day, they would be less inclined to play truant. Interested pupils are also more likely to be better behaved. A minor misdemeanour could be excused with a verbal warning and a request for an explanation – but a repeat of the misdemeanour should warrant a reaction. Physical punishment is unsuitable because it teaches that violence is acceptable. Getting pupils to perform caretaker-supervised physical labour, gardening, cleaning or other school maintenance activities are suitable – but not if they are performed during class-time (i.e., they should only be carried out in break times or for a brief period after school-time – or before school-time). Many pupils might enjoy doing a bit of gardening, so activities like cleaning toilets (which would be ideal to perform after school-time) should be preferred – after all, it might be good training for future employment! If a misbehaving pupil (i.e., one that is preventing other pupils from learning) has to be sent from a class for time-out, it could go to a cubicle that is able to be electronically linked (e.g., via closed-circuit TV) to its class so the pupil doesn’t miss any lessons – although, if the pupil isn’t interested in learning anything, there would be no compulsion for the pupil to follow any lessons. The Education Ministry should be concerned about such an attitude, but – if it is satisfied with the learning environment it has created – its primary concern has to be for the pupils who want to learn and are disciplined enough to conform to accepted standards of behaviour. The needs and safety of such pupils must always take precedence over the rights of continually disruptive or violent children – even at preschool level. However, that type of pupil should not be suspended or expelled from the education system – even if there is an adult at its home to supervise it. What the Education Ministry can do is have a system for properly handling those pupils (e.g., the pupil could be sent to a special centralised school which has the facilities and expertise to deal with a group of problem pupils). The aim should be to facilitate a return to normal classes – but only when the ministry is satisfied that the pupil isn’t going to be disruptive or violent again (if a pupil has to be kept at a special school for the remainder of its education, so be it).

If the Education Ministry is recording births in order to assist parents with their preschooler’s development, it could use that information and home contact as the foundation of a department which is responsible for child welfare. If the department identifies a pupil’s home environment as the cause of its disruptive or violent behaviour, the department could endeavour to assist the parents in creating an improved situation. However, if the situation fails to improve, or if the initial situation warrants such action (e.g., if the parents clearly aren’t interested in assisting with the development of their offspring, or are incapable of doing so), the department ought to have the authority to remove the pupil from that environment and place it in a foster home – or a boarding hostel attached to a *special centralised school*. By the way, there should be no justification for having any other kind of boarding schools. Any pupil whose parents live in an isolated location but can’t be home schooled with the assistance of communications technology, should board with relatives or a family who live near the closest school and return home for weekends. Preferably, people should refrain from living in isolated locations if they have children. Anyone who chooses to live in an isolated location, sends its children to boarding school, or abuses (or neglects) its children, can be called an HB.

The Education Ministry could have another department that keeps a record of each pupil's progress through the school system (including preschool). The industry needs to know how primary pupils of a particular age from within a district compare with each other (e.g., to check the educational standards of different schools; to compare the educational abilities of an age group with its age group from previous years), and standardised tests are the easiest method. However, it takes a lot of organising to arrange simultaneous testing of an age group, so the curricula department should just create tests for the compulsory topics that make up a curriculum and each class could sit the relevant test after completing a topic. If curricula require little in the way of alterations, these tests wouldn't need to be altered much either – they just need to be changed slightly from year to year so pupils can't cheat by obtaining a past test (although the tests could easily be changed slightly for each class – e.g., a computer programme ought to be able to make minor adjustments to a sample test and print out a new version for each class). Any time that a pupil sits a test or has its classroom performance assessed (e.g., end of term reports), this information would be added to its personal record. Teachers could also add special comments at any time (e.g., if the child has been commended or reproached for its classroom behaviour). Such records should discourage misbehaviour, but their main purpose would be to assist the process of matching school-leavers to employment training programmes (and, later on, to assist the selection of managers).

Pupils shouldn't be placed in classes according to common ability (although they could be grouped according to their *learning styles* – r:p1901, ln50). Having pupils of different ability in each class makes it easier for teachers to compare pupils when writing reports, etc. It also presents opportunities for faster pupils to help their teachers assist slower pupils – which gives the faster pupils a chance to develop leadership skills (note that, because first-born children have opportunities to look after younger siblings, they are more likely to develop leadership skills than their siblings), as well as an appreciation of the problems faced by less-intelligent people. In addition, classes should be co-ed so pupils of both sexes are encouraged to develop the skills needed to successfully mix with either sex in adulthood (note that HBs accentuate the differences between the sexes while humans accentuate the similarities).

Standardising education and educational resources, and spreading them evenly among schools, should mean that children can gain as good an education at their closest school as any other – therefore, unless a child is ill-disciplined, it would normally attend the closest educational facility to its home (it necessarily follows from this suggestion that there would be no such thing as *foreign students* – unless they are adults enrolled in employment training courses). However, pre-schools ought to be grouped so that all of their pupils go on to attend the same primary school (i.e., a child will attend the relevant primary school even if another primary school is somehow closer to its home).

In addition to aiming to develop a pupil's language and maths skills from preschool level to a proficient level, primary schools can also be responsible for teaching history, science and social studies. If there are no intermediate or middle schools (r:p1920, ln30), pupils could attend primary school for at least seven years. However, if primary schools cover some ground currently done by secondary schools (e.g., in maths and subjects like history, etc.) they may need to cut into some of the time currently allocated to secondary school studies – meaning pupils might have to attend primary school for eight years (in that case, allocating one half of the fields to pupils who are in their 1st to 4th years of attendance and the other half to the older pupils ought to be common practice – but having completely separate schools for the younger pupils and the older pupils should be regarded as an impractical option).

There should be one secondary school per suburb, fed by the primary schools of its suburb – and, ideally, be located in the middle of the suburb. But if secondary schools no longer have to teach maths (though pupils may get opportunities to apply maths in other fields of learning) and some other traditional subjects (e.g., history, science and social studies), what purpose would they serve? Well, they could teach philosophy, environmental studies (covering topics like ecosystems, pollution, meteorology), nutrition (including basic food preparation) and first-aid – to give pupils the general life-skills that will assist them in adulthood. Primarily, though, they would be a fundamental link between the Education industry and every other industry. They would teach pupils about the different industries operated by society so they understand what each does, why it does, and how its activities relate to – or affect – other industries. The purpose of teaching pupils about society's industries is to help prepare them for becoming members of the workforce, and to help industries select members of their workforces. Collectively, the human species possesses a wide range of physical, mental and social skills; individually, a human's ability to perform each skill can vary from non-existent to perfection personified. Many industries already know what types of skills are best suited to the tasks their workers perform, and any industries that don't should quickly be able to identify those skills. While studying a particular industry, the pupils could perform mental and physical tasks (and perhaps aptitude tests) that are designed to find out which of them have the skills required by that industry (and they could also go on field trips to industrial sites). Their performance can be added to their school records.

NZ pupils are currently expected to complete at least three years of secondary education. If secondary education is properly organised, three years might be more than enough time to cover the coursework suggested above. Pupils could devote one period per week per subject to covering philosophy, etc., and spend the remainder of the week – plus the next week or so – learning about one particular industry, then move on to another industry (instead of having every secondary school in the district study the same industries at the same time, different schools can be studying different industries – which would enable specialist lecturers to move from school to school; and industrial site field trip visits to be spread through the year – rather than having all of a district's first-year pupils, for example, arrive at the same site on the same day). For the first year, the information covered – and the tasks set – could be fairly basic; for each subsequent year, the information covered should become more in-depth and the tasks more challenging. Secondary schools could have large theatres so all of the pupils from a year can attend the same lectures (if secondary school education is spread over three years, each secondary school may need to have three lecture theatres – four if secondary school is spread over four years; alternatively, each secondary school has just one or two lecture theatres, utilised at different times of the day by different age-groups), although they still ought to have standard-sized classrooms so pupils can do follow-up work in smaller groups – assisted by one or two teachers (who could be called tutors). By the time a pupil has completed secondary school, it should know what type of job it would like to do and, more importantly, what type of job it is best suited to – which, in some instances, will be an unskilled position! Tutors could help pupils identify a suitable career. Any pupils who decide what career they want in the first year or so of secondary school, or before entering secondary school, would have a chance to work on improving their skills in the relevant areas before those skills are tested. However, pupils might not always be able to train for their chosen career. If the number of training positions in any of its courses are limited, an industry will have to review the school records of applicants and select those whose skills best match its requirements (and, if there are still too many applicants, eliminate those whose records show that their characters are less disciplined, less organized, etc.).

WORK

It has been objected that upon the abolition of private property all work will cease, and universal laziness will overtake us. According to... the bourgeois, the disappearance of... property is the disappearance of production itself, so the disappearance of class culture is to him[or her] identical with the disappearance of all culture. That culture, the loss of which... bourgeois society... laments, is, for the enormous majority, a mere training to act as a machine. - Marx & Engels

There is hardly a [hu]man today who fails to see both the uselessness and the stupidity of collecting taxes from labour[ers]... for the enrichment of idle officials... If fifty years ago both a rich and idle [person] and a poor and illiterate one were alike convinced that their respective states (of continual holiday for the one and continual toil for the other) were ordained by God... now (in Russia as well as in the rest of Europe owing to mutual intercourse and to the spread of education and reading) there is hardly a... rich or poor[person] who does not from one cause or another doubt the justice of this state of things. Not only are the wealthy conscious of being to blame for the very fact that they are rich, and try to expiate their guilt by donations to science or art (as they formerly atoned for their sins by contributing to Churches) but the greater part of the working people openly regard the existing order as a false one, bound to be changed or destroyed. Some religious people... consider the existing order unjust and ripe for abolition on the basis of the Gospel teaching as taken in its true meaning; others consider it unjust on the basis of socialistic, communistic, or anarchistic theories, which have now already penetrated to the lowest strata of the working people. - Tolstoy

The law, that to live [a hu]man must work, first came home to me upon reading Tolstoy's writing on bread-labour. But... [the] divine law, that [a hu]man must earn his bread by labouring with his own hands, was first stressed by a[nother] Russian... T. M. Bondaref. Tolstoy... gave it wider publicity. In my view, the same principle has been set forth in the third chapter of the Gita, where we are told, that... who[ever] eats without sacrifice eats stolen food. Sacrifice here can only mean bread-labour... (By M. K. Gandhi)... ['Let your reward be in the actions themselves; never in their fruits' says the *Bhagavad-Gita*.] My idea of socialism is that every one should get the same wage. A lawyer, a physician, a teacher... or a sweeper – all should get equal wages... [Notes of a talk with Gandhiji]... [S]ince money has no stable value, it is wrong to assess the value of labour in terms of money. Such a method of evaluating labour is unscientific... Village needs led to the rise of the artisan class; where they could not be created locally, they were invited from other places. The same needs brought the mere agriculturalist under the control of the trader. A few persons with greater intelligence or cunning than others of the agricultural class also took to that profession. They did not require to abandon their lands. They were cultivated first through labourers and then through lessees. Thus came about a division of labour. But in the division of earnings, the merchant claimed a share both in the produce of the land and the labour of the artisan, while [it] admitted nobody's share in the earnings of his trade. Similarly, the landlord claimed a share in the yield produced by the artisan by giving him no more than just sufficient for bare existence, while [the landlord] himself gave no share to the latter from his earning from other lands or occupations... The reforms now attempted aim at eliminating the landlord and the 'middle[person]', (that is, the shopkeeper or the agent), making the artisan and the farm-labourer 'free' classes and enabling them to take a due share of the fruits of their labour... "A Government has to deal with... human material and not only benefit it but make it... participate in the doing of... work. The odd thing is that it will only benefit the people if they benefit themselves. You cannot benefit them by giving them doles. We want greater production and there are people who are unemployed, doing nothing. On the face of it this is illogical. A person who is unemployed should produce somewhere because [it] is a consumer anyhow... The person who is unemployed... can always do some productive effort by himself or in a group in his village or wherever [that person] may be. The economist will tell you that this [person]'s work is not very little, because that work multiplied by a million becomes very big..." This is a very important idea and is... an exponent of the *Sarvodaya* philosophy... The Sarva-Seva Sangh... is an all-India institution of experts for planning and executing programmes of work.

In my opinion, the... development of industry and machinery has made the struggle for existence very much more severe, greatly to the detriment of the free development of the individual. But the development of machinery means that less and less work is needed from the individual for the satisfaction of the community's needs. A planned division of labour is becoming more and more of a crying necessity, and this division will lead to the material security of the individual... In such an economy, the means of production are owned by society itself and are utilized in a planned fashion[(r:p283, lns43-4)]... I do not believe that the remedy for our present difficulties lies in a knowledge of productive capacity and consumption, because this knowledge is likely, in the main, to come too late. Moreover the trouble in Germany seems to me to be not hypertrophy of the machinery of production but deficient purchasing power in a large section of the population... The natural remedies for our troubles are, in my opinion, as follows: – (I) A statutory reduction of working hours, graduated for each department of industry, in order to get rid of unemployment, combined with the fixing of minimum wages for the purpose of adjusting the purchasing power of the masses to the amount of goods available. (2) Control of the amount of money in circulation and of the volume of credit in such a way as to keep the price-level steady... - Einstein

A key concern for the future is what work people are to be involved in when only part of the population, and only a fraction of those individuals' time, will be necessary to produce all the goods and services that the planet can tolerate and society can use... Basically the thrust of industrial and technological development over the past two centuries has been to substitute energy-driven equipment for human labor, thus eliminating jobs. But new products and services were continually being generated, thereby creating new jobs as old ones disappeared. In recent decades massive advertising promoting consumption and waste has been needed to create sufficient demand for these new products and services. Now, however, we are encountering environmental and resource limitations that push us in the opposite direction, toward conservation and frugality... If human[s]... basically sought to escape from work, industrialization might be considered a success... since it has made possible the elimination of so much work that humans once had to do. But both from observation of worker behavior and from the findings of psychological research, there is ample evidence that persons seek meaningful activity and meaningful relationships. [A hum]an thrives not on mindless pleasure, but on challenge. Thus, although full employment is no longer needed from a production standpoint, full participation is essential from a social standpoint... When people speak of "meaningful work" they do not mean that the task itself is necessarily exciting and challenging every moment, but rather that the larger project of which it is a part has meaning... If there is a central project in which people believe – such as conquering the... technological frontier, or building a new society or a world democratic order – then even routine tasks take on meaning. On the other hand, if there is no central project that enlists the loyalties and commitments of... citizens, even a technically complex and challenging task can become stultifying and meaningless. - 1976

...until the share of the ordinary [citizen] in the product is increased, ...[t]he incentive to increase production... is slight or nil. - 1977

...the nature of much of the work available in the form of jobs discourages people from doing it well. It is pointless and boring, if not worse, and it is alienating in the sense that it is being done for someone else – often an impersonal organisation. People no longer feel compelled to work hard at jobs which they dislike or which fail to engage their interest. The work ethic, at least in the sense of taking pride in one's work and wanting to do well, cannot survive the increasingly widespread introduction of the kind of work which the development of an institutionalised economy involves. A new sort of work ethic may be beginning to emerge... Trade unionists are beginning to campaign not just for the traditional right to work, but for the right to work on socially useful products. [Ironically,] while the institutionalised economy fails to create enough work in the form of jobs and compels many people to do unsatisfying and pointless work... much important work is not carried out at all. This includes especially the kind of work which would improve the quality of life – the creation of better surroundings and amenities, and the provision of personal care and attention to people... Should the policy-makers encourage work-sharing? Should they aim to reduce the working week to four days or possibly three? - 1978

There will still be people who work seven-day weeks, no matter how short the legal work week, because that will still be the way that creative and ambitious people who enjoy their work can stand out above their colleagues. But there... is a natural distribution of talent and intelligence, and millions of people have the bad luck, through no fault of their own, to be born with less than an average share. We've made it virtually impossible for people at the lower end of the intelligence distribution to find employment in a productive, rewarding, peaceful occupation. - 1981

A small group of comfortable white-coated technocrats can control the whole of a manufacturing process while primitive methods of truck loading and unloading remain, increasing the gulf between the skilled and unskilled groups of workers. While the highly skilled worker, and to some extent the semi-skilled, will begin to approximate towards the consciousness and function of the pure information worker, the unskilled could easily remain at the bottom of the heap, their role undisturbed by the technological revolution. It is extremely difficult to imagine the robotization of garbage collection although various microprocessor-aided devices might relieve some of the burden. Those tasks which require unremitting physical labour at present, however, are the ones least likely to be eliminated and this is an obvious area of future social discontent... Over millennia or centuries, [the] progress... of discovery and invention... was substantial; in the lifetime of a [human], however, it brought no appreciable increase in the product of his labour. Population tended always to increase faster than production, maintaining a constant equilibrium of scarcity... The inexplicit premise of scarcity is stated plainly enough in the plan of the ancient cities. Invariably it shows the palace, the temple, and the garrison within the ruin of the walls and, outside, the traces in the soil of the hovels of the slaves. Thus [4/5]ths of the population was made to render up the surplus necessary to sustain [1/5]th in the new enterprises of high civilization. Put the other way around, agricultural technology and the social arrangements it sustained made it possible for some people to explore the protean potentialities of the biological endowment the human species had acquired in the long journey of evolution. For the small fraction of the population to whom such enterprise was open, it can be said that they made the most of the possibilities and opportunities. History is first and foremost the story of their extraordinary lives. They gave impetus to the advance of invention and discovery; they explored new realms of aesthetic experience... and... they led... bold adventures in politics, war, and conquest. Of the 80[%] of the population who were excluded from history – except when war loosed murder, famine, and pestilence on the land – history has little to say. It has even less to say about the underlying inequity of the social and economic institutions – whether slavery, serfdom, helotry or other forms of pseudo-speciation – that laid the burden of history on their backs. Laws were passed to regulate the treatment of slaves and serfs, but the gross immorality of these institutions was never called in question until modern times – not until, that is, the inexplicit premise of scarcity itself had been overturned and its annulment had made these arrangements morally as well as technologically obsolete. - 1983

Evidence available from the new generation of mini computers based on the silicone chip indicates that these are mainly labour displacing rather than job creating. They include robotics in industry and word and data processors in services. It has been forecast by... [analysts] in Britain... France and... Germany that between 30 and 40[%] of services employment in typing, data processing, clerical, design and related staff could be displaced by these technologies within the next ten to fifteen years... This would be a devastating contraction of employment overall granted that in the post-war period, it has mainly been public and private services which have absorbed those workers displaced by technical progress in industry... A report prepared for the Central Policy Review Staff of the British government in 1978 predicted that within thirty years Britain could produce all her projected material needs with only 10[%] of the existing industrial labour force if robotics were extensively applied... This report has been criticized on various grounds. Trade union opposition, management inertia and other factors could well offset it. But its message is none the less striking. Some of the reaction to these forecasts is simply ostrich-like, claiming that such displacement of labour has never occurred before. But in fact it has occurred, throughout Europe and the U[S], in the key sector of agriculture. From being the dominant employment sector in Britain, employment in agriculture by the turn of the last century was down to less than 15[%]. In the EEC countries, agricultural employment was still as high as 25[%] in the 1950s, but now is less than 10[%]. In Britain the sector now accounts for only 2.5[%] of total labour and in the U[S] only slightly more. While it is possible that the new products such as mini-computers and data processors may create new employment opportunities on a significant scale, it also seems unlikely that they will create significant net employment. Major technological unemployment now appears more clearly on the agenda than when Marx wrote of rising technical and organic composition of capital in the 1860s... In a clear sense this makes a radical response to the current crisis more than ever relevant... It also necessitates negotiation of major changes in the economy and society: shorter working time... In December 1982, while three million people were already out of work, British manufacturing industry worked 9.66 million hours of overtime. In December 1983, this figure had risen to 11.36 million hours, whilst the incidence of short-time had fallen from 1.61 million hours at the end of 1982 to 0.46 million at the end of 1983. If it became magically possible to outlaw overtime, a quarter of a million new jobs could be created overnight. The number would increase as working hours were reduced. In 1981, the TUC adopted a motion... instructing the General Council to campaign for a limit on the number of hours worked annually, reducing the working week 'by statute to a maximum of 35 hours', providing a 'minimum holiday entitlement of six weeks per annum...' and reducing the 'qualifying age for retirement pensions to 60 years'... [S]upport for this case... showed that engineering workers in Sweden were, at the time, working 1,500 hours annually, while... 'the British engineering worker is working 1902 hours a year.' ...It was [also] pointed out that Europeans enjoyed far better holiday entitlements than British workers... In... Germany 90[%] of workers get six weeks' annual holiday, or more... Introducing... longer paid holidays for working people... [in] some... industries and services... may mean a 35-week year such as that enjoyed by many academics in higher education institutions... These proposals obviously raise vital questions about pay. How can living standards be maintained and improved if working hours are reduced? ...There is a strong case... for arguing that children should be looked after by [mothers and fathers] equally... Cared for almost exclusively by [their mothers], children grow up with a limited picture of the respective characters and capacities of [guys and gals]: this is one of the main ways in which sex stereotypes become rooted in people's minds. While [fathers] continue to segregate themselves from children, they are cut off from a range of experience which would broaden their understanding and no doubt alter their political priorities (and which they might even enjoy)... We need... to

re-organize paid employment so that parents of both sexes can spend equal time with their children... It would help... to create the conditions in which... [both parents] could participate equally in domestic work as well... - 1984

It is important to remember that parents have a relationship with each other as well as with their children. Parents serve as sources of mutual emotional and physical support and comfort. There is considerable evidence that nonworking mothers of young children are among the least satisfied and most depressed group of adults. This is in large part attributable to the task load, restrictions, and constant demands placed upon them in their caretaking role and is reflected in the mother-child interaction. These stresses can be reduced by the support and appreciation of a spouse. High mother-infant involvement and sensitive, competent, affectionate mother-infant relationships have been found when fathers were supportive of mothers... Even successful maternal adaptation to pregnancy and low maternal distress during labor and delivery are related to the responsiveness and support of husbands. Dual participation in household chores and caretaking can free both parents for more playful and pleasurable interactions with their children and relieve some of the burdens often experienced by parents, especially mothers... - 1986

Vital to the creation of a workable and fair economy is the concept of work sharing. If [technology means] fewer people are needed to produce the same quantity of goods, it is better to redistribute work instead of creating a huge underclass of people who have no access to employment. T[he]... book *Abandon Affluence!*, argues ambitiously that we could make a green economy succeed on no more than a one-day working week... The 1980s have seen the substitution of full-time mass employment by part-time, low-paid work. A green 1990s could see the introduction of secure and properly paid part-time work for all. Much of what is known as the 'black' economy needs to be made legal. Unemployed people who do a little work but not enough to support themselves totally are criminalized by the Department of Social Security and forced into working covertly. - 1990

About 60,000 of... [NZ]'s beneficiaries will now have to find work to keep their benefits or face tough penalties. The changes, which come into effect today, [affect] people on domestic purposes and widows benefits and spouses of unemployment beneficiaries... The Alliance's social security spokes[person]... said the start of work testing for beneficiaries would be the biggest assault on the poor since the benefit cuts of 1991. Over the next 12 months, people on the DPB and widows benefits whose youngest child is aged over 14 will have to register with the N[Z] Employment Service to find part-time work or training. Those with children aged between seven and 13 must attend a yearly planning meeting with Income Support to discuss their plans for getting work. Married or de facto spouses of people on the dole have to find fulltime work when their youngest child is aged over 14. Those with children aged between 7 and 13 must also attend a yearly planning meeting. Beneficiaries who fail to attend the annual meeting or who fail to attend a job interview or take up a job offer, will have their benefits cut. The cuts range from 20[%] for up to four weeks to a complete stand-down for 13 weeks. Around 115,000 people already on the unemployment benefit will also be affected by the penalties from today if they fail work tests. Today also sees the stand-down time halved to 13 weeks for people who leave a job voluntarily or are dismissed.

...The Government wants to amend the Employment Contracts Act to prevent employers being tripped up on procedural issues in dismissal cases if the dismissal is fair. The Minister of Labour... wanted the fairness of the decision to be "the dominant issue." ...[it] had heard of "one or two" Employment Court cases where the employee had "nicked a fair sum of money" but the dismissal had been found to be unjustified because the proper steps had not been followed. Earlier, in a speech to the Government to Business Summit in Wellington, [the minister] said the... Government's work-for-the-dole scheme will not be fully ready to begin until late next year. Even then, the targets for getting long-term unemployed people off the dole and back into the workforce will be cautious. The Minister of Employment... made it clear yesterday that planning would not be rushed and targets would not be over-ambitious. It would, for example, be too ambitious to expect that most of the 15,000 unemployed for more than two years would be back in the workforce by the end of the parliamentary term. Under the scheme... [- modelled on the AUS]n Government's... work-for-the-dole plan... - ...unemployed people will be paid a "community wage" equivalent to the dole for prescribed work or training, with the top priority being the long-term unemployed... [The minister] hoped that regional employment commissioners could be appointed by the end of this year, consultative committees appointed after that and legislation passed by June next year. [The minister] outlined his timetable for the scheme at [the] business sector conference in Wellington. [The minister told delegates] that no work approved for an unemployed person under the scheme would displace other jobs. Later [the minister] said it was "absolutely critical" that private-sector employers be involved in the regional groups, which would determine which jobs and training qualify, and where other employment funding should be spent. [The minister stressed that it] would never support a time limit for a person receiving state support. "That has never been raised as an option." The aim was a continual reduction in the length of stay out of work... until "we might have a situation... where we have no one registered unemployed over a year."

...A programme run... to help sole parents into work is to be expanded. The Minister of Social Welfare... said the Compass programme, aimed specifically at domestic purpose beneficiaries and recipients of the widows benefit... was at present working with about 10,250 people. Evaluations had shown it was successful in getting many sole parents off the benefit and into work or training... Income Support would now expand the programme to include about 16,000 people nationwide. The cost of running the programme was partially offset by savings from benefits.

...Beneficiaries may have to abide by a contract setting out what is expected of them in return for a benefit under a new "code of social responsibility." ...The Treasurer... described the individual plans for beneficiaries as a contract between them and the taxpayer.

...THE POLITICIAN[SAID: "I'M INTRODUCING A CODE OF CONDUCT BETWEEN BENEFICIARIES AND THE TAXPAYER."] WE THOUGHT:] WHEN ARE WE GOING TO GET ONE BETWEEN POLITICIANS AND THE TAXPAYER?

...IT'S ALL very well for [NZ's PM] to run around talking about a great new dawn of socially responsible welfare, quoting... [the British PM]'s plan for compassion with a hard edge, but [NZ's PM] should think hard about the curse of the two-income family[, which]... is in many ways responsible for social problems from... gangs, widespread rape and murder to... rampant paedophilia... There is a... significant social malaise caused by having mum and dad both away at work. Pre-school kids have a right to expect one or the other parent to be always at home, and later they have a right to expect a secure, welcoming home to return to at lunchtime or after classes. The end of the old-fashioned home, thanks to two-income parenting, is the real reason for the breakdown of the family unit and its deplorable consequences... The two-income, under-parented home... produces armies of unhappy, insecure kids, who grow up misfits unable to form proper relationships with one another or with society. Hard to face, but it's a fact... As for unemployment, too many couples taking a job each are a significant cause of it. Even a small reduction in double-income families will mean plenty of jobs for all who want them.

...IT has been called "the pretty addiction" and "the best-dressed problem." But mostly it's been called nothing at all. Workaholism isn't a recognised disease, such as alcoholism or drug addiction. Some employers even revere it... But to... [a professor from] the University of North Carolina-Charlotte... work addiction is the unheralded family crisis of our generation. Not just because some people work too much: but because of what a workaholic lifestyle could quietly be doing to their kids. "Outwardly with workaholics, everybody and everything looks great,"... Workaholics often earn comfortable incomes; their families appear to have everything. But when a workaholic's kids reach adulthood... their emotional framework often collapses like so many matchsticks. According to... research, adult children of workaholics often end up in therapy with failing marriages, depression or a sense of anger they can't identify. At the heart of their troubles, [the professor] believes, was a well-meaning but absent parent who unconsciously taught them that you are judged by what you do, not who you are... ALTHOUGH statistics are hard to come by,

[the professor] acknowledges, most therapists who focus on work addiction believe that 30-40[%] of working adults qualify as workaholics... The toughest problem is convincing those who have crossed the line – from enthusiasm for a job to a pathological desire to work – that they may have a problem. In a success-oriented society, few workaholics see themselves as dysfunctional... [but if] you are regularly choosing to work more than 40 hours a week other than for financial reasons, you are probably suffering some kind of job insecurity or low self-esteem... BURNOUT is often the result of working too hard... It has three common features – emotional exhaustion, de-personalisation (seeing other people as numbers or objects) and a lack of satisfaction in your achievements. Common symptoms include irritability, aggression, poor organisation, low concentration and no sense of humour. Grumpy bosses are often suffering chronic burnout.

...Researchers at Wellington School of Medicine are seeking volunteers for a study of chronic fatigue syndrome. They will be testing a theory that the condition... [– whose] main symptoms were loss of energy, aching muscles after exercise and loss of appetite... [–] may be caused by problems with the body's involuntary nervous system... [I]f a link could be proven, it may give a handle on how to manage the syndrome. To test this theory, the school needs 50 people aged 10 to 25 who have or have recently had glandular fever... Volunteers and a test sample of healthy people will have tests on their blood pressure and nervous systems before being tracked for about a year to see how their condition develops... [V]ery little was known about chronic fatigue syndrome. It was often dismissed as a psychological condition and treated with anti-depressants... Recent reports from A[US] and England indicated it was a real condition, which had huge costs in terms of productivity, because sufferers were often unable to work.

...There is a lot of stress about. Whether staff are more stressed than before the economic reforms began in 1984 or whether their employers are readier to seek help for them and thus it *seems* as though there is more stress is not... clear. But... a human resource specialist and now general manager of nationwide EAP Services, a company that specialises in de-stressing staff, believes it is the latter. "We've seen a change in attitude by employers to employees... They realise... staff are a real asset and... losing one is expensive because they have to recruit and train a replacement." Nevertheless, today's workers are generally expected to do more and to do it better. The result, say... human resource consultants... is the dreaded burnout. "It has become an enormous problem in the nineties,"... According to research by [human resource consultants in AUS], employees "are working 30[%] longer with tremendous increases on workloads." For this, partly blame modern telecommunications. Pagers, faxes, laptop computers, multi-line phones: It is a conspiracy to put the office wherever you happen to be. Managers aren't immune either... Indeed... [m]anagers might need a stress de-tox more than their staff. Further... [AUS] research shows that firing an employee can be more stressful for managers than losing their own job. "Management training doesn't prepare you for sacking people," says [the specialist]. "It is highly stressful, can result in weeks of sleepless nights, tears, the usual stress releases such as alcohol, coffee and exercise." ...In order of angst, the... most stressful situations are firing staff, losing your job, mergers and acquisitions, strikes, starting a new job, the end of the financial year, customer irritation, workplace change, introduction of new technology, deadlines, performance reviews, the omnipresent telephone, working to a budget and, at the bottom of the scale, working to quality standards... Managers can generally tell when something is wrong. The tell-tale signs are lateness, erratic and mistake-filled performance, moodiness, drinking, indecision and procrastination, aggressiveness and impatience. But managers are generally ill-equipped to provide counsel on personal issues and haven't got the time anyway to play nursemaid. Additionally, staff don't necessarily want the boss to know they are struggling. "It is best to tackle problems before they draw the attention of management," EAP advises staff. To make it easier for staff to make contact with counsellors, some companies have signed up to a self-referral service... Given the opportunity, staff aren't slow to seek help. At The Warehouse, most of the staff who contact EAP did so through the confidential... 24-hours-a-day... help line... Humanitarian considerations aside, there is a bottom line in a happy workforce... According to EAP... every dollar invested in successful counselling gives \$6.60 back in employee-related costs such as sick leave. Timely counselling can also reduce staff turnover... A lot of stress originates outside the office. EAP... has isolated about 80 categories of disorders ranging from personal relationships and especially domestic tensions – a category which is on the rise... [In related news, c]ouples in which both parents work argue more than couples with one breadwinner, according to a Belgian study.

...FRANTIC efforts to juggle work and family commitments are creating unbearable stress in the workplace. Both parents work in more than 50% of N[Z] households, and in 27% of families there is just one parent. Three years ago, 12% of unemployed [gals] and 3% of [guys] had left jobs because of family responsibilities. Many [workers] are caught in the double squeeze of having children late in life and also having to care for elderly parents. Invariably, something has to give in this exhausting tug-o-war. "There's no point managers pretending staff are not affected by family pressures," said... [the] executive director of the Equal Employment Opportunities Trust. "They don't stop caring when they turn up at work." The [EEOT] launched the Work and Family Network in April last year, to highlight and provide information on areas where work and family intersect... More employers are getting the message that family-friendly work-place policies were good for business... Overseas, workplaces with family-friendly policies were rewarded with increased loyalty, quality staff, less absenteeism and fewer resignations. A commitment to flexible working hours could have a huge effect on workplace moral and efficiency, [the executive director] said. In one simple example cited by the trust, machinists were encouraged to phone home after school to check on youngsters. Errors were immediately reduced and productivity increased because staff no longer fretted about their children. "It's much easier to recruit if you are known as an organisation that allows staff to balance paid work with family commitments... [and o]rganisations can't afford to lose highly trained people because of inflexibility on parental leave, working hours and holidays. It costs 50%-150% of a person's salary to replace them."

...Do you fancy the idea of teenagers watching videos in the office? How about using the company computer for homework or even giving the chief executive officer a demonstration of the latest technology? It is not as far-fetched as it sounds, says the [EEOT], which is widening its campaign on family-friendly workplaces to include the needs of workers with older children. The... most practical solution was encouraging workers to spend time with their teenaged children – even if that meant bringing them into the workplace... They could also be employed during school holidays and after school to do tasks such as filing, photocopying and answering the telephone, freeing adult staff for other duties.

...Breast is best for baby – but it could be good for business too. A group promoting family-friendly work-places is advising employers to encourage [workers] with babies to feed them at work. The idea is being welcomed by the Employers' Federation and the Minister of [Gals'] Affairs... who says it will help get [gals] into responsible positions in the workforce. The EEO Trust... says that bosses who take such an approach will be rewarded in the bank: an American study has shown that absenteeism among the parents of breast-fed babies is one-seventh of the rate among parents of bottle-fed babies. The disparity is put down to the fact that babies fed on breast milk are usually healthier, allowing parents to spend more time working and less time caring for sick children. The trust's executive director... said that providing facilities for breast-feeding could also encourage [mothers] to return to work, saving employers the enormous cost of recruiting and training replacements. Ideally, working mothers would pop into the company creche to feed their babies... Where it was not possible to provide day care, employers could help... by encouraging nannies to bring babies to the workplace to be fed and by providing a clean, comfortable and private place for them to be fed in.

...[NZ m]others are no longer breast-feeding their babies because financial pressure forces them to go back to work too early, says a top health official... A Plunket survey... showed that rates had dropped by about 10[%] in the past three years. Breast-feeding is regarded as one of the best forms of health protection for babies... The Transitional Health Authority's new maternity manager... said mothers had to give up because they could not afford to stay at home on a single income and found it too difficult to breast-feed at work.

...Workers [in NZ] have a low awareness of parental leave entitlements, according to a Labour Department survey. The industrial relations service poll shows that 45[%] of mothers and 83[%] of fathers did not apply for parental leave before the three-months-pregnant deadline required

under the Parental Leave and Employment Protection Act. Only 5[%] of mothers in the survey said they experienced problems in their application for parental leave. But 16[%] did not have an agreement to return to the same job, which is their right under the act. The survey found 13[%] of mothers had changes they did not agree to imposed on them after they returned to work, while 40[%] of employees surveyed believed they had no parental leave rights or did not know what they were. At Parliament yesterday, members of the 12 Weeks Paid Parental Leave group chose Labour Day as the obvious time to highlight their campaign. "It is the day to remember hard-won employment rights and paid parental leave is an employment right that exists around the world and should be enshrined in our legislation," said a spokes[person]... The group promoted it as a social insurance scheme funded by the Government through employer levies. [An] Alliance list MP... has a member's bill before the House seeking 12 weeks' leave through an amendment to the Parental Leave Act.

...[the amendment to legalise s]tatutory paid parental leave for... [NZers] who temporarily exit the workforce to have a child probably has the proverbial snowflake's chance in hell[of being passed]... In fact, a recent case before the Employment Court showed some new mothers wanting to re-enter the workforce are still having to fight hard just for more flexible hours, let alone pay while they're off work... [A] trust manager with NZ Guardian Trust in Auckland, had to battle for half an hour's lunchbreak (and not the usual hour) so [it] could get home 30 minutes earlier to fit in with childcare arrangements. On a more positive note, one big employer – National Mutual – has just developed initiatives to encourage... employees... who leave to have babies to come back to work. "[90% of our gal employees]... (who comprise 58% of the company's workforce)... having babies have taken parental leave, but only about 40% have come back to us... We want to improve that." The reasons... had [as much] to do with corporate culture and values as with concern for the bottom line. But with competition rife in the financial services industry, some figures just out of the U[S] are probably having their own effect. In the US, researchers... had found that the cost of a liberal parental leave policy was far less costly than replacing a pregnant employee – 30% of annual salary compared with replacement costs of between 70% and 150%. What constituted a "liberal parental leave policy" in the US was not stated, although that country shares with [NZ] the distinction of being practically the only two countries in the [First W]orld not to have a form of statutory paid parental leave. A[US] has a maternity allowance for all [mothers], which is a one-off payment of around \$800 that is paid whether or not the mother was in the paid workforce before taking parental leave, and irrespective of whether her employers gave her paid parental leave. Most liberal in paid parental leave are the Swedes... [whose] provisions include up to 12 months of wage replacement, with a quota of payment for both parents. In Britain since 1994, most [employees] who leave jobs to have children are entitled to a statutory maternity pay of 90% of their salary for the first six weeks, and a payment of £54.55... for the next 12 weeks. But... there is no requirement for employers to make maternity payments to their mother-to-be employees... although... around 37% in fact do so, according to a survey by the [EEOT]. The length of paid leave varied from two days (for super mums!) to six months. However, said the trust, there may have been some confusion among respondents between paid and unpaid leave. It is the latter that is guaranteed by law. Both [mothers and fathers] are eligible for unpaid leave of up to one year. Unpaid leave is also given in the form of maternity leave, granted... for up to 14 weeks from the birth of a child, while two week's paternity [leave] can be granted for [fathers]. The former, where it occurs, is often a continuation of the provisions in some public sector collective agreements that provided 30 days salary as an ex gratia payment to [employees] who temporarily leave jobs to have children.

...[career-minded gals 'who put off having babies until their mid-30s can find motherhood a huge financial struggle, say researchers. Every year more gals ignore the "ticking body clock" and postpone having a family because of other priorities, such as work and travel. But when the time is right for children, they are not prepared for the expense. Although they may have been in the best position to save by working for 15 or more years without baby expenses, they also had the least incentive. They are more likely to have spent their income maintaining their lifestyle and put off saving for their future, just as they put off having babies. "Couples who delay having children are in a more complicated situation, fraught with potential financial problems," said a lecturer in the Otago University education department. Couples suddenly have to reduce their spending or they will not have enough money to raise their children, the lecturer told the inaugural child and family policy conference in Dunedin. "This unanticipated reduction in spending can be extremely painful and stressful because people tend to become dependent on their current spending levels." The lecturer and her husband have tracked the lives of nine career gals in their transition to parenthood. The subjects, all over 35, either chose to postpone pregnancy until they were financially secure, thought they were not capable of having children or met their partners late in life. The saving they expected to do in their 40s, at the height of their careers, gets postponed – at a time when money is needed most. Mothers coped by cashing in pension funds, adjusting their mortgages or withdrawing term deposits to "fund" their babies. When returning to the workforce they hit the "maternal wall" of slotting back into their jobs, while leaving their babies in someone else's care.] ■ Where you work and what you work with has been blamed for everything from insomnia to heart attacks. Now the threat to fertility is becoming another occupational hazard... [T]he invisible threats to baby production lurking at work are spelled out in draft guidelines for employers published by the Occupational Safety and Health Service. Because more [gals] are working through their pregnancies in a wider range of jobs they were potentially exposed to more hazards, said [the guide's] co-author... They were also returning to work earlier after giving birth, exposing themselves to chemicals that can get into breastmilk. "The reasons for that could be economic or because the child-bearing years are also the most career advancing years... But we are saying that employers of [gals] of child-bearing age should take account of the risks to new and expectant mothers as part of their hazard control." OSH is pushing for employers to treat reproductive hazards like any other danger in the workplace and to warn staff of child-bearing age of the potential risks... "The onus is on the employer to identify all the hazards and to manage them." Although some dangers to new and expectant mothers – such as radiation – were well known, others were less obvious. Jobs that cause vibration through the body, such as driving off-road vehicles or operating industrial sewing machines, had been associated with miscarriage, prematurity and some birth defects – apparently because the vibrations interrupted the blood supply between mother and foetus. Machines causing hand and arm vibrations – hair dryers, mixers and chainsaws – could also contribute to occupational overuse injury during pregnancy because expectant mothers had more elasticity in their joints through increased hormones, plus lower fitness levels... A noisy workplace could contribute to raised blood pressure, stress, fatigue, early miscarriage, prematurity and stillbirth... damage to the foetus could occur at levels as low as 70 decibels. Ordinary conversation was 60-65 decibels... and street traffic about 85. A mother's tissue did not screen out noise by more than 10 to 15 decibels. Children had three times the rate of high frequency hearing loss if their mothers were exposed to hazardous noise levels in their first three months of pregnancy. Heat was another risk for the mother-to-be and the unborn child. [Gal]'s metabolism rates increased during pregnancy and they were less able to tolerate heat or humidity... [Pregnant gals] doing heavy physical work outdoors in summer might be susceptible to heat stress. In extreme cases, such stress could decrease the blood flow to the womb, override an expectant mother's natural protection and result in premature or deformed babies... Toxic substances... could also... cause development problems in the foetus... The guidelines warned pregnant workers to avoid contact with pesticides...

NEARLY four years ago, a happy event for [a]... Christchurch couple... – the birth of their [first child] – turned to devastation. [Their]... son... was born with a double cleft palate and no eyes. A Christchurch City Council parks worker for eight years, [the mother] blames the serious birth defects on alleged exposure to a fungicide, Benlate. Former council workmates had similar reproductive problems. One baby was born blind because the optic nerve failed to form and another suffered severe epilepsy. One worker was found to be infertile. Du Pont, the U[S] chemical giant which manufactures Benlate, has rejected any link with birth defects. A city council report found no evidence chemicals were to blame, but it stopped using Benlate when the allegations arose. In the [Christchurch couple's] case, tests ruled out genetic or chromosomal causes. Since leaving her job, [the wife] has had two more babies, [both]... born without disabilities. [The wife] hated using sprays herself, but worked in areas close to where spraying was carried out. A possible connection between Benlate and birth defects was discovered by British researchers several years ago.

Last year, a Florida family successfully sued Du Pont for \$6 million after their son was born without eyes. Du Pont is appealing the Miami jury's verdict. The [Christchurch couple] have hired an American lawyer and are preparing a law suit again[st] Du Pont, while awaiting the outcome of the appeal. [The husband] said a \$6 million payout was not a huge amount considering [their son]'s quality of life. "At the moment [our family] gets a \$29 a week handicapped allowance from Income Support Service. [W]e would get that if [our son] had bad nappy rash." ...[the husband] said OSH guidelines on productive hazards would at least make people aware of potential dangers in their environment. "Because chemicals are such invisible things, people think nothing will happen to them. You walk down the street and see people spraying their roses without any protective gear..." ...THE RISKIEST JOBS... for pregnant [workers]... that can lead to physical abnormalities[in their babies]... often before a [worker knows it] is pregnant... are... 1. Laboratory workers, chemical processors and manufacturers... 2. Radiator repairers, car battery manufacturers, renovators and painters... 3. Car park attendants, testing stations, fire fighters, emergency workers attending smouldering fires, warehouse staff working with diesel or petrol-powered forklifts... 4. Theatre nurses, surgeons and anaesthetists... 5. Cleaners and nurses... 6. Radiologists and radiographers... 7. Divers and hyperbaric chamber workers... 8. Laboratory staff... vets and others looking after animals and dealing with animal products... [including f]arm workers... and... zoo staff... 9. Early childhood workers, school teachers... 10. Food processors and handlers.

...[A handicapped adult] has been testing... voice recognition software that could put him back in the workforce. The 38-year-old from Dunedin was a qualified fitter and electrician felled 11 years ago by a karate blow that left him unemployable. Nerve damage and pain means [the 38-year-old] cannot sit down or work with his arms – or do much of anything that means the slightest flexing of his spine, except stand and walk. IBM brought him to Auckland for yesterday's launch of another version of its OS/2 operating system, Warp 4, previously codenamed Merlin. One of the features aboard OS/2 Warp 4 is the latest version of VoiceType, for dictation and control of the operating systems and programs... From his experience with VoiceType so far, [the 38-year-old reckons it] can start planning a return to work – ...[a]s a qualified counsellor – since [it] can walk or stand wearing a headset while working the computer by dictating information, commands and managing files... So far VoiceType appears to work reasonably accurately with normal speech, even though the version [the 38-year-old] spent the weekend learning was one tailored for American accents... It was not quite able to cope with fast continuous speech, but could cope with fast speech as long as each word ended crisply... [The 38-year-old] believed that with the addition of a scanner (...[it can't] hold a book or pages up to read) and help to scan written notes and files [it] could be self-employed.

...About four in 10 N[Z]ers have some sort of disability or long-term illness... Do we see only the amputation, the blindness, the mental illness? Or do we see the whole person and make sure opportunities for rewarding work, education and personal development are within reach? N[Z] has made remarkable progress in opening doors for people with disabilities in the past decade and we are at the vanguard of change internationally. We have moved well away from dependence and segregation and are hot-footing it from discrimination as fast as we can... Given choice, opportunity and appropriate resources, people with disabilities can achieve both the ordinary and the remarkable... Workbridge Inc... [has] worked with some awe-inspiring achievers... One... was born with no arms and one leg. However, [One Leg] is equipped with an intelligent brain, good coordination with her multi-functional foot, mouth, chin and shoulders and has lots of "toes-on" experience. [One Leg] is studying for a bachelor of arts in social sciences and hopes to go on to criminology... participates in a drug education programme in schools... [and] has scaled the second-highest peak of Mt Ruapehu, one of N[Z]'s highest mountains... [Workbridge assisted her] into an office manager's job by organising a specially adapted telephone system, a table and chair. [One Leg] beat 119 other applicants. But 10 years ago, [One Leg] worked in a factory, run by [Workbridge's] predecessor, the Rehabilitation League. There her jobs included collating labels, soldering holes into pushchair straps and putting plastic ends on to curtain weights. Obviously, her potential was far greater. A labour market approach means [Workbridge gets] people with disabilities into real jobs – not sheltered workshops. They earn real money, can develop skills, enhance their self-esteem and get long-term job satisfaction... [Workbridge now has] 27 employment centres throughout N[Z], each employing a team leader and up to four placement coordinators. Last year [Workbridge] placed more than 3500 job-seekers in jobs, and almost 5500 into training opportunities. [Workbridge has] had some 55,000 job-seekers on [its] books... The... organisation... [has] workshops and initiatives for different groups facing additional barriers: Maori and Pacific Island clients... By developing these specialist areas... Workbridge... [has] vastly increased the numbers of these groups registering with [it] and getting jobs. More doors are opened with new technology. [Workbridge currently] has two clients who can only move their hands. A voice-activated computer enables one to study at university and the other is now able to write and perform music with a computer and synthesiser. If getting a job relies on having an adapted sewing machine, for example, or a specially designed chair, [Workbridge provides] funds through the Ministry of Employment.

...The manager of the Royal N[Z] Foundation for the Blind library has accused North Health of discrimination in a row over funding for special technology. [The manager], who is blind... may have to resign because [it] can no longer carry out her duties on her employer's upgraded computers. [The manager] and five other blind staff applied for about \$60,000 from North Health, which funds employment aids for disabled people. They wanted to buy special technology... [such as speech synthesisers so they] could hear what was on... [their computer screens, which would allow them to continue] to do their job, but say they were turned down... [The manager] and her colleagues [claimed they] were being unfairly treated because they worked for the foundation. "Had we been working in any other place in town, we would have got the funding." ...But North Health's manager for disability support services... said the foundation should have approached North Health before deciding to switch computers. "This is public money and we're not going to make any hasty decisions." A long waiting list of people wanted funding... Every application would be judged on merit, and no organisations or individuals were discriminated against. "We recognise the foundation is an important charity, but we've got a tight budget."

...The "traditional" N[Z] employee – young, white, able-bodied[and the] heterosexual... head of a nuclear family – is becoming rare. But most employers, although they may be getting that message, are not acting on it, says the E[EOT]. Results of a survey conducted for the trust will be made public at its national conference in Wellington today... They show... [that m]ore than a fifth of the adult population (22[%]) describe themselves as having a disability, 10[%] are gay, and 18[%] of families are headed by single parents... The survey [also] found more than two-thirds of the employer respondents still have no documented plan to put policies in place. "There is quite a lot of awareness that this is an issue, but when you translate that into meaningful activity, like holding managers accountable for performance in this area, it's not quite happening," said... the... trust's executive director... [E]mployers... who did not promote equal opportunities... in the workplace... risked costly litigation and losing staff and market share... Just under 1800 organisations, mostly with 50 or more employees, were surveyed about child-care facilities, work and family information, flexible work arrangements, anti sexual harassment policies and bias in recruitment... □ ON the subject of... [recruitment, employers] and job seekers can now list or apply for job vacancies on the Net. The N[Z] Employment Service web site at <http://www.nzes.govt.nz> has information on how to get a job and services offered to employers. There's also a handy map of NZES offices around the country.

...STRANGLER budgets make it tempting to go it alone when hiring new staff. When specialists ask 15%-20% of the successful candidate's gross annual salary, many organisations decide to sidestep the recruitment agencies. They probably figure, how hard can it be? Place an advertisement in the newspaper, wait for the resumes to roll in, arrange a couple of interviews and they've landed a new receptionist or manager. And saved a bundle in professional recruitment fees, right? Maybe not... [according to the director of an] executive search and selection company... "Companies who recruit internally, often... try to judge job applicants from resumes only, to avoid being inundated with phone inquiries. This short-cut recruitment can lead to disaster down the track. The in-house approach, unless you have experienced recruiters, doesn't necessarily save costs..."

The cost differential between... do-it-yourself... recruitment... [and outside] participation in finding new staff... is insignificant. But there's risk of getting it wrong and having to bring in a professional recruiter to repeat the exercise. That doubles the cost."

...SO, THE new manager has turned out to be a highly-paid dud, but you're stuck with him. [The new manager] seemed the perfect fit for the job during the interviews. What went wrong? Most likely a wobbly selection process, according to... an industrial organisational psychologist at Waikato University. Too many organisations still treat the job interview as just a chat, [the psychologist] said. "Interviewers are not clear what they want from a candidate and bring a heap of bias to the interview." ...when [the psychologist] arrived here from the US in 1989... [it] was common in a traditional interview for different applicants to be asked different sets of questions based on the interviewer's personal preference... "My guess is, around two-thirds of large organisations now use some form of structured interview. But many managers still take shortcuts. They skip a few more hours' preparation and throw away the opportunity to get the best person for the job." ...Ideally, candidates should be interviewed by the person to whom they would be directly responsible... "But research shows that most people over-rate themselves as interviewers. Around 20% of people are skilled at interviewing, but everyone thinks they are in that 20%. Without training, it is easy to fall into legal and ethical pitfalls, such as privacy issues[...]" ...said... a human resource consultant at Lampen Group. "Traditionally, most interviewers... ask the wrong questions and fall into the trap of not comparing apples with apples." Snap judgments, usually based on appearance, were made when a candidate walked through the door. Other blind alleys for untrained interviewers were being influenced by factors not related to job skills, such as old boy networks and mutual interests... The structured approach to assessing job candidates sought to create consistency, and a fairer, more objective appraisal... "With structured interviewing you get 'predicative validity' – a better match for the job," said [the consultant]... The first step in structured interviewing is to thoroughly analyse the job role and identify core competencies. Next, suitable standard questions are devised based on what's required of the job, and to probe relevant experience. Questions will typically include posing hypothetical job situations for the candidate to respond. Other questions are designed to evaluate skills such as analytical thinking... "The theory is past behaviour is the best predictor of future behaviour,"... Questions must be unambiguous and clearly job-related... Loaded questions such as "what would you have done differently?" or "what would you say is your greatest strength/weakness?" had no place in structured interviewing. "Why would anyone admit to doing something that was not successful or highlight a weakness when they are trying to impress?" ...A pre-determined rating scale to measure answers, generally 1-5 points, and a system of evaluation must be agreed by the interviewers before candidates were seen.

...JOB interviews are useless for selecting the best person... says... [a former] human resources consultant, Commonwealth Employment Service manager, and union official... In his diverse roles... [the AUS]n... has observed hundreds of interviews, most of them disastrous... Most interviewers are hopeless and nearly all applicants stumble trying to sell themselves... Even some excellent sales people were terrible at selling themselves... No wonder so many excellent candidates flunk the interview test... His conclusion: Traditional interviews only get the right person for the job by coincidence. "Studies have shown that there is no correlation between interview performance and job performance,"... [The AUS]n has passed on insights of how to play the interview game in his best-selling book *The Secrets of Getting A Job*. "I wrote the book out of frustration... The interview process is illogical. It's a competition that requires applicants to use skills they will never have to use again. But there is a game to play and job applicants have to learn the rules." The first three minutes of the interview are the most important. Interviewers form an instant opinion through clothes, general appearance, how you handle the introductions... "Most interviewers will spend the rest of the interview either confirming or refuting this initial opinion,"... One constant observation the author found most unsettling was there was only a loose connection between what the interviewers said they wanted from an applicant and the person they choose for the job. And the least asked question was about the job itself. "This is because the interview is not, and never has been, about the best person for the job, or about ability skills or the desire to work... It can't be: There is no way of knowing from an interview who is the best person for the job." Interviews... could only be about who appeared to be the best person for the job... The trend to put job applicants through psychological assessment [is also] nonsense. "Psych testing for jobs is voodoo, a notch above horoscopes... I know people who have sat two assessments within a week and got totally opposite scores." A more sensible, although not always practical, approach was to design an actual work trial for job applicants. A sales person would spend a morning serving customers on the shop floor, and the motor mechanic would work on a vehicle. "This gives a far better insight into a person's ability... Job interviews are too susceptible to opinion, emotion and feeling... This is why so many companies end up with clones. But enlightened organisations recognise that a bit of friction is a good thing, it sparks innovation." ...Personnel consultants often know they have [a] good candidate, but don't put them in front of the client because they know the person will perform poorly at the job interview... [The AUS]n's cynicism about the interview process had been reinforced after [it] had coached people into jobs they had lost a short time later because they lacked specific skills.

...JOB fairs look set to grab the recruitment spotlight in N[Z] following the success of the first careers exhibition... Job fairs provided a direct route to the people doing the hiring. Organisations also became aware of who was in the market place... Information technology specialists and graduates crowded the Aotea Centre in Auckland last week to discuss employment opportunities with... some of the 20 corporate exhibitors... Electronic Data Systems had 20 vacancies to fill. "The exhibition has exceeded our expectations," said [the] EDS project manager... "We have spoken to a lot of good people." The American company has 1500 employees in N[Z]. In the US, it recruits up to 40% of staff at job exhibitions... Bank of America, the most technologically advanced in the US, attended 104 job fairs a year where it did 86% of recruitment... But, personnel consultants need not feel threatened. Job fairs would never replace recruitment agencies... said... the... managing director of Career Exchange... The Auckland fair was organised by Career Exchange and followed its successful technology careers exhibition held earlier this year in Sydney. Around 40% of the 2000 job vacancies were filled. The same number of jobs was on offer at the Auckland show... The... [managing director] expected 30% of these positions would eventually be filled... Career Exchange will hold job fairs through Asia Pacific in the next six months. "We want to brand this region as one job market,"... Did this expose N[Z] to international job poaching of its scarce IT specialists? "We exclude overseas companies participating in local career exhibitions... But many organisations at the shows have offices around the world. You can't stop them from putting people where they are needed... The world is going through an incredible growth in IT... Globally, there are 500,000 vacancies that can't be filled. Upskilling is lagging way behind technology advances."

...China may be experiencing an economic boom to make the world envious but it is set to suffer from a serious shortage of talented people, according to a new official survey... The survey of the Chinese Association of Aged People indicated that more than 42[%] of China's professors and associate professors would retire around the year 2000. And 50[%] of its senior engineers, research fellows and agronomists are also expected to retire by that time... while only a third of the Chinese who have studied overseas in the past 10 years have decided to return their expertise to their homeland... "The lack of talents – especially a shortage... in the scientific and technological fields – will greatly affect the sustained growth of the Chinese economy and is detrimental to the country's international competitiveness," said the survey's co-ordinator... The survey's co-ordinators had also... found that of... people with senior professional titles, only 6.3[%] were aged younger than 45, with only 1.1[%] younger than 35.

...N[Z] is in the grip of a skills crisis that threatens [its] ability to develop industries and keep pace with the demands of a global marketplace, say industry trainers and researchers... There is also growing concern that skills taught do not match employer needs and expectations... [Indeed, a] review commissioned by the Auckland Business Development Board in 1995... concluded available training was not meeting the needs of employers... The skills shortage has been brewing for years, according to... [a] Waikato University senior lecturer at the centre for Labour and Trade Union Studies... "N[Z] has undertrained by 100,000 people since 1988. If we fixed it tomorrow, many industries would still have serious skill

shortages until 2010.” A plan needed to be put in place with all affected sectors – employers, Industry Training Organisations (ITOs), unions, researchers and the Government, said [the lecturer, who is especially] critical of government policy that viewed industry training as a private sector responsibility. The Industry Training Act took away the obligation on employers to train, but up-skilling was essential to progress... One of the [review’s authors, who is] the professor of International Business at Auckland University, agreed N[Z] industry needed more direction. “You need competency at the top end. It’s been proven overseas, to achieve this, an interventionist strategy works best.” Government policy on industry and training dated back to the early ’90s when the development of ITOs and standards was encouraged. There were now 52 ITOs, which was too many, according to some observers. Employers might have to deal with several ITOs at one time. Tasman Pulp and Paper... had to deal with 14 ITOs for a training programme at Kawerau. A reduction in the number of ITOs was needed to ensure flexible... training... [and] would mean... less [resources are] spent on organisational bureaucracy... said... [the] CEO of the Engineering Industry Training Organisation (EITO)... In A[US], for example, the number of training organisations was reduced from 47 to 18... [The CEO] said one of the biggest training issues faced today was the increased demand for multi-skilled workers. [The CEO] favoured ITO groupings on an industry basis. Funding and recruitment rivalry between ITOs representing the same industry would be minimised... The skills shortage was most apparent at the level above apprentice and below management, said... [the] Transport and Technologies head of department at Unitec, in Auckland[, who] had noticed more people were opting for skills-based training at polytechnics. [The head then] said an over complicated qualifications framework was creating highly qualified, multi-skilled people no longer happy to work in factory floor positions. “Employers don’t necessarily want someone who can do almost anything... They are looking for a cost-effective way to get the job done. Paying for skills that don’t get used is a waste of money.” [The department head] believed over training had also led to employees becoming dissatisfied with the industry they have chosen. “The motoring industry is a classic case. For every 100 people who enter their first year of employment, 80 have left by year 10. Likewise, if you have 20 people working in one place, assuming they are all around the same level, there’s a one-in-20 chance of promotion. Many people don’t wait around for that chance.” ...Some industries are weathering the skills shortage better than others. The dairy and forestry industry, for example, where there was significant capital investment and comparatively few staff, was making good progress... But small employers – the majority – were suffering. They are taking on fewer apprentices because of the cost and end up poaching staff from other small companies and from bigger companies that do train people... A N[ZES] survey in 1993 found the lack of companies taking on apprentices meant employers were having a hard time finding qualified tradespeople. Fitters, welders, turners and carpenters were in short supply. The shortage was accentuated by an up-turn in the industry. [The CEO] said the answer was group apprentice training schemes. With a network of 140,000 employers... the EITO was in a perfect position to monitor such a scheme. An apprentice would spend three years working with three employers. Each company would have to pay for only a year and the trainee would benefit from a broad skills base...

Our living standards depend on the skills of our workers. Being small and isolated, we have to be smart to do well. So I was concerned when people in two different trades – jewellery and upholstery – both told me recently that they were worried about a lack of skilled young people in their fields. The upholsterer has been in business for 10 years. When [it started his business], parents often used to ring asking whether their boy could join him as an apprentice. Those calls have stopped in the past three years. The jeweller has had trouble finding an assistant[, and has now] taken on an older person with some experience but no formal qualifications. Sadly, their experiences are common. Our trade training is not working as well as it should... 1992[was] the year when the postwar Apprenticeship Act was replaced by a new Industry Training Act. Apprenticeships, based simply on “serving time” for so many hours, were out. In came traineeships, based on setting standards for each skill unit making up each trade. Educationally it was great. Trainees could set their own pace, pass each unit when they were ready and learn their trade systematically. In some areas it has worked. Traineeships have sprung up where apprenticeships never extended – sport and fitness... for example. Even in some parts of engineering training is booming. Yet in others it is quite a different story... Unionists and recruitment consultants say that even in the big electrical and building trades, there’s a trend towards “deskilling.” ...Increasingly we’re ending up with a partially trained workforce of experienced labourers rather than people with any systematic training... This month the Government is reviewing its policy through a green paper available from... the Ministry of Education, “A Future Qualifications Policy for N[Z].” ...The paper suggests yet another upheaval. At present I[TO]s buy training from technical institutes and others according to their judgment of the need. The paper proposes letting educational institutions offer their own courses too as long as they meet quality standards. It has missed the point. It is proposing yet more formal technical institute training when we have a crisis in training on the job. The point should be to make training in industry more attractive. Industry training is a classic case of “market failure.” Its benefits go beyond the company that invests in it if the trainee eventually leaves, so any individual company is likely to invest less in training than the optimum from the whole country’s point of view. To achieve the optimum amount of training the country should subsidise those employers who provide it. We should be paying them for the time they put into it and meeting most or all of the costs of training at technical institutes... We should make it easier for small firms to offer training through group traineeships in which trainees can go to another firm if the first one runs out of work. Finally, we need to resurrect “planning.” I[TO]s are well placed to plan the training their industries need.

...over the past few years N[Z] has stood out in OECD figures as being top-heavy on wealth-manipulators: accountants outnumber engineers by two to one (in comparison with Japan where the engineers outnumber the accountants by 100 to one, or Sweden at six to one)... Furthermore, maths, science and physics teachers are in much demand... It is a vicious circle... Classes are taken by graduates in areas other than science who almost certainly don’t have a love for the subject and may even resent it. Children sense this and know that the subject is hard. In our consumer-driven society what is the incentive to persist? So they don’t do science at university and our chronic shortage persists... Supply and demand works in the employment market just as it does in all other sectors. Agriculture boomed in the 1970s but the removal of Government subsidies had a dismal effect on employment. During the 1980s commerce burgeoned; last year 3000 commerce students graduated. Master of business administration degrees became all the rage in the late... 80s and [early] 90s but the market now seems to be saturated; Auckland University declined to enrol new students mid-year. Where will be the next boom? ...[the answer] may seem self-evident, [due to] the explosive development of... IT... in the past decade... and... concern... [about] the number of skilled people having to be imported to cope with the demand for [teaching,] engineering, programming and communications positions.

...Jobs with electronic companies will account for more than one third of new manufacturing positions expected to be created in Canterbury next year, a survey by the region’s manufacturers’ shows... The pattern of job growth raises concern about whether there will be sufficient people with the necessary skills and attributes available to fill the expected positions... Despite excellent modern working conditions, the sector has had difficulty filling these positions because too few students, parents and teachers see electronics as a career path. Tait Electronics has a turnover of more than \$100 million and is the largest commercial employer in Christchurch... [-] the electronics capital of N[Z -] ...with 750 staff and 250 overseas. For the past four years, Tait has employed an extra 100 staff each year but the company head... says a lack of suitably skilled people is a serious threat to his company’s growth. [The head] says the ratio of law to engineering graduates in N[Z] is about nine to one whereas in Finland, a world leader in communications, the ratio is reversed. A group called Electrenz has been working hard to improve the image of electronics as a career option. Founded and funded by... [the] director of Swichtex Power Systems Ltd, the group has campaigned for a seventh-form bursary examination in electronics and control. Electrenz promotes teacher-industry links by encouraging site visits, teacher refresher courses and ongoing training courses. Electrenz and the electronics industry as a whole find they are still fighting against outdated public perceptions of manufacturing

that evoke images of dirty smoke-stacks and soulless production lines... The 82 firms which replied to the... survey, representing all manufacturing sectors, projected a total of 191 new jobs in 1998, of which 51[%] were classed as skilled... a third as semi-skilled... and... 11[%] were... unskilled...

Employer training costs are escalating as managers and employees struggle to stay on top of frenzied information and administrative overload. Although essential, specialist training takes staff out of the frontline action, and has the added impost of associated costs... Not surprisingly, more organisations are questioning the return on costs from traditional classroom instruction and, where appropriate, turning instead to CBT – computer-based training. “Last year, 15% of training investment in the US and Europe was spent on multi-media,” said... [the] director of international sales for US-based Allen Communication. “Next year, an estimated 50% of that expenditure is earmarked for CD-Rom training.” Allen Communication specialises in creating interactive software for CBT and traditional classroom training. The company this month launched its Designers Edge “authoring” software in N[Z] that enables professional trainers to write a blueprint for the production of their own multi-media presentations... The demand for the intuitive software programme was born out of frustration. “CD-Rom instruction in the workplace has been hampered by the difficulties in-house trainers and consultants have getting an accurate translation of their concepts on to disc,” said... [the] principal of training company The Learning Curve, which will market the software... The problem had been software programmers. Although skilled at constructing all the components required of a snazzy multi-media presentation, most programmers had no concept of training and learning processes. Designers Edge bridges the gap... “A major benefit of this authoring software is training programmes can be created for individual audiences or processes.”... A volume training CD-Rom – on occupational overuse syndrome, or the Dangerous Goods Act, for the fire service – could readily be up-dated every six months. [The director] said companies were finding a lot of traditional training was too generic. “It is too expensive to put employees in a classroom for days when the majority might only need to know a fraction of the course material.” A multi-media training disc allowed employees to access the sections relevant to their activity. “And most importantly, at a time convenient to the organisation...” ...Studies in the US, that included the Defence Department, IBM and Xerox, showed multi-media saved 25%-50% in training time, with the additional benefit of better retention of information (15%-25%) and transfer (using what was learned).

...*Electronic benefit transfers: bar codes for the poor...* As Finland goes, so goes Namibia – at least when it comes to pensions. The two countries are among the pioneers of electronic pension provision in which recipients draw their retirement cash by inserting a Government-issued card into a cash dispenser, otherwise known as an automatic teller machine. This method of transferring cash from governments to people, known in the trade as “electronic benefit transfer” (EBT), looks likely to make order books and welfare cheques obsolete. More efficient and fraud-proof than paper, EBT systems are part of the welfare state of the future. Bits of northern Italy and three provinces in South Africa have already put EBT schemes in place for paying pensions; Mexico is experimenting with one that monitors the supply of subsidised milk and tortillas to some two million poor families. Britain is planning, ambitiously, to disburse electronically almost all its £90 billion... in social spending by 2000, a[nd a]... pilot project administering child benefit is under way... The welfare-reform law passed in the U[S] last year demands that all 50 states must have EBT in place for food stamps by 2002. Most are taking the opportunity to include welfare payments to poor families in the card as well. Transactive, a subsidiary of GTech, a company based in Rhode Island, has the biggest system in operation so far, in Texas. Under a seven-year contract, Transactive is paid \$US2... a month for each food-stamp recipient, and US97c for each income-support recipient. In return, it does all the training and sets up the infrastructure, such as installing terminals. To receive their food stamps, Texas’ three million claimants swipe their “Lone Star Card” through a terminal at the checkout counter of a shop, and enter their PIN number. The cost of their food purchases is then automatically deducted from their entitlement and added to the retailer’s account. The system recognises the bar-codes of forbidden items such as alcohol and cigarettes, thus ensuring that food subsidies are actually spent on food. Texas officials noticed that, when towns introduced EBT, sales of alcohol tended to drop and of food to rise. Such cards are not truly “smart.” They use magnetic strips, not a microchip, to hold information so they cannot process the data. Spain, however, has decided to be smart. In a programme known as “Tass,” Spanish authorities have begun to embed a vast range of information in new social-security cards. Under the scheme, welfare benefits are still deposited directly into bank accounts. But Spaniards can use the card at designated kiosks to talk to any number of Government agencies. They can check the status of their pensions [or] unemployment benefits, ask about job training, check their health insurance or book an appointment at a clinic... By 2002, every citizen will have a card; already, two million Spaniards do... [Incidentally, life] may begin at 40 for some, but for many N[Z]ers it is the start of an unwanted, unavoidable early retirement. Age discrimination in the workforce may be illegal, but employment agencies working for the 40-plus group say it is a widespread practice... The Human Rights Commission received about 400 inquiries a year about age discrimination... [but] experts say many cases of age discrimination go unchallenged because applicants are not told the real reason they didn’t get jobs.

...[a 42-year-old] has won... \$5000 in... the country’s first successful legal challenge against a case of age discrimination... [It had] applied for a job as a trainee manager of a TAB branch in Wellington in June last year[, and] sat in while his Employment Service officer rang the branch manager to try to get him an interview. [The job-seeker] heard the employment officer say: “You cannot ask for that, it is against the law.” The officer confirmed later that the TAB manager had asked about his age. [The 42-year-old] didn’t get an interview... [and i]s still looking for a job.

...If one more person asks me what I am going to do when I retire, I shall scream. Why do people assume that moving out of a full-time, single-label job means... one is pulling out of the world of work? Let me say – not only for me, but for the hundreds of thousands of others like me who choose to be self-managing, and work in a variety of jobs rather than a single all-consuming one – [we have not retired! We’re still working]. Making the transition from one kind of working life to another provokes reflection on the confused work ethic of our society. Why is it that... kicking or hitting balls around paddocks... can earn [people] hundreds of thousands of dollars, while training to be skilled early childhood carers and teachers will earn them nothing in their own homes, or a pittance in a childcare centre? Why is it good to have one [person] being paid a million dollars a year to work a hundred hours a week making a hundred [workers] redundant so they can be paid \$10,000 a year to do nothing a hundred hours a week? ...Surely we want all our citizens working, as long as they are able, weaving the experience of age and the energy of youth into an exciting social tapestry... Then we could start demanding that everyone learn to work well, because we would be proving that good work counts.

...Thought your days of learning were over? You had better be prepared to hit the textbooks again if you want to hold a decent job and keep pace with the workforce. The Government’s [proposed] shakeup of the tertiary sector... comes amid predictions that most people will need tertiary training during their working lives to keep their skills up to date. Officials aim to overcome the looming demand by breaking down barriers to higher education... The biggest carrot, the universal tertiary tuition allowance... aims to subsidise everyone who wants to study at tertiary level. This replaces the current “cap” on subsidised student places and cuts the need for institutions to bid for a specified number of subsidised student places. The subsidy continues for as long as you keep studying, but the flipside is that students... have to meet the rest of their costs. The universal tuition allowance also means students at private establishments will get the same amount as those in public institutions. From 2000, all students on approved courses will be subsidised on the same basis, although more expensive courses, such as medical... degrees, will get a higher subsidy. But at the same time, the Study Right entitlement introduced to entice school-leavers and beneficiaries into tertiary study is being dumped... [And b]igger subsidies will go to poorer institutions while well-resourced ones will be given less... To ensure that publicly subsidised institutions are providing a valuable service, a new body, the Quality Assurance Authority, will have the overall role of maintaining standards... The Government’s policy document also raises the prospect of smaller tertiary institutions merging because their long-term viability otherwise is in doubt.

...Auckland College of Education will merge with another institution... The college’s council said it would continue to have discussions with possible merger partners, including the Auckland Institute of Technology and the Central Institute of Technology... [while it] was waiting for the

[outcom]e of the Ministry of Education's... discussion papers on tertiary education and teacher education... In May the councils of... [AIT and CIT] supported the prospect of merging the three institutions. Massey University and Wellington Polytechnic are also talking about merging...

Auckland's teachers college is being courted by three merger partners... as competition in the tertiary sector heats up. The... [college] will this month decide between a three-way merger with... [AIT and CIT], or joining Auckland University or Massey University. While rumours have circulated among staff that the University of Auckland will get the official nod as merger partner, [the college's] principal... said the decision was yet to be made. When talking with possible partners... the college had been aware of the need to maintain its well-known and respected "brand", either as a faculty or a college of education within the new institution... The college is one of many institutions talking mergers and strategic alliances... [Smaller institutions were looking] at merging with a larger institution to gain economies of scale and because of concerns over the future of smaller institutions in a time of falling Government subsidies and increasing student fees. Other advantages included a wider range of programmes for students, and for the larger institutions, the chance to offer multiple campuses...

Auckland University could lose its throne as the country's biggest tertiary institution through a proposed merger between Massey University and the Auckland teacher training college. The Auckland College of Education yesterday announced it would work towards a formal merger with Massey University, which is also merging with Wellington Polytechnic... The merger would... strengthen Massey's Auckland presence, which began with the advent of its campus at Albany... The vice-chancellor of Massey University... said Massey was attracted to the Auckland college because both had similar directions and philosophies in teacher education. Massey offers teacher education in Palmerston North, but... while the programmes would be compatible they would retain their own identities. The teacher education programmes offered at Massey's Albany campus would be moved across to the college's... Epsom... site... [Massey] had a "huge" extra-mural programme, and with its two latest mergers the university felt it had the network to cover the North Island well... [● AIT says it] is about to become affiliated with... Northland Polytechnic...

Planned mergers between universities and polytechnics have come under the scrutiny of the Commerce Commission. The chair[person] of the commission... said yesterday that it was investigating planned mergers at several tertiary institutions... to ensure institutions were not breaching the Commerce Act... If the union of the organisations meant they had more than 60[%] of the market then the commission would take [action]... The commission's Commerce Act manager... said it was so far happy that... Massey University[']s... plans were not illegal.

...An interim injunction against the proposed merger between Wellington Polytechnic and Massey University was granted in the High Court at Wellington yesterday. However, the ruling does not prevent the Minister of Education... from approving the merger before its legality has been determined. Manawatu Polytechnic made the injunction application... [■ Manawatu Polytechnic staff might feel threatened by the proposed merger, but NZ]ers... are generally optimistic about job security as long as they performed well. N[Z] ranked sixth equal with Brazil and Norway in the job security/performance poll, while Britain and the U[S] were at the bottom of the heap, according to a survey of multinationals in 22 countries done by Chicago-based International Survey Research Corporation... which has an extensive data base of 28 million workers' opinions in 106 countries, mostly on work issues... India, Mexico, Malaysia, Singapore, China and Hong Kong took top spots in the poll on job security... In terms of technological innovation, the N[Z] employee thinks much is lacking, unlike in Singapore where workers ranked their companies' technological innovation highly. Only 65[%] of those surveyed here said they had the computer systems needed to do their job effectively, compared with 72[%] in AUS. NZers... ranked their management above A[US]ns, having seen them cope with new directions and the changes in management structures.

...EMPLOYEE empowerment taken to the extreme has seen [a]Brazilian marine and food processing machinery manufacturer... power his company to 900% growth in 10 years. Under [the Brazilian]-style employee empowerment, employees decide how much they and others should be paid, have access to the company's financial records and can choose their own bosses... The Brazilian's methods are based on three fundamental values: Giving employees control over their work, incentives through profit sharing, and opening information channels to keep employees informed on what works and what doesn't. While most N[Z] employers are light years away from the [Brazilian] model, some companies have already started down the empowerment path. These include: Fisher & Paykel, Interlock, ICI, Lion Nation, Mainfreight and C[H]H... The human resources director at C[H]H... said N[Z] companies were slow to empower their staff because the all-important management buy-in remained low. "Empowerment is a two-edged sword," [CHH's human resources director] said. "It's one thing to offer staff extra discretionary freedom but getting them to use it is quite another matter. A company's existing power brokers can also see it as a potential threat to their own control levels."

...One of the management lessons of the year – perhaps the lesson – is that the art of business has swung from the organisation of things such as equipment, property and finances to the infinitely more subtle but more rewarding job of managing people. Time after time, it comes back to homo sapiens – that asset which the "company doctors" of the 80s tried to treat like inanimate objects. A recent example? Levene & Co, a second-generation business that had prospered largely through a caring, even paternalistic, attitude to staff until it was sold to the Skellerup Group, later the troubled Maine Investments... Levene's demise... looks to have resulted from a more mechanistic form of management that saw not people, but numbers. Although the detail of managing people might be awkward at times, the principle is simple. Put yourself in their shoes... "People no longer want to think of themselves as just economic units, mere cogs in some company machine." They never did, of course. The contemporary human resource-oriented management experts almost unanimously agree that most employees want to feel they are valued and are making a contribution. At Portland Cement, for decades a union-run dinosaur, a determined programme of pushing the rewards for initiative all the way down the line has produced some remarkable benefits. For example, a bulldozer driver who had for years cheerfully ripped up... expensive tyres on rocks and thought nothing about it, suddenly came up with an idea that protected the tyres... and turned him from a drone into an inventor... Just when individual employment contracts appear to be dominating industrial agreements, the Manukau City Council has signed a substantial collective deal that... has both parties in raptures... [T]he third-largest local authority in N[Z], says the new deal is a "partnership contract" that binds employers and employees in a spirit of cooperation with deep implications for the future of local government. The wildly enthusiastic PSA Union describes it as "a flagship agreement that will give Manukau Council a competitive edge." It now wants to extend the agreement to all N[Z]'s 7200 local government employees. This apparent dream collective employment contract was negotiated without even the usual rancour – "positional bargaining" in labour terms – and in double-quick time... In theory, a... practical result of the agreement will be less friction between management and staff... Often too much management theory can trick executives into ignoring the obvious... Keep it simple. Perhaps we... [should] commit to memory the words of... [a] father of management studies: "So much of what we call management consists in making it difficult for people to work."

...MODERN offices are being torn apart by downsizing – not of staff, but space. Size doesn't count in these new workplaces. Large individual offices are being dismantled to blend into more fluid, co-operative environments... Companies have been forced into workplace design changes by new technology... flatter management structures and a leaner workforce. Information technology had made it possible for people to work productively almost anywhere and any time... [says the] professor of Facility Planning and Management at Cornell University in the US. Ericsson is at the forefront of office design change and flexible work practices. "Organisations are rewarding people for what they deliver, not where they deliver it from," said Ericsson's corporate marketing manager... The company has 16 flexible office projects around the world. At its... NZ... headquarters in Wellington – home base for 150 people – Ericsson plans to accommodate 500 roving employees in 4845sq m within four years. This will cut the average space per person from 32.3sq m to 9.7sq m. Operational costs have already been slashed by installing a cordless phone system throughout the seven-floor building. "It cost... \$100,000, but paid for itself within six months... Staff can take incoming calls from anywhere in the building. They don't have to return to their desks and call back..." Project teams created work places as required by simply moving sliding

partitions, wheeling their special portable desks to the area and plugging in computers. [The professor] directs the International Workplace Studies programme at Cornell. The research consortium is made up of 17 leading companies in the US, Europe... and... Japan... includ[ing] IBM... General Electric, DuPont and Shell. Research focused on alternative “best practice” workplace arrangements, including team environments, non-territorial and virtual offices, and home-based telecommuting. Shrinking work floor space and the redevelopment of office buildings in N[Z, AUS], Japan and the US had... [enabled companies to save] substantially on real estate costs... But saving on rent was not the main motivation for N[Z] companies to reconfigure their offices, said... [the] managing director of Colliers Jardine. “More flexibility and improved productivity are the main drivers of change.”

...Today’s competitive environment means we’re increasingly having to work harder and put in longer hours. But what we really need to do is work smarter. Switched-on businesses recognise there will never be enough hours in the day, and they’re learning the key to time management is to use those hours better... [(note that some US and British businesses employ NZers to field phone calls from customers outside of their normal trading hours – as it works out cheaper than paying penal rates to have local employees work through the night). By the way, w]ider introduction of the three-and-a-half-day working week had suffered only a temporary setback, the president of the Federation of Labour... said last night. Commenting on the reintroduction of a five-day week at Kensington Carpets after 18 months of working three-and-a-half days, [the president] said there was a future for shorter working weeks, although they could generally only be applied to industries working long hours and involving machinery.

...Lying down on the job may be the solution for shiftworkers suffering fatigue, according to an Otago University academic. Twenty-minute “power naps” are increasingly being seen in industries overseas as a way of maintaining alertness on the job... A longer sleep of one or two hours could be counterproductive [as] sleepers enter a deep-sleep stage and could suffer “sleep inertia” – grogginess and disorientation – if woken early. So far only the aviation industry had accepted the concept of providing for sleep breaks but studies had also been conducted in Japan with night-duty nurses... “Our bodies are programmed to be asleep at certain times and awake at other times. The human body is not designed to stay awake all night...”

...[A study shows night workers are in danger of giving new meaning to “graveyard shift.” Working the night shift can not only ruin your social life, it puts you at a higher risk of developing heart disease. The heart is forced to work harder to keep shift workers alert during the hours the body naturally prefers to rest and repair itself. While there is no current research on the topic in NZ, cardiologists confirmed that shift work – and the sleep deprivation associated with it – pose a significant health risk. “You know it’s terrible for you. One of the well-known forms of torture is sleep deprivation,” said the head of cardiology at Christchurch Hospital. The professor believes that workers who alternate between day and night duty put their bodies through enormous stress. The body’s internal clock dictates that blood pressure and heart rate should fall at night. But people who worked the late shift forced their blood pressure and heart rate up by trying to stay awake when the body most needed to slow down. “Night shift isn’t necessarily something that will cause you harm if you do it for a little while. But if it goes on for months and years, it’s a different story.” Researchers from the University of Milan, who wrote the article published by the American Heart Foundation, found that the production of cortisol, a hormone which stimulates the heart rate, did not adjust when people worked at night. This meant they might not be able to handle stress as effectively as their colleagues who worked 9 to 5. But the director of the Centre for Sleep Research at the University of South Australia said shift workers probably suffered more heart disease because they drank too much coffee, ate fast food and did not exercise as much as they should. The director believed that shift workers resorted to “inappropriate coping mechanisms.” Companies have recently put in a lot of effort to cut down the other, better known effects of night shifts – grumpy, sleep-deprived and occasionally befuddled workers. Generally, police officers work seven nights in a row as part of their 5-week rotation. However, Auckland maritime police have tried out a 10-day roster that ensured a maximum two nights in a row on night duty. Night shifts alternated with two day and two evening shifts, followed by four days off. “It was brilliant,” said the sergeant who developed the roster. “The guys loved it. They felt better and they weren’t as grumpy.” After nearly 27 years of shift work, the sergeant would rather work any roster than the 5-week model, which left officers short-tempered and so tired their judgments could be impaired.’

...‘Chernobyl (1.23am) and Three Mile Island (4.00am) are just two examples of accidents which occurred during the wee small hours and were attributed to human error. It’s been suggested that shift work was to blame because it affects the human biological clock. Shift work also causes a condition known as daylight deprivation’ – a sign that we aren’t designed to be nocturnal! (Editor’s note: ‘Sleep is to rest the brain, not the body. When tired we can’t control our desire to sleep. The prefrontal cortex – used for planning and highest thought processes – is the part of our brain that is most affected by sleep deprivation.’)

...‘the idea came to a Boston University sociologist as the sociologist was walking out of a hospital where it had been studying shiftwork among nurses. There are a lot of things happening after dark, the sociologist thought. I wonder what they are? Soon the sociologist began to chart the night, as if it were a new territory, a work as intriguing as the frontier world of the Old West a hundred years ago. The sociologist believes we are moving into the age of *incessance*, when business as usual will mean business 24 hours a day. Already there are signs of this startling picture in America. In his recent book, *Night As Frontier*, the sociologist estimates that at the last US census, about 29 million USers, on average, were out of bed during the first hour after midnight. Most of the late crowd were out spending money; almost 20 million were eating in restaurants, shopping or travelling. But 7.1 million were earning wages via their regular jobs. Even between three and four in the morning, usually the quietest hour before the dawn, 10.6 million people were awake, with some 4.1 million at work. But on the night frontier, sleep prowls close to the perimeters of wakefulness. Eyeballs tremble at its approach. Often it wins. It shut down a nuclear reactor early in 1987, for example, after the US Nuclear Regulatory Commission got a tip that some of the operators and supervisors on the 11-7 night shift at the 2200-megawatt Pennsylvania facility appeared to be asleep. “It’s extremely difficult to change the mechanisms controlling sleep,” says a physiologist. Even when people force their eyes open, their physiological tides begin to ebb. Body temperature drops. Breathing slows. Can we learn to dispense with long hours of night sleep? The answer may lie hidden in some eye-opening studies. Research on sleep behaviour in 160 different species of animals, from insects to primates, shows that nearly all creatures except humans seem to break up sleep into several discrete phases per day. “We go against nature when we sleep just once in 24 hours,” says a psychologist of the University of California. People have long believed that naps disrupt night sleep. But the psychologist says it may be the other way round: night sleep disrupts our natural tendency towards nodding off during the height of the day. The psychologist is hopeful that, in the future, more humans will sleep more like animals, spreading short periods of slumber over the day.’

...‘If it is sleep that knits up the ravelled sleeve of care, as Shakespeare said, then an overwhelming number of people are walking around with tatty shirt cuffs. Judging from recent surveys and clinical experiments, most experts in sleep behaviour agree there is virtually an epidemic of sleepiness. Even people who think they are sleeping enough would probably be better off with more rest. In one experiment, 16% of a study group of university students who averaged between seven and eight hours of sleep a night could doze off during the day in five minutes if allowed to lie down in a darkened room – evidence that those students were sleep-deprived. Researchers further discovered that if students spent one week getting to bed an hour to 90 minutes earlier than usual, they improved their performance on psychological tests. As added evidence that people don’t sleep enough, one sleep-researcher cites the bedside alarm clock. “If that’s how you wake up every morning you’re shortening your natural sleep pattern.” The beginning of our sleep-deficit crisis can be traced to the invention of the light bulb a century ago. From diary entries and other personal accounts from the eighteenth and nineteenth centuries, sleep scientists have deduced that the average person used to sleep about nine-and-a-half hours a night. “The best sleep habits once were forced on us, when we had nothing to do in the evening.” By the 1950s and 1960s, that sleep schedule had been whittled dramatically, to between seven-and-a-half and eight hours. Now social and economic trends are slicing ever deeper. “People cheat on their sleep, and they don’t even realize they’re doing it,” says the specialist. Perhaps the most relentless robber of sleep is the complexity of the day, say researchers. When pressures from work, family and friends mount,

many people consider sleep the most expendable item on the agenda. Often, though, our efforts to squeeze ever more tasks into our days and nights backfire. The person who invests in a full night's sleep, experts say, will be more than recompensed in heightened productivity, creativity and focus. Another thief of sleep is shift work. Researchers say the brain has difficulty varying sleep times, which means that these employees usually suffer a net loss of sleep. Because their reaction time and attention span are affected, sleepy people may be more prone to making mistakes on the job. Many major industrial accidents, including Three Mile Island and Chernobyl, occur in the late night or early morning, when researchers find that workers who monitor equipment are probably not at their most alert. One US government study estimated that up to 10% of traffic accidents may be sleep-related, and that perhaps as many as 20% of all drivers have fallen asleep at the wheel at least once. Recent studies have also found that sleep-deprived people have an impaired short-term memory and are affected by smaller quantities of alcohol than rested people are. Just one bad night's sleep can make a person less efficient on mental tasks. Worse still, the effects of sleep loss are cumulative. A person who chronically sleeps 90 minutes less per night than is necessary will feel far worse on Friday than on Tuesday. "By the fifth night, you've lost virtually a whole night's sleep. That's the day when you're just praying to get through it." Sleeping on the weekends does help the body recoup. But in chronic cases you may need weeks of catching up to reverse the effects of sleep loss. Sometimes a sleep-deprived brain will try to snatch a break by falling into so-called microsleeps, which last a few seconds and which may occur without even being noticed by the sleeper. In many tropical-zone countries, people often take siestas in the afternoon. Researchers say the brain tends to fall asleep more easily in the afternoon, suggesting to some an evolutionary predisposition towards napping. But they add that most people who get a full night's sleep will not need a nap. If you need to make up for lost sleep on the weekend, experts advise going to bed earlier rather than sleeping later. If that is not possible, they suggest taking a midafternoon nap for an hour or less on Sunday.'

... 'IF YOU'RE among the lucky and the wise you will be sitting down to read this morning's newspaper feeling refreshed and invigorated after a good seven to nine hours of blissful, uninterrupted sleep. If not, you're probably killing yourself. Getting a good night's sleep is not so easy, you say. There was too much to do last night. You were at the office 'til late, there was dinner with clients, homework from your MBA class, the kid's sports clothes needed washing, and you can't kick your Internet habit. Either that or you live in Auckland where traffic gridlock forces you to get up earlier each morning and means you are getting home later each night. Today you will be feeling the full effects of tiredness, with a sleep-debt of probably seven or eight hours built up over the week. You have the symptoms of a sleep-sick society. "It's to do with people doing too much during the day and then staying up too late at night," says a Wellington sleep specialist. "And someone's put the crazy idea in our heads that successful people only need four hours sleep each night and everyone else is lazy." Then there are those who want to sleep but can't. They lie awake each night with growing panic about not sleeping, which only makes it worse. Not sleeping becomes a source of embarrassment. They never discuss it at work because they know it is affecting their performance, but don't want to be considered impaired. Insomnia is not a disease, but a symptom of some underlying cause that keeps you awake. It could be anything from a disruption to your body clock from travel, consuming too much caffeine or alcohol, stress or depression. Resolving those issues can resolve the insomnia but, warns a Green Lane Hospital sleep specialist, insomnia can't be cured, only managed. People who have been severe sufferers never attain the sleep quality enjoyed by people who've never had insomnia. In the meantime, according to health care research company IMS Health, the sleepless accounted for 328,000 visits to doctors last year, took away 325,000 prescriptions for something to help them to sleep and, overall, contributed to an annual \$3 million market in this country for hypnotics and sedatives. Whether we blame the stresses of modern life, the invention of the light bulb or a misinformed culture that makes a virtue out of staying up late and rising early, too little sleep is turning ours into a dangerously sleep-deprived society. Dangerous because sleep deprivation diminishes our life expectancy and puts us at greater risk of injuring ourselves and others. According to America's leader in sleep research, doctors are being wilfully ignorant about the dire effects of sleep deprivation on their patients – and themselves. After 13 years working in Nasa's fatigue management unit, a NZer returned home to become one of our few dedicated sleep researchers. The NZer agrees that knowledge among doctors and the public about sleep disorders and the dangerous effects of too little sleep is pitiful. It also complains of too few resources to adequately diagnose and treat sleep disorders, a view backed by the Green Lane specialist, whose waiting list is five to seven years. The specialist says doctors have little alternative to prescribing much-maligned sleeping pills, because there is no funding for therapists to assist the sleepless. Although scientists now agree sleep is essential to a healthy body and mind, they don't know why. Right now the only thing most of us know about sleep is what it feels like not to do it. Many of us mistakenly believe sleep is something the body imposes on the mind, rather than being an essential part of life the brain demands. We tend to exalt the likes of Thomas Edison who claimed to need only three or four hours sleep each night. The lesser known fact about Edison is that the inventor would fall asleep in board meetings the next day, often for five hours at a time. What is known is that the more you stray from your normal sleep requirement the more determined your brain becomes to put you to sleep even if it is at inconvenient moments like when you are driving, operating heavy machinery, or the chief executive is addressing staff on this year's budget round. Which is why tiredness is now not only thought to play a role in alcohol-related car crashes, but fatigue among crew and management has been accepted as the root cause behind the grounding of the Exxon Valdez in Alaska's Prince William Sound and the explosion of Nasa's Challenger spacecraft. In NZ, the Land Transport Safety Authority attributes 8% of fatal crashes and 5% of injury crashes to fatigue. It puts the social cost of death and injury on the roads caused by fatigue at \$200 million yearly. Even so, the LTSA thinks fatigue-related road crashes are under-reported in NZ because police aren't trained to recognise the signs of it – like a crash on a straight piece of road with no skid marks from one set of tyres, meaning that driver was probably asleep. The Traffic Accident Research Foundation is financing Wellington Medical School's sleep investigation centre to study the role of sleep disorders in traffic accidents. In the pilot study of 600 adults, 42% said they rarely or never get enough sleep. Half said they seldom or never wake feeling refreshed. Moderate daytime sleepiness affected 12% and 4% said they had a severe problem. Some of those will be suffering from one of the 80 or so sleep disorders now identified, and the list is growing. Not only are we sleeping less than our ancestors, but we are either working longer or at times our bodies say we should be asleep. Since the advent of the Employment Contracts Act, allowing for more flexible working hours, 25% of us now have contracts that allow for shift-work, a particular threat to a good night's sleep. Otago University professors are looking at the effects of longer and more flexible working hours on our sleep, and ultimately our health. The idea isn't to oppose flexible working hours, but to give us better information about the effect they have on us so we can manage our sleep better in response.'

... '*Body clock* You wake after a good night's sleep and start to climb out of bed. Take care! You're beginning the most dangerous time of your day. For the next 2 hours or so, you are 2-3 times more likely to suffer a heart attack or stroke than in the late evening, the safest cardiovascular time of day. According to a study headed by a US sleep physiologist, 6am to 10am is the average peak time for many other major causes of death. Until recently, doctors were taught that the human body lives in homeostasis, changing little during the day. The science of chronobiology – the study of how time affects life – is sparking a medical revolution by revealing how much our bodies change through circadian (daily) rhythms. The long-held belief that some of us are "larks," or morning people, and others are "owls," or evening people, has now been confirmed by measurements of circadian rhythms in morning and afternoon people.'

... 'People are pre-destined to being night-owls, jet-lag sufferers or afternoon dozers by maternal genes which set the human body clock even before a baby is born, French scientists suggest. Understanding exactly how the clock functions could help people working at nights, or after flying into different time zones.' In related news, **the number of people needing treatment for a potentially fatal sleep disorder in the Midland Health region... [-] estimated... at up to 2000... [-] far exceeds the available funding, says a specialist. The Greenlane Hospital sleep specialist... estimates that 99[%] of cases of obstructive sleep apnoea are undiagnosed, and says that once sufferers become aware they could get relief, health providers would not be able to keep up with demand... The illness causes their upper airways to narrow, constantly waking them up.**

... 'YOU are dozing on a tropical beach, cocktail in hand. The shine shines. The waves gently lap the shore. Then you wake up. Sorry – you're dreaming. And yes, you're back in the office, with a Tuesday morning hangover from the Monday morning blues. It's enough to make anyone

consider taking a day off. If you've been feeling like this you won't be surprised to learn you're not alone. Absenteeism is on the rise worldwide. A survey by the Industrial Society in Britain found absenteeism rates there had risen by 25% in the last [3] years. In the US unscheduled absenteeism rose an estimated 14% between 1992 and 1995. It continues to cost American business millions of dollars a year. Questionnaires and surveys that try to measure job satisfaction have found a strong link between dissatisfaction and absenteeism – that is, if you're unhappy at work you're more likely to take days off. So why, in this age of enlightened management policy, employee empowerment and workplace therapy, is it that we still feel inclined to take "mental health days?" More to the point, how come work is so damn depressing? The same surveys have an answer. Research finds only a weak link between job satisfaction and the type of job performed. It does not matter what kind of work you do, it's your surroundings that make the difference. So you could be a high powered lawyer or a postie – if your boss is crazy or your office is depressing you won't be happy. Environmental problems that cause that unhappiness can include problems with reward systems, work load, the quality of supervision and physical working conditions. There's no point adding money to this list of woes because it's confirmed by research that no one thinks they ever get paid enough... Then again, the fact that you're unhappy in your job could be your parents' fault. Some researchers believe job satisfaction may have a genetic component. Their conclusion is based on psychological studies of twins... Or it could be a generational thing. A recent survey of job satisfaction in the US for business magazine *Inc.* found most 18 to 34 year olds felt secure in their jobs and that their development was encouraged. But Generation X doesn't like to be too happy; of all age groups surveyed, this one was least likely to be "extremely satisfied" with their work.

...Monday, bloody Monday! The day is starting gloomily: it's cold and raining. Your bed has never felt so warm and cosy. There's nothing that urgently needs your presence at work today, so why not take a sickie? Most of us have done it and some make a habit of it. An A[US]n study showed that on any given day, 4[%] of the population will be taking a sickie. That's a lot of days off: 60 million a year in that country. Proportionately, N[Z]'s figures are likely to be similar... Surprisingly, very little research on absenteeism of the sickie type seems to have been done in N[Z]... Generally, representatives of employers, the Labour and Health Departments and Statistics N[Z] agreed that Mondayitis (or Fridayitis) was a problem, but... there was almost no facts available to indicate its extent... Some organisations seemed to accept Mondayitis as a matter of course. In summertime, perhaps when the fish are biting, there are some organisations where taking a Friday or Monday to extend the weekend appears to be quite common. If Mondayitis was not from that cause, said... [an] Associate Professor... of the Auckland University School of Medicine... then it was likely to be caused by excessive drinking. "It is a common pattern for alcoholics... to take Monday off work." ...A report on research by the Industrial Society in Britain shows that a third of managers there believe that more days off work are taken because of personal problems and Monday-morning blues than because of genuine illness... [But the] Society believes that managers can be blamed for Mondayitis because they have allowed job insecurity, longer working hours and increased workloads as a result of "downsizing" to increase stress levels. And many companies accepted, without trying to do anything about it, that some jobs are boring... Companies which have tried to do something about "voluntary absenteeism" have not always achieved the desired outcome. In some organisations, incentive payments to reduce the number of days taken off work resulted in increased absenteeism because people came to work even when they were really sick, spread the illness and caused others to take time off. In some cases, unlimited time off for sickness had the wrong result when workers, knowing that they could stay home for as long as they wanted, felt guilty about staying home and came to work sick rather than waiting until they are well[(in NZ, companies 'aren't obligated to pay new staff for sick days during their first 6 months – so many don't, so those workers go to work sick')]. Factors... shown to reduce the incidence of unjustified absenteeism include encouraging people to work in teams rather than as individuals, and giving workers control over their working environments.

...The German cabinet has agreed that Government employees who call in sick from work should receive home visits to check whether they really are ill. On average Government employees miss 17 days a year... • [I'm often asked by labour relations students how]... long must an employer carry a sick employee? Most managers are humane about staff members who become too ill to work for long periods, particularly if they're valuable to the company. But economic considerations clearly make it impossible to keep a seriously ailing employee on the payroll for an unreasonable period of time. However, as the recent case... [involving] Motor Machinists quickly established, employers abuse at their peril the correct procedures for laying off a sick staff member. A machinist had been off work for nine months after injuring a finger in a grinding machine. At the end of that time [the machinist] obtained a medical certificate which cleared him for a trial return to work. But before doing so, [the machinist] took some annual leave. Three days before the employee was due back at work, the company told [the machinist that it] was no longer wanted because, the employer explained, the... machinist's... dermatitis – ...which had caused the injury in the first place... – ...could flare up again... The[employer's]... relatively common... assum[ption] was, however, incorrect... Motor Machinists had... made the elementary mistake of not consulting a specialist medical opinion before ending the machinist's employment... The upshot was that the machinist won hands down a personal grievance case in the Employment Court, with compensation and costs... "There have been a number of recent cases where employees have been dismissed before they have been given the opportunity to present their own medical evidence, and they have been held to be unjustifiably dismissed," said... a... lawyer...

['Sick children are supposed to stay at home and many parents use up their sick days looking after them.' However, 'parents who can't afford to get time off work to care for sick children are sending them to kindergarten and school – making teachers and other children sick.' 'Each year 9 out of 10 NZers catch a cold and 50% get the flu – most catch it off each other']...

THE cold and flu season brings more than sniffles and sneezes to the workplace. It also brings resentment. Healthy employees in America are grumbling about sick workers who spread germs on the job. Those who are ill, however, say they feel too guilty to stay home. The tension is pitting worker against worker... [although, ironically, sick] employees are coming in because they don't want co-workers to shoulder extra burdens and don't want unfinished work to pile up. And fear of losing a job still lingers following massive job cuts earlier in the decade... Despite workers' fear, many employers say they don't want sick people at work. Some even balk at letting ill workers come in. "If someone comes in sick and plays the part of the martyr, we tell them to go," said... a president of First National Bank. First National employees earned one sick day per month and they are urged to use them... At some companies, sick days can be turned into cash if they're not used up by year's end. Also, many employers offer paid-time-off banks that lump sick, holiday and personal days into one group. Taking too many sick days can leave less time for a holiday.

...the Holidays Act 1981... sets out a minimum code for the number of holidays a worker is entitled to receive. In addition to annual holidays, every [NZ] worker is entitled to 11 statutory holidays on pay... This obligation to provide 11 paid statutory holidays is one of the most fundamental elements of the Holidays Act. A worker cannot be forced to work on one of these statutory holidays unless... [it] has agreed to so do in his or her employment contract. Some employment contracts provide that an employer has the right to require an employee to work on one of these holidays but even if the contract does contain such a provision, the employer is still bound to provide the worker with a paid pay off in lieu of the statutory day. This is so even if the worker is required to be at work only briefly on a statutory holiday: someone who works only 1 hour on Christmas Day will be entitled to a whole day on pay in lieu. For many years employers attempted to effectively buy their way out of the statutory holiday obligation by paying workers penal rates – double... or triple time – for working on a statutory holiday. [However, in] a case universally known as the Telecom decision, the Employment Court made it clear that even if the employer had paid a worker penal rates for working one of the statutory holidays, that worker was still entitled to a paid lieu day. If a worker works on a statutory holiday who decides when the lieu day is to be taken? Ideally the employer and worker should agree on the day but the Employment Court has said that if agreement cannot be reached the holiday should be taken at the convenience of the employee. Another contentious issue is the rate at which an employee is entitled to be paid for statutory and lieu days. Many employment contracts provide for payment on the basis of an hourly rate plus a number of allowances, for example, shift...

clothing... and meal allowances. Should the pay an employee receives for a lieu day include those allowances? The Employment Court has on two occasions said "yes". In *N[Z] Harbour Workers Limited v Lyttelton Port Company*... [the judge] held that a worker was entitled to be paid exactly the same amount as [it] would have earned had [it] actually worked the day... [But the] Court of Appeal took a somewhat different view in *Ports of Auckland* and held that "on pay" did not include overtime, bonuses or allowances which... depend... on actual working results. The problem with the Holidays Act is that it attempts to be all things to all people – to prescribe a minimum code which applies to full-time... part-time... casual... and shift-workers. The shortcomings and problems with the act were acknowledged in 1995 when the then Minister of Labour... announced a review of legislation... This "urgent need for review" prompted the minister to call for submissions which closed on May 22, 1995... [Unfortunately, the] legislation was not introduced before last year's general election and the review has been on hold since then... It seems certain that legislation reforming the Holidays Act will be introduced this year but we are unlikely to see any reform until 1998 at the earliest. [Meanwhile, the current Minister of Labour] has indicated that flexibility will be the key to any reform. [The minister] has said that the Government wants to make the act more flexible for everybody "so they can enjoy their holidays rather better than is possible at the moment." [The minister] has also said that there is absolutely no intention to reduce present statutory holidays but... believes that the way in which the holiday entitlements can be enjoyed by employees is a matter for reasonable negotiation. This focus on flexibility can only mean that the reformed Holidays Act will give employers and employees greater latitude in agreeing when holidays are to be taken and may well allow employers to buy their way out of providing statutory holidays.

...A Government sports funder is taking its leisure message to heart with extra... holidays in return for staff staying at work... longer each day. The Hillary Commission for Sport, Fitness and Leisure... [wants] staff to take five extra days' holiday as a reward for knocking off 10 minutes later or starting 10 minutes earlier than other public servants. The time off is added to statutory holidays and one day's annual leave to give a two-week break, from Christmas Day until January 8. This leaves them with three weeks and four days of normal annual leave to be taken in the year it falls. Most Government agencies close until January 5, forcing staff to dip into their annual leave entitlements between the statutory holidays... ■ N[Z] looks set to follow the US where the burgeoning employee leasing industry will soon take over as the biggest employer...

IN THE squawking tropics of Parrot Jungle and Gardens in Miami exists a thin slice of workplace revolution. Despite the noise, this upheaval is peculiarly quiet. But within 10 years, the 102 Parrot Jungle employees will be working for perhaps the largest private employer in the US, bigger than Wal-Mart or General Motors. The business is not chain stores or autos... [but] worker... leasing... Chances are many will be swept up by the upheaval, too, if they work for a company with fewer than 500 employees, and 70% of the [US] labour force does. Companies that lease workers are growing by such bounds that they will employ 37 million by 2007, up from 2.5m in 1995. Go to work for one and you will report to the same job at the same place and to the same manager. But you will have to resign your current employer. Your new employer of record – which keeps personnel files and has the ultimate authority to hire and fire – will be Staff Leasing, Administaff or another of the companies scrambling to establish itself in this new industry. Although it's best known as employee leasing, the industry now calls itself professional employer organisations (PEOs) in a bid to improve its image after a decade of fraud and bankruptcy. Don't confuse PEOs with temporary agencies. PEOs don't send over a few workers when things get busy[, or to fill in for staff who are sick or on annual leave]. PEOs permanently employ everyone at a... company from the president down. PEOs have been growing as fast as temporary agencies, more than 30% in employees and revenue a year, and there's little to threaten that pace. The potential market of companies with fewer than 500 employees is \$3 trillion, and only 2% so far has been captured. Why will so many go to work for PEO companies? Simply, it's because many small company owners are tired of being distracted with human resources headaches such as workers' compensation, family and medical leave laws and discrimination suits. Large companies combat it all with an army of lawyers, accountants and HR specialists. Small companies are deciding it's worth turning over their payrolls plus 14% to 30% and relinquishing ultimate control of their workers just to get it all off their backs. In many ways, it's levelling the playing field between small and large companies. Consider Parrot Jungle, a sort of Sea World with feathers, whose employees have been working for The Vincam Group since 1989. Vincam knows nothing about parrots. But with 28,000 other employees – up from 12,000 a year ago – Vincam knows that proper performance reviews are crucial when defending against wrongful termination suits. And that there are solvents used to clean bird cages that must be on a list of toxic materials or the company could be slapped with a \$11,000 fine... Such expertise does not come cheaply. Parrot Jungle's owner... turns over his annual \$2.3m payroll to Vincam, plus a fee of... \$440,000 a year. But [the owner] said it was worth it so [the owner] could focus on critical duties. Like getting cockatoos to bicycle along the high wire. There are things Vincam can afford to do for small companies that they would never dream to do on their own. It spends \$7.3m a year on technology and has a computer room dubbed "the spaghetti bowl" because of its complexity. It has a doctor and 40 nurses on staff, whose duties include training hotel maids to protect themselves from Aids and hepatitis... [Speaking of maids, w]here would the... British... country-house... be... without its simpering serving-wench... [o]r, indeed, the... frosty butler...? Britain has rediscovered servants. Over the past 10 years, according to Government figures, the fastest-growing category of consumer spending has been domestic service. In 1989, Britons spent the equivalent of £1.45 b... today on all kinds of home help. By 1995 this had more than doubled... As a share of total household expenditure, domestic service rose from 0.4[% to 0.9%]. The growth in income inequality is, presumably, partly responsible. The services of those at the bottom of the pile are more affordable to those at the top than they used to be. Growing labour mobility probably has something to do with it: Britain is flooded with young foreigners short on skills but eager for work. And at the other end of the age range, growing unemployment among older people means a supply of more mature, reliable types who find it hard to get jobs in companies. The steady increase in the proportion of [mums] working has also pushed up demand. Over half... with a child under 10 now work. Compared with most other European countries, Britain's state provides little nonschool child-care, leaving parents to buy it for themselves. Recruitment agencies such as Hutchinsons Domestic Staff... report a steady increase in demand at the top end of the servant range, save for a dip in the recession of the early 1990s. Hutchinsons provides live-in butlers, whose annual salary is about £18,000 and housekeepers, who earn about £16,000. But most of the rise in expenditure is not by the rich on old-fashioned, starch-collar service, but by middle-class, double-income families on part-time help. Child-minders, cleaners, gardeners, dog-walkers and a bustle of other helpers are taking over the domestic chores of Britain's exhausted couples. Plenty of the work is arranged informally and wages paid in cash, thus avoiding tax, but an increasing share of contracts go through agencies. Setting up an agency has become easy since licensing requirements were abolished two years ago. Some established firms complain that deregulation... let in fly-by-night operations funnelling illegal immigrants into exploitative contracts. Certainly, there have been a few horrible cases of Filipina maids imprisoned by employers; but most new agencies exemplify the steady professionalism of domestic-service jobs that has already made a clean sweep of office cleaning.

...[I]t may be one of the world's richest people but the Queen believes that by watching her pennies, her \$multi-million fortune will look after itself. Even her family are limited to a single, modest present apiece at Christmas, while her staff get a Christmas pudding worth a few dollars from the cheapest supplier. In fact, it isn't easy being one of her servants. The pay is so terrible, some have been forced to claim state benefits to support their families, while a 104-hour working week is normal. ● 'The state of California has used a draconian law to seize millions of dollars worth of assets belonging to Britons, including Her Majesty's Stationary Office. Legislation allows California to take possession of bank accounts, stocks and the contents of security deposit boxes if they are dormant for longer than three years. A court was told California's funds were swollen to the tune of US\$400 million a year from the sale of personal property. A federal judge has ordered a stop to the seizures until "reasonable" efforts to reunite owners with their assets were improved.'

...Demand for household servants is soaring in the US, particularly in New York and Silicon Valley, where the new rich are pining for butlers in the Jeeves mould as never before – causing demand for experienced butlers to exceed supply. With annual salaries for top butlers reaching \$US123,000, butler

schools are thriving, especially those teaching household management in its traditional form. Lessons include how to tip-toe around marital indiscretions, how not to look smarter than your employer, and how to organise dinner parties for a boss used to eating pizza straight from the box'.]

...WHY do people hate cleaning ovens? "Basically, because it's a dirty job," says [the operator] of Lovin' Ovens. "And it's something you can get away with for a long time. You can shut the oven door and nobody knows." When the shame becomes too great, it's time to call [the person] who drives a car with OVENS plates. [The operator] always asks her clients to spray their dirty ovens the night before, so that [it] doesn't have to inhale the chemicals. "Clients very rarely won't,"... says [the operator, who] usually charges \$40 for an oven that takes an hour and a half to clean. [The operator] once charged \$60 for an oven so disgustingly dirty that it required three cans of oven spray. Some clients expect to have more than their oven cleaned. "Some think you are going to pull the oven out from the wall and clean all around it. They almost expect you to clean the kitchen for them." Lovin' Ovens was started by [her] son-in-law when [it] was a university student. When [the son-in-law] became a teacher [his mother-in-law] was left "holding the baby." [The mother-in-law, who] cleans up to three ovens in a day... always wears rubber gloves and kneels on a rubber cushion – but still has permanent bruises on her knees... [-] believes that more people are turning to household services to help them cope with domestic chores. There are not many professional oven cleaners to lend a helping hand, however. "There have been a few people who have started up oven cleaning – but they haven't lasted... If you are a one-[perso]n band there are just so many ovens that you can do. And if you try and get people to help you – they just don't last." [Another Aucklander] pushes an iron for a living... [The] previously national distributions service manager for *Readers Digest*, w[ho] was made redundant last year after more than 20 years with the company... bought a master franchise for the Green Acres Ironing service... Although his mates snicker at his new job, [the former manager] is confident that [it] will have the last laugh. A [US] research puts lawn mowing first, ironing second and home cleaning third in the preferred household services stakes... Ironing is a household chore that many people detest. And his customers are always delighted to have the tedious task done for them. "It's always hanging over them... We wave a magic wand and free up time to do something else." ...[the master franchisee] charges \$30 for a bag of 15 items, which takes about an hour to iron... An ironing franchisee can expect to earn \$800 a week for 25 to 30 hours at the ironing board... [The former manager] hopes to have more than 30 franchisees ironing for customers all over Auckland's North Shore in the not-too-distant future. By then, [it] expects that his marketing, management and support role as master franchisee will keep him away from the ironing board. But [the master franchisee] will probably always end up with a few bags of ironing to do... [The master franchisee], who stands while [it] irons, keeps boredom at bay by listening to talk-back radio, or watching cricket and [the US queen of talk] on TV... THE weekly trip to the supermarket is inevitably boring. You park your car, grab a trolley and load it. You then unload it three times – at the check out, at the car and at home. If you're shopping for a family, the whole tedious exercise can take an hour or more. Grocery Express was started two years ago, to relieve householders of this relentless chore. [The owner] runs the business from her Mt Wellington home, with help from two employees in central Auckland and two more in Whangaparaoa. [The business] has 200 clients on [its] books, not all of them regular... Grocery Express charges \$15 for up to \$100 worth of groceries. Supermarket shopping is being trialled on the internet, but [the owner] is confident that her thriving business will not be affected. "...we offer personal service – and that is very important... Besides... [o]nly a small number of people work with the internet – and some elderly people can't even handle a fax machine,"...

[Children are bitten by snakes on rubber plantations in Malaysia, inhale pesticides picking coffee in Tanzania and are hurt on construction sites in Portugal, says the United Nations Children's Fund. "Hazardous child labour must be left behind, consigned to history as completely as those other forms of slavery that it so closely resembles," said the Unicef director. Calling for global action, Unicef said countries should provide schooling for all children, enforce international treaties they signed and immediately end "intolerable forms of child labour such as prostitution or bonded labour." Unicef's report on child labour around the world, which follows one on the same subject several months ago by the International Labour Organisation, contended that 250 million children between 5 to 14 years were working in conditions detrimental to their health. The report also sought to debunk myths that child labour was found only in poor nations, that it was inevitable in families of extreme poverty and that most children were employed in export industries that could be reformed through sanctions and boycotts. Mexican-American children work on farms in New York state, including fields wet with pesticides, and can be found in sweatshops of the US garment industry. In Britain, 15 to 26% of 11-year-olds and 36 to 66% of 15-year-olds are working. Nevertheless, most child labourers live in the developing world, half of them in Asia, where bonded labour is common. Children as young as 8 are pledged by their parents to factory owners or agents in exchange for very small loans. The report also criticised the World Bank and the International Monetary Fund programmes']...

An international conference on child labour ended on Thursday with delegates expressing guarded optimism that the worst forms of exploiting 250 million working children worldwide can be stopped. "Because the causes of child labour are complex, including poverty, social values and even cultural complacency, there can be no simple or single answers,"... the executive director of... Unicef... said. "But two things are obvious – first, that the exploitation of children in hazardous work is totally unacceptable, and second, that it can be stopped," [the executive director] told the final session of the two-day conference in Amsterdam. "Hazardous child labour is a betrayal of every child's rights as a human being and is an offence against our civilisation." The conference has focused on the most intolerable types of child labour – slavery, forced labour and the use of children in prostitution, pornography and drug trafficking. It called for an immediate end to such practices and hoped that discussions between the 200 government ministers, union leaders and children's representatives present would help to lay the groundwork for a worldwide ban. Delegates said this could now happen because of changed attitudes. [A delegate from] the... ILO... said: "Those of us who remember what the situation was like a decade ago, remember a few individual voices crying in the wilderness. But now the issue has jumped to the top of the international agenda. I think it can be stated that the battle against child labour is being won." International action has been complicated by fears among developing countries that it may undermine their main trading advantage – cheap labour. The Indian Minister of Labour... said: "Parents send children away to work instead of sending them to school not because they want it, but because there is no option or alternative for their biological survival." But [the Unicef executive director] said improved access to education was one of the keys to solving the problem of child labour.

...Experts on child labour have begun a four-day international conference hoping to create a global strategy against the exploitation and abuse of... children. The Oslo conference – arranged by the Norwegian Government together with the... ILO... and... Unicef... – aims to provide an outline for legislation, education, social measures and development to fight child labour. According to ILO figures, 250 million children between the ages of five and 14-years-old are working, with about half in full-time employment... [The] director at the division of evaluation, planning and policy at Unicef, said, however, that the estimates of the numbers were "just the tip of the iceberg." ...The proportion of child workers under the age of 10 years could be up to 20[%] in some countries... Many instances of child labour occurred in "invisible settings" such as back-alley sweat shops, in prostitution or in domestic service for parents or guardians... –[and] the problem is spread across the globe... [A delegate from the ILO] said the Geneva-based organisation wanted to see a complete ban against children working under 12 years of age and for special protection for girls from being exploited... The conference, a follow-up to a similar meeting in Amsterdam... has attracted around 350 delegates from 35 countries and around 100 organisations. [The Unicef evaluation, planning and policy director] said acknowledgment of the problem of child labour was growing both at the Government and family level, although it would take many years and resources to eradicate. - 1997

A leading human rights group is accusing the U[S] of violating international standards on child labour by allowing minors – the vast majority Latinos – to work gruelling hours in the fields at the expense of their education, their health and other basic human standards. In a report entitled *Fingers to the Bone: U[S] Failure to Protect Child Farmworkers*, Human Rights Watch says hundreds of thousands of minors across the country are working days of 14 hours or more, often for well under the legal minimum wage, and are being exposed to highly toxic pesticides and running

serious risk of illness and injury from heavy equipment and sharp instruments. "In the fields, the U[S] is like a developing country," says the report's author... Under the Fair Labor Standards Act of 1938, agricultural workers are exempt from the age restrictions that apply to almost every other sector of the economy. Although US politicians have lobbied in support of a far-reaching international treaty to outlaw abuses of child labour, the US itself is not in compliance with the treaty, H[RW] alleges. "A 12-year-old kid can work unlimited hours on a farm, but isn't allowed to work in a fast-food restaurant... There's no good reason to have such a double standard." The report, based largely on extensive interviews with teenage farm workers in Arizona and research in other western states, showed that the problem is countrywide... The report urged the US Government to close the labour standards loophole and severely restrict the rights of farmers to employ minors. [The author] acknowledged that it was often low pay and poor conditions endured by parents that pushed them into sending their children out into the fields, and that some farmworkers would therefore oppose a ban on child labour. The report included graphic testimony from melon and cotton pickers, and from one 15-year-old girl trapped in a cherry packing factory in Washington state during a carbon monoxide leak. "This girl who was working by us fainted," the girl... is quoted as saying. "A couple of hours later another girl fainted... After her a bunch of people were fainting. The manager told us to keep working, wouldn't let us leave... These kids were jumping on the doors to tear the tape off [and] open the doors so we could get outside."

...[yesterday] a New Lynn clothing business[person]... was found to have recruited sewing machinists from Thailand, fabricated time and wage records and forbidden workers to leave the premises even while off duty... [The businessperson] who ran a sweatshop factory forcing [the]Thai immigrants to work 14 hours a day, six days a week has been personally fined \$24,000. The money must go to the six workers. But they will not get almost \$300,000 in back pay. An employment tribunal judgment... confirmed that [the businessperson] underpaid her staff by \$295,000 but those arrears could not be pursued because of bankruptcy... The raid on [the businessperson]'s... home and factory in May last year was at the time dismissed by her and her husband as departmental prejudice against Asian workers... The tribunal said that i[t]... was difficult to imagine a more serious infringement of the rights of employees... In the judgment, published in this month's Employment Cases Summary, the tribunal found [that the businessperson] had "deliberately, systematically and persistently breached the minimum standards set by... the Minimum Wage Act 1983..."

...THE Government has given the lowest paid workers and young people a... pay rise to come next year. The adult minimum wage goes up 2[%] from March 5 to \$7.70 an hour, and the age of eligibility drops from 20 to 18 years. The minimum youth wage for those aged 16 and 17 also rises to 80[%] of the adult minimum over two years... [The] Youth Affairs Minister... says the rate increases match the average wage rises of the past year... But [the]National Distributors Union secretary... says the wage rise doesn't go far enough. "The adult minimum wage should be at least \$8.10 to \$8.80 an hour to reflect the rise in average wage over the past eight years... The minimum rate has slowly declined as wages have risen and until now successive Governments have done nothing about it." In other changes, employers will no longer be able to claim an exemption from paying minimum wage rates to employees training on the job for certain qualifications. They will have to pay a training minimum wage at the youth rate.

...THE government is to unveil a new initiative to give lower income N[Z]ers skills to find new jobs. Fresh Start will be launched next month to bridge the gap between the rich and poor. Speaking exclusively to *Sunday News*, [the PM]... said: "When 56[%] of employers say it is difficult getting staff, there is obviously a skills shortage – and that is crazy... We want to foster a dynamic relationship between industry, polytechnics and government. If business says 'we want more of that' then we have to help them,"... [U]nder Fresh Start... employers... will [be surveyed]... to find out the skills they require in prospective workers. [The government] will then start training courses at polytechnics to provide those skills... [By the way.] Treasury researchers... say... [t]he popular belief that N[Z] has suffered from a long-term "brain-drain" is wrong... Instead, N[Z] has experienced a "brain exchange" with the rest of the world in the past 40 years, with the skill levels of arrivals at least matching those leaving.

...N[Z] is in danger of losing the worldwide race for skilled workers. There is a global scramble to attract people with the skills vital to a modern economy – the European Union alone estimates it will be 1.7 million qualified workers short by 2003 – and the signs are that N[Z] is falling behind. The quarterly surveys of business opinion by the N[Z] Institute of Economic Research show a sharp increase in the number of firms reporting difficulties attracting skilled staff in the past six months. More than 40[%] now identify it as a problem... The Auckland and Wellington Chambers of Commerce also say members report increasing difficulty getting skilled staff... Lack of skilled staff is also seen as making N[Z] less attractive as a place to invest... Although IT is the most talked-about area, the shortages are developing right across the economy from traditionally high-tech areas like health – Auckland Healthcare had to cut back cancer treatments this month because of a chronic shortage of radiation staff – to more physical occupations, such as forestry. The causes are complex and the subject of frequent debate. But they include a mixture of rising demand for specialist skills, low levels of unemployment, skilled people seeking higher pay overseas, a mismatch between what the education system turns out and what business needs, and the ageing population (which means a smaller pool of workers).

...Sixtieth birthdays might replace 21sts as the [21st] century's rite of social passage if worldwide... ageing... trends... continue... [Incidentally, as of today] 65 years is no longer the compulsory retirement age and companies now have to treat their aging workers pretty much like anyone else...

Age shall not weary or even retire them A company whose job specifications require staff to run the length of the factory... at the rate of 100m in 15 seconds, climb 20m walls or lift 100kg lead ingots might be able to compulsorily pension off its 65-year-old workers. Otherwise... age no longer exists in employment terms... The new law is an example of employment legislation catching up with the fact. For the past 50 years... many workers aged 60 or over have been able to offer experience *and* fitness but have been pensioned off on the mistaken assumption that older employees get physically past it. However, [although the 'human brain starts to shrink from age 40 (affecting short-term memory)'], a wealth of research in the past 25 years, particularly through [US] agencies such as the National Council for Ageing, has shown fairly conclusively that the link between age and performance has been greatly exaggerated. For human resource purposes, however, the issue is deeper than compulsory retirement. If staff exercise their entitlement and stay on longer, employers will have to... introduce performance management techniques to see how everybody shapes up, not just the sexagenarians. There are three exceptions to the new law... • Government departments can still require employees to retire at any age, at least until the end of this year when they fall into line with other employers. • Contracts written after April 1992, where employees agreed to retire at a certain age, can still be enforced. • ...jobs where there is a "genuine occupational requirement" to be a certain age can exclude oldies. But... this test is very strict and will be difficult for most employers to satisfy. Having said that, don't expect a boom in 75-year-old piano movers.

...A[US]ns are being encouraged to put their retirement dreams on hold and keep on working for the good of the country. Although the experts say an ageing population is not a crisis, A[US]ns should be encouraged to stay in the workforce beyond 65 to reduce the growing costs of caring for the elderly. A Productivity Commission report released yesterday... said working more productively to generate higher incomes to improve retirement savings would enhance the quality of life for older A[US]ns and relieve pressure on the Government purse... "The A[US]n worker [except for those at very high incomes] has an incentive to retire early, live off superannuation savings and then claim an unreduced age pension at age 65,"... a senior economist with the World Bank, wrote in [a]report Policy Implications of the Ageing of A[US's] Population. The economist]... dismissed concerns that people working longer would increase unemployment among younger workers...

Paid work past about age 45 is vanishing fast. This change of the past 20 years has been huge and relentless, touches all levels of society, spreads right across the [First W]orld and shows few signs of halting, let alone reversing. And if present trends continue, then within a decade a third of all [NZ guys] in their later 40s will be "retired" (without significant prospects of getting paid work again) and half... by their mid-50s. Even fewer [gals] will have substantial paid work – perhaps 40[%] by their mid-50s. Consider just how deeply we are already into this "post-war world." Until the 1970s, 96 in every 100 [guys] had full-time paid work through from their 20s to their early 50s: only then did employment fall off. Using data from the... census, in which full-time work is 20 or more hours a week, we find that by 1996 the proportion of [guys] in full-time work was... 77[%]

for those in their later 40s, 65[%] in their later 50s and 40[%] in their early 60s. Only a few per cent more had some part-time work. Moreover, each successive birth cohort now begins paid work... later in life, reaches its employment peak at a lower and earlier point and sees its work fall off sooner and faster than for any predecessors... The nature and quality of the shrinking work are changing also. More and more of it after age 45 is self-employment, much of it uncertain, insecure and low-paying... International studies suggest the important explanations for the trends are not poor health (today's middle-aged are healthier than ever), mandatory retirement laws (most people finish work long before any compulsory retirement age), state pension age (again, most "retire" long before reaching this), or employment in the public or private sector (both drop older workers equally readily). More unexpected – and unwelcome perhaps – is that overall economic performance matters little either. Booming and stumbling economies alike have for 20 years been shedding their mature employees, as "jobless growth" policy takes hold. Several key forces are at work. First, automation, or the computer revolution, which helps to do away with many routine procedures or lets them move to cheaper places and people. Secondly, the blind drive of global capital for short-term "efficiencies," which leads to retaining as few staff as possible and as young, pliant, insecure and cheap as is possible. For many, it leads to an unpleasant, pressured workplace which we want to leave when we can. Thirdly, the disappearance of much manufacturing from [First World] economies and with it large numbers of better-paying jobs once dominated by the middle-aged. Fourthly comes attitudes, or the (questionable) belief that older workers are more expensive, slower, less enterprising, adaptable or retrainable than younger ones. Fifthly, and easy to overlook, is life-style choice, or a rising "culture of leisure" – the expectation among the middle-aged of an extended period free of work while still physically vigorous. All this is likely to intensify in the next few years, for the middle-aged are the fastest-growing segment of the population... The implications are enormous – for individuals, families, workplaces, public services, personal and collective retirement savings, taxes to support an ageing population and much more. Yet ordinary citizens and policy-makers alike remain in denial about the changes facing us. We blame individuals for their joblessness in mid-life, and urge them to retrain as if jobs will be there for all who do so. We... muse on raising retirement pension age next century to 70 or beyond, as though this will somehow make jobs available and so "solve" the problems of an ageing population... The London-based Future Foundation goes much further, predicting children born in the next decade will retire at 80... And we kid ourselves that economic growth will deliver full jobs for all. It will not happen: large-scale, later-life joblessness is here to stay, and it is time to debate some difficult matters. Do we care if some people past 45 have jobs... and most do not...? If we don't, then how are we to find income for the many without earnings. Or don't we bother? If we do care, then how might we bring about a different sharing of work so that older workers stay on? Through "elder-friendly workplaces," part-time work, job-sharing, flexible hours to allow for parenting duties, more holiday breaks, extra retraining budgets? Through subsidies for employers to take on those past 45 – or regulations enforcing it...? ...Perhaps we could be more visionary and abandon the idea that work for pay is normal and good and proper, welcome the release from the drudgery of it all, embrace a working life totalling 25 years or less and enrich personal and community lives through the resources and time thus freed? ...[By the way, NZ's] growing army of part-time workers, which stands at 420,000 now, accounts for almost one in every four members of the permanent workforce. A Household Labour Force Survey shows that this revolution in work patterns is showing no signs of abating. In the [past] year... the permanent part-time labour force grew 30,000, or 7.7[%], while full-time employment fell 19,000, or 1.4[%] (this figure might not take into account the fact that, because of the 'downturn in the economy, some NZ manufacturers have been forced to cut hours to a 4-day week to avoid redundancies'; note that the)... 35-hour week, the innovation that earned French workers scorn and envy around the world, seems destined to fade away as France grapples with a sagging economy and stubbornly high unemployment... It was only this increase in part-time work that enabled the Government to claim there had been an increase in the permanent workforce over the past year. Labour market flexibility was a key policy objective of the controversial Employment Contracts Act... Part-timers covered by collective agreements have access to the same rights and protections as full-time workers, such as sick leave and holiday entitlements. What worries people like... the director of the Centre for Labour Studies at Auckland University and... [the] national secretary of the Service and Food Workers Union, are the part-timers and casuals who are not in any collective agreement. "The feature of the hospitality industry," says [the unionist], "is part-time and casual work, and generally there are no collective contracts for workers other than those in large accommodation hotels and the odd pub. Mostly they're on individual contracts." The national secretary of the National Distribution Union... agrees. "We don't negotiate all the contracts for workers in this industry. There are some employers who refuse to let the union on site. I'm sure there are some pretty dodgy arrangements out there." One of her concerns is the development of employers offering part-timers extra work on a casual basis... [Another concern is her belief that] the growth in part-time work disguises significant underemployment, "where there are people who would happily have a full-time job but there isn't one so they're maybe working a 30-hour week and scrambling around looking for extra hours..." Household Labour Force Survey figures tend to bear out these claims... Between March 1987 and March [this year], the proportion of part-time workers wanting more hours increased from 11.6[%] to 29.8[%]... However, these figures need to be put into perspective. While nearly 30[%] wanted more work, only 6.8[%] of the part-timers actually wanted a full-time job.

...More of us now have part-time work. Those working less than 30 hours a week jumped 24.5[%] this decade. Fulltime employment grew about a third less at 7.9[%]... 1.74 million of us are in work – 80[%] of us toil for someone else. About 7[%] will be employers, 12[%]... opt for self-employment and just under 1[%] of us... work for a family business. There is still a city-sized crowd of us officially looking for work. In September 128,000 were unemployed. At December 10, 895,050 of us, including superannuitants, were on some sort of benefit... About 5500 N[Z]ers are neither workers nor beneficiaries. They are the ones now residing at Her Majesty's pleasure in one of the country's 17 prisons. They probably wish they weren't there; but then, a growing number of N[Z]ers outside the walls and wire of the country's lockups wish they were not in N[Z] at all. In the year to October, 68,261 of us left our country, either permanently or long-term... The bulk, nearly 33,000, jumped the ditch to A[US]. But we seem prepared to move to just about anywhere, including, for one person this year, a place called Andorra... We hope it was worth it... About 1.1 million N[Z]ers are enrolled in educational institutions of one kind or another, from kindergartens to universities.

...*Future not so bright for most universities...* There is something about a document called "Bright Future – Five Steps Forward" which calls to mind a visit I paid to Communist China in 1978. At that time, the only splashes of colour to be seen throughout China were huge billboards bearing red Chinese characters proclaiming the great virtues of the "four modernisations." Like the Chinese Government of that era, our Government seems to have an almost superstitious faith in the power of slogans – particularly slogans containing numbers. Unfortunately, as the Chinese Communists discovered, slogans are not enough. That is not to say that "Bright Future" is not a significant step forward. It is not so long ago... we were assured at every turn that government had no role to play and... it was up to market forces to produce the right answers. Now – perhaps a visit or two to Ireland or Finland later and faced with the truth about our own economic performance – we are suddenly told that government does have a responsibility. This is a welcome change of heart. Welcome, too, is the channelling of more resources into higher education – particularly the scholarships to encourage research – though the sums involved are pretty small. And who could quarrel with Bright Future's insistence that our future depends on how well we educate ourselves at the highest level? ...there is scarcely a government anywhere in the world that would not subscribe to the same fine sentiments... Unfortunately, [what]... matters is not what governments say but what they do. What the Government has done in N[Z] over the past decade or so is somewhat at variance with the language of Bright Future. Funding per student has fallen so sharply and fees have risen so steeply that the deterrent effect on the numbers going to university is now unmistakable. But it is not only numbers which have been affected. It is quality as well. An A[US]n graduate will have had 50[%] more spent on his or her university education than a N[Z] graduate will have had. N[Z] universities might use their resources more efficiently (as I, the... vice-chancellor at the University of Waikato... believe they do) but a disparity in resources of this size must affect quality. There are already worrying signs that a growing number of students at both

undergraduate and graduate level cross the Tasman for what they perceive as a better and cheaper education. The brave words of Bright Future must be set alongside this reality. Even more worrying is the gloss on Bright Future provided by [the Minister for Enterprise and Commerce] in a radio interview. [The minister] envisaged that just two or three elite research universities would carry the responsibility for the nation's research effort. The first point to grasp about this suggestion is that a university which is not funded to carry out research, and which therefore does not do so, cannot claim the status of a university in the international academic community. [The minister]'s bright idea is really a prescription for just two or three universities for the whole of N[Z] – a country which is not manifestly overprovided with university education... It doesn't take a genius to twig that when "two or three" centres are proposed the bureaucratic mind thinks immediately of Auckland, Wellington and the South Island... This further narrowing of an already dangerously narrow research base would be exactly the wrong remedy for our ills... Bright Future is full of praise for innovation, but the strategy is essentially risk-averse. It suggests that research will be funded only for known and prescribed outcomes. This is to fly in the face of all that we know about the essence of scholarship and research – that it is a voyage of discovery whose most valuable outcomes are often the least expected. This is the seminal idea which has underpinned so much of human progress over the past half-millennium... Bright Future means a welcome change from a direction which was heading nowhere, but more work is still needed on the best way forward.

...Auckland University is... striking up an alliance with its polytechnic neighbour, the Auckland Institute of Technology. The two voted last night to become partners in an agreement ostensibly designed to offer students the best possible tertiary education... [-] students... from one institution would have easier access to the other... qualify more readily for academic credits... and... notice more choice in study programmes... But papers obtained by the N[Z] *Herald* show that Auckland University's main motivation is to protect its status and market share from rival tertiary providers. The papers, outlining a regional strategy, said Auckland University could not sit back and watch AIT win university status and become a competitor – on its own, or with another tertiary provider... [(i)t is possible that other tertiary providers will join the group[-] Manukau Institute of Technology already has alliance status with Auckland University, while Northland Polytechnic has established relationships with both members of the alliance[])... The only other option was to downsize and become an "elite" institution, but that was too risky. Within a year there could be more than six universities in Auckland: Massey's Albany campus, Waikato's expansion plans for South Auckland, Otago University's move into Auckland, and AIT and Unitec's drive for university status. Global universities could offer long-distance learning. Other problems were inner-city traffic and parking hassles that made suburban campuses more attractive to students... The alliance is not a merger, or legal partnership, and both institutions will retain their identity and autonomy. However, they want to see one council run both institutions in the future. Meanwhile, the university vice-chancellor... will head a new board with power to make recommendations to the councils of both institutions.

...*'Getting noticed' secret of success...* The secret to promotion is getting yourself noticed by the decision-makers, even if you are not the most qualified candidate, says a networking specialist. In Wellington this week... [the AUS]n professional speaker with a background in sales, telemarketing and hospitality, said shunning self-promotion was a N[Z] weakness, and a part of our culture. [The AUS]n believed employees should make an effort to go to work functions to get noticed – go early and leave late – and try good old-fashioned flattery with their bosses. "The higher up the ladder you go, the less positive feedback you get... You have to realise that everyone, if they are at the top of the tree or the bottom... likes to get recognition." Making the effort to get yourself noticed would pay dividends. "I have observed that the people who get opportunities these days, the jobs, or the promotions, are not necessarily the most qualified... They are the people who are most visible..." ...N[Z]ers were very entrepreneurial and innovative, and networking could provide strategic alliances for both groups. "It's not who you know, but who knows you..."

...YOU'RE a good worker and enjoy your workmates. Then you get a promotion to supervisor and find yourself on the other side. How do you cope? Do you come down hard to show you're boss? Do you turn a blind eye to negative behaviour because you still want to be one of the gang? Such dilemmas are common, says [a trainer] of Training Matters[who] runs one-day introductory supervision programmes for the Auckland Chamber of Commerce, which focus on people management, covering assertiveness, conflict management, delegation, and influencing skills. But the starting point is relationship strategies. "We are motivated by different things, so each person needs to be handled differently. It is very important to know the person you manage..." New supervisors may have been... chosen for their people skills rather than technical nous... [The] organisational development manager of Ecopine, a CHH business unit, says traditionally supervisors weren't expected to have people skills and some staff struggle with the idea it's necessary. But a good supervisor needs knowledge of the job, coaching and mentoring skills, the ability to get staff behind them, and deliver results... Time management and prioritising are also biggies... Such practical skills are also important because many supervisors feel they're drowning under their work load... "They have to learn to let go. The problem is that sometimes people are identified as having potential, but they're not taught how to supervise." ■ The... Auckland... [who set up the new Internet] site, Staffyourself.com... is among those who have abandoned th[e old]... recruitment sector... model... [in which] a commission is often collected based on the appointee's first-year salary... [H]is... is a database-driven site in which jobs or resumes are posted free. Every four hours the database churns over, matching skill sets to positions and sending employers a shortlist of potential matches... Staffyourself.com also sends out fortnightly e-mail bulletins of what is happening in various industries, so people don't have to keep going back to the site for updates. The e-mails also act as a reminder for people to adjust the database if their skills or circumstances change... It is at the next stage [that the Auckland]... and his partner... hope to make money. While employers are sent brief descriptions of the likely candidates, to get the full cv from the secure database they need to subscribe – \$50 a month or \$250 a year – and then pay a \$10 transfer fee for each cv requested... A dozen employers are using the service already, including a major telecommunications company, a car retailer and a bank, and [the Auckland] is talking to other banks and retail chains... More than 200 job-seekers have registered, despite a minimal advertising budget, and about 40 have found work.

...Several people are sitting in a small reception area, nervously clutching resumes as they wait for a job interview. Time passes. Some of the applicants check their watches. Others drum their fingers. All but two leave in frustration as it becomes obvious nobody is coming to talk to them. One of those left, a young [guy], turns to the old [guy] sitting next to him and asks: "Are you here for the cheese-maker's job?" "No," is the reply. "I hire the cheese-makers." Guess who gets the job? This probably sounds familiar. It was a television advertisement for Mainland Cheese, and it also illustrates values at work in business. The young [guy] got the job not because [it] was necessarily the most knowledgeable or experienced, but because [it] shared the company's value of patience. Values will never entirely eclipse qualifications in such professions as law and medicine, but employers of all sizes are increasingly looking beyond the curriculum vitae and into the soul of a prospective employee... A [recent] survey... found that employers rated reliability, motivation... [c]onfidence... and teamwork higher than... [e]mployment history... qualifications and training.

...WHATEVER happened to employability? A much-banded concept early this decade, employability was meant to sum up the brave new employment deal. Instead of a job for life – impossible to promise in today's competitive conditions – employers would provide committed employees with self-development incentives, "ensuring" them of a job with a different company when the old one disappeared. Job security was dead – but long live employment security. With rare exceptions, the concept has been slow to materialise. "...employability was viewed as a radical shift, but in retrospect it has been honoured more in the breach than the observance," says... [the] principal author of a report titled *Employability: Bridging the Gap between Rhetoric and Reality*. It was commissioned by the Confederation of British Industry, the English Trade Union Congress, the British Government and several leading companies. Many employers, particularly in the private sector... quietly jettisoned the idea of employability. This says a lot about modern management. In essence, employability was an attempt to salvage something from the wreck of the downsizing epidemic of the late 80s. Having stripped out a whole layer of administrative and middle management jobs – 600,000 in the U[S] alone – companies suddenly found that their cost-cutting efforts had resulted in huge hidden costs. Overstretched and demoralised, many organisations

found themselves psychologically paralysed. To remotivate disaffected survivors, companies needed to replace the previous fractured contract with a new deal – and fast. Employability seemed to fit the bill. In place of the paternalistic and dependent employment relationship of the past, it proposed a more equal adult one. By equipping employees with marketable skills, the theory ran, companies were effectively making them independent. To keep them loyal and to prevent them from exercising their new-found marketability, they would have to be given challenging, fulfilling jobs... they really wanted to do. Everyone would gain. In practice[... over a third of surveyed companies]... say... employees lack necessary skills and attributes, particularly in the areas of resilience and ability, to cope with change. This is a kind of catch-22. As the report says, “The skills and attributes that individuals need to cope with the emotional insecurity associated with the concept of employability are not there in many organisations. Yet... these are the very attributes that employability is meant to provide.” Part of the trouble is that managers have consistently misunderstood the scope of what they are attempting to do, overestimated their capacity to do it, and underestimated the cynicism their behaviour would cause. Downsizing and delayering... made the task more difficult. The process involved getting rid of many coaches and mentors who were subsequently found to be most needed, and it increased time pressures on remaining managers. “Senior managers have been reported as following the time-honoured practice of change management, oversimplifying the past, over-exaggerating the present and over-romanticising the future... The language of change management promised far more than could be delivered in the climate of globalisation.” In particular, 95[%] of companies lack the leadership to motivate people in a climate of rapid change. And that holds at all levels. If anything, the report plays down the vast employee cynicism that exists and the difficulty of making further progress on the new agenda... This is confirmed by a survey for the British Joseph Rowntree Foundation. It... found that even though unemployment is low and the economy is growing, employees are much more concerned about redundancy than they used to be – a feeling reinforced by a very marked lack of trust between staff and bosses. The failure of companies to deliver on employability... is now coming back to bite those companies where it hurts. As the labour market tightens, employees in high demand are in the driving seat – and after the lean years of downsizing they’re making the most of it. Managers are discovering that the market-based approach to employment – giving workers shorter contracts – works both ways. Even Silicon Valley bosses, themselves a product of the world’s premier job-hopping culture, are beginning to worry about lack of employee loyalty... So though the word employability has disappeared, the need for a career-resilient workforce still stands. Much will depend on the ability of leaders and human resources departments to understand and harness the forces of motivation.

...Staff turnover in N[Z] companies is generally “way too high”, says an international study issued yesterday. The survey found that turnover in the local tourism industry is frequently above the internationally recognised danger level of 15[%] a year. The figures come from recruitment giant TMP Worldwide’s six-monthly Job Index Survey... It offers the most up-to-date picture of how often N[Z]ers change their jobs... Overall, 39[%] of surveyed companies admitted losing between 6... and 15[%] of staff every year. Turnover of between 16... and 51[%] plus was reported by 19[%] of businesses. In addition, 7.6[%] of companies surveyed had not measured their staff movement at all... [T]urnover figures incorporated redundancies, which had risen in some international companies with N[Z] headquarters in Auckland as the global shakedown of large corporations continued. The larger centres probably also had more job opportunities, making it easier for people to job hop... TMP[’s] strategy director... said higher turnover was expected in industries employing large numbers of unskilled and younger people, as in parts of the tourism, service and hospitality sectors... Of the tourism businesses surveyed, 37[%] reported annual staff turnover above 15[%]. In the health sector... a third of companies lost more than 15[%] of their staff a year. In IT, advertising and marketing, nearly a quarter of companies reported staff turnover above that level... [Other i]ndustries with turnover above 15[% are]... Financial services... Telecomms... Media... Government... Food... Legal...

N[Z]ers love to shop and we have the sales assistants to prove it. A snapshot of life in N[Z from the] last... Census reveals that “sales assistants” outnumber all other occupational categories. The 85,530 total is around 30,000 more than the number of general clerks (55,311) and nearly twice as many as the 43,077 general managers... [The remainder of the m]ost common 10 occupations... [were:] Cleaner 32,724... Retail manager 29,121... Primary school teacher 27,522... Secretary 26,484... Dairy farmers and workers 26,331... Crop and livestock farmers and workers 25,920... Registered nurse 25,272... [The l]east common 10 occupations [were:] Paste-up artist 6... Basket and wicker worker 18... Nondestructive testing technician 30... Filtering and separating equipment operator 33... Nonmetallic mineral products kiln or furnace operator 42... Sugar processor and refiner 42... Metallurgist 45... Distillery worker 45... Straddle-truck operator 45... Tobacco product process worker 48...

Pulling the strings Is the resourceful DIY Kiwi becoming an endangered species? [I ask this because] so many people are making it their business to make our personal decisions... Both the demand and supply of personal advisers is growing, and quickly: life or stress coaches, career counsellors, financial advisers, household managers, space organisers, wardrobe planners, performance coaches... there’s a myriad of small businesses cropping up to help you help yourself. What do they all do, you ask? Let’s take a few examples. A space-organiser... will come to you, say, if your office or kitchen is [in] chaos or if you are panicked about moving house. In the course of a three or four-hour consultation (\$250-300) [the space-organiser] will give you a “diagnosis” of your problem and help you to design a system to cut through the clutter. [It will also] bring in tradespeople, order your files, even borrow paintings to make sure you’re comfortable in your space. Next, to make sure you’re looking as good as your newly streamlined house or office, you’ll need an image consultant... Now you’re looking good. But are you thinking straight? Time for the life coach to help you change your job, your goals, or maybe your attitude... While there’s no way of knowing how many N[Z]ers are paying for some kind of personal development or advice, the anecdotal evidence is that it’s rising quickly and... [the people] who use s[uch] services... tend to be cash-rich and time-poor, aged 30 or 40... Less than a generation ago, such services would not only have been rarer than excess pounds on a personal trainer, they would have been scoffed at. It’s all American mumbo-jumbo, dad would have grumbled... But there’s a muddle of paradoxes here: people seeking to simplify their lives by hiring more people and seeking more information; adding another appointment to their list of commitments because they’re so busy; bringing in a stranger to gain more control over their own life. To extend [a British author]’s thesis, they buy further into the ergonarchy as a means of fending it off... – “the ergonarchy: rule by a work ethic closely entwined with a consuming duty.” Writing in the *New Statesman*, [the author] argues: “Where once we worked in order to make things, and thus keep warm and fed, now we work in order to earn, and earn in order to spend in order to work. We live longer and healthier lives, but not necessarily in tranquillity and contentment.”

...Doll creator’s career doesn’t seem like work... [Her] job is all about “playful spontaneity”... The Te Henga resident... spends her time making dolls and dressing them up to look pretty or handsome... – each with a unique appearance. “They don’t seem to have a point, but people seem to love them,”... says[the person who] has been making dolls for 10 years and was pleased to discover [it] could turn her hobby into a career... [The Te Henga resident, who estimates it] has made a few hundred dolls, many of which have won national awards... creates all her dolls... and spends up to a month on each. A lot of time is spent making sure the designs are foolproof[because the doll-maker]... also teaches people in classes throughout the world, and over the internet, how to do the same. “It seems to attract weavers, knitters, painters, dress makers and quiltmakers. A lot of people can’t sew. They just like making silly people,” says the mother of two. “Some days I think this can’t be work – I’m having too much fun,”...

If the prospect of another day at work is depressing, some consolation comes from scientists, who have found that sad workers make better employees. Overturning years of popular belief that happy workers are the best workers, the finding could spell an end to the corporate culture of treating workers well to ensure they are productive... [P]sychologists at the University of Alberta in Canada, found sad people made fewer mistakes and devoted more energy to their work than their happier colleagues. This is because happy people devoted a considerable amount of their energy and attention to maintaining their cheerfulness, [one psychologist] said. “The happy workers were more likely to think of their work as something that might damage their happy mood. But sad people devote more energy to their work in order to distract themselves from their sad feelings.”

...I live in an area considered to be family-oriented and affluent – there are nice houses, boats and... cars, and the residents have holiday houses, overseas trips and... [kids] in private schools. Therefore I can't help wondering why the wives complain about their lot and talk about returning to the workforce "for something to do"... I take my carless neighbours shopping and do voluntary work, which I enjoy. Surely these bored housewives could do likewise for the less fortunate, and let someone else work who needs the income. Perhaps then they will realise just how lucky they are.

...[a] Tauranga couple... are happy their intellectually handicapped son... aged 27, can come home at last. The[y]... have won a long battle with "the system" to win a precedent-setting ruling by the independent Complaints Review Tribunal that they can apply for the paid position of caregivers... With three school-aged children to support, they cannot afford to live on one wage... They knew the decision would be trendsetting, possibly opening the floodgates for relatives of other disabled people around the country, but say "our son drove us". For nearly 20 years, the[y]... have argued that the best place for [their son] is at home, where [it] is loved and secure. It is discriminatory, they believe, to pay strangers to be caregivers for the disabled yet expect families to do the same work for free. With an elder son – three younger siblings were born several years later – the [couple] looked after... their... intellectually impaired... son... until... [it] was eight. But the 24-hour seven-day a week demands took their toll, and they reluctantly let their son go to an IHC hostel. From age 14, [their son] was in a contract board situation with paid caregivers. It has been an unhappy saga for both [the son] and his parents, who claim their gentle son has been the victim of prejudice, greed and selfishness... Over the years, [their son] has always come home for part of each week and for holidays and special occasions. But the funding available for outsiders to look after him stops when their son crosses their doorstep. [The mother], a registered nurse, says the child with a disability has specific needs regardless of who looks after him... Earlier this year, [the mother] wrote and published a book – *Kids for Sale*, – ...which highlights the difficulties experienced by families caring for disabled loved ones and the alienation they can suffer from authorities who "know best" for [NZ's intellectually impaired kids]. The title reflects the [couple's] view of the financial exchange which goes with [their son] to caregivers outside his family. Now they are "ecstatic" the Complaints Review Tribunal has ruled in their favour. It is a relief, they say, to know they were morally right in their battle...

YOU MIGHT think living with a disability is tough. Try working with a disability. Even worse, try not working with a disability... Of all patients that pass through ACC's services, a mere 17[%] with spinal cord injury get back to meaningful work. And those whose disability is the result of an accident and comes under ACC are the lucky ones. Anyone born with a congenital condition like spina bifida or cerebral palsy gets much less assistance and funding – and the Government and judiciary justify such distinctions despite the Bill of Rights... [Someone who] spent 14 years running the NZ Spina Bifida Society... has spent the year working with some severely disabled children who see her as a role model... [-] a disabled person active in the workforce, living an independent life and making a valuable contribution to society. However the recessionary slashing and burning has cut into the education sector and [her] job will come to an end at Easter... [It] must now join thousands of others struggling to find work in a contracting job market. And for her, the struggle is harder because of the way people see her disability... [It]'s seeking work now.

...An Auckland organisation that finds work for the disabled has already placed staff with 100 companies, but needs more firms to hire 400 people still looking for work. Workforce Personnel has found jobs for the disabled since 1991. Its clients include people with physical and intellectual disabilities as well as those who are deaf or blind. Several companies, including NZ Post, Adventure Cycles and Hunza Productions, have taken on staff – some as many as nine... One company that has a firm commitment to employing disabled workers is Bluebird, which initiated Project Blue to create positions specifically for the new employees. Over the past few years, Bluebird has hired five people through Workforce... Bluebird[']s human resources manager... says Project Blue... began in 1995 after a mother approached the company to find work for her disabled son. "...it's certainly not a charity. Our Project Blue team have to make a worthy contribution to the business, and they are doing that very well."

...Disabled workers... are dismayed that... Workforce Industries... is considering laying off... the least productive of its 200 or so workers. It blames financial woes and a claimed lack of subsidies earmarked by the Government to make up for the planned repeal of a law sparing it... from paying the statutory minimum wage to... people with disabilities... [In related news, b]eneficiaries will have their payments docked if they turn up even 15 minutes late for jobs under the work-for-the-dole[(or community wage)] scheme that starts next week. Sanctions will also apply against beneficiaries who fail to answer questions, fail to cooperate or who walk out of interviews with Department of Work and Income officials... Although the Government had the authority to impose... penalties, questions remained about whether the scheme was forced labour and broke conventions of the International Labour Organisation. "The difficulty everyone is having is defining whether this is akin to a Chinese forced labour camp[,...]... Labour's employment spokes[person said yesterday, adding that] dependent children were unfairly punished by benefit sanctions... Beneficiaries who take part in the community wage will be entitled to \$21 extra a week, and up to a further \$20 a week for costs.

...THE GOVERNMENT has been battling over multi-million dollar funding for a new super department running the work-for-the-dole scheme just days out from its launch. A funding package for the new Work and Income Department is expected to go to Cabinet for approval at the 11th-hour tomorrow. Cabinet ministers will also be told the final set-up costs for the new department, estimated to be around \$70 million, including capital costs. Beehive sources close to [the]Associate Social Services Minister... said the demoted Employment Minister had still been negotiating funding for the new department late last week. "There's a scramble for funding at the moment. The money's been allocated but everything has been rethought because of the economic situation." The department will bring together the Employment Service, Income Support and Community Employment Group, which together have operating budgets of around \$600[m ('the restructuring is expected to create annual savings of \$20m')].

...Work and Income N[Z (your 'one-stop shop for all unemployment and beneficiary needs')] has been criticised for spending \$79,000 on designing a new corporate wardrobe and glossy brochure detailing it.

...[Winz's] chief executive... has called in two public relations firms, a private eye and a firm of business consultants to investigate and manage the fallout from allegations of overspending on staff training. [The CEO wouldn't] reveal what this advice is costing, but said some figures might be available later... Industry sources said public relations consultants in Wellington were normally charged out at \$200 to \$300 an hour, although some cost more. "It's the Government gravy train which drives prices up to that level," said one... Meanwhile, figures supplied by Winz show it has budgeted \$538,000 for internal conferences and seminars this financial year. They include \$154,000 for a three-day, 130-person national managers conference due to be held this month but postponed six weeks... The internal conferences budget did not include the June 3-4 Wairakei managers' training course, for which \$165,000 was spent on charter flights. [The CEO] said that course was part of an overall staff training budget of \$4.8 m... "We are a new organisation. We have enormous training requirements." Winz has asked the Auditor-General to investigate the charter flight issue. The ministers responsible for Winz... have asked the State Services Commission to review [the CEO]'s performance in light of the affair.

...Taxpayer-funded compensation for a suspended [Winz] manager may exceed the... bill for charter flights that triggered the controversy. The manager... resigned and is suing Winz for unjustified, constructive dismissal... The Employment Court could grant up to 18 months' lost wages and about \$50,000 for humiliation if Winz lost the case. In her letter of resignation, [the manager says it] has no chance of a fair hearing from Winz because [the CEO]... would make the final decision on her fate. "You have a clear interest in the matter, your recollection of events and of your own actions, conduct, comments and instructions to me is in important respects totally different from mine,"... said... her letter... Given claims that [the manager had misled the CEO], there was no basis on which [it] could trust the Winz boss to be impartial. "You have tried to make me a scapegoat for the failings of the organisation, and... been unrestrained in your efforts to do so,"... [Her lawyer said his client] wanted a mediating member of the Employment Tribunal to carry out the investigation. [The CEO claims it only] approved \$126,000 of the cost of... [the] charter flights... Meanwhile, a State Services Commission review of [the CEO]'s performance in the affair is due to go to the Government on Monday and be made public on Tuesday... [The]State Services Commissioner... had hoped to look at a separate Audit Office report first, but that is expected to take

several weeks to complete. An interim Winz report on the issue, given to ministers, suggests that \$65,000 more than the going rate was paid for the charters.

...[WINZ] is under fire for spending up large again – this time on office furniture. WINZ has called for tenders from furniture manufacturers to create “a set of furniture that will take WINZ into the future using the most ergonomic technology available.” [A]Labour MP... said it was another case of WINZ having wrong priorities... WINZ has already spent a “massive amount” on new furniture and refitting its offices... “They should be putting more money into frontline staff and better support for N[Z]ers on the edge of survival.” ...[a WINZ spokesperson] refused to answer questions about whether the furniture was a waste of taxpayers’ money... [In another development, the] State Services Commissioner... has censured the W[INZ] head over the... \$165,000 [that]was spent chartering planes to take staff to a conference.

...A senior [Winz] manager, suspended after the department spent \$165,000 on charter flights for staff, has received a secret out-of-court settlement understood to include an apology and a big cash payout. But the *Herald* is not allowed to name the manager because [it] has had her name suppressed... [(however, if you want to know her name, refer to *Herald* articles published on the 19th of last month, and 22nd + 31st of the previous month).] A source told the *Herald* that the... package, reached after mediation, [was for over]... \$100,000. But this could not be confirmed. The former manager’s lawyer... declined to comment... [The new] Social Services Minister... last night confirmed that a settlement had been reached... [but] understood there was a strict confidentiality clause that prevented his disclosing the details... [before adding that, “I] will not be tolerating waste and sloppiness at the top of Government agencies.” [The former]Social Services Minister... denied knowledge of any settlement... The Crown Law Office had advised that a settlement would be appropriate, but [the former minister] had not been asked to sign a deal, which would have been required had it involved as much as \$100,000... [Winz’s CEO] refused to release information about the case, saying the manager’s privacy had to be protected. Two investigations into events surrounding the Taupo staff conference and the charter flights... failed to find specific fault... Rather, it was the result of a series of miscommunications and mistakes. After a separate probe, [the]State Services Commissioner... docked some of [the CEO’s] \$37,500 performance bonus. But... stopped short of blaming anyone... Four days... [ago Labour’s spokesperson] on social services, revealed another bungled dismissal of a Winz executive that had led to a \$100,000 payment. It was later repaid because the amount exceeded [the CEO’s] authority, but was replaced with a compensation package worth \$110,000, including \$50,000 in cash and six months’ paid study leave.

...Lectures have started for tertiary students but thousands are still waiting on Winz for their student loans before they can officially enrol. Universities and polytechnics are doing their best for students – enrolling them anyway and providing emergency grants and loans – but students and staff are angry the year has started in chaos. [One student], aged 20, who is studying at both Auckland University and Unitec, has heard nothing from Winz since last week when the agency told her [to]... expect her loan within two days. [The 20-year-old] has phoned Winz twice a week since January, each call usually involving 15 minutes on hold, and has replied to several requests for more information, including two for her signature. [The 20-year-old] was supporting herself in the meantime with part-time work, but two friends had pulled out of plans to study this year after battling to get an allowance and loan for the second year running. “They just got sick of it and decided to work instead... It’s mayhem. You can understand why people miss out on an education because they can’t be bothered going through all this.” Winz[’s spokesperson]... said many students had not yet returned to study, and so were not due to be paid. “Student allowance payments and the living cost component of a student loan are paid in arrears and a student is not entitled to receive their first regular payment until their second week of study,”... it took at least three weeks to pay out a loan after the student had applied for it, including the seven-day “cooling off” period, required by the Credit Contracts Act. This time frame depended on there being no delays from any of the parties involved: Winz, the student and the institution. The... Social Services and Tertiary Education Minister... said yesterday that goodwill by some institutions had minimised loans problems... but... some institutions were going to get nervous if the fees money did not come through soon... [Incidentally, Winz – which ‘spent \$150,000 on its own inquiry’ into the charter flights for staff debacle – has] sent a letter to a dead... [person demanding it] pay back \$21.69 for a superannuation payment covering the day after his death. The [dead person]’s daughter... was dumbfounded by the letter. Winz has since apologised and launched an investigation.

...A[senior] state sector chief executive has called on his fellow public servants to get back to basics and regain the trust of N[Z]ers. The] Secretary for Justice... said a series of controversies, culminating in the Winz debacle, had shaken public confidence in the new era public service. “Public servants aren’t readily able to give voice to it, but they are also concerned. I think there’s a deep sense of unease, at chief executive level, at second tier level, right down to junior civil servants who have only ever worked under the new system... It is critical that leaders in the public sector demonstrate they have a real grip on the basics. That means going back to the basic values and ethics of public service.” ...[the secretary] agreed to comment after a request by the *Sunday Star-Times* to [the]State Services Commissioner... to nominate a chief executive to talk about the public service response to the unprecedented censure of [the]Winz chief executive... last week. [Winz’s CEO] was publicly caned by [the commissioner] for her department’s chartering of an aircraft to take staff to a training course at Wairakei, a training exercise which cost a total of \$325,000. The... reprimand was a new low for the public service after an already bad 12 months. State sector credibility has taken a severe battering from recent events such as... alleged heavy-handedness by the IRD, a series of golden handshakes, questions over lavish expenditure in... government agencies, and corruption prosecutions last year for IRD and employment staff for selling client information... “People are asking the question, have the state sector reforms somehow loosened the strings too much?” ...The new system allowed risk-taking by [CEOs], but the price to be paid was sometimes mistakes would be made. “If you say we’re not prepared to tolerate risk of anything ever going wrong, then you end up with a colourless, grey, do-nothing public service, which really only exists to manipulate the rule books and never deliver anything,”... The new state sector had strong financial rules, which made it easier to identify who was accountable and to sheet that responsibility home, as had happened in the case of [Winz]...

Do you receive a Community Wage, Independent Youth Benefit, Widows Benefit or Domestic Purposes Benefit, or are you the partner of someone who is receiving an Invalids Benefit, Emergency Benefit or Community Wage? If you are, you’ll probably have a Job Seeker Contract with [Winz] that sets out your obligations as a job-seeker... From July 1... your Job Seeker Contract will be replaced by your own Job Seeker Agreement. If you have job seeker obligations as part of your benefit, you’ll need to develop and sign a J[SA] with your Case Manager. Your J[SA] will set out your obligations as a job seeker, such as being available to look for work and coming in for interviews with us when we ask you to. Also, if you’re offered a suitable job, we’ll expect you to take it... If... you fail to meet your job obligations without a good and sufficient reason your benefit will be suspended until you meet your obligations. On your third failure, your benefit could be stopped for 13 weeks. For people receiving a benefit at the married or sole parent rate, the suspension or cancellation will only apply to half of the total benefit payment. The new system is designed to encourage you to meet your obligations... to find a job... Our job is to help your find work, and to provide income support to people who... are unable to work. These changes help us to do that by putting more emphasis on activities that... best suit... your situation.

...Combating crime is all in a day’s stroll for the... Waitakere City Wardens. The... 11-strong team that voluntarily walks the streets and car parks to act as security for the New Lynn area... often carry elderly and invalid people’s shopping, talk to people in need, and do a bit of crowd control. They have no enforcement powers, but can call the police or the relevant authority – and the response is quick... [The team] has started looking for funding and sponsorship so the community service can become a stand-alone organisation... [T]he warden team[are also]... looking for new recruits to join... [them as Winz] has stopped referring people to community work for the unemployment benefit... All new recruits are trained, and some move on to jobs with security firms... With more sponsorship, it is hoped the wardens will be able to patrol more of Waitakere City.

...People are working more hours today than ever before... 21.2[%] of the total N[Z] workforce are working more than 50 hours a week... Long working hours mean less time to relax... The result is... [that t]he pressures of work are... coupled with the... stresses of everyday life.

...The Health and Safety in Employment Act has been in force for nearly two months but so far the issue of workplace stress – the hot issue when the act was debated – has yet to make an impact. What is causing a bit of stress, however, is the requirement for employers to provide protective clothing. The problem is particularly tricky... and... cost[ly]... in industries where the number of casual staff is large, such as forestry or construction...

Workplace stress has become so bad that thousands of workers are presenting themselves for treatment, their symptoms similar to those of psychiatric outpatients, an investigation has found. “This is not a minor worry any more. It can be a serious crisis in people’s lives,” said [a p]rofessor... who has surveyed 10,000 victims of workplace stress across Britain. “The problem is definitely no longer linked only to management occupations. It now includes ordinary office workers and manual workers, too.” In the private sector, employees are suffering from the requirement to deliver higher and higher productivity per person. In the public sector, beleaguered staff are often being asked to bear greater responsibility with fewer resources... Undiagnosed anxiety conditions now cause more lost days from work than complaints such as backache, hangovers and stomach upset... The report suggests workplace counselling can reduce the incidence of office stress by 50[%]... Almost 1000 big British firms already provide free stress counselling services to employees... *Stress beaters* ■ Exercise [3 to 5] times a week... ■ Make time to switch off each day and be with family and friends. ■ Laugh. Life is too short to be serious all the time. ■ Have an active social life outside work... ■ Spend time tackling different tasks during your day, and take short breaks. ■ Learn to delegate or tell someone when your workload is... too much.

...*Work can be as addictive as any drug – and just as destructive if not treated...* A survey conducted by the Institute for Personnel and Development... shows that more than a million workers in Britain consider themselves “addicted” to their jobs... “Work addiction is becoming more prevalent at the clinic,”... [a] senior addiction therapist at the Priory Clinic, Bristol... says, “and like any other drug, it can, if pursued to its conclusion, be fatal.” Addiction often manifests itself in long hours. In the IPD research, one in three of people working more than 48 hours a week, said they were addicted. But, says [the therapist], you don’t need to be working all hours to be hooked. “You may be working nine to five – but if all the time you’re at home watching TV you’re actually thinking about work, you need to think about what that means...”

...*Do we work to live or live to work?* ...These days it can seem quaint to think that it’s enough to do a 40-hour week. Many of us are now working longer and harder than our parents or grandparents, either to make ends meet or to meet the standards of the performance culture... [A] University of Auckland economist... says an attitude shift is needed. “We used to think it was quite fun for people to get drunk a lot. We now no longer think that kind of behaviour is acceptable at all. If we really thought that workaholicism was really unacceptable and sick like alcoholism, rather than worthy of applause, we might get a healthier perspective on work.” Just how out of kilter our view of work has become can be seen in our changing attitudes to childhood. Having escaped the mines over a century ago, increasing numbers of children are now being subtly recruited into the world of work. In the US, many school districts have dropped gym classes and even playtimes. “No Time for Napping in Today’s Kindergarten” a recent *New York Times* article proclaimed... A recent article in American magazine *City Journal* describes the new youth culture, among young professionals at least, as “ecstatic capitalism.” Youth today want jobs with “soulfulness.” Work in the new economy, complete with long hours and a blurring between business and pleasure, is the place to find individual meaning and recovered community in a fragmented world. As online magazine *Ecompany* puts it, the modern workplace is “not just a place to work, it’s a place to live.” ...a senior lecturer in organisational analysis at the University of Auckland... says the corporate obsession with team-building, for example, is an attempt to patch over the reality of declining job security and increased workloads. “It’s a way of tapping into yet another human resource. That term signifies that the whole of the human is supposed to be a resource for the corporation.” Somewhere along the line, the idea of working to earn a living has been overrun. We don’t have jobs; jobs have us. Not since the work ethic was born out of the reformation in the 15th century has so much meaning been invested in work. Thanks to John Calvin’s idea of predestination – that God had already decided who would be blessed with eternal life – it was then believed that success at work was a sign that a person was amongst God’s elect. As sociologist Max Weber explained it in *The Protestant Ethic and the Spirit of Capitalism* in 1904, work had become a way of worshipping God. “In exchange for being diligent and hardworking, we got a sense of spiritual satisfaction, a kind of salvation,” [says the lecturer]... “That ethic has been undermined because people are no longer getting the satisfaction of that cultural side of the bargain, whether it’s spiritual or about community. We’re now just getting consumerism.” ...an associate professor of science, technology and society at the University of Wollongong... traces the trend for mass, non-essential consumption back to the 1920s. Between 1860 and 1920 production increased 12 to 14 times in the US, while the population increased only three times. With US markets reaching saturation, there was debate over whether to cut work hours and so reduce production. “Employers didn’t like that idea and actually argued for ways to persuade people to buy more in order to keep work central to people’s lives,”... In a figure typical of developed countries, the average full-time worker in the U[S] in the early 1990s was working 140-163 more hours each year than in the 1970s. That’s an extra month a year, not including the extra day a year they spend commuting... A[n AUS]n Government survey in 1997 concluded that A[US]ns “endure more stress, work faster and more intensively, and put more effort into their jobs than they used to.” ...In Japan, studies estimate that 10,000 people a year die from overwork...

Japanese lead the way in dying to succeed at work... [T]he ailing former [Japanese PM] represents a culture that has given the world a new word... At the age of 62, in a country famous for longevity, [the former PM] might have expected 20 more years of good health... [Yet,] last week... the [then P]M... suffered his stroke... But as the week wore on, a... question presented itself: not why [the PM] fell ill so suddenly, but how on earth [it] lasted for so long. The background to his sudden illness came out in a remarkable briefing by his outgoing deputy press secretary... who described in some detail [his boss]’s extraordinary work regime. In his 20 months as P[M, it] took... three full days off. During weekdays and Saturdays, [the PM] rose at 6 am and started at the office at 8 am – or much earlier if there was a cabinet meeting to be chaired. Work – including meetings and hosting official receptions – occupied him until 11 pm, and [it] had fallen into the habit of waking in the middle of the night to review paperwork and read reports... [E]ven on Sundays there were visitors to receive and paperwork to catch up on. His last real holiday – two days of golf and relaxation in the mountain resort of Karuizawa – was eight months ago. In the week before his collapse, [the PM] had to deal with a volcanic eruption that displaced 15,000 people in the northern island of Hokkaido, and the defection from his Government of a coalition partner... All P[M]s work hard, of course and [thi]s case would not be so surprising if it was just the tragedy of one [perso]n in exceptional circumstances. In fact, [the former PM] is just the most prominent among tens of thousands of Japanese who die, commit suicide or fall sick every year as a direct result of murderously long working hours. The situation has generated a word, which has been adopted for use in English by the U[N] International Labour Organisation: *karoshi*...

The Japanese Government is aiming to introduce a medical insurance scheme to help to prevent “karoshi,” or death from overwork. Under the plan, people who show “critical” symptoms in four categories – obesity, high blood pressure, high blood sugar and high blood lipids – will be able to have medical examinations free of charge. Those with all four symptoms are about 35 times more at risk of dying from overwork... Some 90 people died from overwork in 1998... up from 32 in 1994. The Labour Ministry plans to... implement the legislation in... 2001.

...WORKERS will use any excuse to get out of being late for work – including the death of a relative. Elderly grandmothers are the most prone to die. “But that explanation starts to wear thin when granny has died for the fourth time,”... says... [the]employment and manufacturer’s union spokes[person, who]... regularly speaks with bosses upset at their employee’s tardiness. “We tell employers to use their discretion if a worker has a valid excuse for arriving late,”... But now new research has found the most common excuse people use for arriving late for work is traffic congestion. A major jam – like the one caused when an ink truck spilled its load on Auckland’s Harbour Bridge last November – set some commuters back for up to four hours. But that’s just tough according to [one]employment dispute consultant... [who] says repeated traffic excuses

would not be acceptable to bosses. "We get a number of calls from employers questioning whether traffic problems making people late for work are a valid excuse... But it's the perils of living in the city really." ...workers should leave home earlier to compensate for any delays. One of the more unusual cases [the consultant has] dealt with was a [gal] who had two written warnings for being late. "The next time [the worker] was more than an hour late... So the boss had written up an instant dismissal letter and they gave it to her when [the worker] finally arrived at work. This boss told the [worker it] didn't want to hear any excuses but it turned out [the worker] had rescued another motorist from a burning car on her way in,"... ■ The... Labour Minister... is seriously considering... proposals... [to give f]ulltime workers... four weeks' annual leave...

Cabinet ministers are being pressured to support four weeks' minimum annual leave... [A f]ormer Cabinet minister... argues that ministers themselves have at least four weeks' holiday a year... [M]inisters spent a lot of Cabinet time planning their breaks, and not supporting the move would be seen as a double standard... But... [i]t is thought the ministers... will take the view that... the time is not right economically...

[The] Labour Minister... and the Employers and Manufacturers Association say that granting hardworking N[Z]ers an extra week's holiday will cost the country \$1 billion a year. That is wrong. They base their calculation on everybody getting an extra week... But they forget that 17[%] of the N[Z] workforce – including the minister]... his parliamentary colleagues, [and] just about anyone else on his high salary level... [-] is already entitled to at least four weeks' annual leave... N[Z] lags well behind the rest of the western world when it comes to holidays... In voting in favour of a minimum of four weeks' annual leave for all, the Labour Party is not buying votes as [the minister] would have us believe. It is acknowledging that much of the wealth is being enjoyed by an elite group in our country [who keep] promising to "trickle it down" to the majority. Give workers a break.

...Why do you get sick when you take a break? ...It's a familiar scenario – you work, work, work and then, when you finally take a holiday, you fall ill and spend the first week in bed. No, it is not your imagination, it is becoming recognised as a real phenomenon and has even been given a name – "leisure syndrome". The heads of the A[USn and NZ] medical associations agree that the syndrome, which often seems to strike its victims on holidays or weekends, is real. It often takes the form of a headache, migraine, cold, flu, viral infection or simply intense tiredness during time off work... [The NZ] Medical Association chair[perso]n... said some people tended to keep up their defence mechanisms while they were at work. "When they have a task to do people can keep their defences intact until the end and push away exhaustion... And then when they stop and are supposed to relax, they are physically exhausted and lose the capacity to ward off sickness." Some also get ill when they finally stop working because they have ignored warning signs to slow down or take a day off.

...Imagine if every time you took a sick day, your boss registered the date and reason you were away on a central sickie register that could be accessed by other employers checking you out for a job in the future. Just such a register has been set up in A[US], and there's nothing, not even our Privacy Act, to stop it happening here. The A[US]n sick day register was launched... by [a]Queensland recruitment company... Employers can register, free, the details of any worker who has taken a sick day and for \$A40... a year can receive 10 sickie reports. "Prolific sickie and compo claimers are costing small businesses millions of dollars a year, and we believe it's time to weed out the troublemakers", says the service's website... ■ The... law provides [AUSn workers]five days sick leave in the first year of employment, then eight days in subsequent years. Canada: Ten days unpaid sick leave a year in organisations of 50 or more employees (most people have sick leave insurance as part of their medical insurance). UK: Three days a year. Any more and the employee goes on to a complicated state benefit system which may or may not be topped up by their employer... [NZ's] Holidays Amendment Act 1991 says that after six months employment, every worker is entitled to five days special leave... [- to be used when the] worker is sick[, the]... worker's spouse or dependent children or parents are sick[, or if it] suffers a bereavement... [-] for each ensuing 12 months.

...A supermarket chain is offering staff three days' domestic leave a year, a first for the industry. The leave for Woolworths, Big Fresh and Price Chopper staff sprang from collective contract talks with the National Distribution Workers' Union... The leave could be taken when a staff member was the primary caregiver for a sick child, partner, parent or other dependent relative... [While on the topic of annual leave, t]he Labour Party is under pressure to deliver more holidays if it wins the next election... Delegates to the party's conference served notice... that they expected the next Labour Government to raise statutory minimum leave from three to four weeks... – a move employers fear could add nearly \$1 billion a year to their costs... But... the Engineering, Printing and Manufacturing Union, the largest of the four unions affiliated to Labour... estimates the cost of the change at \$350 million a year, or 0.8[%] of total employment costs... Union leaders welcomed the move, saying it would bring N[Z] in line with Europe at a time many people were working longer hours to make ends meet... The conference also voted to bring Labour into line with the Alliance by supporting a remit calling for 12 weeks' parental leave paid for through a levy on employers. Existing Labour policy is for six weeks paid for by the taxpayer... [□ 'Swedish parents receive a m]aximum weekly rate... [of \$1205 (jin NZ dollars) for] 13 months... Germany 14 weeks 100% of earnings France 16 weeks \$775 Canada 15 weeks \$639... Britain 18 weeks \$265...

The long-running campaign for paid parental leave cleared a major hurdle yesterday when [the ruling party] bowed to lack of numbers in Parliament, enabling legislation to go to a select committee. But the big test for the Paid Parental Leave Bill will come when the private member's measure returns to the floor of the House at some point in the next six months. Even if the bill still has the numbers to pass into law, [the]... Government... could employ a rarely used veto, which allows [i]t... to kill any Opposition initiated measure that has a significant impact on departmental budgets. Yesterday's 109-11 vote was a triumph for the unionist and Alliance list MP... who lobbied MPs for support in the face of opposition from both [the Government] and Act. Her measure would allow [mums] or their spouses to take the first 12 weeks of maternity leave as paid leave. The parent would be paid 80[%] of his or her earnings out of a central fund[, although no] employee would be paid more than the average... weekly wage. The paid leave would be financed by a flat-rate percentage payroll levy on all employers at a rough cost of \$1.50 a week per worker on the average wage. The across-the-board levy is designed to prevent the full cost of the levy falling on workplaces with mainly [gal workers. The Alliance MP] estimates 22,000 work[ers]... would be eligible for paid parental leave each year at a cost of about \$110 million to employers. The vote on the bill's second reading was an early but minor setback for [the Government] following Tuesday's confidence vote, which was touted as showing it had the numbers to sway the House... The [PM], a former Minister of [Gals' Affairs, said the Government]'s subsequent support was contingent on "significant modification" to the bill... [The PM] said parental leave should be funded by employee as well as employer contributions[, and be income-tested]. The needs of [mothers] needed to be weighed against the risks that funding leave might cost their jobs... [The PM also] said it was too early to say whether [the Government] would contemplate using the veto as [the PM] did not want to pre-empt the select committee's work.

...The Paid Parental Leave Bill should not proceed because bosses should not have to pay for a responsibility that is not theirs, the Employers Federation told... the social services select committee... yesterday... [Its CEO] said the federation did not oppose paid maternity leave but believed it should be done through the welfare system or some other way, not funded solely through a levy on employers... The federation said the idea that paid leave made it more likely for a [mother] to return to work, thereby reducing training costs for a replacement, overlooked the fact that someone had to replace the person on leave. In response to questioning from... [the] federation deputy chief executive... the... [bill's sponsor said,] "Parental leave is a social good... but it is no more a social good than three weeks' annual leave, minimum wages or sickness and domestic leave. Yet we impose by law the cost of all these on employers." [● 'A poll estimated 63% of NZers support the idea of giving 12 weeks of paid maternity leave.'

...some mothers] are returning to work days after giving birth because they cannot afford to take time off, Parliament's social services select committee heard yesterday. The... Maternity Services Consumer Council, comprising almost 100 groups with interest or involvement in Auckland

maternity services, said... three months' paid leave would free [mothers] from money worries while they recovered from pregnancy and childbirth and established feeding routines. The national secretary of the Service and Food Workers Union... said many of the 23,000 workers the union represented were too poor to save to have a baby and struggled to survive when on unpaid maternity leave. In one example, a factory worker earning just above the minimum wage could afford only one week's leave before returning to her job while her family cared for the baby. Her work meant [the mother] was on her feet all day at a processing stand. The union had tried to negotiate paid parental leave for its members but employers were unresponsive. The National Distribution Union reported more success, with companies such as... Woolworths... K-Mart... and... Foodtown... offering their staff two weeks' paid leave. The National Council of [Gals] said it supported the bill but believed it should be jointly financed by the state and employers... A delegation from the [gals'] section of the National Party's Port Waikato electorate opposed the bill... [because] the group believed one parent should be at home with children until they were 12 or 13. [The group's spokesperson said paid] parental leave was not the answer as it only encouraged [mothers] back to work earlier... The committee heard from 12 groups yesterday. One day of submissions is left next week.

...The Government may yet adopt a limited paid parental leave scheme financed by the taxpayer, but has effectively ruled out employer contributions... [after] the Minister for Enterprise and Commerce... told an industrial relations conference in Auckland that "this is an employee benefit which should be paid for by employees, or at a long stretch, the taxpayer." ...*One Network News* reported last night that the cabinet was considering a \$50 million fund to be divided between parents of newborns.

...The Government is scrambling to head off employer-paid parental leave with an alternative "mother and baby" package – possibly featuring tax breaks, bigger childcare subsidies and more help for new mothers. But it may still stop short of granting any form of parental leave, which is fiercely opposed by some of its own MPs and supporters... The Government – which axed the family benefit in December 1990 to save about \$70 million – now plans to buy its way out of the problem with an extra \$30 million to \$50 million... on measures that it claims will help new mothers.

...[the] Paid Parental Leave Bill offers 12 weeks' paid leave to working couples which can be shared between mother and father on the birth of their child. [But] for families in which the mother is a full-time caregiver at home, the bill only gives two weeks' paid leave to the father. This is discriminatory. It sends a message that those who contribute at home are deemed worthy of little support compared with those in paid employment. Such a message is an affront to a significant proportion of N[Z]ers. Over 30[%] of all two-parent families have mum as a full-time homemaker. For families with children under five, the [%]age is up to 60. The couples represented by these families are not "dinosaurs" as [the bill's sponsor] implies, but have simply made a different choice about what is valuable. That choice often entails significant financial sacrifice. In spite of this, the concept of mums as homemakers is almost totally lacking from public debate and their existence and efforts go largely unrecognised in public policy. The tax system focuses on individuals rather than families and ensures there is little reward for couples who choose to have one parent at home. The earning parent is simply taxed as if the other didn't exist. In contrast, where both parents decide to enter paid employment the state recognises and affirms that choice with a tax rebate and a range of childcare subsidies. This policy is deliberately tilted in favour of both parents entering the paid workforce. [The Alliance] bill will tilt it even further. In view of that the Government needs to think carefully about its goals before forming its response to the bill. Does it want to continue with an agenda aimed primarily at increasing fem[inine] participation in the labour force and which discriminates against [those gals] who choose a different path? Or does it want to help all [NZers] having children, regardless of their employment status? Will it even dare... to provide some balancing incentives and affirmation to [gals] who choose full-time motherhood?

...[an Aucklander] went back to work when her first child was [7] months old. But after her second child, [it] chose to quit work and stay at home. "I just felt I could do it with one, but two is double the load and I didn't want to continue in the rat race." The... mother is one of many who leave their jobs thanks to "second-child syndrome." According to British research, [mums] struggle to cope with work and two children, and instead choose to leave the workforce. A Kent University study... shows 75[%] of mothers return to work after their first baby, but half drop out of the workforce completely after the arrival of the second child. The head of the sociology department at the University of Auckland... says parents often quit work after their second child because of difficulties with childcare... [A] new book, *Three Shoes, One Sock and No Hair Brush: Everything You Need to Know About Having Your Second Child*... says: "Most [gals] are totally unprepared for the impact of a second child on their working lives. It isn't just the cost of childcare, although that's important. It's the lack of time, the strain on relationships of having both parents in work, the complex logistics of working life with two [kids]. All these factors together prompt – and sometimes force – [mums] to re-evaluate their priorities."

...Discrimination in the workplace against pregnant [employees] is rife, but few report it. From workmates' unkind comments about big bellies and raging hormones to job loss, [gals] find reactions to pregnancy overwhelmingly negative, say [gals'] advocates. Although few agencies keep a log of complaints from [workers] concerned specifically about their treatment when pregnant, experts agree that the problem is huge. The Employment Court fielded 18 such complaints between 1991 and last year, while the Human Rights Commission averages five to 13 a year. "It's the tip of the iceberg," said [a commission spokesperson]... "We suspect it is a pervasive problem because anecdotal information suggests a lot of [pregnant workers] experience discrimination and even hostility." ...And as [one]Wellingtonian... discovered, getting justice for discrimination is not assured. [The Wellingtonian] sought redress from the commission after the Stock Exchange terminated her membership 18 months ago when [the Wellingtonian] took time off to look after her newborn child. But her attempt failed when it was discovered that the exchange is exempt from the Human Rights Act... because its rules are considered to be regulations... Other employees who could find themselves ineligible for protection from the act are crews of foreign ships and aircraft, those who work in national security or out of N[Z], and members of the Armed Forces and the police... Parliament's finance and expenditure committee this week promised [the Wellingtonian it] would get a hearing with the exchange... This week, the *Herald* revealed that a [person] was awarded close to \$13,000 because [it] was dismissed from her job after falling pregnant. In two cases mediated by the Human Rights Commission between November last year and February, [mothers] won out-of-court settlements. The Employment Relationship Service says employers must keep a [worker]'s job open if her parental leave is for four weeks or less. If longer, they would be expected to keep the job open unless it were a "key position" that could not practically be filled by a temporary replacement. In that case, the employer must offer the [worker] "employment preference" over a six-month period after the end of parental leave for any available jobs similar to her old job.

...The Government last night defeated an Alliance bill proposing 12 weeks' paid parental leave... [by] 60 votes to 58... but Opposition parties came close to delaying a vote until the next parliamentary term. Labour and the Alliance kept debate alive until [the]Speaker... demanded a vote one minute before Parliament was to adjourn... [The bill's sponsor] said the plan would return under "a new government."

...[the actor] has one Big problem with her pregnancy. Her *Sex And the City* co-star... keeps claiming [it]'s the father. "...and it's causing all sorts of problems,"... Not that [the actor] is too angry with [the guy] who plays her on-again, off-again love interest... in the sexy show, which begins a series of repeats on TV3 on Saturday... Just for the record, the baby's real father is [the sta]r's actor husband... and friends are already putting pressure on him to take time off after the birth. "For the last generation of [mothers] raising children the father just wasn't present and it wasn't expected. Now we expect our boyfriends and husbands to be there," [the expectant mother] says. "Isn't it funny that we can place those demands on them these days? I think once I go back to work [my husband] wants to carry a little bit of the weight so [it] can be counted on but I feel I'm lucky that I'm in a profession where I can bring my child to work. Most [mothers] don't have that opportunity."

...OVER the past few decades, as more and more [gals] have entered the paid workforce, a popular notion has arisen that [gals'] share of the workload has become increasingly unequal. The concept of the "double shift", where [gals] spend their days in paid employment and then come home to look after the family, has become firmly embedded in our thinking. The natural conclusion is that [guys] do not pull their weight and work as hard. Therefore they must be lazy. Yet the Time Use Survey carried out in 1998... by Statistics N[Z], in partnership with the Ministry of [Gals'] Affairs, showed this to be a myth. Announcing the results of this study in May... Statistics N[Z] stated: "Guys and gals] spend about the same amount of time working, on average seven hours a day or 49 hours a week". It went on to explain that "[gals] spend two hours a day more than [guys] on unpaid work, while [guys] spend two hours a day more than [gals] on paid work". Despite this well-researched evidence, the concept of gender inequality in time spent working continues. And the perception of a difference in working time between [the sexes]... is not confined to this country. Recently I presented a paper at an international conference in Canada on time use. I had the data from the Time Use Survey and had looked at the time that [guys and gals] who were in relationships spent working at various stages of family life. My conclusion was that, when we collated both paid and unpaid work, the amount of time the [guys and gals] spent in work, at all stages of the family life cycle, was generally equal... This finding... was not what the conference organisers had expected. They had difficulty finding the logical place or theme that encompassed my research. Consequently I presented my paper under the theme "The Gender Inequality of Work". So why is there such a disparity between the findings of the Time Use Survey and the prevailing popular perception of workload sharing by [guys and gals] in our society? The answer lies in what work we have considered when making the comparisons. Often when we have looked at the sharing of the workload between... [the sexes], we have looked only at certain aspects of work within the home. The opening article on "[Gals in NZ]" in the *Weekend Herald* provided a good example of this. The statistical snapshot stated that [gals] did 62 minutes of food and drink preparation a day, compared to 29 minutes by [guys]. And that [gals] spent 61 minutes cleaning to [guys'] 15 minutes. Yet if we were to choose lawn mowing, car maintenance or other outside work as the only basis for comparison, the figures would be unfairly biased towards [guys]. To get an accurate picture of who does what work we must look at all forms of work across the spectrum and not get carried away with comparisons about who does the washing or who cleans the car. It seems that [guys] in our society are too often seen as a large, slow-moving target and so it is tempting to take a pot-shot at them. On receiving Statistics N[Z]'s finding that the workload between [guys and gals] was evenly shared, the *Herald* ran a story that stated, "Survey confirms what [gals] already know. A [gal]'s work is never done" and that "[gals] spend twice the amount of time on cooking, cleaning and laundry than [guys]". While it is undoubtedly true that [gals] do more housework, this selective reporting of the findings of the survey could only reinforce the public perception that [gals] in this country work harder and longer than their... counterparts. The *Herald's* front-page article made very little of the fact that [guys] carried an equal workload... So the myth of the lazy [father] was perpetuated. What really happens? As an example, the birth of the first child in a family leads to the work patterns of both the mother and the father changing dramatically. The time spent working by both genders increases as they add the care of the child to their workloads. The time spent by [gals] in paid employment drops, while the time [they] spend... in unpaid work rises. But the... [father] takes on slightly more paid work, as well as considerably more unpaid work within the home... While we can all point to couples where... [the gal works] longer hours than... [her partner], and we may even feel that this is the case in our own lives, this study shows that... it is time that we jettison one of our cherished myths and admit there is a fair sharing of the load – and that [both sexes]... make an equal, though different, contribution to the wealth and well-being of our society.

In a moneyless society, parenting could be acknowledged as a valuable job. Indeed, because the early years of a child's development are so important ('the first three years last forever'; 'research shows most kids learn from their first birthday to mind their parents and it is easier to bring about long-term changes in behaviour before the age of 6 or 7 – by the time they get to high school you can only control, rather than change behaviour; yet early intervention programmes are 80% successful'), parenting should be viewed as a full-time job for both parents – unless the child is being raised by a solo parent – until the child starts preschool (i.e., the recommended length of maternity and paternity leave ought to be about three years). It wouldn't be compulsory for both parents to take three years leave, but only an HB would rate any other form of employment above being with its own offspring for as long as possible. If the couple has a second child before the first begins preschool – the sensible thing to do (from the children's perspective, and because it means people won't be leaving and returning to the general workforce more than once) – their parental leave will be extended; and be further extended if the couple has any more children (when returning to work, parents might just do one or two days a week until their youngest child is settled into preschool and they are re-acquainted with their jobs).

Allowing people to leave the workforce for a number of years so they can care for their preschoolers might be a huge drain on an economic society, but not a moneyless one. This is because many of the industries that exist in an economic society would be extinct in a moneyless society, and most of the remaining industries will have a decreased requirement for personnel (especially if technology is used in place of human labour as much as is practical). The extinct types of employment include: accounting, economics, taxation, insurance, banking and associated industries (e.g., credit card companies, financial advisers, debt collection, mints), stock and related markets (e.g., futures), retail sales and related industries (e.g., marketing and advertising), pension services, charities. (Note that financial industries employ at least 13% of NZ's workforce – including 'over 23,000 people working in banks' – and '1/4 of NZers work in sales or related industries'.) Amongst the types of employment which are likely to have a decreased requirement for personnel would be au pair services – only solo parents who don't have anyone else (e.g., the child's grandparents) who can give them assistance with their kids, or a break from their kids, should need an au pair. In addition, every able-bodied adult who isn't on parental leave would be expected to participate in the workforce of a moneyless society – so there will be no unemployed people or idle rich, including royalty (and, because there couldn't be any rich or royal people at all, no one will be employed as servants to anyone who is capable of serving itself). Furthermore, if the world was united, there would be no need for diplomats – NZ alone has '49 diplomatic and consular posts located in 41 countries and territories' – secret services, or any related jobs (e.g., electoral role offices and election officials; political party staff). Some industries could do with an increased number of personnel (e.g., education) but, overall, a moneyless society would require less work to be performed and have a lot more people available to do it. Therefore, apart from allowing parents of young children to leave the workforce for a number of years (and eliminating the performing of part-time work by pupils outside of school hours – excluding personal study, the only form of work pupils should have to do outside of school hours is *chores*), it should also be possible – if the workload is spread evenly among the available workers – to reduce the number of hours each worker has to complete each week. It is unlikely that the number of hours could be reduced to a *one-day working week* – i.e., 8 hours per week – but it might be possible for the 40-hour week ('the numbers of hours worked declined in the US from 38.6 in 1960 to 34.3 in 1991') to become a 24-hour week, which would mean that, for each 7-day period, every worker will literally have one day of work and six days of rest!

A 24-hour week ought to be regarded as an ideal figure – because, if it is possible to reduce the working week below 24 hours, the spare time can be used up by lowering the retirement age, or by increasing the number of holidays. However, if workers only have to complete 24 hours of work each week, they shouldn't need to have more holidays. Certainly, there should be no justification for having statutory public holidays – because 24 hours could be completed in three 8-hour days, or four 6-hour days, or any other combination of hours that suits both the worker and its industry while still enabling the worker to have at least three whole days off each week (although some workers might prefer, and be able, to spread their 24-hours over five or more days – and some might insist on working more than 24 hours – but working two 12-hour days, which may be possible in many industries, should not be encouraged). Incidentally, industries (or sectors of industries) should not operate during evening and night-time hours if it is unnecessary for them to do so.

Four weeks annual leave ought to be a sufficient amount. Excluding Education and any industries that can't avoid having one or more seasonal breaks, industries would have to roster holiday leave so that they can continue to function to the required capacity year-round (if the industry someone works for can accommodate it, a worker could use all of its annual leave at once, one day at a time or any other combination). Parents of school-aged children will have to be given preferential choice when it comes to taking annual leave that coincides with school holidays (but, because only one parent needs to be on holiday at the same time as their children, a couple could choose to arrange their annual leave so that they split some or all of the school holiday weeks between themselves then share some of their annual leave – or take separate leave – at a different time of the year). After parents, workers should get to choose when to take their annual leave according to seniority (hence, new workers who are childless might not get any choice about when they can have some or all of their holidays). Only one of an industry's world ministers may be on holiday at a time (excluding, perhaps, those from the Education Ministry – or any other industry that has good reason to completely or partially shut down at specific times of the year). Likewise, a state minister and its deputy – or a manager and its deputy; an organiser and its deputy; a supervisor and its deputy – will have to take leave at different times (which means that unless they work for the Education Ministry, deputies with children won't get preferential choice when it comes to taking leave if the person they are deputy to also has children).

To enable teachers to work just 24 hours, the school week could be four days long, and the school day divided into three periods: 9.00am – 10.30pm; 11.00am – 12.30pm; 1.30pm – 3.00pm. Between 10.30am and 10.45am, half of the teachers could have a 15 minute break while the other half watch the pupils, then the first group could watch the pupils while the other half have a 15 minute break; between 12.30pm and 1.30pm, teachers would have a break of 30 minutes and 30 minutes of playground duty (note that workers from other industries could take as long as they want for a lunch break – providing that they complete their allocated hours each day, and their industry can cope with staff taking a longer lunch break then finishing later than otherwise expected). Assuming that the practice of including the morning-tea break in a worker's hours remains, each teacher would only have completed 5 1/2 hours work between 9.00am and 3.00pm. However, if each class has at least two teachers, one teacher could start at 8.30am and finish at 3.00pm, and another could start at 9.00am and finish at 3.30pm – thereby raising their daily hours to 6. It would also mean that pupils who arrive at school early will be supervised, and one teacher is able to tidy up the room at the end of each day (or is available to supervise pupils who are performing cleaning tasks as a punishment). Teachers should have the same amount of holidays as every other worker and, therefore, so would children (decreasing the number of school holidays would compensate for time lost by having a 4-day school-week). It would be ideal for couples who have school-aged children if both the mother and father were able to work two 8-hour days plus two 4-hour days (i.e., each week one parent works 4 hours between 9.00am and 3.00pm for two school-days while the other is doing its 8-hour days, then the parents swap their hours for the two remaining school-days, thus enabling both parents to have a 3-day weekend that coincides with their children; alternatively, if their industries enable them to do so the parents could work some 4-hour shifts in the evenings while the children are asleep and one parent remains at home). Therefore, industries that operate for seven days each week should encourage rosters which allocate non-school-day work to childless workers, and industries (or sectors of industries) that are able to operate for just four days – or three days – each week could align their work-days with the school-week. If a couple is unable to arrange suitable work hours on one or more school-days, or on a non-school-day, they would have to arrange for the children to be looked after by grandparents, other relatives (e.g., aunts or uncles) or friends (e.g., their children could go to a neighbour's house, or the home of a classmate which is supervised by at least one adult).

If a child becomes sick on a school-day it shouldn't be sent to school (or should be sent home if it becomes sick while at school – unless the illness requires hospitalisation). If both parents are rostered to work that day – plus any subsequent days if the illness persists beyond 24 hours – and there isn't a relative or adult friend who is able to look after the child, one of its parents (preferably the one with the least responsible position) should be given leave. A sick adult who doesn't require hospitalisation ought to be able to look after itself and, therefore, its partner, or one of its children, needn't be sent home to stay with it.

Humans don't like to be sick, so they look after their bodies, which means they are less likely to require sick leave (but some may have unfortunate medical conditions that periodically prevent them from performing their work when rostered). Therefore, workers needn't be allocated a set number of sick leave days each year – it should just be assumed that workers are being genuine whenever they claim to be sick (after all, people would have a decreased need to 'skive off' if they are working less hours). However, every sick person should be examined by a doctor in order to aid its recovery, and ensure that its illness isn't contagious. If doctor examinations were compulsory, it would be theoretically impossible for a worker to take unnecessary sick leave (note that people who are severely affected by menstruation could receive a doctor's certificate to take sick leave whenever their worst time of the month falls on a working day – although such people could instead have their rosters arranged so that their days off will coincide with their worst time of the month; or, if their industry enables it, take a day off and simply arrange to work on their next rostered day off). When it comes to sick workers the main concern of an industry will be whether or not its operations can cope without them. If the sick worker is only off work for one day, its absence might not be a problem (if each industry was slightly overstaffed, non-sick staff would only come under pressure whenever more than normal absences occur), but if there is a problem – or if the worker is off work for more than one day – its industry could initially check to see if an unrostered worker is able to cover for the sick worker. If an industry is unable to cover for a sick worker by this means, it would need to obtain cover from elsewhere (although some sick workers – especially those who regularly use computers – may be able to perform part or all of their work from home).

In order to evenly spread the workload among available workers, each industry would need to estimate how much work it has to perform in total hours per year, and there will need to be an additional industry whose purpose is to maintain a balance between the estimations of the various industries and the number of available workers within each district. It might take a while to create a balance from the time such a system is set up but, eventually, the estimations of each industry should be expected to become fairly constant (hence, it may be possible to draw up most – if not all – rosters a year in advance). Therefore, when a balance has been created, it should be possible to work out how many hours each worker must perform in its lifetime. If every worker was expected to perform the same total of work-hours during its lifetime, the Employment Ministry would be able to run an account for each worker which opens when it first enters the workforce – or enters a training course – and closes when the worker retires. Parental leave could be included in a worker's account – any years parents take off to raise young children being added to the standard age of retirement (i.e., if, for example, a couple takes parental leave for a total of eight years because they have three children, that couple would be three years older when they retire than a couple which only takes parental leave for a total of five years – or eight years later than childless workers) – but, because full-time parents work virtually 24 hours every day, this shouldn't be necessary. When a worker's account is nearly empty, that worker could go into a period of semi-retirement – in which it joins a pool of workers who can be called upon at short notice to cover for full-time workers when necessary (obviously, semi-retired workers would only cover positions that they have previous experience with – if a district urgently needs to cover for a sick worker or, if necessary, until a full-time replacement has been found for a worker taking parental leave, and none of its semi-retired workers have the required experience, the worker's industry could try to reshuffle the tasks of the worker's colleagues so a semi-retired worker can be used to cover less-technical tasks; or the Employment Ministry could try to source an experienced semi-retired worker from another district). Moving into semi-retirement shouldn't have to be compulsory – indeed, some workers may be more useful to society if they continue to work full-time until their work account is empty. Semi-retirees would only work when required – which, on occasions, means they might have to work a 24-hour week – and continue to be semi-retired until their working account is empty (although all semi-retired and able-bodied fully-retired people should be regarded as a reserve workforce that can provide assistance at short notice during or after, for example, a natural disaster – be it in their own district or another; and every full-time worker may be required to work longer than 24 hours a week during periods of civil emergency – without having the overtime taken off their account).

This type of work system makes it possible for an individual to bring forward or delay its retirement – by working more or less than 24 hours each week, or by taking more or less holidays each year – but that should be discouraged (because doing so will increase the Employment Ministry's workload). However, the number of workers required by some industries may vary during the year (especially where work is seasonal), so some workers will need to work in more than one position, and perhaps for more than one industry, during a year. If such a worker can't be re-positioned immediately, be it in a position that utilises its training or one that requires less skills, the worker should have to take a holiday until another position becomes available (rather than being classified as unemployed) and, if the worker ends up having more than the standard allocation of annual leave – because it had already nearly or completely used up its holiday leave for that year – the worker could have leave deducted from the next year (alternatively, to keep calculations easy the worker would just benefit by getting extra holidays).

Rather than allocate a set number of bereavement days, each worker could instead be able to take a bereavement day – or days – whenever a family member or friend dies but not have it count as a deduction from its working account (i.e., a worker who takes a year's worth of bereavement days during its working life would effectively retire a year later than someone who takes no bereavement leave). By the way, if the Education Ministry employs two or more teachers per class, it should only be necessary to provide a replacement (perhaps from another class) when more than one teacher in a class is absent.

In some instances it may be possible for an industry (or sector within an industry) to say that a worker is expected to complete a minimum amount of work – without making any mistakes – during a working-week, and allow its workers to work at their own pace until that minimum amount is completed (i.e., if a worker prefers to work at a slower or faster pace than expected, it can take more or less than 24 hours to do the work – as long as its work is of an acceptable standard; if not, the worker will have to redo the work as unofficial overtime). In other instances a worker – or a team of workers – may be unable to perform its work due to, for example, weather conditions. However, if an industry knows what the average total of unavoidable down-time in hours is each year for each district, it can consider those hours when estimating how much work it has to perform in total hours per year. Down-time hours should be classified as normal (or official) working hours – but if a task has to be completed by a certain date, and a worker has to do extra hours to make up for lost time, the overtime ought to be deducted from the worker's work account (although at a real-time rate – as opposed to a penal-time rate).

To make it easier for the Employment Ministry to keep work accounts up-to-date, a computer programme could automatically deduct 24 hours from each worker's account every week, and the Employment Ministry would only access its account if the worker completes more or less than 24 hours during a week (excluding any excess hours performed voluntarily), or takes more or less holidays than allocated during the previous year. The Employment Ministry's task will be even easier if organisers were to be responsible for collating any deviations in their workers' hours at the end of each week then, at the end of each year, inform the Employment Ministry if a worker's account needs to be adjusted up or down.

As part of its role, the Employment Ministry could be an industrial relations mediator – although, in a moneyless society, there should be little or no conflict between workers and the industry they work for (e.g., there will be no strikes for extra pay or allowances; there would be no justification for any industry to maintain unpopular or unsatisfactory work practices and conditions), and it ought to be possible to deal with such conflict without needing the assistance of a mediator. In addition, the Employment Ministry could act as an inspector of industrial accidents.

Another responsibility of the Employment Ministry would be managing training institutes. This will enable the Employment Ministry to balance the annual training needs of respective industries with the number of school-leavers. Each district could have one central training institute, and each industry (including Education) can have a faculty on its campus. Placing every industrial faculty at the same location – as opposed to various campuses – will allow faculties to share facilities such as lecture theatres, and even lectures (some worker classifications – e.g., engineer – may have to be utilised by more than one industry and, although some tasks would be so industry-specific that they require independent tutorials, other tasks will be generalised enough for trainees from different faculties to cover the theory together; note that a moneyless society may continue to have work-sites – or work activities – that synchronise the efforts of multiple industries). Some courses might be so specialised that an industry only needs a few trainees worldwide, in which case the tutor could conduct lessons via communications technology (as opposed to temporarily moving the trainees to the tutor's district – r:p1925, ln20).

When working out their annual training needs, industries would have to take note of future developments within their area of work and figures relating to the number of experienced workers who are due to retire (or transfer to the semi-retirement pool, or take parental leave). If an industry needs to have a minimum number of trainees in a course but there aren't enough suitably-qualified school-leavers, rather than select less-suitably-qualified school-leavers to raise course numbers – which could result in having some trainees fail the course (effectively wasting everyone's time and effort) – the industry should look at upskilling some of its existing workers (i.e., a worker who originally was less-suitably-qualified – and, therefore, trained for a less-skilled position – might, after working in an industry for a number of years, have gained enough experience to enable it to complete a more skilful training course; an unskilled worker may perform its job to such a high standard that its industry, or the Employment Ministry, recommends it receive training for a semi-skilled or skilled position). However, an industry should only invite existing workers to upskill – as opposed to forcing them to upskill. If course numbers are still insufficient, the Employment Ministry could identify (with the aid of educational records – which can form the basis of a work record, linked to the work account, when a school-leaver becomes a worker or trainee) workers from other industries who, as school-leavers, were suitably-qualified but trained for a different profession (perhaps because, at the time, the training courses for their first- or second-choice careers were filled with other school-leavers). Any identified workers who want to change their profession (some people prefer to perform the same job throughout their working life while others prefer variety; illness may render some people unable to continue performing their chosen career, but not another) – and who can be spared by their current employer – could then be invited to enter the course. Indeed, workers who want a new job could be placed on a standby list by the Employment Ministry for easy reference. Although retraining existing workers would be the less-preferred option, workers who increase their range of skills will ultimately be more valuable to society – especially when they enter semi-retirement. Some workers may need to be retrained when they return from parental leave (and, regardless of whether they have to undergo retraining, they might have to be given a temporary position – perhaps one that they are overskilled to perform – until a suitable position becomes available for them to fill).

When it comes to placing trainees, those who perform the best should be given first pick of the available positions. However, all trainees should spend a minimum period of time assisting an experienced worker before entering a permanent position. Therefore, upon graduating, every trainee could immediately be placed with an experienced worker, then individual trainees can be shifted to a permanent position as vacancies in their sector become available. If for some reason an industry ends up with more qualified workers than it needs in a sector, and no existing workers (or not enough of them) volunteer to seek a new position elsewhere, the worst performed of the sector's workers (excluding recent graduates) could be dismissed from their positions and, if any of them can't be found another position within the same industry, those workers would become the responsibility of the Employment Ministry – which would try to place them with another industry (performing unskilled work if necessary) or retrain them. Once a balance between the workloads of every industry has been created, there may be a constant excess of workers, which means the Employment Ministry might eventually have a constant pool of predominantly unskilled workers who are sent as groups or individuals to help out wherever the ministry deems the need is greatest at the time (the need having been identified in advance – as opposed to after the fact, as is the case with utilising the pool of semi-retired workers) – and, therefore, some workers might be employed by one industry one week then another the next week.

Even unskilled workers require some form of training (be it just an induction course) – and have talents that are better suited to performing particular unskilled tasks – but it should be relatively easy for unskilled workers to change jobs and industries. Any unskilled worker who wants to change its job could – after first gaining permission from its present industry – apply to the Employment Ministry for a transfer, which would only occur once a suitable position becomes available (which might be to another position within its present industry). A consequence of this process might be that the unskilled workers who are least conscientious or disciplined end up being stuck with performing the tasks which are least popular! Incidentally, most disabled or

handicapped individuals should be capable of performing some form of unskilled work (even if it is just for a few hours one day a week) – and many are able to perform certain semi-skilled or skilled tasks (some might even manage to become ministers) – but some tasks could suit people with particular disabilities or handicaps more than able-bodied people (consider dwarfs – of which there are ‘about 250 in NZ’ – and any task that requires working in a confined area or being able to move through small spaces, or in outer space or whenever low body weight is advantageous; blind people and any task that could be done in the dark; deaf people and noisy tasks – but not if their being unable to hear places them in danger; people with no sense of smell and working in smelly environments).

As is the case today, some professions may require workers to undergo training throughout their career (consider the medical industry). Furthermore, any workers who are promoted to supervisors ought to receive some form of training in management theory (as well as spending time performing any tasks – including unskilled tasks – they are unfamiliar with but are performed by workers they will oversee), which could become more formal when a supervisor is in the process of being promoted to an organiser (each industry will have to work out how they can best access the performance of each worker, primarily for future reference when selecting people to be promoted – or dismissed; each worker’s record will need to be compiled by the person who oversees it, and stored on computer in such a way that the record can’t be tampered with by unauthorised people, while allowing the worker to access the record if it ever wants to check the details aren’t incorrect). However, there would be no monetary reward for being promoted in a moneyless society, and there shouldn’t be any material rewards either – the respect of colleagues and society in general, and personal satisfaction in receiving more responsibility, should be reward enough. Likewise, the only thing a demoted supervisor, manager or minister would lose is the respect of other citizens and, perhaps, self-respect. Assuming the process of selecting people worthy of gaining promotion works properly, there ought to be no cause for anyone to be demoted for making mistakes (mistakes would, however, be a sign that a person isn’t qualified to receive further promotions) – or for anyone to have a valid reason to protest about someone’s promotion (although people will be acknowledged as having the freedom to lodge a protest – and then defend their motives to the relevant ears) – or for unacceptable behaviour (be it at work or in social situations). Note that any worker who abuses its position of authority (be it at work or not) should be demoted to a position which has no authority – at least over other workers – although the demoted worker might have to assist its replacement if the replacement (who would normally be an incumbent deputy) isn’t ready to take on its new role; or until a deputy to the replacement has been found. Preferably, however, another manager – from the same management level or a higher level – or a semi-retired worker, should be found to act as the replacement’s mentor in such instances.

It might be possible to create a moneyless society overnight, but the process would be a lot smoother if such a society was formed in stages. The initial aim should be to have all of the citizens (including children) of a district receive the same amount of money each week (as already occurs ‘in parts of China’). In order to achieve this, the Employment Ministry could use the latest census results, taxation and beneficiary records, company employee records, electoral and school rolls to make up a list of the district’s total population. Once an initial list has been formed, the Employment Ministry could begin to pay an equal allowance to each member of the list on a weekly, fortnightly or monthly basis (it may be easier to start with monthly payments then work towards weekly payments). Ideally, the Employment Ministry should create a new account system for each payment (parents or caregivers can receive payments for children via one account) that can be accessed via existing automatic teller machines, but another option would be to use existing bank accounts as much as possible, cash payments via the point of employment when that isn’t possible, and have the remainder of the population visit an Employment Ministry office to receive cash payments (alternatively, a combination of existing accounts and cash payments could be utilised until a new account system can be introduced). The reason why a new account system would be ideal is because all other bank and investment accounts could then be closed down – meaning that, excluding any cash that a citizen may have stashed (which could be overcome by introducing a new currency), wealthy citizens wouldn’t be able to temporarily maintain their economic advantage over the rest of the population. However, it might be possible for current bank account balances to all be wiped before the Employment Ministry begins to direct-credit its payments into them. In addition, the use of a hard currency can be eliminated if existing technology is utilised to directly debit any purchase a citizen makes from its account – although accounts would have to be programmed to block purchases that will take them into overdraft. Debts incurred prior to the time of initiating a moneyless society (including those between countries) can be immediately forgotten – as is suggested by the biblical verse St Matthew 6:12 – while shares and other investments would automatically become worthless.

Citizens would be responsible for checking that they are on the list and their details are correct, and the Employment Ministry could be responsible for cross-referencing all the information available to it – including details of births and deaths – to find out if anyone is trying to double-dip or claim for children who don’t exist (or aren’t living with the person who is receiving their payment). The Employment Ministry can punish such offenders by reducing their payment by a set amount, publicising their names to create embarrassment and demoting anyone who is employed in a position of authority. It may be impossible to completely eliminate fraudulent payments, but the situation is unlikely to be any worse than it is at the moment!

The Employment Ministry can introduce extended parental leave and use its account list to ensure that every other able-bodied adult is working. Those who aren’t employed, or who have been made redundant because their industry has shrunk or disappeared, would have to be placed into a new position (even if it is just a temporary position as a labourer or cleaner). Any people who refuse to work at all, or who refuse to work the required amount of hours each week, may receive less than the normal amount of weekly pay as a punishment. The Employment Ministry shouldn’t pay extra to any people who end up working more than the required amount of hours – instead, there could be opportunities to reward such workers with non-monetary perks. Some industries might be understaffed to start with and have to remain so (meaning that the industry has to operate at a reduced capacity, or its employees have to work longer hours than normal) until additional staff have received adequate training – although their situation can be improved by returning retirees to the workforce. Retirees could also act as tutors, although it may initially be more useful in many instances to simply have trainees assist experienced workers – this would help to immediately decrease the workload of experienced workers. Attempts to decrease the number of weekly working hours and retirement age, or increase the number of holidays, should only be made once workloads have become uniform across every remaining industry.

It wouldn’t be essential for each district within a state to pay the same amount, or even to use the same currency (if purchases of services and products aren’t able to be directly debited from accounts), but each citizen within a district would have to receive enough to cover its expected living expenses. Each citizen or family will have to learn to cope with living on the amount provided. The living expenses of a child are likely to be less than an adult, but the balance can be given to the child as pocket-money.

Some industries (e.g., Education) could immediately provide their services (or produce) for free. Other industries would have to continue to provide their services at a cost (which ought to remain constant – i.e., unless shortages in supply demand that a price be altered upwards, there would be no justification for inflation) until doing so is no longer necessary. Each of these industries could estimate what they expect a citizen to spend with them each week or month, and the Employment Ministry can add up those estimates to find out how much the minimum weekly payment needs to be. However, prices or charges ought to be scaled according to importance (i.e., assuming they require equivalent resources to provide, a less essential service or product should not be less expensive than a more essential one – within an industry and in comparison to other industries). If the district has maintained the use of a currency, any money an industry receives will have to be sent to the Employment Ministry (which might have to maintain accounting services to keep track of such money). Industries should not have to charge each other for work performed, and neither should districts or states – therefore money wouldn’t need to be transferred between industries, districts and states. When an industry is able to stop charging non-industrial customers, the Employment Ministry can adjust the value of its payments downwards, and keep doing so until no industry is charging for services – at which time payments can be stopped.

...Hey poor Hey poor You don’t have to be poor any more... come inside...

HOME

shelter, as a habitation for the family group, had its origin in primitive bush dwellings and caves. Its character was determined by climate, the availability and adaptability of materials, and defense against enemies and the elements. The bush dwelling, in its most primitive form, consisted only of a roof made from branches and leaves or interwoven reeds suspended between trees or poles. From this beginning, it led to an entire category of framed structures involving the basic elements of post-and-lintel construction... In cold or temperate zones, the cave was a prevalent means of shelter... Where there were no caves a primitive structure evolved which was windowless and walled with rock, mud, and even ice and snow. The... natural stone or mud dwellings gave rise to the techniques of brick-making, masonry, stone-cutting, and joining, and the spanning of ceilings by various methods... Sociologically, the introduction in early times of stone and wood as building materials required male labor, and the female members of the family group were supplanted as the “housemaker[s].” Until recent times, architecture has concerned itself primarily with religious or secular public buildings. The private residences designed by architects were usually modelled after public buildings and were intended only for the wealthy or the ruling class. With the social and economic changes brought about by the events of the 19th and 20th cents., domestic architecture for the middle and lower classes has increased and become a principal preoccupation of the modern architect, as well as the modern family group. Despite enormous technological advances in central heating and new methods and materials of construction, sentimental notions of individual protection and defense have persisted with regard to the function of domestic architecture. Thus there are still thick walls and a minimum of window openings... The multicellular city apartment dwellings and the prefabricated private house of the 20th cent. have marked the appearance of a new era in domestic architecture, conditioned essentially by the interrelation of economics and industrialization... *town planning* is the physical organization of an urban community along lines beneficial to the population in general. A fairly recent development in human history, town planning as we know it today did not start until the days of the Roman Republics, at which time invading armies would set their camps in the shape of a square, intersected by two pathways which met in the square’s centre. Later, many of these camps became cities...

The name city is given to certain urban communities by virtue of some legal or conventional distinction. It also refers to a particular type of community, the urban community, and its generic culture, often called “urbanism.” In legal terms, in the U[S], for example, a city is an urban area incorporated by special or general act of a state legislature. Its charter of incorporation prescribes the extent of municipal powers and the frame of local government, subject to constitutional limitation and amendment. In common usage, however, the name is applied to almost every [US] urban centre, whether legally a city or not, and without much regard to actual size or importance. In A[US] and Canada, city is a term applied to the larger units of municipal government under state and provincial authority respectively. N[Z] has followed British precedent since the abolition of the provinces in 1876; the more populous towns are called boroughs... In... [Britain] itself, city is merely an official style accorded towns either in their historical identity as episcopal sees or as the beneficiaries *honoris causa* of a special act of the crown (the first... was Birmingham in 1889). Except for the ancient City of London (an area of about 677 acres in central London under the jurisdiction of the lord mayor), the title has no significance in local government in the U[K]. In all the other countries of the world, the definition of city similarly follows local tradition or preference... As a type of community, the city may be regarded as a relatively permanent concentration of population, together with its diverse habitations, social arrangements, and supporting activities, occupying a more or less discrete site, and having cultural importance that differentiates it from other types of human settlement and association. In its elementary functions and rudimentary characteristics, however, a city is not clearly distinguishable from a town or even a large village. Mere size of population, surface area, or density of settlement are not in themselves sufficient criteria of distinction, while many of their social correlates (division of labour, nonagricultural activity, central-place functions, and creativity) characterize in varying degrees all urban communities from the small country town to the giant metropolis... It was no accident that the earliest of [humanity]’s fixed settlements are found in the rich subtropical valleys of the Nile... Tigris... Euphrates... Indus, and... Yellow rivers or in such well-watered islands as Crete. Such areas provided favourable environmental factors making town living relatively easy: climate and soil favourable to plant and animal life, and adequate water supply, ready materials for providing shelter, and easy access to other peoples. Although [humanity] with ingenuity has been able to utilize almost any environment for town living, environments favourable to the production of food and shelter and ease and comfort of living clearly possess advantages for the beginnings of urban life... Preurban developments that paved the way for urban life... included such factors as traditionalism, a power structure, and a form of economic as well as social organization. Traditionalism lay in the acceptance and transmission of what had worked in the life of the group and was therefore “right” and to be retained. Some form of power structure involving subordination was necessary, for leadership was a vital element in urban living... Also prerequisite to group life were new economic and social institutions and groupings such as property, work, the family, a system for distribution of commodities and services, record keeping, police for internal security, and armed forces for defense. New value orientations and ideologies may also have affected the course of urbanization, though their importance is still highly conjectural. There are those who have felt that urbanization depended on a new outlook; it meant people had become more rationalistic (and less mystical); it meant that, for purposes of building, they were more willing and able to defer immediate for more desirable later gratification; it meant more emphasis on achievement and success as distinguished from status and prestige; it meant a cosmopolitan as distinguished from a parochial outlook; and it meant that relations between people were more ordered, impersonal, and utilitarian, rather than only personal and sentimental... About 10,000 years ago in the Neolithic Period, [our ancestors] achieved relatively fixed settlement, but for perhaps 5,000 years such living was confined to the semipermanent peasant village – semipermanent because, when the soil had been exhausted by the relatively primitive methods of cultivation, the entire village was usually compelled to pick up and move to another location. Even when the village prospered in one place and the population grew relatively large, the village usually had to split in two, so that all cultivators would have ready access to the soil... [The] Neolithic... domestication of plants and animals eventually led to improved methods of cultivation and stock breeding and the proliferation of... crafts, which in turn eventually produced a surplus and freed some of the population to work as artisans, craftspeople and service workers... By 3500 BC urban populations were distinguished by literacy, technological progress (notably in metals), social controls, political organization, and emotional focus (formalized in religious-legal codes and symbolized in temples and walls)... Cities proliferated along overland trade routes from Turkestan to the Caspian and then to the Persian Gulf and eastern Mediterranean. Their economic base in agriculture (supplemented by trade) and their political-religious institutions made for an unprecedented degree of occupational specialization and social stratification. From central vantage points, cities already gave some coherence and direction to life and society in their hinterlands. The growth of cities, however, was by no means the inevitable outcome of a succession from primitive life to civilization. As... “Role of the City in Ancient Civilizations” (in *Metropolis in Modern Life*... [1955])... pointed out... an alternative

and, in some ways, inimical type of community had arisen in the steppe-lands of Asia based upon animal husbandry: the nomadic encampment. Like their urban contemporaries, the nomads were no longer “primitive”... In addition to pastoralism, they had developed great oral traditions, abstract art styles, and numerous crafts, albeit no formal architecture. Led by warrior chiefs, these self-sustaining migratory peoples encroached upon the settled agricultural-trading areas to the south. During the 2nd millennium the Indus civilization was engulfed by an onslaught of Aryan nomads, while other peoples, using horses and chariots, penetrated the urban heartland from Mesopotamia to Egypt. In these circumstances of prolonged upheaval, survival required the perfection of warlike arts and predatory supply systems, which transformed the urban communities into paramilitary states – e.g., the Hittite, Egyptian, and Mycenaean empires. Citizenship, though still a ceremonial service, was increasingly associated with the bearing of arms. After 1200 BC even the city-empires (a city-camp hybrid) lapsed into chaos and disorder until the lifting of the Hellenic “dark ages” during the 8th century BC and the transplanting of the syncretic city-state beyond the eastern Mediterranean by Phoenicians and Greeks... The heterogeneous peoples that created the Greco-Roman world inherited a technological and nonmaterial culture from [SW] Asia which helped mollify barbarism and nourish the growth of cities. Their trading colonies, from the Crimea to Cadiz, eventually brought the entire Mediterranean within the orbit of civilization. It was in the Greek city-state, or *polis*, however, that the city idea reached its peak. Originally a devout association of patriarchal clans, the *polis* came to be a small self-governing community of citizens in contrast to the Asian empires and nomadic hordes. For citizens, at least, the city and its laws constituted a moral order symbolized in magnificent buildings and public assemblies. It was, in Aristotle’s phrase, “a common life for a noble end.” When the old exclusive citizenship was relaxed and as new commercial wealth surpassed that of the older landed citizenry, social strife at home and rivalry abroad gradually weakened the common life of the city-republics. The creativity and variety of the *polis* gave way before the unifying forces of king-worship and empire epitomized by Alexander the Great and his successors. To be sure, many new cities were planted between the Nile and the Indus through which the amenities and forms of city-culture were carried back to the east, but the city itself ceased to be an autonomous body politic and became a dependent member of a larger political-ideological whole. The Romans, who fell heirs to the Hellenistic world, transplanted the city into the technologically backwards areas beyond the Alps inhabited by pastoral-agricultural Celtic and Germanic peoples. But, if Rome brought order to civilization and carried both to barbarians along the frontier, it made of the city a means to empire (a centre for military pacification and bureaucratic control) rather than an end in itself. The enjoyment of the imperial Roman peace entailed the acceptance of the status of *municipium* – a dignified but subordinate rank. Initiatives passed to the centre; and, in the east, the culture of provincial cities became imitative, their politics trivial. They contributed little to the larger economic life beyond the needs of their social elites and the payment of taxes; they tapped the surpluses created by local agriculture and trade in rents and tribute. As Roman citizenship became more universal and formal, the idea of public duty gave way to private ambition. Municipal functions atrophied; and, except for their fiscal duties, it was in a passive role that the city survived into the Byzantine era... In Latin Europe neither political nor religious reforms could sustain the Roman regime. The breakdown of public administration and the breach of the frontier led to a revival of parochial outlook and allegiance, but their focus was not upon the city. Community life now centred on the fortress (*burgum*) or castle (*castellum*); the term city (*civitas*) was attached to the precincts of the episcopal throne, as in Merovingian Gaul. Early medieval society was a creation of camp and countryside to meet the local imperatives of sustenance and defense. With Germanic variations on late Roman forms, communities were restructured into functional estates, each of which owned formal obligations, immunities, and jurisdictions. What remained of the city was comprehended in this feudal-manorial order, and the distinction between town and country was largely obscured when secular and ecclesiastical lords ruled over the surrounding counties... as the vassals of mock emperors or barbarian kings. Social ethos and organization enforced submission to the common good of earthly survival and heavenly reward; the true city, *civitas Dei*, was not of this world. The attenuation of city life in most of [NW] Europe was accompanied by provincial separatism, economic isolation, and religious otherworldliness. Not before the cessation of attacks by Magyars, Norse[people], and Saracens did urban communities again experience sustained growth. Recovery after the 10th century was... fostered [by] a new era of increased tillage, enlarged manufacture, money economy, the growth of rural population, and the founding of “new towns,”... In almost all the medieval towns the role of the merchant was central: his needs and aspirations had a catalytic effect and, largely as a consequence of mercantile enterprise in the long-distance staple trade, cities were to flourish once more. Under commercial stimulus, feudal obligations were relaxed and European society was made over anew by the city and the marketplace in pursuit of self-government and economic gain... It was no coincidence that the 12th and 13th centuries, which saw the founding of more new towns than any time between the fall of Rome and the Industrial Revolution, also witnessed a singular upsurge toward civic autonomy. Throughout western Europe, towns acquired various kinds of municipal institutions loosely grouped together under the designation “commune.” Broadly speaking, the history of medieval towns is that of the merchant elites seeking to free their communities from lordly jurisdiction and to secure their government to themselves. Wherever monarchical power was strong, they had to be content with a municipal status, but elsewhere they created city-states. Taking advantage of renewed conflict between popes and emperors, they allied with local nobility to establish communal self-government in the largest cities of Lombardy, Tuscany, and Liguria... [T]he corporate freedom of the towns brought emancipation to individuals... In the 14th c... the urban movement subsided as Europe entered... a period of political anarchy and economic decline that did not much abate before the 16th c... At a time when local specialization and interregional exchange required more liberal trade policies, craft protectionism and corporate particularism in the cities tended to hobble the course of economic growth. The artisan and labouring classes, moreover, now challenged the oligarchical rule of the wealthy... and gentry, disrupting local government, and ultimately destroyed the basis of civic autonomy: prolonged social warfare led to “popular” despotisms and fiscal bankruptcy. Visitations of plague, fanatical crusades against heresy, and Turkish encroachments on the routes to Asia worsened conditions in town and country alike. Europe turned inward upon itself; and, except for a few large centres, activity in the marketplace was depressed: the cities surrendered their liberties and their population. These centuries of decline were relieved only by the slow process of individual emancipation and the cultural efflorescence of the Renaissance, which laid the intellectual basis for the great age of geographical and scientific discovery exemplified in the new technologies of gunpowder, mining, printing, and navigation. Not before the triumph of princely government, in fact, did political allegiance, economic interests, and spiritual authority again become centred in a viable unit of organization, the absolutist nation-state... The virtue of absolutism in the early modern period lay in its ability to utilize the new technologies. Through the centralization of power, economy, and belief it brought order and progress... and provided a framework in which individual energies could once more be channeled to a common end. While the nations stripped the cities of their remaining pretensions to political and economic independence (symbolized in their walls and tariff barriers), it created larger systems of interdependence in which territorial division of labour could operate. Though new mercantilist policies built up national wealth, they did not necessarily foster the growth of cities. All too often the wealth of nations was dissipated by war... o[r]... went to bolster the monarch’s power and advertise his fame; the splendour of court life and the baroque glory of palaces and churches were paid for by merchant enterprise and the toil of peasants and crafts[people]. Only in colonial areas, notably the Americas, did the age of expansion see the planting of many new cities, and it is significant that the capitals and ports of the colonizing nations experienced their most rapid growth during these years... With the exceptions of [the UK and Holland], however, the proportion of national populations resident in urban areas nowhere exceeded 10[%]. As late as 1800 only 3[% of the] world... lived in towns of more than 5,000 inhabitants.

Over 3,000 years ago, the world’s three largest cities were... the Egyptian cities of Thebes (100,000 people) and Memphis (74,000) and the ancient Asian metropolis of Babylon (54,000). One thousand years later, Rome had become the largest city with almost 600,000 inhabitants. By 1,000 A.D.,

the leading giants had become Cordova, Spain and Constantinople (both around 450,000). The first city to top 1 million inhabitants was the Chinese capital of Peking, late in the eighteenth century. It was only with the Industrial Revolution that the process of urbanization accelerated rapidly. In England, the first centre of industrialization, the imperial capital of London reached 2.3 million by 1850... and the incredible size of 6.5 million by 1900. In that year, twenty metropolises boasted 1 million-plus populations, a number which tripled during the next four decades. World urban growth has soared even more dramatically since 1950. Between then and 1975, the total number of metropolitan dwellers in the world more than doubled. Even more alarming, urban demographers project that the 1975 total may triple by the year 2000. At the beginning of the next century, the metropolitan area of Mexico City is expected to be the world's largest city with a population of 31.6 million[(in the early 1960s, Mexico City's 'Federal District – the city and surrounding towns – had a population of nearly 5 million'; in '1980, Mexico City's population was estimated at 16,000,000'). According to UNFPA projections, the percentage of the world's people living in cities will rise from 41 to 51[%] during the next twenty years. The figure was 19[%] in 1920... The world's poorest regions are urbanizing most rapidly... [F]rom 1950 to 2000, Africa will establish the pace among the eight major world regions with a 981[%] increase in city dwellers, from 32 million... to a projected 346 million... By 2000, U[N] demographers project a grand total of 82 cities in the 4 million range, 61 of them in today's [Last World]... Furthermore, of the 191 world cities over 2 million (there were 30 in 1950), two-thirds will be located in today's... [Last World]. Of the 440 cities over 1 million... again 2 of every 3 will be located in today's [Last] World... These burgeoning [Last] World cities face the stiffest challenge of all in meeting the employment and basic service needs of newcomers from the rural countryside... The urban horrors that Charles Dickens described so vividly in nineteenth century London will seem slight compared to the ills that await [Last] World cities in the coming years. - 1982

Every time a census is taken in the U[S], a flurry of attention is given to the shifting patterns of the population. The newspapers are full of stories that detail the number of rich who have left the cities... It seems reasonable to suggest that this natural migration could conceivably be encouraged on a much wider scale to offset the strains of overpopulation. One such concept that particularly interests me is a plan designed to alleviate the living conditions of disadvantaged people in the nation's large urban centres. Under this plan, families already receiving government assistance – such as those on welfare or, perhaps, unemployment insurance – would be eligible for government-funded relocation from urban ghettos to a variety of areas where living conditions and job opportunities were better. - 1984

...urban areas need to be greened and made pleasant to live in... In a green society, towns will not grow beyond the ability of the countryside around them to provide fresh and healthy water and food, recreation, timber and wildlife habitats... Rural and urban communities... are not separate from each other and one should not dominate the other... Greens would maintain... a constant flow of environmental, social and cultural information between them. Towns will return compostable materials to the countryside... The ideal green solution would be for each town or village to contain all the facilities for work, social and cultural activities required by the community, and to be surrounded by an agricultural hinterland that feeds it. All such settlements should fit into the ecosystem with minimum disruption to it...

'If one were to look for the single basic building block of the ecological world, it would be the community'... [T]he 'human animal' has historically favoured communities of 500 [to] 1,000 people for face-to-face contact and 5,000 [to] 10,000 'for the larger tribal association or extended community'... Communities much bigger than this are regarded as undesirable because they cannot be sustained on their own resources... [and] 'it is probable that only in the small community can a... [human animal] be an individual'... Greens (and particularly bioregionalists)... are also likely to suggest that... a federation of communes is the only viable political-institutional form for the sustainable society to take... The idea is that resource problems are best solved by bringing points of production and consumption closer together – we should no longer be talking of producers and consumers but of "prosumers"... though, the arguments that... surround Green communitarianism are familiar: is it practical? would such a life be stultifying? what would the relationship between communes look like? and so on... Similarly... the classic left position... [is] that 'The number of people which can be supported by an area of land is not given by nature, but by the sort of society in which they are organised'... - 1990

Our population is increasing, but available land for housing is steadily decreasing... Home ownership is still the aim of most people, although... [c]hanging government policies and a swathe of new terms... have caused a certain amount of confusion as everyone wonders how it will affect them, their homes and their dreams... So, rather than getting upset about change, it is better to investigate what these terms mean... *Medium-density housing* Mention medium-density housing and watch people become defensive about the "quarter-acre block". Two images seem to predominate – that of blocks of units overshadowing and overlooking their own backyards, and the soulless and endless concrete apartment blocks of Eastern Europe. A recent survey shows that most A[US]ns think they do live in medium-density housing, including 39[%] who live in houses on full blocks! ...Until the advent of the car, housing had to be within walking distance of work or close to public transport, such as trains. These older semi-detached and terrace dwellings, now being enthusiastically renovated, actually provide about 40 to 50 dwellings per hectare, a medium density, compared with the low density of eight to 12 dwellings per hectare in traditional detached housing. With small lots, townhouses and villas, a medium density of 20 to 40 dwellings per hectare is easily achieved. Medium-density housing can be created in carefully planned new sites, or by adding additional dwellings to existing full block areas where regulations permit. In the newly developed medium-density areas, thoughtful street planning has kept busy and hazardous through traffic to a minimum, with many houses planned around cul-de-sacs, and narrower streets that reduce the speed at which vehicles travel. This creates a far safer and more pleasant environment. For most occupants of the new developments, medium-density housing has many benefits which have improved their lifestyles, including better planned outdoor space, quieter streets, better communal facilities and transport and more attractive surroundings. *Urban consolidation* In the older parts of our cities, the population has generally been falling steadily for some time, as families have moved to larger blocks and singles and young couples enjoyed the convenience of inner city living. "Urban consolidation" means the government would like to encourage more people back to the existing urban areas, where the provision of services such as electricity, roads and public transport is already well established and there is less public cost in increasing the number of new dwellings. While many inner-city houses will not be suitable for dual occupancy; as small industries relocate and their larger sites become available, these can be re-zoned as suitable for residential development... *Dual occupancy* "Granny flats" are most people's idea of dual occupancy, and until recently were about all that could be done with the average suburban block. Now in many urban areas, an existing house on a lot larger than 400 square metres can be converted to dual occupancy by extending it either out or up; and on some blocks over 600 square metres, a separate dwelling may be erected... Dual occupancy can be used to allow relatives to live with families in separate accommodation... or to provide rental income for the home owner. The property owner does not need to live in either of the dwellings. *Zero lot lines* This is an American term meaning "building to the boundary", or specifically, placing one windowless wall on the side boundary. Sometimes a garage or carport can also be incorporated, extending to the front boundary. This technique makes better use of space on smaller sites by creating one larger and private side yard per block, rather than two narrow side passages which are each overlooked by the neighbouring houses. Front and rear setback conditions for siting houses may also be varied with council approval, to provide better access to sunlight and giving scope for better design and orientation of houses. *Cluster housing* Generally, this refers to housing estates which have single-storey, detached houses on smaller lots, but planned around additional community open space. The... idea is to achieve medium density while maximising outdoor space through overall planning concepts. *Multiplex developments* Duplex, triplex and multiplex developments are larger houses designed to look like one big house while actually being

divided into two, three or more residences. Larger old houses can be successfully divided without dramatically altering the exterior. This type of redevelopment can be very effective in retaining character in areas where existing houses are large. *Relocatable homes* These are not to be confused with mobile homes, which are like very large caravans. The relocatable home is manufactured in a factory and then transported to the site in two sections by semitrailer. Once in position, the two sections are joined and any decks or verandas added. Internal walls are painted, curtains and floor coverings are installed and the house is ready for occupation. The relocatable home can be delivered to your own block of land, or to a park or estate which will give you long-term lease of a site and additional communal facilities. Where detached dual occupancy is permitted, a relocatable home can be a speedy way of adding an extra dwelling. The house can be sold and removed if necessary, or taken with you to a different site later.

...Facing France's Loire River stands a line of strange constructions cut into the rock of the cliff side. These are the troglodyte dwellings, whose inhabitants "came up to the surface" in the wake of the industrial revolution. People had begun to dig into the earth [t]here in the 11th century, to extract the material for the Loire chateaux and the neighbouring towns. The more buildings rose above the earth, the bigger the holes in the valley became. Today, more than 300 people still live in the troglodyte dwellings. The "troglos" used to be sold for next to nothing. Today, it's a different story – fashion has caught up with the troglos and their owners refuse to sell, as prices continue to rise. About a third of the restored cellars are owned by Parisians, who come to play troglodytes during the weekends. This infuriates the purists. They say the troglos should be lived in all year or they will suffer from damp. If properly heated, aired and looked after, the "cave" becomes a quite healthy place to live in. - 1991

If people will use industrial technology equitably and wisely, they may at last, in the words of... Gandhi, "make... Earth a fit home for [humanity]." ...The centralized management of the Soviet industrial revolution achieved, beyond doubt, its greatest success in the necessary and concomitant urbanization of the population. Between the two wars, the Soviet Union had built nearly a thousand new cities. Their planning turned on a nuclear module of about 10,000 people housed in multifamily apartment buildings. Along with the modest (by European and American standards, minimal) apartments, the module produced the requisite number of classrooms (elementary and secondary), food stores and other consumer services, clinics, public places, and gardens. The land, having no value in a socialist economy, afforded generous green space around and between the modular centers in the new cities... Middle management and blue-collar workers enjoyed approximately the same square footage of dwelling space. By most accounts, these arrangements have been agreeable to the citizenry... In the [most] comprehensive survey of modern Soviet society assembled... the reader finds, that [the] urban population increased from 33[%] of the total population in 1940 to 60[%] in 1970; the average number of persons per household was 3.7 in 1970, compared with 7 persons a century ago. By 1970, 86[% of gals] of working age had... jobs; 78[%] of households had two employed members, and the natural rate of population increase declined to 0.8[%] from 1.3... in 1940... No one, in 1950, planned for the requirements of a [world] population doubling to 5 billion today... [(Editor's note: 'The human population reached its first billion mark around 1800, and 130 years later, in 1930, had doubled to 2 billion. In just 45 years, by 1975, it doubled again to 4 billion, cutting the doubling time by 2/3rds. The 5 billion mark was reached in 1987. However, these figures are only crude estimations based on census counts. Not all countries take a census of their people, and those that do inevitably undercount populations. Furthermore, the migrations of large numbers of people from war-torn or impoverished regions make accurate census-taking impossible. Therefore, the actual number of people in the world is probably higher than indicated.')] Recent projections show the world population increasing to a total of... more than 6 billion in the year 2000. Significantly, they show fertility in countries with a total population 3.3 billion in 2000 reaching the "replacement" rate... – that is, the "net reproduction rate" of 1, at which [gals], on the average, bear a single daughter... – ...during the following decade. That portion of the world population continues to grow, from lengthened life expectancies, for about a generation thereafter to a projected stable total of 4.4 billion. The 3.3 billion is the population in 2000, first of all, of the countries classified as having attained "high human development." These are the [First World] countries, many of them already at the replacement fertility rate, plus most of the newly industrializing countries that are now treading toward that rate. To the 3.3 billion total, however, a significant group of other countries... also add their populations. The largest addition to the total is the population of China... To see that country arriving at the replacement fertility rate before 2010, it must be assumed that the present trend in fertility, fostered by the country's equitable income distribution and its heavy investment in the formation of human capital, will persist. The... projections show India bringing the next hugest national population, 994 million in 2000, to the replacement fertility rate early in the following decade. The growth momentum in the Indian population, owing to the presence of a large number of young people with their childbearing years ahead of them, carries the country to a projected ultimate stationary population of 1.7 billion. That is 100 million larger than the ultimate... population projected for China. The addition of India's 1.7 billion to the 4.4 billion accounts for about 6 billion of the world's projected stable population of 10 to 11 billion... ['According to the 19th-century English economist Thomas Malthus, the lowest level of subsistence is a food supply just sufficient to sustain life obtained by the maximum work effort the population can exert. Malthus also believed human populations are limited by the food supply because they grow geometrically (by increments of 2, 4, 8, 16, 32, and so on), while food production only increases arithmetically (2, 4, 6, 8, 10, and so on). Humans tend to increase their numbers beyond the carrying capacity of the land until famine, war, or disease wipes out the excess.' Yet 'efforts to limit the number of births by contraception and abortion are rejected by large parts of the world. In parts of India your wealth and prestige is measured by how many children you have, while much of the rest of the world is Roman Catholic. Religious practices, customs, etc., have been too much to overcome. But the biggest factor in the current population rate of increase is the fact that modern medicine has vastly increased the number of people who survive childhood and grow to maturity and live to a ripe old age. The story is told of an English missionary doctor who spent years bringing medical care to a remote African village. Before his arrival, only 2 of 8 children survived to maturity. Due to immunization, insect control and modern medicine, 8 out of 10 children survived to maturity. When the doctor pointed with pride to this accomplishment, the chief of the tribe said, "Wonderful! But who will feed them?"] The explosion that will produce nearly half of the projected ultimate world population presently engages the populations of the countries recognized as the poorest and most backward. Among these are Pakistan and Bangladesh in South Asia; Iran and the Arab countries of Asia Minor and North Africa, including the richest oil exporters; most of the countries in sub-Saharan Africa, and the lagging Latin American economies. They have a present combined population of 1 billion... China... stemmed and diverted the pressure of its growing population by locating industries in the villages, by building new industrial cities, and by rigorous policing of internal passports... [but t]he continuing growth, at 1.2[%], of China's one-fifth of the world population has compelled the country to permit its bigger and older cities to grow. Shanghai is already one of the more-than-10-million agglomerations; Beijing is projected to join it in A.D. 2000. China has succeeded, however, in housing its urban populations in buildings that meet its minimal standards, at least, by massive building campaigns. Such campaigns... have not [always] fared as well. In a slum-clearance drive, authorities in Seoul, South Korea, displaced 100,000 households to "replace" them with 16,000 dwellings. Nigeria, in a \$3.5 billion campaign that the country could ill afford, built 100,000 new dwellings, which were promptly occupied by the better-off... The... world's poorest billion people... are bound to procreate and to increase in number. No power at human command is authorized to remove or to reduce their presence; none can forbid their procreation. Their numbers are fated to increase. What the fortunate... people... can do is help them to arrive at that improvement in the human condition at which they will be glad to bring their population growth to a halt... ['To blame the Last World for its poverty and overpopulation is merely an excuse for the richer countries to do nothing about the way in which resources are distributed globally or, indeed, their own population problems. The fact is that Holland is twice as densely populated as India, and Britain is two and a half times more densely populated than China. Western Europe has a population density of 94 people per square kilometre in contrast with the average Last World country of 34 people. The 16

million or so babies born in the First World will have an impact on the world's resources that is four times greater than that of the 109 million born in the Last World. Rather than preaching to the less developed countries about population levels, an examination of the global distribution of wealth would do more to aid the population crisis than all the money spent by the First World on family-planning programmes. The selfishness of the developed countries, which analyse issues in their own terms and disregard global perspectives, is legendary. They should all be considering alternative social systems designed to sustain life for all.' Outside of] the centrally planned economies... [it] has proved impossible... to stop the implosion of... landless people... from the villages into the cities... In the shantytowns that surround those cities on every continent, half or more of their populations live in shelters they have contrived for themselves. People live in these communities without any of the amenity afforded to the rest of the urban population by the infrastructure and public utilities of the city proper. - 1992

Most of the roughly 100 million homeless people in the world are [gals] and children, and up to 600 million live in inadequate, unhealthy shelters, says the U[N]... In its bleak assessment, the U[N] report says 50,000 people – mostly [gals] and children – die daily because of poor shelter, polluted water and bad sanitation. About 70 million [gals] and children live in homes where cooking-fire smoke damages their health. If housing could be brought up to a minimal accepted standard, there would be 5 million fewer deaths and 2 million fewer disabilities a year, the... [UN estimates. However, p]roposals to declare housing a human right are opposed by some [Last] World countries, which fear a legal obligation to house the poor.

...the U[N] High Commission for Refugees[says the]... total number of... people... uprooted... [by] armed conflicts since... W[W2]... is estimated to be... 50 million. [80% are gals] and children, while 90[%] of war casualties are now civilians, not combatants. So who is a refugee? According to the 1951 Refugee Convention, a refugee is a person who: "...owing to well-founded fear of being persecuted for reasons of race, religion, nationality, membership of a particular social group or political opinion, is outside the country of his nationality and is unable or, owing to such fear, is unwilling to avail himself of the protection of that country..." Debates on immigration at times risk confusing refugee issues with immigration concerns and lead to an unfortunate misconception that refugees are the same as migrants, that all asylum seekers are would-be immigrants trying to by-pass immigration rules. Unlike most other people who leave their country, refugees seek admission to another country not out of choice but... necessity, to escape threats to their most basic human rights. Left unprotected by their own governments, refugees have no choice but to seek the protection elsewhere. As uprooted foreigners, usually with scant material resources, often without passports or documentation, deprived not only of the protections of a government but also of the traditional protective structures of family, clan and community, they are perhaps the world's most vulnerable people... The right to seek sanctuary from persecution is one of civilisation's oldest principles. Throughout history, people have welcomed the persecuted stranger and granted asylum. Better-known refugees include Jesus Christ, Mohammed, Albert Einstein, Sigmund Freud... and Lenin. But it is only in the 20th century that action to protect refugees has been organised on a world-wide basis. UNHCR and today's international system of refugee protection were born in response to the suffering caused by... W[W2]... The 1951 Convention relating to the Status of Refugees, supplemented by a 1967 protocol, is the Magna Carta of international refugee protection. [2/3]rds of the world's states... are parties. The convention's most basic premise is that states may not force a refugee to return to a country where... [it] has a well-founded fear of persecution. Over time, even most non-signatories have come to accept this as a customary rule of international law. Under the convention governments assume basic obligations towards refugees... In general, these rights only amount to treatment on a par with that of other legally resident foreigners. Asylum countries do not have to keep refugees who are a threat to their security. The Convention also excludes people who are undeserving of protection from being granted refugee status – [e.g.], those who have committed war crimes, or serious non-political crimes. The Convention also recognises that people can cease to be in need of protection as refugees – [e.g.] if fundamental changes take place in their home country. Enforcement largely rests on the goodwill of states... In the last 45 years, the overwhelming majority of refugees have found protection under this regime. N[Z] was one of the early countries to become party to the convention, in 1960. There are two ways in which refugees come to N[Z]. 1]st, an annual quota programme provides for up to 800 recognised refugees to be resettled in this country. Resettlement is a valuable solution to the predicament of refugees, but it is a last resort – where it is not possible for refugees to return home safely or to remain in the neighbouring country where they initially sought refuge. N[Z] plays a valuable role as one of only ten countries which offer regular resettlement quotas... [But N[Z]'s geographical isolation has led to it sheltering far fewer refugees than other countries closer to the scene of conflicts... 2]ndly, there is the asylum channel, where people who are temporarily in N[Z] can apply for recognition as refugees. Those who turn out not to be refugees are subject to normal immigration procedures, including removal... N[Z]'s most significant roles in helping refugees began with an intake of 860 Polish orphans and other children... in 1944. The event is commemorated in a plaque... which reads: "You gave us shelter when we were homeless." Since then N[Z] has given protection to more than 20,000 refugees and displaced people... In 1959, during U[N] World Refugee Year, N[Z] was a pioneer in opening its doors to disabled refugees and their families, many of whom had been living in camps since... W[W2]. This initiative prompted the U[N] High Commissioner for Refugees... to declare in 1964: "Throughout the world, this breakthrough of N[Z]'s took on a significance that far transcended expectations. The international significance of N[Z]'s humanitarian action [went] far beyond that of this particular scheme. In fact it set off a whole chain reaction which saw a succession of overseas countries follow suit with similar programmes." In 1989, N[Z] became the second country to set up a special quota for "[gals]-at-risk," in recognition of the fact that... [gals] are among the most vulnerable of refugees.

...Though they do not know it, the... children represent a social time-bomb which Hong Kong is in no way equipped to defuse. They... represent a new wave of migrants, potentially the greatest since refugees poured in... from newly communist China in the 1950s... [The girl], aged 5, squats on a bunk among plastic bags, pots, pans, food and clothes, squinting in the permanent gloom at a book. Nearby, her six-year-old brother pushes a truck along cracks between floor tiles so laden with years of filth they have formed dirt roads... When they first started living... [here] six months ago, the children became seriously ill because the place was so filthy... [T]hey share with their father... a "cage-home," an airless rabbit warren of a room, pervaded by the smell of urine and faeces, up seven flights of narrow, stained stairs. [The cage-home building's rooms are normally rented by guys], most of them elderly itinerant workers or invalids. It is hardly a place to raise children. But the two... children ended up here because one of those sick, if not so elderly, [guys] is their father... The smell of years of uncleaned excrement... [from] the one toilet [which is] shared by nearly a hundred... [residents] is so powerful it hurts the nostrils. Studying is about the only thing the children can do. Playing is out, said their father... because it leads to "trouble." [Their dad] has a deep cut on the bridge of his nose because... [it] was beaten up by another resident whom [it had] accused of "interfering" with his daughter. "I don't like the way some of them look at or play with my daughter," [the dad] muttered giving me a look any parent, anywhere in the world would understand... Cage homes are so grotesque that many middle class Hong Kongers believe they no longer exist. They evolved fifty years ago when the more than one million refugees fleeing communist China arrived in Hong Kong with nowhere to live. Enterprising flat owners filled rooms with three tier bunks, covered them with chicken wire (hence the name "cage home") and rented out the bunks as bed-spaces. New immigrants cannot apply for public housing until they have lived in Hong Kong for seven years, so they are providing the cage-home landlords with an ever growing source of tenants to replace the Hong Kong poor who have managed to climb the rental ladder. [The girl and her brother aren't] the only immigrant children living in cage homes... [A]n 11-year-old boy left a two-storey house in a Chinese village where [it] kicked soccer balls in the streets with his friends, for a bunk shared with his father, an elderly construction worker [it] barely knows. The boy arrived with his mother... who throughout 26 years of cross-border marriage believed her husband was a wealthy [person]. At 52, after years of applying for a permit, [the boy's mum] got her chance to come to Hong Kong and seized it, determined her youngest child would realise her dream of wealth and success... [The mum] packed her things, said goodbye to her envious neighbours and set off in triumph. Now [the mum]

spends her days lying on a bunk in the [gals'] section of the cage home, separated from her husband and son and robbed of a lifetime's dreams. When I asked how [the mum felt when it] discovered the truth about her husband's life in Hong Kong, [it said nothing, though it] didn't have to, the sadness on her face made words redundant. Finally [the mum] whispered "The living conditions are much better in China." Though her life in China was far better, [the mum] is not going[back. Firstly, the mum] cannot go back and admit failure, but secondly, and more importantly, [it] is here to find a future for her son.

...Thirty-nine people have been confirmed dead in a fire in a high-rise... building in downtown Hong Kong yesterday. Officials said 79 people were injured and 39 were still missing. People trapped behind sealed windows in the 16-storey... block tore off their burning clothes, Government radio said. Others tried to jump to safety or were forced to cling to air-conditioners or wave frantically through small vents. One firefighter was killed after falling into an elevator shaft and four others were taken to hospital. The... Governor... inspected the rescue operation and... praised the firefighters for their bravery and said regulations would be tightened to prevent similar disasters... [In local news, the] Fire Service is concerned at how quickly a fatal fire swept through a Howick house on Saturday and will investigate the insulation. The owner of the home, Christopher John Bower, a 31-year-old supervisor, died in the blaze. Three [of his] friends... escaped through rear windows... Mr Bower's body was found in the lounge of the house after the 6 am blaze gutted the modern two-storey home... The fire was initially treated as a homicide, although an autopsy showed no suspicious signs... The cause of the blaze has still not been determined, but a Fire Service safety hazards manager... was concerned about the amount of thick, black smoke produced by the fire, how far and quickly the flames spread, and the apparent breakdown of the insulation material... the insulation... was a new material which was commonly used, but [the manager] would not name it until further investigations had been carried out. If the insulation proved to be faulty, the finding would have wide-ranging implications for home owners and insurance companies...

The Government has backed off its long-awaited plan to make N[Z] homes warmer after being threatened with legal action. [The]Rotorua-based... builder of Lockwood homes, fears it will lose sales if it has to meet higher insulation standards. It has support from the Business Roundtable, which also objects to the planned tougher Building Code. Since 1977, N[Z] homes have had to be insulated to the standard considered appropriate for Auckland's relatively warm climate. The code was regarded as interim but has remained for nearly 20 years. In that time, more than 370,000 houses have been built, many of them in areas with cooler climates than Auckland's. The thermal performance of N[Z] houses lags behind that of most developed countries. Collectively, they put significant demand on energy resources, while their owners bear the brunt of electricity price increases. Houses are usually expected to last about 100 years [(although most 'modern homes have a pathetic 65-year life span')] and cannot be fully insulated once built... Lockwood... said yesterday that the costs of meeting the new standards for solid wood construction houses would be between \$5000 and \$7000. This would penalise Lockwood houses. The proposed insulation standard is not regarded as a radical step. It would have applied only to the South Island and the North Island's central plateau, leaving unaffected many North Island areas that are cooler than Auckland. Officials from the Building Industry Authority who did the preparatory work for the new standard, sent it to the... Department of Internal Affairs... for Government approval. The Minister of Energy... revealed in answer to a written parliamentary question this month that... [Lockwood] lobbied intensively against the standard, sending copies of its objections not only to the authority [and himself] but also to... the Minister of Finance... and Minister of Commerce... [The Finance minister] accepted the advice of his department and sent the matter back to the authority and the Energy Efficiency and Conservation Authority, asking whether they had taken into account the issue of "embodied energy" when looking at the requirement for homes to be energy-efficient. That would mean considering not only the amount of energy required to heat a house during its lifetime, but the amount of energy it takes to build it to the higher insulation standard. One of the officials who worked on the standard, the authority's technical adviser... said... energy savings over the life of a house would be many times the extra energy used building it to a particular energy-efficiency standard. [The adviser also] thought the cost of meeting the standard would be much less than \$5000... [In related news, t]he near-pristine Okura Estuary has come out the winner in a long running legal argument over whether North Shore City urban sprawl should swallow it up. The Environment Court issued its judgment yesterday on the metropolitan urban limits case which has for years pitted Auckland councils, Government departments and wealthy landowners against each other in a battle over development of the estuary shores. The... decision, released after a five-week hearing said to have cost all the parties well in excess of \$1 million, has effectively saved the ecologically sensitive estuary from urbanisation... Asked for responses to the result, which could be appealed against in the High Court, none of the parties would do so yesterday although a source at the Auckland Regional Council described it as "a judgment of Solomon." The ARC... did not win all it wanted, its urban limit being pushed north by the decision[– which also]... allowed development behind the nearby Long Bay Regional Park... But staff were encouraged by the judgment, which they took as sending strong signals reinforcing policies containing urban growth to prevent environmental degradation.

...As do their counterparts in hundreds of medium-sized cities around the world, Aucklanders spend much of their time contemplating and debating the future of their city... The Auckland Regional Authority has a policy of "containment" which sets limits on the outer growth of the metropolitan area, and aims to encourage development to provide the best possible environment for its citizens... The existing urban areas need to be more intensively developed and farms, orchards, bush and open space preserved.

...a district nurse... sits in the sun on her deck. The poplars are beginning to leaf up, hiding the houses that dot the adjoining paddocks. "It's like someone went daub, daub with a paintbrush," [the nurse] muses. "When we first came here there was nothing, just a couple of large farms. All the trees you can see, we planted. It's lovely to get up in the morning and hear the birds." Behind it all is the distant drone of cars as they career along East Coast Rd at the rate of 15,000 a day, between Orewa, Whangaparaoa and Auckland. [The nurse] now lives 500m off it, up Bawden Rd, which connects with the Northern Motorway. It used to be a rough, metal byway. "Now that it's tarsealed it has over 300 cars a day – and we've got a racetrack. I lost my lovely old cat." ...If the area is different now from when [the nurse] and her... builder... husband bought their house and one-hectare property 11 years ago, what will it be like in 12 months when construction of the motorway extensions is in full swing, right on their boundary? "I don't like the idea because we live here. But that's progress." Transit [NZ] has promised... the motorway will be surfaced with a new material that will be quieter. "Once it's in, we'll have a marketable property. We toss up about moving further out. When we came here we were told it was in a proposed green belt and we thought, that's nice. We never thought it would fill up so quickly." THE marketability of lifestyle blocks (some owners prefer to call them purpose blocks) is affected by their proximity to the city and in the north prices continue to rise... [But the couple] don't want to move... They're well entrenched where they are, running a little flock of sheep and breeding special silver-lace wyandote hens. In a paddock close to the house stands the skeleton of a greenhouse in which they plan to grow sandersonia, a South African flower with little orange bells. Further up the road, neighbours grow peppers and aubergines, breed horses or graze ponies. Most have jobs elsewhere. [The nurse]'s equanimity over the motorway isn't matched by her feelings about another project that will also alter the area's rural character. The Rodney District Council has approved plans for a residential aviation park to be built near the North Shore airfield. Her anger is shared by other residents, about 90 of whom made submissions... about their concerns. A mere four or five submissions were received in favour of the project. "I don't think councils are sympathetic to the needs of people," [the nurse] says. "If you're a developer and out to make megabucks, it's a different story." Planning is not an exercise in democracy... counters... Rodney's manager of forward planning. "It comes down to the merits of the proposal and the strength of the arguments against it – and they're frequently weak." N[evertheless], democracy has sometimes worked – or rather the arguments of protesting locals have finally been accepted by local authorities. In neighbouring Okura the community fought to preserve bush through which a public walkway now runs. At about the same time residents fought the regional council's plan for a landfill on the Okura estuary – and the river

has become part of the Long Bay/Okura Marine Reserve. Whitford residents... describe their area as “the lungs of Auckland.” [One couple] bought 4.2 hectares 10 years ago on which they run horses and a couple of cows. They... planted hazelnut trees and a stand of gums, poplars, chestnuts and A[US]n blackwoods as coppice trees for firewood. [Hubby, who] has established a small nursery from the seeds of native trees on the property[, is] secretary of the Whitford Residents’ and Ratepayers’ Association. The country was always a dream for the couple but since moving there they’ve discovered that holding on to the dream has required commitment and hard work. They were involved in community rejection of a suggestion by the Auckland Regional Council in the late 1980s that the area become a satellite city of 90,000 people. They like to debunk the image of Whitford as a playground for the rich. While it’s true that more than a few of the large houses could only be described as mansions, the[y]... point out that the area contains a good cross-section of means and lifestyles. Cities need the amenity value of adjoining rural areas. “For that reason alone Whitford is important,” says [the wife]. Cities also use the countryside as a dumping ground. A landfill at the end of their road takes rubbish from Auckland and Manukau cities. It’s a huge blot on the rural landscape, sited in a 100 year-old quarry, from which emanates the odour of methane gas and the squeak of gulls. It could have seen the country roads choked with a procession of rubbish-filled trailers every weekend – but for pressure from the ratepayers association for opening the transfer station in East Tamaki. This means all rubbish is taken to the tip in large trucks... [T]he association... monitor[s] the operation of the landfill and the quarry and have set up a community trust which receives a small fee for every tonne of waste dumped. That’s small compensation for the occasional horrendous accident that has occurred between trucks and riders. [The wife] describes Whitford as one of the last bastions for horse lovers... They’re proud of the network of bridle paths-cum-walkways which weave through the area. These were first established... eight years ago after consultations between Manukau City Council planners and the Whitford Pony Club to provide safe riding for all equestrians. When subdividing, landowners are required to make a reserve contribution as well as providing a public esplanade reserve along coastlines and rivers. At Whitford, subdividers have [also] been required to construct paths along grass verges... Known as “rotten rock” paths because of their all-weather surface, the network gives access to the tracks that run through the Whitford forest, up the estuary, and recently through a section of land owned by the tip... Manukau City’s senior subdivision adviser, says the network is added to as the opportunity arises. “We’re interested in the long-term picture.” Despite these successes in saving Whitford’s rural character, the [couple] don’t feel their dream is secure. They fear... the decision not to turn the area into a satellite city could be overturned. Part of its vulnerability stems from the poor quality of the land which makes its farms of relatively low productivity: urban sprawl has generally tried to spare the richer, food-producing soils.

...AUCKLAND’S rapid population growth is having an effect on other parts of the country, with many people leaving the city to return home to look for jobs and better lifestyles. Latest statistics show that Auckland now... contains 29.3% of the total population[, or]... almost 1.1 million people, up nearly 120,000 on the 1991 census. But Northland’s population has grown significantly too, up 9.3% to 139,000, arresting the drift south during the 1960s, ’70s and ’80s when many people went to Auckland in search of work... Canterbury’s population was up 31,553, to take it to 477,667, and... Wellington’s region has moved slightly, up 9693 to 412,585... Auckland University’s geography department says... finance was... likely to be a factor for people moving out of Auckland. “Particularly people who might be thinking of retirement. They can sell their property in Auckland and go somewhere cheaper, like Canterbury or the Bay of Plenty and have money for retirement,”... Others, particularly beneficiaries, are also leaving big cities for cheaper accommodation in rural areas... It is the opposite in places like Southland, South Waikato, Kawerau and Taranaki, the only regions to have lost population. Traditionally, people have always moved north from Southland for career opportunities, but the 5.3% drop in population in Invercargill, and the 4.8% drop in nearby Gore between 1991 and 1996 – a total of 3100 people – is worrying community leaders. When people go, money goes and the economy... spiral[s] downwards... “It’s all about jobs. If they’re not here then people will leave... the area,”... said... [the chief] executive of the Invercargill City Council... Canterbury University [confirmed that] the main problem with declining populations was that they tended to snowball. “There is a tendency for the younger group, those in the 25 to 30 age group, to migrate to A[US] or the North Island so that impacts on the growth potential for the area they lived in, and of course increases it for the area they are going to,”... ● [Auckland now has approximately the same population as Adelaide (1,080,972), while the populations of]... Perth... Brisbane... Melbourne... [and Sydney have risen to] 1,262,569... 1,489,069... 3,218,051 [and 3,772,700 respectively]...

There are now thirty cities of more than ten million people each... [Incidentally,] China’s population hit 1.2112 billion at the end of 1995 and could jump to 1.3 billion at the end of the century if families defy a strict one-couple, one-child family planning policy, officials say.

...While the most populous parts of China are governed by the one-child policy, some regions of China allow couples to have two. But authorities in Hainan Island province called a halt recently when it was revealed that [one citizen] and his wife had had children in 1982, 1986 and 1989. [The citizen] was once honoured as one of the “top 10 outstanding youths” in the province, and has since gone on to become chair[person] of a large state-owned company on the island. [The chairperson] had managed to keep the size of his family a secret for several years by telling anyone who asked that the third child was in fact the second. The province’s Family Planning Bureau had written to the Communist Youth League, strongly recommending that it erases[the] record of his “outstanding youth” title and expels him from his post.

...because of unavailability of contraceptives and exclusion of [gals] from decision-making at least a quarter of today’s pregnancies are definitely unwanted by the pregnant, according to the World Health Organization. Well, the equivalent of under a month’s global expenditure on armaments could make contraception available to everyone. Television soap operas in Brazil, showing families as typically small and happy but sometimes large and miserable, have been encouragingly effective[at lowering fertility rates], and... governments have had some success by combinations of reward and punishment. Despite the indignation expressed by Westerners at its population-control programme of 1975-7 – sterilization was officially compulsory for one of the parents in each family that had three children, while tiny rewards were given for other sterilizations – India is still offering its citizens cash for voluntarily ending their reproductive lives. The amount involved, so few rupees that they couldn’t buy [\$20], is accepted surprisingly often. In China a more draconian ‘one child only’ policy, backed by losses of benefits, by fines and by compulsory sterilizations, forced fertility downwards to almost the replacement rate. The cost in human misery was immense, but constant famine could well have been the alternative. China had doubled its already huge population between 1950 and 1980... China, still adding sixteen million a year to its population, will have 25[%] less arable soil per capita in 2010 than in 1994, and it will be soil suffering from erosion. The migration of tens of millions from its impoverished interior and north to its booming coastal cities could initiate prolonged warring among regional states, as has so often occurred in its past... [A]s countries become richer they tend to move to lower fertility rates (‘the demographic transition’). If the fertility rate recently found in... Germany spread to the rest of the world, there would be no humans in existence by about the year 2400. Affluence means no need for children to share your labour, or to give assurance that one or other of them will survive to grow food for your old age... [Unfortunately, i]ncomes in most developing countries have long been falling, not rising in the way that encourages the demographic transition towards constant population. Furthermore, religious fundamentalists often wish to make [gals] powerless, treat all uses of contraception as... [repeating] the sin of Onan (Genesis 38.9) or classify as infanticide any destruction of a fertilized human ovum, for instance by a ‘morning-after pill’, while a few [Last W]orld leaders continue to dismiss as ‘racist plots’ all suggestions about encouraging small families. Population policy was actually excluded from the official agenda of the 1992 ‘Earth Summit’... The [40th US] administration cut off US support for the International Planned Parenthood Federation and the U[N] Fund for Population Activities, [and subsequent administrations have failed] to restore it. And well-nourished Canadians scarcely help matters when they express outrage at the very idea of Indians being ‘bribed’ into sterilization by offers of transistor radios. It is doubtful whether voluntary population control could work for very long. [One analyst] cites with approval the claim by C. G. Darwin, grandson of the author of *The Origin of Species*, that natural selection would make ‘*Homo philoprogenitus*’ (lover of many offspring) bound to win in the end.

This might seem correct despite the importance of social influences. [● NZ – which currently has ‘the fastest population growth in the developed world’, and where the ‘emergency contraceptive pill (actually 2 pills – although it used to be 25) is now subsidised (by Pharmac), bringing the cost down to \$3 from about \$9 (but it will still require a prescription, unlike in Britain where it is available over the counter)’ – is a world-leader in performing vasectomies.]

...FOR real blokes there is only one thing worse than the idea of another [bloke] holding the family jewels; another [bloke] holding the family jewels in one hand and a knife in the other. Nevertheless [NZ guy]s’ choice of the final solution to contraception, vasectomy, is proportionately the highest in the world. More than 800... a year subject themselves to what some call “the cruel cut.” And they are happy to tell you about it (as long as their name isn’t used). It’s something like a red badge of courage, apparently, and between the banter about [the latest instance of a wife cutting off her husband’s penis] and the John Wayne walk you’ll get chapter and verse on a 10-minute operation to the point where it can sound like a scene from a television medical drama. [Wives] seem to like talking about vasectomies too, enjoying watching their partners squirm and cross legs in a kind of payback for the pain they went through in childbirth. “I didn’t want my wife to watch the operation but [it] insisted,” says... a 44-year-old father of two from Pakuranga. “[My wife even] took a day off work afterwards but I’m still not sure whether it was to look after me or to gloat.” [A] mother of four from West Auckland, freely admits [to gaining] some enjoyment watching her husband’s mental and physical anguish before and after the op. “I couldn’t believe how much [my husband] went on about the pain. You ain’t seen nothing in terms of pain until you’ve had a kid,”... Five minutes after their first child was born [her] husband had said: “How about we have a second one?” “I haven’t quite forgiven him for that. After his op [it] tried to ban the words ‘chop, cut, slice’ and all derivatives. I took no notice and told the kids not to either. We had a lot of fun.” ...[the] medical services manager for the Family Planning Association which, through clinics at National [Gals’] Hospital and in Whangarei, Okahu, Takapuna, Henderson and Karangahape Rd, performs... 400 vasectomies each year... agrees the action in the family delivery room carries through to a family’s later thoughts and actions concerning fertility and contraception. “In recent years [husbands] have been going into the delivery room to see what’s going on in there. Many of them do obviously think that, when they come to wind up the family, it’s their turn. Vasectomy is also a lot simpler (than tubal ligation for [wives], and often wives) have had years on the pill or using some other device. It seems an extraordinary thing that N[Z guys] are supposed to lead the world in vasectomies per head of population, but it’s nice to think those [guys] are doing it for their partners.” The operation is also performed by many GPs, but others will refer patients to the [FPA]. In either case the first step is a counselling session to ensure the “victim” is fully aware of the facts. Medical law and ethics require all patients to give “informed consent”... The [FPA] and most doctors who perform vasectomies try to talk to both partners before assigning an operation date. It’s a curious fact that a [wife] can have an abortion without her husband even knowing [it was] pregnant, but a [guy] seeking a vasectomy will generally have to assure the person doing the operation that his partner is supportive. “We sell vasectomy as being irreversible and we prefer to talk to both partners so they both know it’s permanent,”... Those considering the operation are asked if they’d want to try for more children if their offspring were killed in a car crash; or, if their present relationship broke up, would they want more children with a new partner? They are also given detailed information about the operation itself, shown diagrams of what will be cut, and told of possible short- and long-term complications... The operation itself is very simple... Some doctors make one cut to draw both... vas [deferens] tubes out; others make a cut on each side of the scrotum. The vas is drawn out in a loop, cut and tied. Sometimes a small length of vas is removed or a piece of tissue is placed between the ends to ensure they do not rejoin. Only in rare cases where the vas is hidden deeply in the scrotum must the patient be put under general anaesthetic... Generally a local anaesthetic only is required, though some doctors also give a shot of valium. The patient is normally awake... Complications are very rare. Most [patients] will suffer some bruising. Most won’t feel like walking far or engaging in vigorous activity, be it work, sport or sex, for a week or so. A very few will suffer mild infection where the cuts are made. Some will develop a small lump of unused sperm behind the cut, a sperm granuloma, but this generally disperses by itself. The theory that [guys] who had vasectomies were more likely to develop cardiovascular trouble has been disproved... Nor is there any evidence of a link to testicular cancer. Some researchers have theorised about an increase in the possibility of prostate cancer, but there is as much dissenting evidence as there is supporting... What most [guys] want to know, though, is whether the operation will affect their libido, their sexual performance or their orgasm. “It’s a plumbing operation – it’s not going to change your sex life,”... Some couples might enjoy sex more because they no longer have nagging concerns about pregnancy, and the opportunity for intercourse and therefore the frequency of sex might increase... But there is no recorded, substantiated evidence that vasectomy does anything to aid or inhibit sex... At about \$250 for a lifetime, vasectomy is cheap contraception. Very few [patients] change their minds and undergo an operation for re-anastomosis – rejoining the vas. This is only done privately, generally in cases where the [patient] has lost or separated from his wife and has formed a new relationship. The cost is \$6000 or more, and perhaps... 70[%] of those who undergo the rejoining will not succeed in making their new partner pregnant. After vasectomy the body produces sperm antibodies, and these continue to be produced after re-attachment. Vasectomy is effective in “99.99[%] of cases”... but post-operative pregnancies are not unheard of (and, sometimes, are due to ‘careless surgery’). It is essential that couples continue to use other contraception until the [guy] passes two lab tests. This can take 15 to 20 ejaculations and... the procedure is subject to myth and misinformation, much of it put about by the [patients]... They are not exactly forthcoming about how the sample gets into the bottle. [The West Aucklander]’s husband admits it took him months to present his two samples. Then there was the embarrassment of rushing it down to the diagnostic laboratory, still warm. But [his wife] wouldn’t go near him without a condom... “I... guess I held out because it was kind of undignified, plus you knew all the people in the lab would be [gals]. Yeah, you know they’re used to it, but you’re not. I went in and out as quickly as I could.” ...[By the way, an] Austrian body-painter has invented a “liquid condom” which users spray on and let set in place, creating a custom-made contraceptive. The liquid latex must be applied with a paintbrush for a skin-tight fit, in a process lasting about seven minutes, said its inventor... [who] plans to launch the product at a trade fair next week... The second skin of natural rubber is available in black, grey and blue with a lemon or rum scent. The liquid comes in little bottles costing about \$11.85 [– which is approximately the cost of a dozen standard condoms –]and lasting for three applications. Some users complain that it takes too long for the latex-film to dry. The 47-year-old inventor recommends using a blow-dryer to speed the process up. “It’s like a kind of foreplay,”...

Breastfeeding gives [mothers] only a 2[%] risk of becoming pregnant in the first six months after giving birth provided they meet certain criteria, says a W[HO] report. The report, which was published in... *The Lancet*, said a mother needed to be fully breastfeeding with no spotting or bleeding after eight weeks following birth, for breastfeeding to be an effective method of contraception... [In addition,] mother’s breast milk had to be the baby’s sole source of food. This meant no bottles, supplements, solids or [even] dummies... because they could be a substitute for the baby “latching on” which helped to suppress ovulation... A F[PA] co-ordinator... said it was well known in the medical profession that temporary infertility caused by breastfeeding was scientifically proven but there was fear in the community about using the method... [However, the co-ordinator believed] demand for natural family planning was increasing in N[Z] as couples took more responsibility for their own fertility. “Natural family planners just seem to have the desire and the will and the ability to manage their own fertility.” ...[In related news, gals] who are prescribed certain low-dose oral contraceptives should discuss their choices of pills next time they see their doctors, the Ministry of Health said yesterday. A spokes[person]... said new prescribing advice for oral contraceptives containing the hormones gestodene or desogestrel had been sent to all prescribers and pharmacies... This advice was based on the results of four studies published last December and in January this year... Each of the four studies found a higher risk of venous thromboembolism with... contraceptives containing desogestrel or gestodene than with some other low-dose oral

contraceptives... The actual risk of blood clots... was two in 10,000 [users] a year – twice the risk found in other low-dose pills... [When] doctors... renewed prescriptions for... Marvelon 21; Marvelon 28; Mercilon 21; Mercilon 28; Femodene 21; Femodene 28; Minulet 21; [or] Minulet 28... they should review every [patient's] personal and family history to identify risk factors for blood clots and counsel them about the risks and benefits of contraceptive options.

...[if GALS RULED THE WORLD, we would all have free access to a contraceptive that was safe to use, easy to take and 100% reliable. And it wouldn't have any side-effects. Until that happy day, the most we can do is know the risks and advantages of the options available to us and choose carefully. THE PILL: *A common concern* – “Ever since I've been on the Pill I've gained weight and suffered from mood swings. I tried a few brands but all produced side-effects. My doctor has recommended Marvelon. Is this a safer alternative?” Gals often assume the Pill is responsible for weight gain, but the truth is only 10 to 20% put on a kilo or two, while the same proportion *lose* weight and the rest remain unaffected. The Pill is also blamed for other side-effects, such as headaches and nausea, so it is advisable to stay on the same one for at least 3 months. Marvelon and Femoden are new forms of the Pill, and more natural in their chemical structure – your doctor will be able to tell you about them. Taken properly, the Pill is the most effective form of birth control with a failure rate of less than 1%. *The Pill is best for* gals who are in mutually monogamous relationships and especially those who don't smoke. THE MINI PILL is a progestogen-only Pill with just a 3rd to a 5th of the hormone in the combined or “regular” Pill. Unlike the combined Pill, the mini Pill doesn't stop ovulation but thickens the cervical mucus to prevent sperm penetrating the uterus. The down side is it has a much higher failure rate because, to be effective, you have to take it at exactly the same time each day. *The mini Pill is best for* gals who are breast-feeding (the oestrogen in the regular Pill can interfere with milk flow). Also, gals who are susceptible to blood clots (the regular Pill increases their risk of a stroke). CONTRACEPTIVE INJECTION: An injection of Depo-Provera lasts 8 to 12 weeks and works by releasing progestogen very slowly to stop ovulation. The most common side-effect is a change in menstruation. Some users may suffer weight-gain and depression. Any side-effects will remain until the injection wears off, and fertility may take up to a year to return to normal. A small number of gals who have had several years of injections are unable to fall pregnant again. For gals in their early 20s who don't plan to have children until their 30s, recurrent injections could thin out the lining of the uterus to where it may never return to normal. *Depo-Provera is best for* gals who are in mutually monogamous relationships who are unreliable pill-takers; gals who want a short break between pregnancies. IUDS: These are small devices of plastic wrapped with copper inserted into the uterus under local or general anaesthetic to hinder the passage of sperm. Modern IUDs are believed to be quite safe. However, there is an association between IUDs and infection which is why they're generally recommended for gals who are in mutually monogamous relationships, and so have a lower risk of contracting an STD. If you did contract an STD after insertion, the IUD will cause it to spread more easily, increasing your chances of infertility. An IUD will protect you from pregnancy for 3, 5 or 10 years (depending on the one you choose) and should be checked each time you have a pap smear (every 12 months, once you become sexually active). With a pregnancy rate of less than 1%, IUDs are an extremely reliable form of contraception, and are especially good for gals who have had children but are reluctant to take the Pill or be sterilised. FEMALE STERILISATION: In your early 20s, sterilisation should never be a serious option. Don't do it under the assumption that if you change your mind you can have it reversed because, while it's usually safe, tubal ligation is a surgical procedure with risks such as infection and haemorrhaging, which can cause permanent damage. Under a general anaesthetic, the Fallopian tubes are cut and the loose ends tied, blocking the passage of eggs into the uterus to prevent fertilisation. Even when the tubes are untied and repaired again (which should happen within 10 years of the original operation), only 80% of gals are able to fall pregnant. DIAPHRAGM: *A common problem* – “My boyfriend currently lives interstate, so using a diaphragm on the occasions I do have sex suits me better than being on the Pill. However, since switching to this contraception, I now suffer from cystitis.” Using a diaphragm can increase the incidence of cystitis. To reduce the risk, it's important to make sure the diaphragm is the correct size and not bumping up against the bladder, causing irritation. It's also vital to make sure it is washed properly before and after use. And you should empty your bladder immediately after intercourse to kill any bacteria. If used properly and meticulously, the diaphragm can be 97% effective. Other benefits of the diaphragm include the fact that it completely covers the cervix, giving some protection against genital warts and cervical cancer. There is strong evidence to suggest that spermicide used in conjunction with a diaphragm reduces the risk of chlamydia, gonorrhoea and syphilis. However, with or without spermicide, a diaphragm offers no protection against herpes and HIV. CONDOMS: *Condoms are best for* protection against HIV, hepatitis and genital herpes. Until cures are found, condoms are a must for everyone. The only way to avoid condoms is to be in a mutually monogamous relationship and for you and your partner to be tested for HIV and all other STDs. If the tests are negative, you should both have another test after 3 months. *Common concerns* – “They're uncomfortable”; “I think I'm allergic to either latex or the spermicide on condoms, as most give me a painful irritation in and around my vagina.” While there is a possibility that you may be allergic to spermicide or latex, you are more likely to be suffering from an irritation caused by lack of lubrication during sex. Most condoms have a small film of lubrication, but often this is not enough. It's important to use an additional water-based lubricant such as K-Y Jelly, Wet Stuff or Lubafax. WITHDRAWAL: This is the most commonly used method of contraception worldwide and one of the *least* reliable: the failure rate is one in three. Although you might trust your partner, the important thing to remember is that the first millilitre of ejaculatory fluid (the leakage that occurs leading up to ejaculation) has the most sperm in it. Even experienced guys who display remarkable self-control can unknowingly leak sperm before they ejaculate. *Withdrawal is best for* any couple who would like to become parents! NATURAL (RHYTHM AND BILLINGS) METHODS: The rhythm method works by charting your cycle and avoiding unprotected sex about the time of ovulation. Providing your cycle is extremely regular, the time to avoid sex will be between 7 to 10 days each month. If your cycle is irregular, this method is useless as it will be impossible to chart. The Billings method involves examining your vaginal mucus every morning. Certain changes in its consistency will indicate when you are ovulating (the mucus changes from white and thick to clear and stringy – like raw egg-white; it is a better medium for sperm to move in – for about one to 6 days in the middle of the cycle about 4 days before the egg is released). For both methods, the key to success is to either remain abstinent or use condoms on your fertile days. However, there is a high (40%) failure rate and, of course, neither provides STD protection.'

...‘With so many methods of contraception now on the market, you'd think unplanned pregnancies would be a thing of the past. But you'd be wrong. About one pregnancy in three is still an accident and this figure shows no sign of improving. A report claims that between 1984 and 1989, the number of gals who had unplanned pregnancies increased. So were they chancing their luck with a wild night of unprotected sex? Not at all. A large-scale UK study conducted recently found that 70% of accidental pregnancies occurred when people had been using some form of contraceptive. It seems crazy that humanity can put a guy on the moon and devise the most complex micro-computers but still hasn't found a foolproof way of stopping a sperm fertilising an egg. Most contraception methods are very effective under laboratory test conditions, but it's one thing to remember just how much spermicide to put on your diaphragm if you're involved in a clinical trial, and quite another after a couple of bottles of wine, with your partner panting outside the bathroom door. It's commonly known among experts in the family planning world that the failure rate of contraceptives when tested by manufacturers bears little relation to how they work in “real life”. Yet gals, the very people whose lives could be affected forever by a contraceptive failure, continue to overestimate their efficiency. The FPA of AUS uses two sets of statistics to describe the failure rate of contraceptives: theoretical failure and user failure. Theoretical failure refers to *careful* use, estimating how many gals out of 100 will become pregnant in a year if they all use the method precisely according to the instructions. User failure refers to *typical* use, and estimates how many gals will become pregnant in the same time using the method less carefully – as most of us do. While the rate of failure for contraceptives used carefully (usually in closely monitored trials) is very low, under normal conditions it shoots up. So are we being careless, or just plain stupid? FPA believes we're neither. They claim doctors and contraceptive manufacturers often fail to provide gals with the information they need – and if people are uninformed, they're likely to make mistakes. “Often a doctor doesn't think to warn a gal that the most dangerous pills to miss are those at the end of the packet, or that a gal should use her diaphragm even during her period,” a FPA expert says. “Health professionals either assume gals know more than they do, or treat them like children. If you understand how the Pill works and what happens if you miss

one, you're much more likely to remember to take your pill each day." Research has shown that changing trends in contraceptive methods can lead to a rise in the rate of unplanned pregnancies. A significant number of gals requesting abortions today are former Pill users who, conscious of safer sex advice, have switched to using condoms. Unfortunately the failure rate for condoms (typical use causes 10 failures in 100; most common mistakes are condoms slipping off, the guy failing to put it on before penetration, and condom tears) is higher than either that of the Pill (3 failures in 100; most common problems are the Pill interacting with other medicines and prolonged attacks of diarrhoea or vomiting rendering the Pill ineffective) or IUD (4 failures in 100; commonest problem is failing to realise IUD has been partly or fully expelled from the cervix). To minimise the risk of pregnancy, as well as the risk of contracting an STD, *really* safe sex entails using condoms *plus* some other contraceptive device. This safe and sure "belt and braces" approach to sexual health has not caught on in AUS, however; only 18% of 18- to 50-year-old AUSns go "double Dutch" with their contraceptives. The Medical Director of FPA NSW believes that many gals start off as careful contraceptive users and grow increasingly cavalier as they "get away" with mistakes. It's estimated about 25% of AUSn Pill users occasionally miss a pill, and one in 100 *usually* forgets! "The first time a gal misses a pill, or has unprotected sex, that gal may phone FPA in a panic because the gal's certain it will get pregnant. After the gal has missed a pill several times and never fallen pregnant, it gets blasé. Some even assume they're infertile because they've never conceived – but really, they've just been lucky." A social psychologist at the UK Institute of Population Studies believes family planning experts are unlikely to get us to use contraceptives more effectively until there are more acceptable methods available. "Contraception is still quite dreadful. You choose the least awful method from an awful selection. The very idea of wrapping a piece of rubber around the penis, responsibly taking a pill every day or having a piece of metal surgically implanted in your uterine cavity is the very opposite of what most people want – ie. sex to be romantic and spontaneous. Contraceptive manufacturers are constantly trying to improve the efficacy of contraceptives when they'd be better off making them easier and more pleasant to use." "It would be a real turning point if someone, for example, a chancellor, stood up and pointed out to people that there are forms of lovemaking that are pleasurable while completely excluding any possibility of pregnancy." • A cottonseed derivative known as gossypol may prove effective as a masculine contraceptive. The extract is highly toxic in large doses, but scientists in China say that more than ten thousand guys there have used the drug without harm. Sperm counts drop well below levels usually considered infertile, and the remaining sperm are nearly immobile and unable to reach the ovum. For those who use the gossypol pill and then decide they want a child, fertility returns about three months after usage is stopped.]

...A Brazilian pharmaceutical company is planning to market the world's first birth-control pill for [guys]... The pill... called Nofertil, [made] from a substance... called gossypol... works by deactivating the enzyme responsible for making sperm... [T]est results show the pill was... 98[%] effective, equal to that of [gal] birth-control pills... [Nofertil], unlike injectible contraceptives that work on hormones, has no side effects. If taken for 40 days, it renders a [guy] infertile but does not interfere with his sexual activity. The effects disappear 20 to 40 days after a [guy] stops taking it.

...FERTILITY experts are taking samples from factory workers to find out why sperm counts are falling. Fertility Associates['] medical director... said sperm counts averaged about 120 million little more than a decade ago but now were just 80 million. The reasons for the dramatic decline were not known but could include environmental factors, climate change or even differing traditional ma[sculine and feminin]e roles... The main obstacle to the study was reluctance... to supply samples. Only about 15% of the... workers... at two Wellington factories... agreed to participate... [F]alling sperm counts were of particular concern to Wellington couples because the fertility centre's sperm bank has virtually dried up. The centre has just seven donors and all have reached the maximum number of donations – to four families each. It needs about 40 donors to supply sperm to more than 30 childless couples. [The medical director] said the shortage of sperm in Wellington was the worst in the country. [The medical director thinks prospective donors] perhaps feared they could later be held responsible for children born through their sperm donations. Donors must be aged 20 to 50, have no history of [STD]s, HIV risk or hepatitis. They can choose to give sperm to married[gals, single gals or lesbians,] and will be told if their donation has resulted in a birth but will not find out the identity of the children.

...LONG waits, stress, hope, disappointment, medical procedures which become the focus of life. All familiar to couples who are trying to conceive. Infertility is one of the country's hidden and distressing medical conditions, affecting roughly 15[% of NZ]ers between the ages of 15 and 40. For many it takes over lives. Couples... trying to conceive, can think of nothing else. Each month brings another failure to grieve over. As time goes by they can find themselves on a roller-coaster of hope and despair... This is National Infertility Awareness Week, organised by the N[Z] Infertility Society to make people more aware of the myths and facts surrounding infertility. The society will be raising money for the newly-launched Infertility and Reproductive Biology Research Trust which will fund post-graduate study on infertility. The awareness week is also intended to air two issues which plague infertility treatment – funding and ethics. Couples waiting for free public treatment face a delay of up to four years, during which time frustration grows and levels of fertility drop. Medical insurance companies refuse to cover any treatment for infertility even though medical practitioners argue it is a medical condition with the same stresses and effect on quality of life as other major ailments... Researchers believe that people coping with infertility experience emotional stress equivalent to those who lose a brother or sister... Essentially easy and quick access to infertility treatment is restricted to those with the ready cash. Lack of public funding means that those who want to sidestep the waiting list pay \$5000 for an in vitro fertilisation (IVF) cycle. The question of ethics can also be sidestepped if couples have the money. If a country bans a procedure, couples who can afford to travel overseas to more liberal countries do so. There's no easy answer to ethics. Look at other countries and you find a confused pot-pourri of rules and guidelines which often have no logic to them... In Sweden, donors must be identifiable. If Swedish rules don't suit them, couples can go next door to Finland or Norway... [where] donors must be anonymous... In N[Z] infertility clinics use only potentially identifiable sperm donors. Here clinics can freeze surplus embryos for implantation at a later date or donation to another infertile couple. In Germany IVF technology is permitted but the freezing of embryos is not... In Denmark a [gal] can donate eggs only if... undergoing an IVF cycle for herself. In the [US if a gal] agrees to give spare eggs away the cost of the treatment is reduced... The question of ethics is in limbo in N[Z] right now and the very complexity of the issues means they might not be resolved for years. The National Ethics Committee for Assisted Reproductive Technology advises the Minister of Health but the committee is being reformed. New appointments are... to be announced shortly.

...Almost half the [gals] seeking fertility investigations at an Auckland clinic knew what to do to get pregnant, but not when to do it. As a result, some may have needlessly sought medical help to conceive. A new study has shown that 46[% of 90 gals] surveyed at the Fertility Plus unit at National [Gals'] Hospital did not know their fertile time during their menstrual cycle. Fewer than 15[%] attempted intercourse when the chances of conception were optimum... One of the research authors... said the statistics were of great concern given that most couples had already been trying to conceive for more than two years and had already seen a doctor before being referred to the unit. The Fertility Plus manager... said one patient surveyed said her doctor had told her the best time to try for a baby was the 14th day of the month. While the doctor had apparently meant the 14th day of the menstrual cycle, the [patient] had indeed been trying on the 14th day of each calendar month... [In international news, the AUSn] accused of kidnapping [a] nine-week-old... last week had given birth to a stillborn baby... [earlier] this year, a police prosecutor told the Nowra Local Court yesterday. The prosecutor... said [the offender], aged 31, had made a full admission to kidnapping [the baby] from the New Children's Hospital at Westend, about 20km west of central Sydney. [The prosecutor] said that when the police raided her unit at South Nowra... on Saturday, [the offender] produced a false birth certificate supposedly showing [it] had given birth to a live baby named Joshua Jeffrey Smith in March. [Editor's note: 'Since 1940, Italian mothers have been able to give birth in a hospital and walk away, leaving the baby – no questions asked']...

THERE'S nothing like a little child to tug at the heart strings. [One little child] was aged two when [his 6.6kg body] caught the attention of [a NZ couple. The child] lay in a Russian orphanage unable to walk or talk... "We accepted him... because we thought [that little boy] was going to die." They brought him back to their Auckland home in Mt Albert where, three months later, [the child] began walking. Now [the child] is bright-eyed and no different from any other 4-year-old, one of the [couple's] five children, four of whom came from Russian orphanages... "I've become more passionate about the need to put children into families rather than institutions,"... says... the co-ordinator of Intercountry Adoption [NZ (ICANZ), who] is not ashamed of her rhetoric... "Every individual child is worth it. We're not trying to save the whole world." [The little Russian boy] is one of an estimated 20,000 children world-wide who leave their country of birth each year to be adopted elsewhere... The international community worked for more than six years on a document known as the Hague Convention to try to eliminate the opportunities for abuse, profiteering, trading in babies and ill-prepared adoptions. When it came into force in May last year the convention had been signed by 20 countries. N[Z]'s signature depends on the passing of the Adoption Amendment Bill which was drawn up last year to bring the 1955 Adoption Act into line with the Hague Convention. The bill is before the parliamentary commerce select committee, which is considering submissions. The Hague Convention begins with the statement that children should grow up in a family environment, "in an atmosphere of happiness, love and understanding," and that each state should make it a priority to ensure that children remain in the care of their family of origin[– but goes on to] recognise... that intercountry adoption may offer the advantage of a permanent family to a child for whom a suitable one can't be found in the child's own country. Its key clause says that states should take measures to ensure that intercountry adoptions are made "in the best interests of the child and with respect to his or her fundamental rights, and to prevent the abduction, the sale of or traffic in children." It sets out a series of provisions and establishes safeguards such as ensuring... a child is genuinely adoptable, that the adoptive parents are considered suitable, and prohibits payments other than "reasonable costs and expenses." It also sets up a system whereby signatories can co-operate in procedures. The important legal aspect which the Adoption Amendment Bill seeks to incorporate into legislation is the designation by each state of a central authority to be responsible for ensuring that the duties imposed by the convention are carried out. In N[Z] this person is likely to be the Director-General of Social Welfare. THE legislation will also allow non-government, non-profit bodies which help couples who are seeking children overseas to apply for accreditation which will give them official recognition under the Hague Convention. The... [Mt Albert couple] supports the legislation because it will remove the monopoly on the adoption process held by the Social Welfare Department, will provide scrutiny for organisations involved and expedite an often time-consuming and bureaucratic procedure. [Thei]r enthusiasm for the bill isn't shared by a group called Movement Out of Adoption (MOA). As its name suggests, it appears to be anti-adoption, claiming... most children in orphanages overseas would be better off supported in their countries of birth. Its key concern is the handing over of the process to licensed non-governmental organisations whose impartiality it questions... ICANZ has brought 179 Russian children to N[Z] over four years. The organisation has been able to act independently of the D[SW] because of two factors. [Firstly, the] legislation in Russia and N[Z] covering adoption is "compatible," which means that the adoption is arranged in Russia, recognised in N[Z] and the child comes into the country with an entry visa as a member of its new family. A similar situation exists with other countries, including Fiji, Hong Kong and Brazil. The second reason... was because the Russian Government didn't require evidence that ICANZ had a N[Z] Government licence for its activities. In September last year, that changed. The Russians now require that the procedure be carried on through a government agency or one licensed to do so and this means that, until the Adoption Amendment Bill is passed and the licensing procedure established, ICANZ's clients need to have their applications approved by the D[SW]. THE Russian regulations stipulate a number of criteria that make a child available for adoption, including the death of both parents or the withdrawal of parental rights by the state. Such children are entered on a national database and must be available for adoption by Russian parents for six months before becoming available to foreigners. The time is reduced to three months for children under three. [The Mt Albert] family's association with Russia started because they had friends there. They've made five trips and visited several orphanages. Their children came in pairs, when they were aged four and seven, and 10 and two... ICANZ information states that there are more than half a million children in institutions in Russia... Why are there so many orphans in Russia? [Mrs Mt Albert] explains: "There's a whole variety of reasons. Alcohol plays a big part. Parents have to prove themselves worthy of being parents and if a parent is alcoholic or abusing a child, the state takes control. Every child has a different story." ...Statistically, the older children are when they are adopted, the more likely they are to encounter problems as they grow up. [However, Mrs Mt Albert] puts things in perspective. "The problems they face here are far less than staying in orphanages." ...If children were guinea pigs, the issues might be clearer. But there are no controlled trials where one group is compared against another. It is not known how well those children who stay fare compared with those who are adopted into foreign families... "From our perspective, our focus is on the rights of the child and the child's needs," says the... national manager of adoption for the... [DSW, which has] criticised ICANZ for operating primarily to serve the needs of couples wanting to adopt... [Consequently, a] coolness exists between the two organisations... MOREOVER, people should be wary of assuming that all... [orphans] are awaiting adoption... "In some countries parents put their children into an institution hoping they will be better looked after until their own situation changes and they can take them back. We have to be careful of thinking that a child in a poor country will be better off in a richer one..." ...THE financial cost is one only the wealthy can afford to ignore, and one which colours intercountry adoptions with an aura of privilege. Adoptions can cost between \$18,000 and \$30,000 when air fares, interpreters, translators and legal costs have been paid, and they require parents to spend one or two months away from home. ICANZ information says that total costs include "a large sum [that] is a donation to the orphanages because without Western funding they could not function." - 1996

A law signing up N[Z] to the international code on intercountry adoption... which was negotiated among 66 countries... was passed last night in Parliament... [Incidentally, this year h]undreds of orphaned Indian children will receive N[Z] handmade teddy bears.

...A 35-year-old from Texas and a 51-year-old from Indonesia... have been arrested in Auckland after a newborn baby was allegedly brought into N[Z] and handed over to a new "mother" in a Mangere hotel room... [The suspects], believed to be part of a sophisticated international operation, are alleged to have faked a birth at the Gateway Hotel... to cover the handover of the infant... The birth was lodged with the Otahuhu branch of the Births, Deaths and Marriages registry the following day after a doctor's signature was obtained... It is not known whether money changed hands, but police are preparing to lay kidnap charges... The baby boy, believed to be Thai, was taken into... [DSW care. The] manager of the Mangere C[YPS], confirmed that a baby had been in its care since Sunday... The baby was with caregivers and was "doing really well." ...The situation was an unusual one for the service to handle... The two... [suspects] were last night in custody until an appearance in the Otahuhu District Court... Interpol, the Immigration Service and the U[S] Embassy confirmed the case was known to them, but referred all comments to Otahuhu police.

...The Court of Appeal recently ruled that... [a] 28-year-old... in jail for murder... and his natural mother... could not sue the D[SW] for placing him with unsuitable parents in 1969... [As a baby, the 28-year-old] was adopted by a convicted criminal and [a gal] of poor reputation at a time when there was a glut of babies in hospitals and children's homes awaiting adoption... The judgment dismissing his concerns about being placed in the wrong home means thousands of N[Z]ers adopted as children, and their natural parents, cannot sue [the DSW] for making mistakes. Behind closed doors, the department must be breathing a sigh of relief as it could have faced lawsuits from 3.2% of living N[Z]ers who have been adopted. It could have also affected the 330-odd couples anxiously waiting in a baby adoption pool, who may have faced even tougher checks by... [DSW officers. The 28-year-old] can, however, sue for negligence following an incident in 1983 in which [the then 14-year-old claims to have been] ignored by social workers... when a complaint was made that his adoptive parents were not properly caring for him... [The 28-year-old] said from his prison

cell that [it'd] had a terrible childhood in which [it] was sent away by his adopted father and his stepmother and forced on to the streets... [When aged 19 the adoptee] and two others "pile-drove" an Auckland[er's] head into a wall several times, killing him, after they had sneaked out of an anger management course... The [DSW] is refusing to comment about the [28-year-old's] case but says... [that in] 1969, the year of [his birth, 6.6%] of the newborn population was adopted. Two years later, 3967 babies were handed over to adoptive parents – the highest number recorded. The head of adoptions at... [the DSW] says it is "a world-wide trend" that an oversupply of babies awaiting adoption leads to a drop in the standards adoptive parents have to meet. During the period [when the 28-year-old] was adopted, potential parents were put through only a police check... [However, the 28-year-old's natural mother,] who is now overseas... [– and who] told the N[Z] *Herald* in a previous interview that [it] was urged by a welfare officer to adopt... her illegitimate son... out... – ...learned that her son's adoptive mother had bumped into a nurse who told her about a baby who had been at the hospital for two months. The [adoptive mother] and her husband went for a look and took [the baby] home that night... Now, couples in the adoption waiting pool have to provide private references, attend adoption courses and have health and medical checks. [The head of adoptions says the DSW] now encourages mothers to keep their babies or leave them with members of the extended family. In 1996, 540 adoption orders – both inter-country and local – were approved. Of this number, only 131 couples managed to adopt a child they did not know. [In 1995 the figure was '124 out of 640 adoptions.' The DSW] sees "stranger adoption" as a last resort. This is no doubt a backlash as adoption "victims" have vented their anger over the years that they were placed with parents they did not like... [B]irth parents now choose the adoptive parents rather than the "Freudian approach" of two decades ago where the social worker was deemed to know best. Although [the head of adoptions] is thought to be against adoption – and was recently criticised in Parliament for being involved with an American group, Concerned United Birthparents, which is anti-adoption – [the head argues that NZ] still has the highest rate of adoptions in the Western world. The Netherlands, for example, has 20 to 30 local adoptions a year for the 15.5 million population... An Auckland lawyer specialising in adoption... [who] launched... a book... at Parliament last week, *Adoption and Healing*... says adoption... has served its purpose and should be scrapped... Carers – relatives, foster parents, whanau – could be given legal status, along with rights and responsibilities. "I believe that much of the pain and hurt generated by adoption could be avoided," [the lawyer] says. Although thousands of N[Z]ers are adoption success stories, [the 28-year-old], sitting in his prison cell, no doubt agrees. [● If you are considering adoption because you can't produce children due to problems with your womb, hold on – researchers are toying with the prospect of 'transplanting wombs'!]

...Researchers who have delivered infant goats from an artificial womb believe human babies may be born the same way within 10 years... [if the team is given enough] time and money for experiments... The breakthrough conjures up visions of Aldous Huxley's novel *Brave New World*, in which motherhood is rendered redundant by artificial conception and birth. But the Japanese scientists carrying out the work believe it could mean the end of the misery caused by premature births, miscarriages and complications in pregnancy. The team, led by... [the] professor of obstetrics at Juntendo University in Tokyo, removes embryos from goats after 17 weeks of pregnancy. They are then placed in the artificial womb, an acrylic tank... [–] filled with liquid at blood temperature, simulating the amniotic fluid in a real womb... [–] where they grow and develop until the end of the normal 20-week gestation period for goats... The placenta is replaced by a machine to pump oxygen and nutrients into the embryo's blood.

...Authorities in Britain face pressure to tighten surrogate motherhood laws that have made it the rent-a-womb centre of Europe. Britain's inadequate legislation has been highlighted by the case of the surrogate abortion that never was... [A]n English maternity nurse and mother of two, agreed to bear a child that would inherit half her genes and half the genes of... [a Dutch guy whose] wife... had tried unsuccessfully to have a child for 10 years and had suffered through five miscarriages, [after the couple] were put in touch with [the nurse] by the voluntary organisation *Cots* (Childlessness Overcome Through Surrogacy). For expenses of £13,000 [the nurse] agreed to inseminate herself with the intended father's sperm. But [the nurse] later announced that nine weeks into the pregnancy [it] had aborted the foetus because [of her belief that the couple] were unlikely to pay. After the Dutch couple's distress was made public, [the nurse revealed it] was still 14 weeks pregnant and intended to bring up the child as her own. [The nurse]'s actions have made her a pariah in her native Scarborough on the Yorkshire coast, but others regard *Cots* and its boss... as the real villains. *Cots* takes advantage of the blind eye turned by the law in Britain to surrogacy, which is banned in France and The Netherlands and discouraged in Germany... The British Medical Association, concerned at the lack of monitoring and research into the long-term effects, wants tighter controls on organisations such as *Cots*, which has been involved in organising around 200 surrogate births. The [Dutch couple] have vowed to seek custody of [the nurse]'s child, but Britain's Human Fertilisation and Embryology Act states that the surrogate mother is the legal mother.

...A two-year-old has been declared an orphan after a judge ruled [it] has no parents. [The 2-year-old girl] was born as a result of a donor egg fertilised by donor sperm being implanted in a surrogate mother. But a month before her birth, the [guy] who hired the surrogate mother filed for divorce from his wife. Yesterday, [an] Orange County Superior Court Judge... ruled that [the guy] no longer has to pay his ex-wife... \$US386... a month to support the toddler who bears his name. [The guy contended that, because it] had filed for divorce, [it] never legally became the girl's father and that, since no court determined [the girl] was a "child of the marriage," no family law court could order him to pay child maintenance... [The judge agreed and] also ruled that [the ex-wife], who has custody of the girl, "is not entitled to be declared the legal mother." ...Lawyers representing the child and [the ex-wife] will appeal against the ruling. [■ '10,000 surrogate births have occurred since 1976' in the US.]

...NZ's largest fertility service is trying to trace five couples who have had 16 frozen embryos stored at the clinic for the past 10 years – a period national guidelines say should be the storage limit... [T]he 16 embryos belonged to the... couples and exhaustive efforts would be made to find them. The... clinics' self-imposed guidelines say the embryos should now be either reimplanted or discarded, [but] Fertility Associates says it will continue storing the embryos if the couples could not face disposing of them... Couples who have completed their IVF families decided "about half a dozen times a year" to take their remaining embryos out of storage, while others had them reimplanted even though they did not want another pregnancy. "They do it just to give them a chance. This is about as common as discarding the embryos," said... [the clinic's] director... The North Shore fertility service, Artemis, which recently announced it had won ethical approval for the country's first non-commercial IVF surrogate pregnancy, expected next year to be able to donate a number of frozen embryos from one couple. While frozen embryos have been donated and implanted in the past by Fertility Associates, no pregnancies have resulted. The number of embryo donations has been limited because the clinics require the biological parents to be identifiable to the resulting offspring. Artemis has about 300 frozen embryos in storage, while Fertility Associates nationwide has more than 1000 belonging to about 150 couples. Meanwhile, Artemis is preparing ethical committee applications for several couples seeking approval for surrogacy. The couples can produce embryos but the [wives] are unable to carry babies. In the first case a [surrogate] will carry a child for her cousin... [Artemis] said only up to a dozen couples a year needed the service.

...Frozen... embryos are being destroyed at fertility clinics if they are not used... The decision has angered pro-life campaigners, who say the one and two-day-old fertilised eggs are tiny human beings. But fertility clinics say the embryos cannot be kept frozen indefinitely and their biological parents must eventually decide whether to keep them alive... The clinic now had about 20 embryos which had been frozen for more than 10 years. It had sent letters to the owners, who paid \$120 a year for storage... The scientific director of Fertility Associates... said the controversy probably stemmed from the destruction of about 3000 embryos in Britain, where a strict time limit was set on their use. There was no time limit in N[Z].

...Unclaimed frozen embryos belonging to hundreds of couples are set to be warmed and destroyed under new laws coming into effect in Victoria on January 1. Extensive attempts to trace the couples have failed and, if unclaimed after five years, the fertilised eggs can be destroyed

automatically. Other couples have given permission for their embryos to be destroyed... [even though c]ouples can apply for extensions to the time limit... The embryos are taken from cold storage and allowed to thaw at room temperature, which destroys them after 24 hours. Regulations for how they will then be disposed of are now being drawn up... The *Sunday Age* reported yesterday that... [more] than 8000 embryos are in storage in Melbourne... without giving figures of how many were close to the five-year cut-off... But the Right to Life group says the embryos should be kept in storage for longer than five years, although the organisation has campaigned against IVF programmes because of dilemmas such as this... A Right to Life spokes[person]... said the optimal solution... was to continue storage of the embryos so that they could have a chance of future life.

...Clinics around the world are beginning to store pieces of ovary for... young [gals] with cancer... in the hope the immature eggs they contain can be harvested and fertilised later... if treatment leaves them infertile... [Now Auckland] and Christchurch doctors are seeking ethical approval to... try the same technique here. Fertility Associates' director... has just returned from the annual scientific meeting of the Fertility Society of A[US] at which advances in the technique were reported. [The director] said while the procedure had not yet been successfully used, technology was developing so rapidly it should allow cancer patients who were now in their late teens, 20s and 30s to conceive five to 10 years from now. In future, the technique may even be available for babies or young girls with cancer, although permission would be a problem because the children could not give informed consent. Every baby girl is born with millions of immature eggs in the ovary, which are progressively shed[('by adulthood, only about 1/4 are left alive')]. While eggs can now be frozen and stored, their numbers are limited to those harvested during one cycle in which the ovary is hyper-stimulated with hormone treatment. However, a piece of ovary could yield 20,000 eggs. [The director] said cancer doctors had been so focused towards saving lives they had not given much thought to saving fertility. But as increasing numbers of young [gals] survived treatments for leukaemia, lymphoma and breast cancer, it was becoming an important decision. "[Guys] at the moment deposit sperm and have done for years. So if it is good enough to preserve young [guys'] fertility, it is good enough to preserve young [gals']..." The director, who is the newly elected president of the Fertility Society of A[US], said if ethical approval was given, patients' ovarian tissue could be stored from the second half of next year.

...Auckland researchers have found that freezing and thawing can visibly change some stored sperm – for goats at least. The Auckland Medical School team found that in three out of 10 goats, the process made their stored-sperm heads bigger – an indication that the genetic building blocks of DNA, or their packaging, may have been altered. The director of... andrology... services at the school's Research Centre in Reproductive Medicine... said that it was not known what the possible genetic effects could be, if any, and further work was being undertaken. "Are these potentially normal sperm? Sure," said [the director]. "Maybe it doesn't matter." But... if... the sperm's DNA had changed... this could have implications for assisted reproduction in humans... [W]hen semen was used naturally the [gals'] reproductive tract should be able to filter out altered DNA, but in the test tube or using a technique where a sperm is injected into an egg, problems could be encountered. The worst possible scenario would be if the technique led to the birth of a child who looked and acted in a normal way but because of the change in DNA was more prone to contracting a disease. [The director] wanted... to develop safe and effective means of choosing sperm with normal DNA. But there were, [the director pointed out], many normal healthy children who had been born after frozen sperm had been used. Goats were chosen for the research because their sperm heads looked uniform and it was easier to contrast them before and after freezing then thawing. By comparison, human sperm varied greatly. The group's work, said to be a first, was accepted for the recent Society for the Study of Reproduction conference in Oregon, in the U[S]. The scientific director of Fertility Associates in Auckland... said... studies had been done and [they did not appear to show] higher abnormality rates – if anything the rates were less. Around the world people had been trying to reduce the damage that freezing did to sperm. For some [donors], quite a few of their sperm died during the process. "As far as changing the DNA, I don't think that's very likely,"... said[the scientific director]...

Following on from the announcement that an AUSn group is trying to gain approval for gals to 'sell their eggs' comes a report that p[ayments] to sperm donors could be phased out in Britain amid claims that many [donors] are donating samples for cash rather than concern for childless couples. The Human Fertilisation and Embryology Authority, which regulates sperm donations, is proposing to end the £15... a time tax-free payment. They are worried that "dead-beat donors" including drug addicts are profiteering.

...Modern living is hitting [guys] where it hurts the most, with sperm counts falling more quickly than anyone thought... Experts who set out to dispel fears of falling sperm counts found they were lower than reported... The debate... about sperm decline... has been bubbling since 1992, when... researchers... at Copenhagen University said sperm counts were falling around the world, based on an analysis of 61 studies.[However,] British research found that [guys] born in the 1970s had 25[%] fewer sperm than those born in the 1950s, while... New York's Columbia-Presbyterian Medical Center found no decline... [Now] the reproductive epidemiology section at the California Department of Health Services... [has] re-analysed the 61 studies[:] "Overall, in Europe and the U[S] there is a strong and significant decline,"... [which] many... experts, blame[on] persistent organic pollutants... But there could be regional variations[, and counts]... seemed to be going up slightly in [Last World] countries.

...It's a shattering condition which affects thousands of [gals across NZ] – some of whom have no idea there's anything wrong with them. Only when they start trying for a baby and experience month after month of disappointment are they likely to discover they're victims of a syndrome which affects a massive 10[% of gals] in this country. Polycystic ovary syndrome (PCOS) was discovered in 1935 but, until recently, little was known about it. For years, [gals] have suffered in silence simply because the physical symptoms are so embarrassing. [Gals] affected by PCOS are often overweight with bad skin and, perhaps worst of all, excess body hair. In the past, few sufferers have understood the close link between these physical problems and the emotional pain of being unable to fall pregnant. PCOS has stayed undetected – a ticking time bomb that may lead to heart disease, diabetes and even cancer... In many... cases... the symptoms have not been detected because the [gals] have been taking the contraceptive pill... [which] has been masking the problem... Research shows about 20[% of gals in NZ] aged between 18 to 45 have polycystic ovaries but only half of these show obvious symptoms... That's why more of us need to know about this syndrome. Although we're probably part of the happy majority who don't have it, we may have a friend or family member battling infertility or embarrassing physical problems. The good news is PCOS sufferers can be treated and there's every chance a large percentage will go on to conceive a child... "...About 70 to 80[% of gals] with PCOS will be pregnant in one year," says... a senior lecturer in obstetrics and gynaecology[who] works at the Fertility Plus clinic at National [Gals'] Hospital... Thanks to modern ultrasound techniques, doctors can pinpoint PCOS far more easily – [gals] need suffer in silence no longer... Slowly, but surely, the unpleasant physical symptoms can be tackled – bad skin starts to clear up and body hair disappears... PCOS is a hereditary condition... Ovaries affected by PCOS are enlarged and contain more follicles than usual, which look like cysts. Some of these contain eggs and behave normally but some lie dormant and secrete hormones called androgens. These cause a hormonal imbalance which disrupts the message sent from the pituitary gland, so the egg is not released. No egg means no chance of conception and no period. The androgens also affect hair follicles and skin... The first step for [gals] with PCOS who want to get pregnant is to take a course of Clomiphene citrate, a drug which stimulates the follicle to release an egg. Clomiphene is taken in tablet form for five days at the start of a period. It's convenient and easy to take and causes ovulation in 70[%] of patients, although there's a 10[%] risk of multiple pregnancy. If taking Clomiphene doesn't result in pregnancy after about six months, other steps can be considered. One is a surgical procedure called laparoscopic ovarian drilling, or diathermy, which shrinks the ovary in an attempt to make the follicles behave normally. A more commonly used treatment is a hormone called gonadotrophin, which doctors inject directly into the ovary. There's a 20[%] risk of multiple pregnancy... [Speaking of which,] according to a Slovakian paper... a [mother] in the village of Stara Lubovna bore three sons and four girls on January 17, 1723, and that they all went on to live normal lives. It said the village's register of births recorded the historic event, which was credited to a miracle of the black Virgin of Czestochowa, just across the border in Poland.

...[US] companies lined up yesterday to make sure the Iowa septuplets will not want for anything... Gifts from generous individuals and companies for... [the parents] included... a year's supply of... free groceries, a new van and free baby-sitting by people in the[ir] hometown of Carlisle... A new house to replace their two-bedroom house... 32,000 disposable nappies, a lifetime's supply for [7 babies. 7]... car seats and... [7 strollers. 7] years of free cable TV... Heating and cooling bills paid for an undetermined period... But there is no word on how such distant needs as college tuition (estimated to cost... \$US1.5 m...) will be met for the [4 boys and 3] girls. In at least one respect, the family has decided to curtail its future needs. Responding to a reporter's question about whether the couple planned to have any more children, [dad] waved his hands and said, "No, no. That's been medically taken care of." [Dad] did not elaborate... [but] said his biggest concern was to make sure it did not turn into "a big show." ...[a doctor said the mother had needed] intensive physical therapy to rebuild her muscles... [The mother said they had] wondered if God was punishing them when [they learned her body was carrying 7] foetuses... but... told her doctor that aborting some foetuses... was out of the question.

...*Playing God with fertility technology*... [T]he deeply religious Iowa couple who have made world headlines with... their septuplets, credit God for the birth and miraculous survival of their seven babies. But when it comes to the business of making babies, more and more [USers] are placing their faith in technology... and, according to fertility specialists, there is no longer any reason to simply let nature take its course... The most recent statistics from the American Society of Reproductive Medicine show about 10[% of US] couples are infertile – defined as failing to achieve pregnancy after a year of trying. Its survey of 249 fertility centres showed more than 39,000 attempts at assisted conception, ranging from fertility drugs to in-vitro fertilisation (test-tube birth), which had a success rate of 20[%] for 33,000 tries, to donor egg procedures, which were nearly 47[%] successful. In Britain, the number of test-tube births rose 25[%] last year, according to the Human Fertilisation and Embryology Authority. About 20,000 couples try IVF in Britain each year, with more than 3000 babies being born as a result. The birth in 1978 of... the first test-tube baby, has led to a major transformation in attitudes to infertility, with many people seeing no reason to tolerate childlessness for any length of time. But cases like the [couple from Iowa] – and of Britain's [multiple-birth mum], who lost her eight foetuses earlier this year – do cause concern... Fertility extremes make regular headlines now, from the septuplets to the news in April that a 63-year-old California[n]... using a donated egg had given birth. "What have started out as what-if debates frequently find themselves being acted out in real life," said the president of the A[MA]... "We have to help society look at the... array of expenses that go along with fertility care. We are only a few steps down the road to answering the questions." ...[By the way, a] 16-year-old Colombian girl... [from] the poor neighbourhood of Nueva Colombia in... Bogota... is pregnant with six children... Her husband... (22)[, who] is unemployed... called on the Government to help the couple with the costs of raising the children.

...People in the lower North Island will no longer have to travel to Auckland for publicly funded infertility treatment from next month. Central Health has bought artificial reproductive technology services from Fertility Associates Wellington. Thirty to 40 couples in the Central Health region will be able to receive treatment each year, but there will be no impact on waiting lists for the National [Gals'] Hospital infertility treatment service in Auckland, which previously provided services for the whole North Island.

...A National Health Committee report due out today says a points-based system should decide who gets the limited amounts of... fertility... treatment available. The report, *Access to Infertility Services*, suggests would-be parents should be ranked on several factors, including: • The [gals'] age, weight and whether [it] smoked. • The length of time the couple had waited for a baby. • Whether they had other children. • Any previous sterilisation operation... [Gals] with tubal disease would [also] not qualify in severe cases and would need corrective surgery first in milder cases... Under the proposal a 165cm-tall [gal] would be told to lose weight if [it] was over 87kg... [and] would also lose points between the ages of 36 and 42. Couples could be excluded from treatment if they were unable to care for a child through mental illness or were considered likely to abuse a child. Many of these decisions are already made by doctors but the proposed guidelines would make them obligatory throughout N[Z]. The report... says the only fair way to introduce the system, short of a "fertility lotto" draw, would be to raise public funding from \$4.5 million a year. Increases would enable 717 couples to be treated at \$7.2 m... That would still be a small proportion of couples struggling to become parents. Of the 3500 couples who seek fertility treatment each year, about 2380 are eligible. The... Committee suggests a more user-pays approach in its preface to the report, saying couples could pay for less expensive treatments themselves or income testing could be introduced, forcing people who could afford the service to pay for it... [□ The m]ain fertility treatments... available... in N[Z] are: *Donor insemination*: A [guy], usually not the [patient]'s partner, donates sperm, which is kept frozen. When needed it is thawed and placed in the [patient]'s uterus. Average cost: \$450. *Intrauterine insemination (IUI)*: The [partner] produces semen and the sperm are isolated and inserted in the [patient]'s uterus. Often ...he[r]... ovaries will be stimulated with drugs. Average cost: \$750. *In vitro fertilisation (IVF)*: Popularly known as a "test tube baby." The [patient] takes drugs to increase the number of eggs [it] produces from one to about six to 10. The eggs are taken out with large needles and fertilised with ...he[r] partner's sperm in a laboratory dish. Up to three embryos are then placed back in the uterus. Average cost: \$4545. *Intracytoplasmic sperm injection (ICSI)*: Similar to IVF but a single sperm is injected into the egg. Used with low-quality sperm and available only for the last three years in N[Z]. Average cost: \$5545.

...A severely disabled couple have won their long battle to have a baby through a sperm donor... The Auckland couple... were turned down last year by a fertility clinic on the grounds that they could hardly care for themselves, let alone a baby. But now they have been promised fertility treatment as long as the baby is cared for by a full-time nanny, with help from other family members... [Mr Disabled], who is sterile, has a joint-seizing condition called arthrogryposis multiplex congenita. [Mrs Disabled] has cerebral palsy. The couple [had] complained to the Human Rights Commission that Fertility Associates was discriminating against them because they were disabled. Now the commission has announced that the complaint has been dropped because Auckland Healthcare's Fertility Plus clinic will supply the fertility treatment instead. Fertility Plus – which lost the regional contract for public services last year to its private rival – had also refused the [couple's] request... three years previously... The couple, who went on national television last year with their plight, refused interviews yesterday, saying they had had enough publicity. A director of Fertility Associates... said his company was acting in the best interests of the child when it refused fertility treatment.

...People with intellectual disabilities having sex was once a topic kept firmly in the closet. Now, Family Planning has busted the closet open with an educational video... *Four Stories* tells in almost soap-opera style dramatised tales about relationships, pregnancy and child rearing, same-sex attractions and setting boundaries. In the past the public preferred to think people with intellectual disabilities had no sexual urges, said... [the] manager of the Family Planning resource unit. "It was easier to hide the topic away and not discuss it in the hope that nothing would happen. It's a human rights issue really in that everyone has the right to have knowledge about their bodies... and a right to express their sexuality..."

...Dozens of intellectually disabled girls... are being sterilised each year – often for the convenience of their parents. A Wellington lawyer... said yesterday that 46 girls under the age of 20 were sterilised in 1994. Six... were aged between 10 and 15. [The lawyer] has completed a master of laws thesis on the sterilisation of handicapped people and said more girls... are being sterilised each year. Her research shows 33 girls... were sterilised in 1992, and 36 in 1993... N[Z] law allows the sterilisation of handicapped girls under 16 with parental consent. The precedent for [girls] aged over 16 is for the least restrictive intervention possible to be taken. Doctor's must also satisfy themselves that the [girl]'s best interests are upheld.

...The courts should decide whether intellectually disabled children can be sterilised without their consent... Caregivers may have suspect motives for... [using the] irreversible surgery, the IHC said yesterday in a briefing paper. The national advocate... said people under 20 with an intellectual disability had no legal protection from unsought sterilisation. Those over 20 appeared to be protected by a legal precedent related to the Protection of Personal Property Rights Act 1988. Most sterilisations were done to girls, some as young as 10 years old, but some to boys as well... A Wellington lawyer... told the N[Z] *Herald* last month that... 10 more... girls under 20 were sterilised in 1994... than in 1993... It seemed some

sterilisations were not being recorded, “so there may be more going on than we think.” The *Dominion* reported yesterday that a high proportion of sterilisations of intellectually disabled adults appeared to be illegal... [The advocate] said: “The problem is that the law is so vague and it’s not clear to doctors either.” The “one-off solution” of sterilisation failed to address the real issues, including the benefits of sex education, menstrual training and acknowledging the sexuality of all people. “Instead, it reflects the turn-of-the-century argument for genetic purity but presented in benevolent language.” ...The charting of a rise of sterilisations in N[Z] comes amidst furore this week about the forced sterilisation of 60,000 Swedish [gals]...

The Swedish Government could face thousands of legal claims for compensation because of a nazi-style campaign of forced sterilisation... that historians say has been hushed up for years. Shocked Swedes have learned that more than 60,000 [gals] were sterilised to rid society of “inferior” racial types and to encourage Aryan features. Sweden, which has long basked in its image as a champion of human rights, is reeling from the revelations this week that along with Denmark and Norway it pioneered racial cleansing “sciences.” “What happened was nothing short of barbaric,” its Social Affairs Minister... admitted, adding that [the minister] was prepared to review laws that said the sterilisations were written into law and that damages could not be paid... The sterilisations began in 1935, peaked in 1946 and were not stopped until 1976. Most victims were... “poor or mixed racial quality,” meaning people with learning difficulties, poor or not of the common Nordic blood stock. One victim, [who is now a] 72-year-old... said [it] was viewed as educationally “inferior” because [the victim] had no glasses as a child and could not see the school blackboard. Miss [72] was sent to a school for the mentally subnormal and made to sign papers when... aged 17. “I signed because I knew I had to get out... I was sent to Bollnas hospital where... [a doctor] said to me, ‘you’re not very bright, you can’t have children’...” [The minister], who confessed to feeling ashamed that [it rejected Miss 72]’s application for damages in 1996... would raise the subject in cabinet. “It’s the least I can do.” Drawing comparisons between Sweden and nazi Germany is like rubbing salt in a wound for many Swedes, who already feel shame about Sweden’s neutrality during... [WW2] and help offered by governments for the German war effort. [● ‘A Boston doctoral student has uncovered a plan by American scientists in Vermont during the 1920s and 30s to eliminate the state’s “degenerate” bloodlines. The plan, called the Vermont Eugenics survey, studied “good” and “bad” families in the state and listed those which it determined needed to be eliminated. The report led to the passage of a 1931 sterilisation law which resulted in the sterilisation of several hundred poor, rural Vermonters, Abenaki Indians and others.’]

...DENMARK will hold an official investigation [into] its... forced sterilisations, a move the social affairs minister says should have been made a generation ago... [Hi]s announcement comes as neighbouring Sweden endures uncomfortable international attention in the wake of a newspaper... detailing its forced sterilisation[s]... Denmark actually started... six years before Sweden, becoming the first European country to enact involuntary sterilisation... Denmark ended its programme [9] years earlier, however... [H]alf of the 11,000 sterilisations... were done against the patient’s will...

A report released yesterday claims... [that] illegal sterilisations have been performed on intellectually disabled... girls in A[US]. The report... said the High Court ruled in 1992 that only a court or tribunal could authorise sterilisation operations on minors that were done for other than therapeutic purposes. It said courts since 1992 had authorised only 17 sterilisations – despite figures showing 1045 girls had been sterilised during this period. “The law has failed to protect significant numbers of children from significant abuse of their fundamental human right to bodily integrity,” the report said... [However, the AUS]n Health Minister... described the report as “extraordinary,” and a spokes[person] said the federal health department’s view was that its “data had been misconstrued.” “Our department is of the view that it inflates the number of sterilisations by about four to five times,” said the spokes[person], who said neither [itself nor the minister] had seen the report... [While on the topic of sterilisation, AUSns have been ranked 4th in an international survey of vasectomy rates. NZ guys are still] more willing to have a vasectomy than those in other countries... 23[% of NZ] couples of reproductive age use vasectomy for contraception. Next highest are in the U[S (13%) and Britain (12%)...

Up to 16 NZers a month are getting emergency Government grants for “urgent” vasectomies. The [patients] – all low income earners and deemed at high risk of producing more offspring – receive up to \$200 for the procedure. In most cases, their wives or partners have had previous unwanted pregnancies because of contraception failures... The chair[person] of the General Practitioners Association... had urged a vasectomy for one patient whose wife had already had two abortions after contraception failure. The couple, who had three young children, did not have money for the vasectomy and applied for the grant. The alternative was a six-month wait, which could mean another pregnancy. The Government pays the full cost of very few vasectomies because they are seen as low priority operations. The onus is generally on the individual to come up with the \$200 to \$300. North Health... subsidises up to 900 vasectomies a year through the F[PA]. But low income earners with a Community Services Card must still pay \$161 towards the cost... [T]he subsidised rate was often still too much for a struggling family wanting permanent birth control.

...An Indonesian... cut off his penis with a kitchen knife after discovering his wife was pregnant for the ninth time. A friend said the [Indonesian] was extremely stressed at seeing his wife pregnant again, knowing his income was inadequate to support his family... [By the way,] Turkish maternity wards will have work on their hands over the coming months after 600,000 leaky condoms were exported from Germany. The “London” brand condoms were withdrawn from sale in Germany at the end of 1994... The manufacturer said the faulty batches were sent to be destroyed but a few weeks ago, a company executive in Turkey was offered... a batch of... the condoms, still in their original packaging with a German label.

...About 1000 packets of Trojan condoms, sold at service stations in packs of three, have been recalled after they failed to meet a safety standard. On Monday another brand of condoms, Ansell Affinity Extra Strength 12 packs with Nonoxynol 9, were also recalled.

...when is a condom a lemon? ...It may not have been the question on everybody’s mind yesterday, but it certainly occurred to a few of us: how do they know that a condom has failed a performance test and needs to be withdrawn? The recall notices published in every newspaper in the country this week announced that one batch of Trojan condoms (batch 3095, regular with spermicide, three-packs) “no longer meets” the N[Z] standard. The notice, inserted by Wilson Consumer Products, which distributes Trojans in N[Z], asked consumers to return condoms (the addition of the word “unused” seemed superfluous, to say the least) and promised a refund cheque by return mail. It has, it seems, been a bad week for condom makers. On Monday, there was an unrelated recall of another brand... All of this raised the question of how they knew the condoms weren’t working like a Trojan. Is this something that is brought to one’s attention by disgruntled customers who didn’t know until it was too late that there was a problem? ...the brand manager for the pharmacy division at Wilson, puts my mind at rest. Trojans... are tested by the distributors and A[US]n officials before being sent here. But that’s not the end of it. The official tester, known as the Therapeutic Goods Administration, randomly buys and tests condoms that are already on sale. It was just such a test that alerted them to the Trojan problem. The recall doesn’t mean that the Trojan or the Affinity are routinely disintegrating: the test procedure, which Ancell’s regional director... says is tougher in Australasia than in other territories, is exacting. In one, a condom is inflated with 48 litres of air (...that makes it about as big as “three or four basketballs end on end,” which, few would dispute, is well beyond normal operating requirements); in another it is filled with 300ml of water and checked for leakage – by close inspection and with absorbent paper. [The person] who leads the compliance team at the Ministry of Health in Wellington, says the test failure suggests the named brands are deteriorating... His team arranges for tests on 24 batches of 500 each year and allows a failure rate of only 0.4[%]. The trouble with the Trojan recall is that many of the defective batch have probably been used. [The brand manager] agrees that batch, being three-packs and sold only in service stations, would be more commonly bought by casual users or impulsive buyers rather than “people who take them home and put them in the drawer.” But [the brand manager] is relaxed about the predictable trickle of opportunistic lawsuits. [The brand manager] says every recall results in “two or three people ringing up saying that we are to blame for an unwanted pregnancy. But there’s no way they can prove it. They would have to prove they were using it correctly. I’ve never heard of a case succeeding.” ...[Incidentally,] Japan took a step towards approving the low-dose birth control pill yesterday after the key Health Ministry committee gave the oral contraceptive its blessing. That means Japanese [gals] may gain access to the pill for the first time next year.

...The latest in a series of studies on the newest formulation of birth control pills shows they do not increase the risk of blood clots. The study, in the American journal *Contraception*, shows second- and third-generation oral contraceptives carry the same risk of deep vein thrombosis... The third-generation pills were the focus of a worldwide scare in 1995, when several studies published in the British *Lancet* medical journal found they tripled the risk of such blood clots. Government regulators in Britain issued warnings about the pills, and they were followed by Germany and Norway. Sales of the pills, ironically formulated specifically to diminish health risks, plummeted in Europe. In the latest studies the researchers, whose work was financed by pill-maker Schering AG, re-analysed the data from the earlier studies. "We found, for first-time users, that the adjusted ratio of VTE (blood clots) as a function of the duration of oral contraceptive use is generally identical for second- and third-generation pills relative to never users," they wrote. They said the first-time study used many [gals] who had tried other pills before and who may have had problems with them. They also found the new pills did not increase the risk of heart attacks... [but 'reduced acne and helped with difficult periods.' However, they] said more studies were needed to determine absolutely whether the new pills carried any different risks from older ones.

...[when a 34-year-old NZer was 19 it] went to her local Family Planning clinic for contraceptive advice. After a brief chat with a doctor, [the 19-year-old] opted for an IUD... It was easier than remembering to take a pill every day and more convenient than a diaphragm, or so [the NZer] reasoned happily. It seemed an ideal solution, and it worked. [The NZer] didn't get pregnant. But now, [the NZer will] never have children, thanks to the tiny metal device. [The NZer] has endured agony after agony, both physical and mental, since having the Copper 7 IUD fitted. "I had no idea this one little thing would cause so much trauma in my life,"... Within about a year of having the IUD inserted, [the NZer] began experiencing vaginal discomfort. Her doctor gave her antibiotics but they didn't seem to help. By the time [the NZer] was 21 the discomfort had turned to pain and her periods stopped. [The NZer] saw a specialist who removed the IUD and found a piece of tissue, the size of a five cent piece, caught in the knotted cord. [The specialist] took swabs and advised [her] to have a smear test in six months. By then [the NZer] had moved to A[US] and a doctor there told her [that her body] had human papilloma virus (HPV), a virulent wart virus, which in some cases can cause cancer. Because the virus had spread extensively throughout her vulva, cervix and uterus, [the NZer] needed laser treatment to remove the infected cells. A laparoscopy – diagnostic surgery using a telescope-like instrument to look inside her body – revealed not only did [her body have HPV, it] also had pelvic inflammatory disease (PID), a disorder which causes infection and inflammation and in severe cases can lead to infertility. [The NZer] believes her body couldn't fight off the wart virus because it was ravaged by PID... Specialists told [her that] her uterus had "had it" and the best thing would be to have a hysterectomy. "I didn't stop to think, I just said okay. I was in a lot of pain and concerned I had an organ in my body that was diseased and could be dangerous." Her uterus and cervix were removed and during the operation her ovaries, which were covered in cysts, were "cleaned up" and put back inside her. "But I was still in a lot of pain and the HPV came back, so I started extensive laser ablation therapy." ...[the NZer] then had another laparoscopy, which revealed a cyst the size of an egg on her left ovary. As the ovary was no longer working, it was removed in February 1987. Her right ovary was taken out, cleaned and put back, this time in her back, away from her diseased pelvis. Adhesions were also discovered on her liver and kidneys. Not long afterwards [the NZer], who had all her treatment done privately and paid for it herself, returned to N[Z]. "I was still having problems and they decided my right ovary had died so they took it out. It meant everything was gone. I now had no ovaries, no uterus, no cervix. I was only 24. I had no hormones so I had to go on HRT (hormone replacement therapy). If I don't take it I get hot flushes and nausea... While I still had an ovary, I still had eggs and a chance of having a child of my own. I had asked my doctor if they could take some eggs and freeze them before they removed the ovary but [my doctor] said, 'We don't do that sort of thing.' Now there's no fertility treatment in the world that can give me back what was taken away. I had to face the fact that I could go through life alone. I thought, 'What [guy] was going to want me?'" But someone did... [They] were married in October 1994 and they've not given up on having a family. "We really want to be parents so we're looking into the possibility of surrogacy. That way there would be a genetic link through [my husband]. The tough part is finding someone prepared to do something so very special for us." If surrogacy isn't possible, they hope to adopt a baby from N[Z] or a child from overseas... [The NZer] says in many ways it was easier to deal with the fact [that her body] had lost the ability to have children because [the NZer had] always considered what happened to her to be "just one of those things". But that changed... when [the NZer] heard an item on the radio news about... [NZ gals] seeking compensation from American IUD manufacturers. A Wellington lawyer was acting on behalf of [gals] who alleged the Copper 7 caused PID, ectopic pregnancies, infertility and other complications. "When I heard that, something just went ding... Facing up to the fact that what I went through may have been due to a decision I made was really hard. It was easier to believe it was an act of God." After... years of ongoing legal action, claims by [herself] and 95 other [NZ gals] against GD Searle and Co, the [US] manufacturer of two brands of IUDs... have been settled. The... manufacturer and its N[Z] subsidiary did not accept liability but agreed to settle. "Nothing can make up for the loss of what we could have had... But now at least we can put the past behind us." ...• The Copper 7... was withdrawn from sale in N[Z] in 1987. The two brands used now are Multiload and Nova T, which have a different shape and cord to the Copper 7.

...New research shows that [gals] using hormone replacement therapy need to take progestogen for at least 10 days a month if they are to avoid endometrial cancer (cancer of the lining of the uterus)... [The] senior lecturer in reproductive medicine at National [Gals' Hospital says gals] using less than that dosage should switch to a longer progestogen regime. In the early years of hormone replacement, [patients] used to take oestrogen only. It was used to relieve menopausal symptoms, and to minimise post-menopausal bone loss. Unfortunately "unopposed oestrogen"... was found to cause a 10-fold increase in the risk of endometrial cancer. So doctors began to prescribe progestogen as well. That seemed to prevent any increase in the risk of endometrial cancer. But taking progestogen has a downside for some [gals]... "As the number of days of progestogen are increased, then so is the likelihood of experiencing side-effects such as bloating and weight gain and other premenstrual syndrome-like symptoms,"... [Gals on a] reduced progestogen regime should have annual cancer checks... Even after they stop hormone replacement therapy, this testing should continue for 15 years... [In related news, a] non-invasive treatment for fibroids may provide some [gals] with an alternative to the surgical removal of the uterus known as hysterectomy. The procedure, presented at a medical conference, involves a 5mm incision and uses a catheter to cut off blood-flow to the fibroid, a technique known as embolisation. It leaves the uterus in place... More than half a million American[s]... have hysterectomies each year, about one-third because of fibroids, which are non-cancerous growths that can cause pain and bleeding. There has been a raging controversy for years about whether many of these hysterectomies are unnecessary, and specialists have searched for alternative treatments that preserve the womb... A [patient] can no longer bear children after her uterus has been removed...

A new study has found greater reliance on "behavioural contraception"... – coitus interruptus... cleansing of the vagina and breastfeeding... – ...among [gals] having abortions than previously reported... ([p]revious studies had shown the use of behavioural methods ranging from nil to 22.6[%] – all less than [the 34.9%] recorded in the latest study[)]... leading to suggestions that there is a need for more education about the risk of pregnancy. [On a positive note, a British company has developed a 'natural birth monitor that tests urine – green = go; red = no (£50 + £10 for test sticks).']

...We were 9 months pregnant... and didn't know it... Aged 18 with no greater worry than her school exams, [subject #1] woke early one Sunday in 1992 with what [the teenager] thought was a severe belly ache. A warm bath eased her pain and [the teenager] went back to sleep. About 9am next morning, [the teenager] painlessly gave birth to a 2.9kg baby girl. Shock has dulled [her] memory of the event, but [subject #1] recalls wrapping the baby in a towel, walking to her parents' bedroom and entering with the words: "Look what I've got!" In the mad rush to reach the hospital that followed, [the teenager] asked her parents if [it] could keep the baby, to which her mother replied: "Don't be stupid, it's not a puppy." At the

hospital, mother and baby required urgent treatment: [the teenager] for serious haemorrhaging and the baby... for breathing difficulties. [The teenager], who mistook bleeding during her pregnancy for her period, admits [it] didn't take to instant motherhood easily: "It took me six months to bond with [my baby]. I hated the sight of her for a long time. I denied it. The first three weeks I was like a zombie. I kept waiting for someone to come and take [my baby] away." As the months passed, though, [the teenager] came to love her daughter like any mother and now wouldn't have life any other way... [A] senior lecturer at the Department of Obstetrics and Gynecology at Melbourne's Mercy Maternity Hospital, says the incidence of unknown pregnancies occurs generally about twice a year. "Even if you are on the Pill, it can still happen. It is quite possible for a [person] to be on the Pill, have regular periods and be pregnant, because when you come off the hormone tablets and onto the coloured sugar tablets, you do bleed." ...It was a hot day and [subject #2] had planned a relaxing Sunday at the beach. But that morning [the 26-year-old] woke with agonising abdominal pains and... was certain [it had appendicitis]. Subject #2] went to hospital and sent doctors into a spin. They told her the mass they felt was either cancer... or a baby! "Well... I never dreamed it would be a baby, so that made me absolutely terrified because I really thought I was about to die." But [subject #2] was well into labor by the time [it] arrived at hospital and her baby was about to be born. Life [had] appeared perfectly normal for [subject #2] and her partner of four years... "I didn't have any morning sickness, everything was normal, I was still having my period regularly and I was taking the Pill... I locked up the office with my boss on the Friday night, and on Monday... had to ring him and ask... if I could have maternity leave!" ...[the] insurance underwriter had only put on a tiny amount of weight during the pregnancy... Amazingly, [subject #2] had seen her doctor several times during the pregnancy due to asthma, and had been three times in one week, but the baby was not detected. "Most people have nine months to get used to the idea; I had just nine minutes,"... [■ Engl]ish doctors are warning patients about the dangers of delivering babies in a birthing pool. The risk of the infant drowning during the underwater birth, which is thought to give the baby a gentler entry into the world, is well known. But doctors... of the Chelsea and Westminster Hospital in London, described how a two-day-old baby girl developed polycythaemia, a serious blood disorder, after a water birth. The baby was born without problems but the mother insisted on staying in the water with the baby during the third stage of labour, the delivery of the placenta. After 30 minutes [the mother] left the pool and 10 minutes later the umbilical cord was clamped and the afterbirth was expelled. The next day the baby was listless and not feeding properly. Tests showed that [the baby] had very thick blood with an exceptionally high concentration of red blood cells which could cause permanent brain damage. Doctors believe it was caused by an unusual amount of blood draining from the mother's afterbirth while they were both still in the pool. Because the pool is kept at around the same temperature as a warm bath, it allows the blood vessels in the umbilical cord to stay open much longer. When babies are born out of water, the blood vessels constrict quickly after the birth. The baby girl's blood was diluted and [it] has made a complete recovery.

...Giving birth at home is a safe and increasingly popular option... according to a study of... 9776 planned... home deliveries performed between 1973 and 1993... About 2[%] of births were planned home births in 1993, up from 0.04[%] in 1973... The perinatal mortality rate of 2.97 per 1000 births was not significantly different from a selected group of low-risk [mothers] having their babies at National [Gals'] Hospital over the same period. The rate was lower than the national perinatal mortality rate for the same period. The National [Gals'] Hospital figures were used for comparison as the home-birth population was mostly of low obstetric risk, said researchers. They found that many doctors and midwives regarded home birth as risky. Patients, however, saw it as a safe family event where they maintained personal control. The study did not investigate the demographic or socio-economic factors which may influence perinatal mortality. In N[Z], almost all births took place at home before 1914. By 1927, home births had slipped to 41[%] of total births, by 1936 to 18[%] and by 1951 to 5[%]. In related news, a self-styled... UK expert... says couples can choose to have a girl or a boy simply by changing the time they try to conceive. [The daughter of an] eminent physician... claims an 83[% success rate. The] method worked for [a] 37-year-old... and her husband... from Hayle in Cornwall. They have a four-year-old daughter... after following the advice for several months. "Having [a daughter] is proof to me you can choose," says [the 37-year-old]. "Now I feel fulfilled. I love my sons dearly but I felt a bit of a failure not having a daughter." There are many sceptics. [The physician's daughter, who is a former] nursery school teacher... has no scientific data, proof or medical qualifications. [The physician's daughter] simply bases her life's work on her own successful experience and on the desperate couples [the physician's daughter has] advised... "It's true there is no actual proof of what I'm saying, I'm merely a layperson who became interested. All you can do is look at the end results. The thousands of people who have used it say it works." ...After 30 years of counselling others, [the physician's daughter] concludes a couple wanting a girl should have sex regularly to lower the [guy]'s sperm count and they should make love more often just after the [gal]'s period has stopped... [In addition, the guy] should wear close-fitting underwear during the day about five days a month to lower his sperm count... Days 7, 8 and 9 are the most likely days for conceiving a girl. • Day one of your cycle is the first day of your period... For a boy, they should make love less frequently and try to have sex around the time of the [gal]'s mid-cycle, when [her body] produces an egg ready for fertilisation... [In addition, the guy] should wear boxer shorts and loose-fitting trousers to increase the circulation of cool air which will help increase his sperm count... If the [guy] has a low sperm count [it] should take cold showers for three months before trying for a baby... The results are at least based on the biological fact there are two types of sperm and they are known to behave differently. There is the longer-tailed androsperm which produces baby boys and the... gynesperm for girls. Because androsperms are quicker, they work best when a [gal] is ovulating... but they die off when the conditions are not so perfect. The [gyne]sperm is more hardy and, although slower, can survive until the [gal] produces another egg. It seems logical, then, that you can influence which type of sperm "wins" the egg and "sexes" the embryo. The mainstream medical profession has neither officially condemned nor endorsed [the physician's daughter's work. But the physician's daughter] does have support in the medical world and is sometimes recommended by sympathetic gynaecologists... [A gynaecologist] at the Hospital of St John and St Elizabeth in London has been referring patients to her for almost five years. "I don't know why it works but it does for the vast majority I have referred to her,"... says[the gynaecologist.

...gals] whose husbands were more than five years older tended to have boys first, but if their partner was younger or the same age their first child was usually a girl... say British researchers... at the School of Biological Sciences at the University of Liverpool... "We found that this was the case but only for first-born children,"... [The researchers'] findings support other studies showing boys are normally born during and shortly after periods of war or hardship... In most societies [husbands] are, on average, two years older than their wives or partners, but studies have shown that the age gap increased during both world wars, with a corresponding rise in the number of [boys born. The head researcher] said that rank in many animals is related to the sex of their offspring and the same is true of humans. "Human elites tend to have more sons than daughters. If you look at American presidents on the whole the number of sons they had exceeded the number of daughters. It is also the case for European royalty and aristocracy and business leaders...

[A British study of how diet affects the health of new mothers and their babies produced the surprise finding that vegetarian mothers are more likely to have girls. In what is thought to be the first study of its kind, researchers at Nottingham University found significant differences in the sex of babies born to vegetarian mothers and meat and fish-eating mothers. "The birth ratio in Britain is that for every 106 boys born there are 100 girls, that's pretty constant," said one of the authors. "In our sample group of vegetarians there were 81.5 boys born for every 100 girls." Previous studies have shown that diets high in potassium, calcium and magnesium produce more boy babies, but there is no evidence that a vegetarian diet lacks these elements.'

...the "Selnas method" of gender selection, which charts the electrical charge of the ovum (the electrical charge alternates during the month – when negatively-charged, the ovum attracts positively-charged androsperms; when positively-charged, the ovum attracts negatively-charged gynesperms), claims to have close to a 100% success rate – it worked for 153 out of 155 French couples over 5 years.' Another method, which claims to have a '73% success

rate, identifies androperm and gynesperm according to their DNA content (gynesperms contain over 2.8% more DNA' – hence 'sperm that produce girls are bigger than those which produce boys'), while Kiwi] couples could soon order designer daughters by mail. An Auckland clinic is seeking an ethical go-ahead to send semen to an American IVF unit... [which] gives an 85% chance of conceiving a daughter, but is less reliable with boys.

...[they] desperately want a daughter to complete their family. The Auckland couple, who have three sons, had given up hope of having a biological daughter and were trying to adopt an Eastern European baby girl. But a controversial scientific breakthrough in the U[S] has given the couple fresh hope of having their own daughter. The technique, offered by the IVF Genetic Centre in Fairfax, Virginia, is the first time gender selection has been available through artificial insemination. The fertility clinic has developed a technique for sorting the sperm with x-bearing chromosomes... from those with y-bearing chromosomes... About a million sperm are required, using a cell sorter which separates about 100,000 an hour... The technology increases either the number of x-bearing or y-bearing sperm in a sample. The result is that couples are five to six times more likely to have a girl or twice as likely to have a boy by using the sperm-sorting technique. "Those are brilliant odds," says [the wife], who at 38 is not prepared to undergo a normal pregnancy and risk having another boy. [The wife] is willing to go to the U[S] to have the treatment, although... it would be a lot easier if her husband's sperm could be sorted overseas and returned here. The Americans offer a mail-order sperm-sorting service, but N[Z]ers cannot use it until the technique gets official approval here. Sex selection is so new here that N[Z]'s ethics committee on assisted-human reproduction has yet to grapple with the issue. But fertility experts say it will not be long before the technique pioneered in the U[S] is more widely available around the world. There are doubts that the demand for the service will be strong enough in this country to justify the expense of the sperm-sorting machine, which costs millions of dollars. But it is likely that a nearby country, possibly A[US] or Singapore, will offer a similar service soon. The new treatment exposes the sperm to a DNA-binding dye and briefly to ultraviolet light. The clinic that pioneered the treatment says there is a risk that either of these procedures could cause DNA damage to the sperm. But experiments on animals show no evidence of increased birth defects. No reliable research is available on the application of the technology to humans because it is so new... [The director] of Fertility Associates, Auckland, says sex selection had started in the U[S] with little fanfare, but... predicted the topic would generate heated public debate in this country. "The Americans are not so introspective about these issues – they see the rights of the individual as being more important... The N[Z] way is to want to put their nose in other people's business." His clinic receives about one inquiry a fortnight from parents wanting to choose the sex of their child. "Does a group of people have the right to deny access to what would seem to be a reasonable request?" Fertility Associates did not have a view either way... but was interested in gauging public opinion. "I did an informal survey recently and found one-third would seriously consider using sex selection, one-third said they would not care, and one-third would oppose it. Most people's concerns are that all children should be valued, no matter what their gender..." ...If it is allowed in this country, [the director] says the technique will probably be used for gender balancing in families. But a population expert... of Waikato University, has reservations about a technique which allows humans to interfere with the natural balance of the sexes. The issue has to be given careful consideration... because little is known about the impact sex selection will have on demographics. "I would be very, very concerned. There are too many questions that remain unanswered on this issue." [The p]rofessor... says that in some societies, particularly those in South... and East Asia, there is a strong preference for boys, and there may be a latent preference in N[Z] for one sex in particular. A senior lecturer in medical ethics at the Auckland Medical School... also has some reservations over sex selection[– in particular, that if] the technique is allowed in this country... it will be available only to those who can afford to pay for it. "...is it fair that a rich person can choose what sex [its baby has] while a poorer person cannot?" ...As well as paying travel costs to the [US, NZ]ers will pay about \$2000 a cycle, plus \$1200 for tests beforehand to establish suitability for the technique... couples will [also] have the expense of replanting the sperm in the mother... [But the lecturer] says the technique has several advantages: If parents can choose the sex, it will probably lead to smaller families because parents will not have several children to get the sex of child they desire. "In an overpopulated world, this is surely a good thing."

...Once upon a time pregnancy was accomplished through two people having sex. It involved, hopefully, desire, intimacy, anticipation, and uncertainty. Pregnancy and childbirth were a voyage of discovery, a process of bonding closely as a couple in the shared task of preparing for the expected child. In sex selection, the prospective father has a solitary and probably bleak sexual experience. His sperm will be dispatched and returned, graded like hen's eggs, by Courierpost. Next, his wife will have the "sample" inserted by doctors in a clinic theatre. [Husband and wife] need not touch. They need not even jointly be present for either procedure. Sex is made utterly redundant. I suppose [the wife] could help him produce the specimen – this might be preferable to dirty magazines usually kept in clinic "wanking" rooms – and [the husband] might hold her hand during the insemination, or even help the doctor put it in (they do that in some clinics, so the dad can feel [like the dad] did it himself). But it doesn't compete with pelvic thrusting, does it? We seem to have come to a world where what ordinary human beings have done so successfully, for so long, is not good enough. Previous generations, including my own, were by and large content with what they got. There were all-girl families – like my family of birth – and all boy-families, like the one I produced. Part of the drama and excitement of the birth was finding out the sex of the child... Medicalising conception and birth potentially distances the parents from the humanness of this experience. It separates the [father from the mother] and diminishes their roles in the drama. Do we really know the effect this has? Prospective mothers are now so insecure they say they need ultra-sound scans to bond with their babies and make the pregnancy "real". They have to make up their minds whether to have a whole series of tests during the pregnancy to check the foetus is "normal". The implications of this is that you can't trust your own body to do its job without science confirming it, and that the only wanted child is a technically perfect child... Instead of letting nature take its course, with a bit of hit and miss, duplication, and surprise involved, we now have to be in control all the way. [Gals] have a duty to weed out defective offspring. Now the concept of the designer child is expanded to include control over the child's sex. This is being touted as giving parents "choice", that great icon of the consumer society. But will it? What if the [mother]'s wishes conflict with those of her partner? Or those of her wider family? ...Americans tend to think if you can pay for it, you should have it. N[Z]ers do not need to follow their example.

...Pick-and-mix families – the biggest leap forward in human reproduction since test-tube babies – may soon be available to N[Z] parents. Medical experts are meeting in Auckland this weekend at a gathering co-sponsored by North Health and Fertility Associates to grapple with the controversial issue of sex selection... The technology was originally developed for medical purposes – to avoid genetic diseases linked to... [sex] being passed on – but there is already a strong demand from parents who simply want to choose the sex of their child... The demand for sex selection in a small population such as N[Z] would probably be too low to have any impact on the overall gender balance... However, the issue of sex selection in some eastern cultures was more controversial, with [girl] babies considered less desirable.

...“One son is worth ten daughters,” exclaims the exultant South Korean mother of a newborn boy. It's a harsh assessment, but one often heard in [guy]-dominated Asian societies. In South Korea however, the preference for boys has taken a disturbing turn. There are at least 113 [guys] for every 100 [gals] in Korea, one of the highest gender imbalances in the world which, according to sociologists, has profound social implications. A shortage of wives is perhaps the most obvious of these, but more alarming is the willingness of many Korean [mothers to abort girl] foetuses in pursuit of a son. "People don't realise that it's a serious problem," says [the]sociology Professor... of Ewha [Gals'] University in Seoul. In a paper published this year, [the]Professor... cites recent estimates that up to 30,000 [girl] foetuses, or about one in every 12 girl births, are aborted each year after tests to confirm their gender. There are no official figures... [but the] Professor... notes that in a national survey in 1991, nearly one-third of respondents approved of abortion of [girl] foetuses. The abortion rate is extremely high in Korea. One survey says that half of all [gals] aged between 15 and 44 have had abortions, a rate that has stayed steady since the late 1970s. Abortion was widely used during South Korea's

successful 35-year population control programme, and it seems to remain so despite being illegal in most cases. "Many people do not feel guilty about abortion," explains... [a doctor at] the Government-run Korean [Gals'] Development Institute. "They think the unborn baby is not a human being." ...Most [Korean gals] pray for their first born to be a boy, consuming such bizarre folk medicines as raw rooster's testicles and holding religious services to boost their chances. They become increasingly desperate if they produce only girls, leading to more sex-tests and abortions... The so-called "son-preference" is rooted in South Korea's Confucian philosophy, which stresses the role of the son in carrying on the family's bloodline, and in various ancestral rituals. Bearing a son is regarded as a [wife's] most important role. Girls are secondary since they become part of their husband's family after marriage. But these traditions have been modified to suit South Korea's embrace of capitalism. It is a chauvinistic society where [gals] have little prospect of a well-paid job. Boys, simply, are a better bet for parents wanting financial support in their dotage.

...Launching what [it] claims is the "world's first 100[%] guaranteed baby sex selection project," [a]British gynaecologist... is unbothered by criticism that [it] is playing God. "The reality is that advances in human knowledge means doctors and scientists have ever greater opportunities to play God – many of which society welcomes in improving the quality of life, or the relief of suffering... Surgery is playing God and interfering with nature... so what's the difference?" [The gynaecologist] offers parents the chance to choose the sex of their unborn child by embryo selection for the equivalent of about \$20,000. Using existing... IVF... technology, his clinics in Riyadh, Saudi Arabia and Naples, Italy, will take eggs and sperm from the couple, fertilise the eggs in a laboratory, then choose an embryo with the preferred sex to implant in the womb. [The gynaecologist] said the sex of the fertilised egg is evident after about 48 hours... Present sex-choice techniques involving sperm selection provide only an increased probability of one or the other... In applying techniques that have existed for 10 years to sex selection, [the gynaecologist] said, "it was simply a question of who would be first to grasp the nettle." ...[hi]s professional peers and British politicians have accused him of "flagrant ethical violations" and disturbing the balance of nature... [The gynaecologist] was alarmed by the force of the negative reaction, but that... was balanced by inquiries from parents keen on choosing the sex of their children... Asked about his religious beliefs, [the gynaecologist] said: "Church of England..." [The gynaecologist] said his clinics have a place in a world where sex selection is already commonly practised but in cruel and inhumane ways, the result of pressure to produce a male heir in many parts of the Middle and Far East and Africa... "Around the world tens of thousands of babies, whose only crime was being born of the 'wrong sex', are deliberately abandoned to... die." ...There are 15 or 20 clinics worldwide secretly offering sex selection...

['Of the 23 pairs of chromosomes, 22 are *autosomes*, that is, they are possessed equally by both sexes. In contrast, the 23rd pair, the *sex chromosomes*, differs in boys and girls. Girls have two X chromosomes (XX), and boys have an X and a Y (XY) chromosome. The X chromosome is about five times as long as the Y chromosome and carries more genes on it. Since the mother is XX, her ovum always contains an X chromosome. However, sperms may carry either an X or a Y chromosome. If a sperm with an X chromosome fertilizes the egg, the offspring will be a girl (XX); if the sperm carries a Y chromosome, the offspring will be a boy (XY). The sex of the child is thus determined by the father. The fact that some genes on the X chromosome have no equivalent genes on the Y chromosome results in the appearance of sex-linked recessive characteristics in boys. Since a boy has only one X chromosome, if the recessive allele for a defect is present on the X chromosome, the disorder will be manifested since there is no equivalent allele on the Y chromosome to counteract its effect. In girls the phenotypical expression of a recessive allele for a defect will be determined by its interaction with the matching allele on the other X chromosome. If the matching allele is a dominant one for normal development, it will overrule the effects of a damaging recessive allele. For example, hemophilia is a sex-linked trait carried on the X chromosome. Since it is recessive, if a girl receives the deleterious recessive gene from one parent, unless the matching gene from the other parent is also for hemophilia, it will have blood which clots normally. Only if the girl is homozygous for the recessive gene will her blood clotting be impaired. In contrast, if a boy receives the gene from the mother on the X chromosome, there can be no counteracting gene from the father and the son will be afflicted. Two types of abnormal sex chromosomal patterns in boys have been extensively studied. The first, which is known as Klinefelter's syndrome, involves an additional X chromosome – an XXY rather than the normal XY chromosomal array (XXY boys have testes although they are sterile, and they have many feminine characteristics such as breast development and a rounded, broad-hipped figure). The second pattern involves an extra Y chromosome, yielding an XYY array. They share with XXY boys a tendency to be significantly taller than normal boys. It has been reported that both XXY and XYY boys are impulsive and antisocial and are overrepresented in institutions for the mentally retarded and in prisons, particularly in those charged with violent crimes. A third pattern, known as fragile-X syndrome, has only recently been identified and is one of the most exciting new genetic discoveries. Advances in biology and genetics have opened new opportunities for shaping and controlling some aspects of development. Through amniocentesis and chromosomal analysis in early pregnancy we can detect not only the sex of the child but whether the child in utero has disorders such as sex chromosome abnormalities. Parents then have the option to abort and avoid the distress associated with a Down syndrome, sickle-cell anemia, Tay-Sachs syndrome, blind or paralysed child. But what kinds of ethical issues may arise from our growing genetic sophistication? If a fetus has no detectable genetic abnormalities, is sex of a child sufficient reason to abort? Biologists have been able to transplant animal embryos from one uterus to another, to remove and transfer genes from one organism to another, and to artificially synthesize a gene in a test tube. One of the processes which appears to have captured the public's imagination is called cloning, in which body cells are artificially induced to reproduce themselves. Through cloning it would be possible to reproduce a series of identical individuals from a single body cell. A recent novel presented the terrifying picture of cloned cells from Hitler being implanted in dozens of human wombs by rabid Nazis hoping to develop another Fuhrer. Some people might not regard all cloning as quite so undesirable. A basketball team of cloned Dr. J's would warm the cockles of many a coach's heart, and a university president might be delighted at the thought of the university's laboratories being filled with industrious clones from Nobel Prize winners.' □ The NZ] Government will soon introduce legislation to ban cloning of humans. The legislation also will prohibit animal/human hybrids and the implantation of human and animal embryos in the opposite species.

...Legislation outlawing commercial surrogacy... the sale of sperm, ova and embryos... and the cloning of humans had its first airing in Parliament last night.... [T]he Human Assisted Reproductive Technology Bill [will now]be referred to a select committee for consideration.

...TWENTY European countries have signed... the first international convention to control research into human genetic engineering and cloning. The Human Rights and Biomedicine Agreement, which took seven years to complete and was passed by the Council of Europe's Committee of Ministers in November, prohibits the creation of human embryos for research purposes. It also prohibits trade in human bodies or parts and regulates organ transplants. More countries, including all 40 Council of Europe members plus A[US], Canada, Japan and the U[S], may eventually sign the agreement.

...Leaders of 40 nations at a Council of Europe summit have pledged to... enforce a ban on any technique of human cloning that would attempt to create "a human being identical to another human being, whether living or dead." ...They also passed recommendations aimed at making the continent freer and fairer as it goes into the 21st century. The rare two-day meeting at the weekend wound up after taking a closer look at democracy in ex-communist states, hearing from new and would-be members about how they are implementing the rule of law. The summit's final declaration said the council would play a bigger role in protecting human and social rights and helping member states face the challenges of changing societies... The declaration listed among its goals the universal abolition of the death penalty... The summit also pledged to step up the battle against international scourges such as terrorism, organised crime... drug trafficking, racism and anti-Semitism. Speeches revealed different views of the purpose of the council, a less-known body than the European Union – from which it is completely separate – and the possible rival Organisation for Security and Cooperation in Europe (OSCE). One apparently attractive feature of the council is that the U[S] is not a member.

...An ethics panel in the U[S] recommended on Saturday that Congress enact legislation to ban the cloning of entire human beings for now, but allow the cloning of human embryos for private laboratory research. Under the scenario proposed by the National Bioethics Advisory Commission, scientists or doctors... would be prohibited from implanting them in [human] wombs to make viable babies. "Human cloning that leads to the birth of a child should be forbidden by law for at least three to five years," the panel said in its report, which will be sent to [the US President today. The President] asked the advisory group in February to review the complex legal and ethical ramifications of cloning after scientists in Scotland reported they had cloned a lamb – which they named Dolly... Polls shortly after the announcement of the Dolly cloning showed 90[%] of Americans opposed human cloning. [The President] in March broadened his 1994 prohibition on Government-funded human embryo research to include federal funding of human cloning work, saying it raised deep concerns "given our most cherished concepts of faith and humanity. Each human life is unique, born of a miracle that reaches beyond laboratory science. I believe we must respect this profound gift and resist the temptation to replicate ourselves,"... The commission's recommendations appeared to meet the most immediate concern of many Americans – that the procedure that produced Dolly might be used to make children who would be exact genetic copies of a single adult. But critics complained the commission had not gone far enough... [A] Missouri Republican... Senator... said it left the door wide open to future cloning... [In related news, more] than 87 million people in China are surnamed Li, making it the most commonly used family name in the country... [and] the planet... Li, family name of 7.9[%] of China's... population, replaces Zhang as the number one name in China which is listed in the *Guinness Book of World Records*. The surnames Li and Zhang are two of over 10,000 family names used in China, a country composed of 56 ethnic groups, said a study conducted by the Institute of Genetics under the Chinese Academy of Sciences.

...*Hui's who's who crisis shared by millions* LI HUI'S identity crisis hit rock bottom when [Li] started work at the Grand Hotel Beijing a few years ago. [Li quickly discovered it] wasn't the only Li Hui around. In fact, [Li] wasn't even the only Li Hui at the front desk. There were two, including himself, while another worked in financial. When another pair of Li Huis showed up for training months later, the count rose to five. Phone messages were a headache; office raffles were hell ("And the winner is: Li Hui"). Eventually, Li escaped the hotel business but not his identity. Now [Li] listens to radio personality Li Hui read the headlines. Two of his buddies have other pals called Li Hui. By his own reckoning, Li (28) has met six people in Beijing who have his name[, but] knows of scads more. "Maybe I'll form a Li Hui club," [Li] mused one afternoon... "That'd be fun." In the latest of China's looming shortages, from jobs to electricity to marriageable [gals], chalk up another commodity: names. The country claims one-fifth of humanity but just a fraction of its surnames. Of the 12,000 surnames that existed in China centuries ago, only 3100 remain today – a tiny number for 1.2 billion people, experts say. Indeed, the nation's top five family names cover nearly one-third of the population. Couple the shrinking surname supply with a serious lack of invention by many parents in producing given names for their children and you wind up with thousands bearing the same name – along with instances of mistaken identity. Lab tests get mixed up, as in the case of the [guy] who told relatives [it] had inoperable cancer when the unlucky patient turned out to be someone else. Love letters get opened by the wrong blushing recipients. Suspects get arrested for crimes they did not commit, including one [guy] in Shandong province whose name not only matched the villain's but also the local security chief.

...About 1000 police and paramilitary officers have been rushed to the southern Chinese city of Gaozhou to stop clashes over birth-control fines. One official was left suffering internal bleeding after the clashes. An independent daily newspaper, *Ming Pao*, said it understood the fighting began when birth-control officials swooped on the city's Zhaojiang county. Their mission was to check for families with more than one child and to ensure [gals] had been sterilised or fitted with [IUDs. Three guys] were arrested when they tried to warn residents of the arrival of the officials... Many people were also angry at the death of a 26-year-old... after [the 26-year-old] was forced to have an IUD fitted. Another [gal], aged 40, had to pay 10 yuan... for a medical examination to check whether [the 40-year-old] had been sterilised or had an IUD... [■ Babies] totalling the equivalent of N[Z]'s entire population... were born every eight weeks last year in China.

...The number of registered residents in China's capital... is now 12.594 million, according to official figures published in the Chinese press... [Incidentally, t]he world's population will swell to 6.1 billion by 2000 from its present 5.8 billion, and jump to 6.8 billion by 2025, according to a report by the Population Reference Bureau in Washington.

... "Population is not about counting people, but ensuring people count..." [a NZer] told the 1994 Cairo world population conference. Her words set the theme for N[Z]'s first official population conference[, which comes]... at a critical time of radical demographic change. We need to take stock of human capital resources, assess the population's access to social capital resources and ensure that people are taken into account in public policy. Until now we have had relatively high population growth rates. Our ideology has been that population growth is an essential driver for our economy. Recent debates about migration, viewing it as an instant panacea for the economy and an antidote to ageing, illustrate this... Radical fluctuations in fertility levels from prewar to the baby-boom, then the period since, have severely distorted the population's age-distribution. A "baby blip" increased birth numbers around 1990. We now face population waves battering different life-cycle stages, creating peak demands for market products and social services, followed by an ebbing of demand. These waves are inexorable: the people involved are already born. But it is prudent to project their impact. We must debate what sort of society we would like to be, and how these waves might reduce or enhance our chances of achieving it... The baby blippers born about 1990 are the key to meeting the burden of an ageing population. As yet, we seem concerned only with their schooling and health needs. But what about 2005-10 when the baby blip generation enter secondary and tertiary education, and the labour market? Will they have the scientific and technical skills needed for a wealth-generating society? Will they be fully employed, mostly in highly skilled and highly-paid jobs, so that they can look after the baby-boomers? Or will they be under-skilled and dependent on the dole, a fiscal burden themselves, diminishing what savings we might make for the baby-boomers? The last time such a youth bulge hit the labour market, in the 1980s, we radically restructured our economy, then ran a depression on the backs of the young and less skilled. Nobody can disagree with the need for that restructuring but we must deplore the fact that it was undertaken without consideration of human capital implications. Among us are cargo-cultists who believe that we will be always able to meet skill shortages by migration. But the U[S] has our demographic profile. When we need young skilled people, they will too... Public policy debates in N[Z] in recent years have been notable for their failure to discuss human capital. The emphasis has been mainly on financial aspects. In an era in which public sector accountability has become a religion, its most fundamental question – the people it should serve – has been superseded in favour of the short-term and narrow objective of balancing annual budgets. There is a parallel bias in private sector planning. Overseas, by contrast, senior commentators are looking at how demographic composition drives longer-term market trends... It is only by taking broader approaches that high-profile issues can be put into perspective.

...policy issues [were] being raised outside the... Population Conference... – notably at an "alternative conference" held last weekend by the Wellington-based Pacific Institute of Resource Management. It raised two broad issues. First, is there an optimum sustainable population, or "carrying capacity," that we should set as a target for N[Z]? And secondly, if there is room for immigrants in a sustainable population policy, how should they be chosen? Estimates of our "carrying capacity" were surprisingly low. [A s]oil scientist... said that compared with most [First World] countries we have very limited resources – only about 5[%] of our land area has good-quality soils, and we have few metals or other minerals. [A f]uturist... quoting the Government's own recent State of the Environment report, said the average N[Z]er used resources equivalent to 5ha of productive land. Given that we have only 21 million hectares of productive land, and 3.6 million people, with today's lifestyles we are already up to 90[%] of our carrying capacity. In his view, we should therefore hold our population where it is, or reduce it. Of course this argument is complicated by trade – it would be ridiculous to say that a city-state like Singapore, for example, should have its population limited to the carrying

capacity of its productive land. But the argument is basically right, if viewed from a global perspective. We are sustaining the 5.9 billion people in the world only by keeping most of them at a standard of living well below what we enjoy in N[Z]. So on a global scale there is a real limit to how many people we can sustain at any given standard of living. If either population or living standards increase in poorer countries, then this may only be sustainable, at some point, if population or living standards in richer countries like N[Z] come down. From this perspective, we should certainly be trying not to have too many children, and to change our lifestyles so that we put less strain on the environment... But this doesn't necessarily mean that we shouldn't accept immigrants. In principle, if our concern is the welfare of the world rather than purely of ourselves, we should let people live where they want to live. Until living standards in poorer countries are raised to our own levels, that is likely to mean some net inflow of people to this country. Traditional economic arguments about whether immigrants benefit our standard of living are irrelevant – we actually need to lower our material living standards, so that we share resources more fairly with other countries and put less strain on the environment. However, social arguments are still relevant in determining how quickly we let people in. It would be unfair to the immigrants if we didn't limit their numbers each year to the number that we can house, teach English to, find jobs for and provide with all the other facilities that an increased population needs... Which brings us... to the second issue at the alternative conference: how to select the immigrants once we decide to take some. The director of the Refugee and Migrant Service... said we should use part of our refugee quota of 750 people a year to bring the immediate families of refugees who are here. [The director] was appalled at the Government's "unconscionable and inhumane decision" to make such relatives get police and psychiatric certificates and pay \$700 plus their air fares to come here. With 26 million refugees seeking resettlement around the world, [the director] also believes we should increase our intake of refugees at least to, say, 1000 a year.

...ASYLUM seekers who see N[Z] as a soft touch are in for a rude awakening... as the Government moves to stem the tide of refugees... N[Z] takes an annual allocation of 800 refugees... but the latest figures showed that in 1995, 1251 others from 63 countries arrived seeking refugee status. Of those 73% were declined, but because N[Z] had some of the most humane refugee procedures in the world, asylum seekers could stay for up to three years while they challenged the decision. The asylum seeker was eligible for the unemployment benefit and other social welfare handouts if... [it] could not find a job, and the legal procedures were funded by the taxpayer through the legal aid system... [The] Immigration Minister... has ordered a major [review] of procedures relating to refugees... cit[ing] the case of two African stowaways who left a ship in Dunedin earlier this month seeking asylum. They had been earlier refused... entry into the Philippines. When they got to N[Z] they claimed to be fleeing from war-torn Rwanda – possible grounds for asylum – but immigration officials believed they were from Cameroon... "[D]isincentives" should be placed on shipping companies to curtail stowaways. There had been a long-held view by immigration officers that crew on ships arriving at ports were paid by stowaways to hide them on board until they reached N[Z]. Airlines can be made to fly people out of N[Z] at their own cost if they arrive with incorrect documentation... The review will be examined at a conference in [3 months]... The review mirrors developments in A[US], where refugee policies are also under the spotlight. Like N[Z], asylum seekers could stay in A[US] while they contested decisions. However, they were not eligible for social welfare payments... [By the way, the] population of greater Auckland climbed to an estimated 1,138,300 people by June 30 this year, according to statistics released yesterday. It grew at a much faster rate than the rest of the country, leaping... 2.6[%], compared with... last year.

...Auckland could be posting "no vacancy" signs in 17 years given current development policies... By then, all the available opportunities for metropolitan infill housing and redevelopment, new "greenfields" developments in the metropolitan area and in rural and coastal towns, and rural-residential development are expected to have been used up. This assumes a high population growth. Even if growth is at the lower end of the projected rates, the region's residential capacity is expected to be reached within 30 to 38 years. Auckland is at present growing at close to the high rate. There were 357,338 dwellings in the region last year... with an expected gain until 2026 of between 133,000 households (the low-growth projection) and 268,000 (high growth). This would take the population from its current level... to an estimated 1.3... to 1.59 million.

...Auckland City Council has been accused of misleading ratepayers during the development boom between 1993 and 1995. The Parliamentary Commissioner for the Environment... has taken the council to task over its response to environmental issues and the way it handled consultation with the community... [I]t gave out "erroneous signals" to residents at the height of the infill housing furor. In its 1993 proposed district plan the council said that in areas such as the eastern suburbs the capacity for infill development would decrease. But residents were not told that there was an achievable capacity for... an extra 7200 units in Eastern Bays. Similar situations occurred in Avondale and Mt Albert. "Public expectations that infill would decrease were wrong and the council statements may have resulted in residents not making submissions on the proposed district plan because they believed that infill was under control,"... What followed were public meetings where the council was lambasted by residents outraged at what appeared to be unbridled infill development and its impact on suburban infrastructure and amenity values... [His] investigation into the management of suburban amenity values was triggered by the large number of complaints his office received about the infill development... His... report says several factors contributed to the rise in infill housing, including the ability of some developers to build under old rules. Council planning staff faced significant work overloads at the time. This led to the use of private consultants but made it harder for potentially affected neighbours to scrutinise consent applications. The report says the council had "little regard for community groups or the wider environment."

...an environmental adviser and former chair[person] of the Auckland Regional Council's parks committee... laments the loss of a chance to plan for population growth and has a novel solution for Auckland... The recent national conference on population seems to have been something of a flop. It's a pity because reaching a national consensus on a population level should be a matter of some urgency – not just for the future provision of social services like... health, education and employment, housing and basic community services... but also for management of our environment. Centralised planning seems to have been lost from N[Z] culture since the Rogernomics reforms. Once upon a time the country used to take these things fairly seriously. There were regular national development conferences and until the 1970s a National Development Council. And not just N[Z] – national planning led to the rebuilding of Western Europe and Japan after [WW2]... When I was a member of the A[RC] I sat on the committee responsible for producing the Regional Policy Statement. This bulky document, a requirement under the Resource Management Act 1991, was enormously time consuming, expensive and once finished tends to be put away to gather dust in the library. It is a form of planning you have when you are not really allowed planning. In one of countless meetings on the draft council members were given the usual list of Auckland's growing infrastructural and environmental problems – clearly caused by the disproportionate population increase of this region. I suggested inserting a sentence stating that Auckland's development problems could not be solved at regional and city levels alone but required active central government planning. This was seen as 'political' but after an uproar I succeeded. A few months later the policy statement was redrafted and the offensive state planning sentence was quietly dropped. Four years later Auckland's population still continues to grow and so do the problems – transport, waste disposal, environmental degradation and the loss of open space and productive land... Little infrastructural investment has been made in the 25 years since the days... when Auckland's last dams, motorways and harbour bridge were completed. The Auckland Regional Services Trust estimates that \$6 billion of infrastructure is required in the near future... Auckland attracts 80[%] of new immigrants and N[Z]ers alike... We are told that most people prefer to come to Auckland not just for jobs but for the climate. A move to warmer areas is an international trend in [First World] countries... There is a need to divert people from Auckland somehow. Simply ordering people to places like Oamaru will not do. There is need for some lateral thinking. The Far North has the best year-round climate in the country and miles of some of the best beaches in the world – yet the area is a by-word for depression and rural slums. Clearly in neglecting the Far North we... are wasting the full potential of our country. The Government should look seriously at planning for a future city in the Far North... Such a project would create long term work and reduce Northland's notoriously high unemployment rates. A new city would not only take the pressure off the Auckland region but could be an

international showcase for N[Z] technology and environmental management. No doubt this suggestion will be seen by cynics as a pipe-dream and they may be right... However dreams are preferable to the growing nightmare of sprawling Auckland.

...PEOPLE who live in small towns in the South Island, like Alexandra, Ranfurly or Palmerston, greet with deep cynicism stories like the one from Auckland reporting that... [a pair of merchant bankers] have sold their mansions... for \$5.1 million and \$8m, and are upping sticks for greener pastures in Europe. Are these not the [same guys] who had a temporary starring role during the infamous "Winebox" inquiry, people ask – and especially those people in the land agency business who have been living on short rations lately... Business people in southern small towns read with amazement the claims from Wellington and Auckland about "Positive Outlook for NZ Economy." The headlines appear to be repetitious, all on the optimistic and positive aspects of economic activity. Indeed, they often wonder if the architects of such propaganda ever leave their plush offices and travel through areas that have to rely on the primary sector for the bulk of their income... And what is occurring in the hinterland must be reflected in Dunedin and Otago generally because the National Bank's regional trends report has Otago's economic activity trailing the nation for the first time since 1987. While Bay of Plenty, Wellington, Waikato and Northland showed handsome 3% growth, Otago recorded -0.2%... There has been criticism of the Dunedin City Council for what is termed its "lack of leadership" and [the]Mayor... has taken stick for being, allegedly, against industrial expansion. But the problem is deeper than that. Otago has tended to look backwards at what was when the province sailed majestically forward commercially and industrially on the prosperous waves created by the old gold rushes of the 1860s... [● Although the population] drift from South to North Islands reversed between 1991 and 1996 when the South Island gained about 5000 people... the... North Island will be home to 78[% of NZ]ers in less than 25 years, says Statistics N[Z].

...South Island mayors have rubbished forecasts that nearly 80[% of NZ]ers will live in the North Island by 2021... "It just couldn't happen," said the mayor of Invercargill... "They are going on an old trend and we have bottomed out down here. Our farming, fishing, forestry and tourism won't go away." Statistics NZ said Invercargill's population would fall 13,000 by 2021. About 50,000 live there now. "What comforts me is that in 1970 they predicted Invercargill's population would be in excess of 90,000 by 1990... That was so far off the mark – this latest projection looks wrong, too." ...[the mayor] said the Government should encourage people to move south, "because I just can't believe that everyone will want to live in Auckland." The southern lifestyle was exceptional, [the mayor] said. People lived comfortably and everyone knew their neighbours... The mayor of Christchurch... said statisticians should not underestimate the human reaction to overcrowding. "I recently spent an hour and a half on the Auckland motorway and found it stressful. We didn't go very far and I would hate to do that every day. But this report is very helpful and a timely warning to South Islanders. We need to market the South Island exclusively as a tourist destination, distinct from the rest of N[Z]."

...FIRST the Post Offices closed, then the banks. Small-town N[Z] weathered falling export prices for meat and wool, an end to farm subsidies, the closing of dairy factories and meat works. But with the banks went retail business. Across King Country, Taranaki and Bay of Plenty and up into the Far North, small towns have been hard hit. Empty buildings and boarded shop fronts pepper once-busy towns. Is small-town N[Z] dying, a victim of Rogernomics, Government cuts and centralisation? As N[Z]'s total population continues to grow (3.72 million in March) small-town N[Z] gets even smaller – unless it is somewhere tourists or superannuitants want to be. The populations of coastal Coromandel, Tauranga and Northland are burgeoning. Northland grew by around 12[%] and Rodney, the fastest-growing district in N[Z], jumped 20[%] in three years as Aucklanders moved north. But elsewhere it's a different story. "It would appear the aim of central Government is to close rural towns," says... the local police[officer] in... Kawakawa... To the casual observer Kawakawa is thriving – the well-established town centre for a large farming hinterland – but [the police officer] says the departure of the banks was the final straw. "We need something to combat unemployment. They're looking for somewhere... to build a prison. Why not Kawakawa? It would bring a business boost for the town." Every shop has experienced declining business... and the shoe shop closed altogether. Bay of Islands Intermediate, opened for 500 pupils, closed last year when the roll dropped to 110. "The bowling club and the rugby club are well down in numbers and the rugby league club has gone out of existence. If we didn't have the train we'd be just a memory," says [the police officer]. The train, which runs up the middle of the main street, brought 90,000 people last year... [The] secretary of the Kawakawa Business and Progressive Association and bookshop owner, hopes the soon-to-be refurbished public toilets will also be a tourist attraction. "We're getting[an] artist... to put his mark on them. Hopefully people will say, 'Wow! we'll go back there. They've got these neat toilets,'" [the secretary] laughs... It's the same story over the hill in Moerewa. While the region's population rose, Moerewa's dropped by 10[%] to 1697 in 1996. "We can still rely on one another," says [a spokesperson for] the He Iwi Kotahi Tatou (we are all one people) Trust. The trust is the driving social force in a town decimated by the closing of the dairy factory and the drastic "down-sizing" of Affco, the meat works plant the town grew up around. The trust's monthly newsletter, with a 1500 print run, goes into every household in Moerewa and Kawakawa... "About 70[%] of our people are unemployed. That's [Last] World status,"... Many people are angry about unemployment, [the spokesperson adds]. It was not their choice and it has had such a devastating effect... [Her husband, who is] the trust's community worker, says rural communities are facing a lot of issues... But people are starting to fight back. "If we are waiting for a saviour to come in the form of a large company, it is not going to... [However, there] are opportunities in tourism, fisheries and forestry..." ...The whole town is planning a festival – Moerewa Magic – for the end of the month... [and] Moerewa on the Move is the town slogan... The changes are starting. Volunteers help with the trust-run school holiday programmes; a shoe shop has recently reopened; plans are under way to develop a small town reserve with a play and picnic area and to rebuild the public toilets, dismantled because of repeated vandalism... Community caring is a necessary ingredient in towns dislocated by economic change and government policies. Caring is a common small-town theme, whether you're in Kawakawa, Moerewa, Ohura or Pio Pio in the King Country... Pio Pio has a well-cared-for look about it. Volunteers have transformed a vacant lot into an attractive village green, and vacated premises have found new owners – the old ANZ Bank has become a plant shop and homoeopathic clinic. A monthly newsletter, Bird Talk, goes to 740 area households. "If Pio Pio has any disadvantages it is that our children grow up and leave the area for work," says... [the chairperson] of the community board... who has lived in Pio Pio for 30 years... For... Pio Pio's police[officer], the close community is both a plus and a minus. "I know who the crooks are and they know me. We have a working relationship. But it can get a bit tricky when you have to arrest someone you know really well." AT OHURA, the... population of the area has slipped around 5[%] in the past five years but there is still "a core of people who love it here," says... [someone who] works at the Ohura Foodmarket and Hardware[store]. Apart from that only a dairy, a garage and the Cosmopolitan Club ("the only place to get a drink") are left in the town. "People have to go to Taumarunui to get money and they shop there." [The shop assistant] moved to Ohura from Auckland 10 years ago. "I love it here... You know everybody. In Auckland, if someone smiles at you, you feel for your wallet." Business continues to decline slowly... though the 100 prisoners at Ohura Prison are a big support. "They spend a fortune in the shop." Some of the 30 prison staff and their families also live in Ohura, helping to boost the town. [Kawakawa's police officer] might be on to something for [his town after all].

...NZ's] first natural population increase after five years of decline was recorded in the year to the end of September. Births exceeded deaths by 29,973, compared with 28,791 to September 1996.

...A message to young N[Z]ers: you all need to work and have two kids. In return, the student loan scheme should go and there would be more state support for your busy career and family lives. The recipe came yesterday from [population]experts... as ways to address the problems of a slower-growing and ageing population. Professors... from the Population Studies Centre at Waikato University... said it was a crucial part of the country's prospects next century to address the future of the "baby blip" generation. That was the surge around 1991 which took the country back to the 2.1 births per [gal] level needed to replace deaths in our population. Ideally... today's youngsters will keep to that replacement level when

they grow up. [One of the professors] acknowledged that policies coercing or even giving incentives for reproduction have not worked, either overseas or in N[Z]. The professor said, however, that better family support systems, in areas such as housing, could help birth rates.

...THE nuclear family is expanding. Baby boomers who have already seen economic pressures and student loans persuade their children to stay at home, often until well into their 30s, are now deciding it's probably time for their ageing parents to move in as well. That decision is sparked by uncharacteristically unselfish motives from what's been called the selfish generation. Research shows the primary motivation is to do the best for mum and dad. But the growing trend is revealing unexpected fishhooks that often snag the best intentions, resulting in the older parent moving out after a while. Only about 13% of N[Z]ers in the 60-plus age group – some 68,000 – live with their families, but Age Concern's chief executive... says those numbers continue to grow. Partly that's because... [g]overnments and councils are trying to shed responsibility for housing and support services for the elderly, and families are being forced to take on more responsibility for their older parents... Age Concern's CEO... says it's worth remembering that in many cases the suggestion for older parents to move in with adult children comes up when there is a crisis and the children are in "do something" rescue mode. Consequently, other options that might work better are not considered... Other options include the older person continuing to live independently, but with the assistance of the wide range of specialist support services available such as the Stroke, Arthritis and Alzheimers Foundations, various church groups, Meals on Wheels and Age Concern. Most local councils still offer low cost rental accommodation for the elderly, although the waiting lists can be long. There are alternatives like the Abbeyfield Societies, which provide a house for up to 10 people. Each person has an ensuite bedroom, and they all share the costs of a housekeeper who cooks the main meal of the day, does the heavy duty housework and doing their shopping for them. If moving in with the family still seems the best option, [the CEO] suggests a holiday with the family before any final decision is made to move in... "We sort of imagined it would be like *The Waltons* where grandma and grandpa lived with the family and you would all muck in together," said one person whose parent later moved out. "Our understanding was that we had a good opportunity to get together more and to participate in family life. That never happened – quite the opposite." [The CEO] says failure to clarify needs and expectations... beforehand... can turn even the best intentions sour. "For example, we had a [old person] who'd moved into her family's place after... [being] widowed. They were a lovely caring family, really doing it for the best motives. But they were a grown-up family, all working, so the older [person] would hold off going to the bathroom in the mornings because it was like Grand Central Station with everyone needing to use it. No-one realised her needs were being put on the back-burner. And as a result [the elder] developed an incontinence problem, which created more work for her daughter because [the daughter] ended up having wet bedding and wet linen. The daughter growled at her mother for not being more assertive and saying [it] needed to go to the loo." Television – the source of many problems when older parents come to live – was in this case the last straw. As often happens, the younger family wanted to watch different programmes, so the [e]lder... got a television set in her bedroom. "So more and more [the elder] was retiring to her bedroom, and... actually became quite isolated within the household. Her quality of life became worse than when... living by herself: [the elder] had companionship around her but it wasn't always compatible companionship. And it threw a lot of stress on the whole family unit because they loved... grandma but they didn't know what her needs were and how to deal with them." ...Planning... is the key, and that has to include financial arrangements, like whether rent or board will be paid, or whether the older person will contribute towards the costs of adding on an extra bedroom or building a granny flat. In the 1980s there were rebates for granny flats, but those have now disappeared.

...A growing number of N[Z]ers are sandwiched between helping to support elderly parents and the financial burden of bringing up children. This "sandwich generation" has been created by the trend towards later childbearing... – ...[the average age at which NZ gals give] birth has risen... [to] 28.5 years, up from 25.4 years in 1975... – ...coupled with the fact that young people are spending longer in the education system and so remain dependent on their parents for longer, says the newly released Statistics N[Z] report, *Ageing and Retirement*. Cuts in educational and health spending, and the emphasis on self-help and user-pays, have left parents often supporting children well into their 20s while at the same time having elderly parents in need of care... Grandparents are likely to live longer, too. Until 30 years ago much of the statistical increase in life expectancy was illusory in real terms because it was due to declining infant mortality rates. But most of the gains of the last three decades have been concrete... [One couple]'s story is not unusual: in their 50s, they work hard to pay the mortgage and daily expenses, supporting one child at university and another at polytech, and helping out an elderly parent. "It makes me angry when I'm told I also need to be saving a third of my salary to pay for my retirement," says [the husband]. "How the hell am I supposed to do that?" With an increase in one-parent families – from 9 to 18[%] over the past 20 years – grandparents in their 50s are also finding themselves more and more providing crucial support. [One grandparent] who helps her daughter financially, has cut her paid working hours to be on hand for her three grandchildren while their mother works part-time... The increasing numbers of [gals] in the paid workforce – only 31[%] of those aged 15-64 in 1996 were not in the workforce – have important implications, says the report. It suggests there may be increasing ability among the "young elderly" (65 to 75) to care for older people. "Many of those who retire at 65 can expect several years of good health in which they would be capable of caring for relatives." The working-age population is expected to peak at 2.80 million by 2020, dropping slowly to 2.67 million by 2051. At this time [SNZ] projections show that 25[%] of the population will be 65 and over. It is now 12[%]. This will mean disproportionately fewer people of working age will be available to support increasing numbers of retired people. However, there will also be proportionately fewer dependent children than in the past. The average number of children to a family has fallen continuously from 2.49 in 1966 to 1.96 in 1996 and is expected to fall further.

...A pensioner, call him Bob, had a birthday this week... I met Bob for only a few minutes in the course of another assignment. [Bob] called us in over the worn carpet, shook our hands from the well-used armchair where [Bob] rested a busted leg... in Bob's smoke-filled living room... and told us what [this pensioner] knew. Bob turned 70-something that day[and] said his best present was the return to health of one of his cats... his... only... company, for the best part of 20 years... His wife died in the 1960s, his two sons had married and left home. I got the impression [Bob] spent his days rattling around the old place, feeding his cats, maybe occasionally looking at the faded photographs on the mantelpiece. [Bob] did not ask for sympathy, [and] did not seem terribly down, but I left with a sense of his aloneness... Bob got me thinking how many others are out there, living behind drawn curtains. According to the 1991 census a third – or about 127,000 – people over the age of 65 live alone, a statistic which can only have grown markedly in recent years as the average age of the population rises. Beyond those figures there are the grislier stories of elderly people who die and their body not being found for weeks. The voluntary organisation Age Concern reports that its visitor programme for older people living alone can barely keep up with demand. Its national director... says there is a fine line between interfering and supporting. But... people should take time out of their busy lives to care more about their elderly relatives or neighbours... It's not a charitable act... because elderly people have a wealth of experience to give back. I'm ashamed to say I haven't talked to my grandmother in several weeks, probably months. But I've been busy and [Gran]'s in another city, and... and there are no excuses really, so I hope [Gran]'s standing by the phone. [Editor's note: If elderly people have a wealth of experience, how come the bed-wetting granny (r:Ins23-4 above) never thought to use a bed-pan?]

...Dry nights are a long way off for the country's 180,000 bed-wetters. A world authority... said the reason people continued to wet their beds beyond early childhood remained a mystery. However, advances were being made for people who regularly woke to the dreaded damp feeling... [T]he director of the Swedish Enuresis Academy, is in the country giving seminars on bedwetting diagnosis and treatment. Many adults who had wet their beds since birth had no idea treatments were available, [the director] said. It was important doctors could give accurate information. Bedwetting among young children did not primarily stem from psychological problems but medical deficiencies... Problems often arose because their "arousal systems" did not work when the bladder was full. As well, some people did not produce anti-diuretic hormones. Bedwetters could

easily develop psychological problems through the sense of shame or from being ridiculed... [I]nternational research was focused on sleep patterns, bladder function and hormone secretion. A common treatment was to use alarm-triggered mattresses which woke the bedwetter when moisture was felt. Anti-depressants were sometimes prescribed or anti-diuretic hormones to concentrate the urine. This remedy, however, merely delayed bedwetting until later in the night in some cases. "We are still far away from one single pill to cure bed-wetting,"... Recent research showed that about 15[% of NZ] families had one or more bedwetters... [□ Fewer NZ]ers are marrying each year despite more [guys and gals] being of marriageable age. Releasing the 1996 Demographic Trends report, a Deputy Government Statistician... said that in the year to December 1995, 21,579 couples married – 300... fewer than in 1994. The decrease continued the general downward trend recorded since 1991. In 1995 first time-grooms were, on average, 28.9 years old while brides were... 26.9... [Today's NZ]ers were marrying almost five years later than their counterparts in 1971. There had also been an increase in the divorce rate[, which]... rose slightly from 12.2 per 1000... marriages... to 12.3 in 1995. But marriages were lasting longer. The average duration of marriages ending in divorce in 1995 was 14.5 years compared with 14 years for 1986 to 1991.

...Marriages seem to be breaking up all over the place. Or not happening at all. Why should we bother with getting wed? ...TRUE LOVE, two gorgeous children, a beautiful home, buckets of money – [the middle-aged TV broadcaster (r:p1702, ln24) and his young wife] appeared to have it all. N[Z]'s media prince and his med-student princess should have lived happily ever after. Instead they became the latest in a long line of would-rather-not-be husbands and wives. Which makes us cynical and disillusioned common folk want to ask what the point was. Were they ever happily married? If so, what happened? Must relationships these days come with built-in expiry dates and is saying "I do" in the '90s as outdated as telling a [wife] her place is in the home? A lot of people seem to think so: Marriage rates are at a 25-year low as more couples say "I don't" and live together anyway. So, why do fewer people want to get married? ...a 28-year-old Wellington analyst, thought about all that when [it and the partner it's] been living with for nine years decided not to marry. "I think [my partner] was quite keen but I saw a lot of hypocrisy in what, to me, is basically a meaningless legal process. People who have never been to church suddenly go to church. People with feminist views enter into something... based on the contractual ownership of [wives]. From what I've seen, it's really just one stressful day that has nothing to do with anything spiritual or meaningful in my relationship." Objectors such as [her] don't like the fact that marriage was historically about the exchange of property: The bride. Consider the symbolism of the following: Being given from one [guy] (father) to another (husband), promising to "love, honour and obey", changing her surname to his. Although it might not feel that way, the formal vow-and-virginity version of marriage hasn't always been around. Some historians estimate up to half of all marriages in 14th-Century Britain were similar to this century's de facto relationships. To marry, couples "jumped the broomstick" (a broom placed on the threshold of their cottage). To divorce, they jumped back. Originally, churches were used like a small-town post office, to register and keep track of marriages. T[hen the Church hierarchy said: "Let us introduce a formal church ceremony – as a means of raising funds or, at least, a way to give clergy something to do between Sundays." T]oday, the... director of pastoral studies at the College of St John in Auckland, would like to see the Church's role change to one where it can "bless" a relationship, married or de facto. "I don't think marriage is outdated. But apart from the fact that I feel children need to have a stable family life, I can't give you an argument for legal marriage as opposed to a committed de facto relationship. As we tell our students: A wedding doesn't make a marriage,"... The way we get married is becoming a more private and informal process – check out all the couples... in fancy-dress or... doing silly things on beaches, mountain tops and jumping out of planes... Witness also the rise of the non-religious wedding celebrant. AS THE ceremony mutates, so does the result. The way we define long-term partnerships and families has been changing for some time and later this year the Matrimonial Property Act will be reviewed. Married couples are covered by the act, which equally divides possessions of couples married for three or more years if they divorce. Despite wide-spread misconceptions, de facto couples have no such statutory rights. In fact, they have the same rights as flatmates – none. If they split, the courts decide on a case-by-case basis. One way to overcome future inequity is to ensure major property is jointly-owned together. Another is to develop a legally binding agreement about shared property at the beginning of the relationship. Then you'll only have to argue about who gets the His And Hers bath mats. A revamped Matrimonial Act will still be unlikely to give de facto and married couples the same rights. As [the]Justice Minister... comments, "I would be surprised if my caucus did not believe that the sanctity of marriage needs to be respected." Nonetheless, if Church, society in general and, maybe later this year, the State, are ready to accept de facto relationships, then why bother getting married? ...A lot of couples marry only when they decide to have children. Marriage mainly protects the father's rights... [But if] a couple is... living together when the child is born, both parents are considered legal guardians. [Only if] the couple are not... living together at the time of the child's birth, [does mum become] the sole legal guardian. To some couples, having [kids] is akin to getting married, the most important commitment they can make... [A] 34-year-old journalist[and his] partner have been together for more than 10 years and have two primary school aged [kids]. "Once you've had kids there's really no turning back... We talk about getting married every now and then but really, what's the point? It's never been a big deal to me and it's the family relationship that keeps you coming back, not the marriage certificate. Anyway, when you have kids you have different priorities and the cost of a wedding would pay for a lot of music and swimming lessons." THEN there's the idea that de facto relationships don't last as long as marriages. But there is no objective data on this... [A spokesperson for] Relationship Services whose name change several years ago from Marriage Guidance reflects the changing attitudes... thinks even if there was, de facto relationships would still come out looking shorter than marriages because... "nowadays people tend to have a number of longer term relationships – some that even involve living together – before they make a firm marriage-type commitment or get married." ...There's only one big, and some will call it shallow, difference. As one bride says: "Getting married is not the same as being in a long-term relationship because I have stood up in front of 250 people and promised to spend the rest of my life with this guy."

...The 21,506 marriages last year was the lowest number recorded since 1964... Growth in de facto relationships, the trend towards delaying marriage and the growing number of N[Z]ers remaining single all contributed to the drop... I have sometimes found it helpful to reassure people I am not a prude... I have to say, however, that I have been saddened to read of the sexual revelations of [one columnist as it] writes on the future of marriage and about those people [it] knows who have entered and left that relationship with an increasingly greater rapidity and in rising numbers. I think I have read enough of this young [columnist] to suspect that a great deal of what [it] writes is done tongue-in-cheek. I confess to some difficulty believing that "At some point, you start finding yourself at parties where you walk into the kitchen and realise you've slept with everyone in it." My mind crowds with questions. How big is the kitchen? How many people are there in it? Are they all of the same sex? Have all these sexual assignations taken place in such a short time that [the columnist] can remember who they all were? Does [the columnist] keep notes in order to provide herself with comparative selections? My questions prove that [the columnist] does not have a monopoly on cynicism even if most of mine is about her capacity to fantasise. [The columnist] seems to hold that stable marriages are impossible since [it] is frequently engaged in consoling those who come to weep with her over the failed relationships crashing all around her. [The columnist] is probably right in wondering what hope there is... for people who stupidly imagine that anything resembling a marital arrangement has any hope of survival? ..."Desperate for passion on the one hand and desperately cynical on the other, we want the best, expect the worst and get it." [The columnist] points to a lifestyle which is almost certain to ensure failure in any long-term relationship. A great many young people follow a pattern of behaviour which may have become ingrained. The number of first-date sexual relationships reveals the basic attitudes which are so common today. A relationship with another person begins with the other's capacity to provide sexual satisfaction... In such situations the idea that friendship progressing to a deep sense of companionship is a possibility is rarely entertained let alone thought of. For many years our society believed... sexual intercourse needed to be reserved for marriage because that was the safest and best environment in which to express it for the best chance of future happiness. The fact

that that was more observed in the breach than in obedience did[n't] change the belief that it was regarded as relevant... It was the sexual revolution of the 1960s which changed that belief, perhaps forever. The contraceptive pill provided the carefree way and abolished the "No, darling, I might get pregnant" reaction. We have made great progress since then. Now we don't bother about the pill and the authorities are desperately trying to prevent social welfare pregnancies and HIV by getting the F[PA] to instruct little children about honey-covered condoms and oral sex. I asked a friend recently if his 21-year-old daughter had a boyfriend. In my opinion [his daughter] is sufficiently beautiful to need to carry a large stick to beat the boys off. Were I a young single [guy I'd] set out to court her with all the ardour and persuasion I could command, but that is because I see in her characteristics and gifts of intelligence and compassion which lie beyond the fact that [it] is physically attractive, though the latter is undeniable. Maybe... boys of her own age see her only as a sex object because their insight has been anaesthetised by years of conditioning by television soap operas. [The daughter] complains to her father that the pressure to conform to ill-concealed demands for intercourse on the first date make any outing an exercise in plotting how... [to] resist the clumsy adolescent fumbling of her companions. I have to agree with [the columnist that the] future for longevity in romance looks bleak. The view from lives in which adolescent children are trying to cope with the steady stream of... [people] who come into their households as temporary stepfathers and mothers is unlikely to fire the imagination towards settling for a lifelong commitment in their own lives. The commitment of intention and purpose which once undergirded a... majority of marriages has been gone so long that most people have forgotten that they ever existed. Perhaps one of these days some enterprising youngster will take the trouble to read about the social habits of past generations and discover love and commitment and wonder why the hell the older generation never told them about it.

...Young people think it makes sense to experience a little living before they tie the knot. This is the conclusion drawn by Relationship Service's chief executive... from... [SNZ figures. The executive] feels there are benefits in marrying older. "People are more likely to be ready for a long-term relationship if they have acquired life skills such as having experienced living as a single person, sharing a home with [people] other than family members, and being financially self-supporting... Relationships are most likely to survive if both partners are already independent individuals..." The... proportion of never-married [guys] aged between 25 and 34 has more than doubled over the past 20 years. It has tripled for [gals] in the same age bracket... In the past year 7844 marriages, or one in three, were for the second time for one or both partners. Of those who remarried in 1996, 89[%] had been divorced. The numbers of [gals] marrying as teenagers, and the figures for teenage pregnancies, show an interesting pattern. In 1971 nine in 25 first-time marriages involved a teenage bride. This had dropped to one in 25 in 1996. During the same period the number of [gals] who had a child but didn't marry has remained at only slightly more or less than 5000. But the number of young married mothers dropped. In 1971, 8139 so-called nuptial births were recorded for [mothers] aged 20 or under. In 1980 there were 3362, and last year only 497.

...Two in five babies are born to unmarried [NZers according to latest figures, compared to one in five in 1985], but demographers and midwives say this does not necessarily mean a lack of parental support... as many of these mothers were aged in their 30s and in stable relationships. Cohabitation had become a substitute for marriage in many cases and the lack of a wedding was not nearly as important as previously... However, a [wedding is still important in Samoa, where the]... Government has told expatriate couples in de facto relationships to either marry or face deportation. [The s]ecretary to the P[M]'s Department... said de facto relationships were not recognised because they were not part of the fa'a samoa (Samoan way)... "This practice refers only to those who want to stay on from overseas." [The secretary] could not give a figure on the number of couples in this situation... [The PM], who is also Immigration Minister... said... [marriage] was introduced by palagis (white people)... Now pastors made sermons, set up youth groups and other measures so that the things introduced by palagi could be adopted well and the policy was to prevent palagi advocating living together without marriage. [The PM admitted] it was true many Samoan couples were not married... One expatriate who declined to be named said once a work permit was granted, marital status was none of the Government's business. "If they had told us that it was a requirement before we moved here, that would be different..."... Expatriate homosexual couples fared no better. Last year a partner in a homosexual relationship from a N[Z] volunteer agency left to visit his relatives but on return was refused entry into Samoa. His partner, an expert in special education, left Samoa earlier than planned.

...All through the country, thousands of [gals live with gal partners, and guys with guy partners] – 3255 couples, according to the census. But there will be many more, too shy to confide in S[NZ]. They share each other's joys and dreams, sort each others washing, trim the same Christmas tree, and push a single trolley through the supermarket. More and more, when one's work or family has a party, the other is welcomed. They may have had a commitment ceremony, maybe even in a church. Whatever the Court of Appeal may say, they are married. But let the state become involved, and suddenly it turns out that in law they are strangers. Jerome died away from home last year, but the police would not give [his same-sex partner] his address book so that his friends could be told because [the partner] was not "next of kin." They had been together 13 years. If a couple meet overseas they must live together for four years before the partner can immigrate. If they were of opposite sex, two years (of course, legal marriage) would suffice. [A spokesperson for] the Human Relations Foundation... thinks same-sex union diminishes the institution of marriage... Her history [of institutional marriage] has some strange omissions. Where are Muslim polygamy, or the hundreds of wives and concubines of the Old Testament patriarchs? A less idealised view of marriage would mention child brides, arranged marriages, dowries, wives without property rights and wives as property, and suttee. Heterosexual, voluntary, adult monogamy between equals is far from a universal, eternal institution. Her ideal family is frozen in time. The family has evolved and continues to do so, and no single nuclear family stays the same for more than about 20 years from birth to "leaving the nest." [The spokesperson] speaks of "defending" marriage, yet how does it "attack" marriage if more people marry? The biggest threats to the heterosexual family today are not same-sex marriages but unemployment, poverty, alcohol, drugs and domestic violence. [The spokesperson] says children are "usually" born from marriage, and that they are "essential" for a marriage. Yet it is no legal impediment if a mixed-sex couple plan to be "child-free" or if one partner is sterile. [The spokesperson] says it is a "basic human right" to have a mother and father. Many children would gladly forgo that "right" to be free of a violent or neglectful parent. Children of happy same-sex couples fare better than those of stressed-out solo parents or warring spouses. Careful studies have shown that their emotional development (and of course their sexual orientation) is unaffected. Her expression "that covenant union between a [guy and a gal] that we avow in legal marriage" just underlines how strangely intertwined the civil contract and the religious covenant have become. The opposition to civil marriage seems to be mainly religious, yet several churches now bless same-sex unions, while the state does not. The right to civil marriage is a piece of the freedom from discrimination won in 1993 and due to bind the Government in 2000 – a date from which it now plans to renege.

...The Court of Appeal ruled this week that same-sex marriage had no legal status because the... 1955 Marriage Act... overrode anti-discrimination clauses in the Bill of Rights. The five judges found that though the Marriage Act did not specifically ban homosexual marriage, it clearly regarded marriage as being between a [guy and a gal. A former Labour MP], who represented Heretaunga from 1954 to 1960... was sure none of the MPs at the time would have considered the idea of homosexual marriage. "People accepted that there were homosexuals, but for homosexuals to get married was something out of a spoof world." The 80-year-old retired cabinet minister... said the legislation would have passed automatically "because in those days there was no question as to what was right and what was wrong." [The former MP] opposed same-sex marriage, but [believed that] if people wanted change a law should be passed.

...After 15 years living together, [a couple of lesbians]... are in no hurry to get married. The Auckland lesbian couple just want to have the right to tie the knot like everyone else. "We live the same as all the other married couples in our street," said [one of the lesbians], hours after the Court of Appeal ruled same-sex marriages had no legal status. "We want our kids to be successful and happy. We want our garden to be beautiful. We want to do the best we can in our jobs. We want our family around for Christmas. We just do the same things as any other person, so why...? It ain't

fair.” ...Marriage offered a wide range of rights which they could not have, such as being able to adopt children. They had to put their assets in family trusts, not for tax reasons but to protect themselves because the law did not recognise their relationship... The [Court of Appeal] decision came in a test case brought by three lesbian couples in long-term relationships. They were challenging a High Court decision last year that refused their applications to be legally registered as married. Last night N[Z]’s only openly gay MP... said [it] was willing to promote a law change. However, [the gay MP] believed there was little hope of getting a bill passed; the main aim would be to raise awareness of the issue... The meaning of the words of the Marriage Act that bars same-sex marriages are quite clear, the country’s top judges have decided. Particularly the section, in black and white, which specifies that a couple should use words similar to: “I, A.B., take you, C.D., to be my legal wife (or husband).” The act also talks about... his and her, when referring to prohibited marriage partners. It does not spell out the definition of marriage, but as [one of the judges] pointed out, some words and expressions are regarded as so well understood they do not need definition. “In 1955, marriage was one of those words,”... Because Parliament’s meaning was so clear in that act, all five Court of Appeal judges agreed it could not be superseded by section 19 of the 1990 Bill of Rights, even if it discriminated on the prohibited ground of sexual orientation. That is because of the basic constitutional principle that the courts interpret the law, not make it. However, the judges did vary on the underlying question of whether the Marriage Act did breach the Bill of Rights by discriminating against homosexuals. The court president... and [two others] found it did not; [the remaining judges]... felt it did... [While on the subject of anti-discrimination legislation, front] doorsteps are to be banned on all new houses built in Britain under new regulations to ensure access for people in wheelchairs. *The Times* reported yesterday new rules for the 150,000 new homes built in the country every year will also include downstairs toilets, wider doors and corridors and less steep footpaths.

...For the first time in his life, [an Aucklander] has a home of his own. And for someone who has spent much of his life in an institution, surrounded by dozens of people, flattening takes some getting used to. [The Aucklander], who has cerebral palsy, lives in one of three custom-built homes in Pt Chevalier... the first of their kind in N[Z]. The state-of-the-art houses... give [the Aucklander], his flatmate and his neighbours the chance to experience the freedom – and added responsibilities – of living in the community. At the same time the eight residents have round-the-clock care. Speaking with the aid of a computer, [the Aucklander says it] did not miss anything about the years [it had] spent in the Sutherland Unit, which closed last year. In the unit, [the Aucklander] shared a room with four other people. Now [the Aucklander] has his own room in a house built specially for his needs, with remote-controlled doors, wide corridors and custom bathrooms... [A] spokesperson for Focus 2000, an organisation which provides support for the residents, said some had found it difficult to adjust to life outside an institution. They battled loneliness, and for the first time had to manage their own finances and do their own housework and shopping. But at the same time they were able to choose what to have for dinner, go to the movies and go bowling – activities that were rare at the Sutherland Unit. It usually took a couple of years for people from institutions to settle into life in the community. [In related news, ‘people could in future live in “smart homes” that will tell them when to wake up or remind them to lock the back door, a British scientist predicts. The “caring home” – particularly useful to the elderly and infirm – would be equipped with electronic sensors connected to a computer that will remind people to take their medicine or turn off the oven. The bio-engineer at Brunel University near London told the annual British Association for the Advancement of Science conference that the first pilot home could be ready at the university by next autumn. The smart home would allow the elderly to live longer independently in their own homes.’

...‘Almost half a million NZers are in the “Third Age” – more than 65 years old – and that is expected to double in 30 years. Most people prefer to stay in their own homes as long as they can. But the number of superannuitants choosing to live in retirement villages has risen 50% over two years to about 15,000. As an option for the elderly, the villages are promoted as friendly, independent and affordable. Unfortunately, they do not always deliver the desired peace, security and services. Some elderly residents who have signed complex contracts find themselves locked into deals, not getting the services they expected, or being forced to pay higher-than-expected services fees. The Senior Citizens Minister is pledging “comprehensive protection” to those living in retirement villages. The minister is talking to Government departments and bodies such as Age Concern, Grey Power and the Retirement Villages Association with the view of having a bill ready for Parliament next year. The idea of separate legislation for retirement villages follows Law Commission recommendations that such villages should be covered by separate and freestanding legislation.’

...‘The retirement village industry is in limbo – with no over-riding set of guidelines – after the High Court last week threw out a new code of practice for the sector. The 250-member Retirement Village Association – representing about 85% of NZ’s retirement villages – had approached the Government seeking an industry-wide code of practice. The association’s own voluntary code was effectively accepted by the Government as the industry standard, but the association went to the High Court with concerns about aspects of the new code. Retirement village residents usually pay a lump sum to live in a unit, a percentage of which is refunded at the end of a tenancy. But the new code stipulated that when a resident moved out, the unit was to be refurbished to no more than the original condition, less fair wear and tear. The association objected to the clause, as it could be applied retrospectively, potentially saddling village owners with millions in costs – such as carpet cleaning – that could not be passed on to departing residents.’ Incidentally,] **the former co-leader of the Christian Coalition, is retiring from politics and will concentrate on housing conditions.** [The MP] **has been appointed the chief executive of the N[Z] wing of Habitat for Humanity, an organisation that builds houses for needy families. It aims to build 200 homes here by 2000.**

...THE tenant of a Tehran flat whose wife gave birth to triplets has been told by his landlord that his monthly rent would go up... by 50,000 rials (\$[NZ]22) per child... [The tenant says it] can’t pay and will ask authorities to find them a new flat... [In local news, t]he Ngapuhi runanga [council] has disputed suggestions that its Maori housing scheme has been a failure. The claim was made by the [former] Associate Treasurer... who said a housing scheme introduced by the National Government three years ago on the East Coast and in the Far North had produced only a handful of homes. [The NZ First MP] said the scheme had failed because of “mana munching,” in-fighting and legal arguments by runanga officials. “Everyone wants to be a chief. Those who miss out get a lawyer and start fighting... We need individuals who can take control and do it with full accountability. We need people who have gone out and got the skills and are willing to come back. The trouble is they then get slagged by their own people.” However, the deputy chair[person] of the Ngapuhi runanga... challenged those claims yesterday, saying the runanga had in the past three years provided for about 200 mid-Northland and Far North families for about \$3 million. The housing scheme – the first of its kind in N[Z] – aimed to provide better housing for Maori in the north and on the East Cape where it is estimated more than 1000 families lived in substandard accommodation. Under the scheme Maori living in those areas needed only a 5[%] deposit for a Government loan rather than the 15 to 20[%] previously required. The runanga identified those families in need and put them through a series of workshops covering housing options, insurance, rates, budgeting, hapu housing and the roles and responsibilities of homeowners. “This scheme is working well. All the mana munching is with N[Z] First, not us... I challenge [the NZ First MP] to come up here and have a look at how well this scheme is working...” [The deputy chairperson] accepted that the scheme did have problems, but that was largely because there was a lack of cash from the Government for the runanga to administer the programme. “We are doing our best, but you can only do so much with limited funding.”

...[‘An Auckland-based housing association has offered to help rebuild East Timor’s devastated houses using a kitset technology that can build homes for as little as \$40,000 apiece. An Associate Minister of Foreign Affairs and Trade has asked his officials to evaluate the Cooperative Housing Association of Aotearoa-NZ offer. 80% of ET’s houses were destroyed in fighting between the independence movement and Indonesian-backed militias. “Most of the people are still living under tents and emergency shelters like burned houses with temporary leaves,” said an ETese who is studying at Massey University. The student said aid agencies had distributed timber to some villages, but without roofing materials – which the Indonesians removed – or training. Some houses have been built, but many have collapsed. “People knew nothing about building the house. It the past we used to import builders from Indonesia.” The student hopes that funds can be obtained from either the NZ aid programme or the World Bank to train local people in the Cooperative Housing

Association's system. A founder of the association said the kitset system was so simple that anybody could learn it quickly. "In 3 weeks, we can get people from nowhere to an ability to produce their own homes." Financially, the system avoids the crippling cost of interest by using family and community labour to build the first houses, then using the rent from those houses to finance building later houses. The rent is counted as payment towards eventual ownership of the houses either by individual families or the community. In NZ, where the association has built 80 houses, costs have also been kept low through discounted materials and donated land. For the past year, the association has sought Government finance to kick-start cooperative housing for low-income NZers who could never afford their own homes on commercial terms. This proposal is still being evaluated by the Housing Corporation.'

...West Auckland's 'mayor is comfortable with Housing NZ building low-cost homes on prime harbourside real estate at the soon-to-be-closed Hobsonville Air Base. The mayor yesterday said the Waitakere City Council was committed to a mixed development of parkland and housing around a marine industry cluster on the defence land. The mayor was responding to a *Weekend Herald* report saying that Housing NZ and Canadian-based Sovereign Yachts are vying to control 63ha in what threatens to become a deepening embarrassment for the Government. Officials from the Ministry of Economic Development last year fast-tracked the release of a 4ha portion of the base to help Sovereign Yachts cut through red tape, spurred by the promise of hundreds of boatbuilding jobs and millions of export dollars. Sovereign's director has a contract with the council to expand the boatbuilding facilities to create a marine industry cluster. The director also wants to develop residential sites. But his aspirations may be scuppered by a Housing NZ plan to develop a mix of state housing and affordable private homes. The law requires that surplus defence land be first offered to other Government departments for public works. If no department wants it, the land is offered to former owners. The mayor said the council would have to "live with it" if Housing NZ got the 63ha of land ahead of Sovereign Yachts, but did not think that would hamper plans for a marine cluster. The prospect of low-cost housing worries real estate agents, who want the land turned into exclusive waterfront sections. It also concerns the local National MP, who said there would be state housing at Hobsonville "over my dead body". However, the mayor said the MP, who has been dumped as a National candidate for the next election, was "already dead", adding: "Housing NZ is already building some pretty trendy, stylish houses. What people like the National MP find difficult is the people who live in them."

... 'A quintessentially Kiwi house, dubbed the "modpod", has grabbed the attention this week at the Auckland Homeshow "street of houses". Underpinned by a "Pacific Rim" design philosophy, with its clean weatherboard lines and copious deck space, the house reflects the kiwi national identity, unique lifestyle and impulsive weather. On display until this Sunday, the house is a showcase for Haven NZ Limited. The modpod was a collaboration between Master Builders Haven NZ Ltd, Design Arts firm Red Turtle and CTM Architects. A key design challenge was the restricted floor space – imposed by the intention to relocate the modpod to Matarangi Beach Golf Estates following the Auckland Homeshow. This required a light-weight, flexible cladding system and timber floors throughout. Despite its compact size, the raked ceilings and light-filled interior exaggerate a feeling of spaciousness. At one end of the main living area, a full-length veneer wall hides a sleek family-sized kitchen. Extra fold-out bench space is contained in a multi-purpose mobile "grill" that doubles as an outdoor BBQ complete with a Jet-9 gas cooktop. Innovative storage spaces are cleverly contained throughout in the custom-designed cabinetry and Camira furniture – all of which is designed for multi-functional indoor-outdoor use. A fold-away bed discretely hidden in a wall cabinet reconfigures the study/games room to a guest bedroom. Both the main bathroom and separate toilet are readily accessible in the centre of the house. Predominantly full-height cavity sliders, the interior doors maximise efficiency while creating the illusion of space. The Kiwi outdoor lifestyle is encouraged in this house']...

THE great Kiwi house may sound like an attraction at a zoo but it... costs around \$100,800 to build... [or] \$896 per sq m plus GST... That's according to the NZ Institute of Valuers which has just released the specifications for the Modal (most common) N[Z] house. Each year the institute asks its members to supply design details and construction costs of the most common type of new homes being built in their areas. These are combined to produce... a national standard, which reflects design and building cost trends throughout the country. So what does the most common type of home being built in this country look like? According to the institute it is still a three bedroom, timber-framed house... However, there have been important changes in other aspects of the design and the materials used. The exterior is now likely to be clad in fibre cement board (Hardiplank) panels or weatherboards, rather than traditional wooden weatherboards, and it is most likely built on wooden piles. Houses in the South Island showed important regional variations in that they are more likely to be clad in brick veneer, reflecting local buyers' tastes, and built on a solid concrete base because of the ready availability of raw materials. The roof is now made of pre-painted steel sheets (Coloursteel) rather than traditional unpainted corrugated roofing iron. Guttering and downpipes are made from PVC. Exterior window and door frames are white, powdercoated aluminium, and the house has a floor area of 100sq m with a 4sq m deck. Inside there are open plan living areas and painted, rather than wallpapered, walls. A freestanding, solid fuel fireplace, provides most of the heating requirements. The house has 19 power points, 19 light sockets and two telephone connections, one each in the kitchen and main bedroom. [■ In the US, 'the nationwide median sale price of a one-family home rose from \$23,000 in 1970 to \$120,000 in 1990. The average floor area of a new one-family home is 2,075 sq. ft; 48% have one floor, 47% have two or more, and 5% are split level; 27% have four or more bedrooms and 14% have two or fewer; 60% are heated with gas, 32% with electricity, and 4% with oil; 33.9% have central air conditioning; 63% have one or more fireplaces; 81% have garages. Only 75.1% of homes had access to public sewers and 84.7% to public water supply. In 1990, residential buildings accounted for 39.7% of all new construction, private nonresidential buildings for 23.8%, and public buildings for 26.9%. In 1987, there were 544,200 construction establishments with 5.054 million workers']...

Tilt-up precast concrete sounds as exciting as watching paint dry, but there is more to this subject than meets the untrained eye. In the new age of multiplex cinemas and rapid construction warehouses with huge single-pour wall slabs in place of the old concrete block construction, advances are being made by a small Wairau Park business which is taking concrete further into house-building, introducing better insulation and making large-structure building cheaper. Tighter construction costs in the wake of the 1987 crash and, eventually, a change in heart by designers, have brought big changes to concrete's place in the building industry. "Designers were looking at first just to replace a cladding," said [the]Reid Engineering Systems general manager... "We needed them to use the strength of the panel as part of the building... The system was started in the US at the turn of the century but didn't become popular until the development of cranes after the war which gave them the lifting power to hold panels in mid-air. The system was used for firewalls and factory units and came to Christchurch in the 1950s, but they didn't have good methods of lifting or propping them up." Tilt-up concrete might have been used in Auckland's construction boom of the 80s, "but we needed to solve the lifting problems, how to hook on to the crane without the concrete cracking and how to temporarily support something that could be five storeys high, hanging in the air. [Also, we] couldn't get any interest from the major builders pre-crash. They said everything had been designed in blockwork or steel portal frames... [But our chairperson] started to make contacts around the world in the 80s, looking for innovative engineering systems. One was the reinforced earth system for retaining walls by a French engineer, who ran straps back so the more load you put on the earth, the more it held itself up. In N[Z], we started with concrete-lifting systems... We then looked overseas at building methods and at tilt-up construction... The turning point in the late 1980s was the first Countdown supermarket in Auckland... at Papakura, in a cluster of three buildings with Liquorland and the Roadhouse Diner." It was an excellent way to show how to take out internal columns, generally a nuisance in commercial and industrial buildings. "We pushed designers to use the concrete wall panels to support the building, and were coming in 10 to 15[%] more economical on overall building costs." Come the 1990s, builders were interested on the cost basis they had been ignoring "and... tilt-up has become the norm." ...So came the next stage in tilt-up concrete, overcoming the non-insulating character of plain concrete. One way was to put batts against the wall's interior, strapping it and finishing with a gib lining. "But concrete will absorb energy and can be a wonderful night-storage heater. Lining it, we were wasting that energy." ...European builders had been making insulated concrete panels for 30 years, normally using a polystyrene sandwich,

but the stainless steel ties used to hold the concrete layers together caused heat loss. Reid Engineering found a [US] glass-fibre tie, much stronger and non-heat conducting, and modified it to make it both cheaper and easier to use. "The biggest building using the [US] system was the Blind Foundation addition in Newmarket. It's quiet, and heats and cools well. We've also done a lot of barrel stores for the wine industry, keeping the wine at a constant temperature." But the [US] system was unsuitable for small commercial buildings and house walls full of doors and windows. "We redesigned it so the extra cost of insulation and conductors dropped to one-quarter of the [US] system's premium over normal unlined tilt-up – \$10 instead of \$40 extra over the normal \$90 to \$100 a sq m erected." For insulated residential use... most systems fell within a range from \$110 to \$160 a sq m and Reid Engineering's design... has been used successfully on townhouses in Hopper Developments' Maygrove subdivision at Orewa and in three-storey apartment buildings being built by Oakland Construction at New Lynn... For the next round of highrise construction, [Reid Engineering] focused on the problem of reinforcing bars sticking out of concrete slabs and beams and worked with Pacific Steel to design threaded reinforcing steel. "They saw a way of adding value to reinforcing steel. For the Manapouri power station's new \$200 million tailrace tunnel... we used our new Reidbar to anchor all the rocks – 2500 tonnes of rock bolts." This range of threaded bars has been designed for roof tiedowns and wind braces, for simpler and less congested formwork as well as rock anchoring. For concrete floors – where shrinking had traditionally been solved by sawing the floor into squares so when it cracks it cracks in the saw cuts – "in the last six months we've effectively pre-shrunk floors by casting our Reidbar into the floor in a plastic tube, poured the slab, then the next day tensioned the bar up to a five-tonne load with a jack. So when the concrete shrinks and wants to crack, it won't... because we've already pulled it into compression." One of the first buildings using the system is a Wiri freight depot where the concrete slabs measure 60m by 40m, "done at less cost than conventional sawed flooring because we're cutting down on the steel in it, and using the steel more efficiently by stretching it in the floor at the start." ...The Reidbar was introduced at the Quay West apartment building after construction had started, and was incorporated in floor slabs from level 6. Its use enabled the builders to cut the precast floor depth from 265mm to 180mm and to present a flat underside, simplifying the construction of lightweight walls between apartments. The new bars also have a place at the foot of multi-storey buildings, being supplied for the base isolators in quake-resistance pads.

...[*Divine vision hits brick wall* In one day, the AUSn can build an insulated concrete house costing less than \$10,000. But after four years of bringing his vision to fruition, the AUSn can't understand why no one wants to invest in what it believes could be a billion-dollar industry. The AUSn worked for 20 years renovating houses, and spent a number of years as a missionary in Last World countries. One day, while on a bus in Nepal, the AUSn had a vision of a green brick with nubs of concrete emerging from it. The AUSn was convinced the vision came from God, and six years later began to work on the new construction method, using egg cartons in the floor and bricks made of recycled plastic and wood fibre. These are built up as walls in Lego-block style, after which concrete is slowly poured in from the top. The concrete "oozes" through the plastic while a plasterer spreads it flat, burying the framework. It sets to a strong, double-insulated house. The light bricks cost about \$5 each – \$15 a metre compared to \$100 a metre for traditional concrete bricks. At the National Fieldays at Mystery Creek, people laughed at the AUSn as it made a floor out of slightly modified egg cartons. But when the show was over, the AUSn had a large truck laden with heavy machinery drive over the floor to break it up. "The truck drove over it five times and it wouldn't break. We had to lever it up and break it from underneath. The AUSn says the lack of interest from investors and buyers in his idea has amazed him. "I should be having people knocking on the door saying 'how do you do it and where can I sign up?'. But I haven't had one person offer one dollar towards it all." Disappointed by people's reluctance to change from concrete blocks and by the lack of Government support, the AUSn is considering taking his invention to AUS or the US."

...VILNIUS, Lithuania, a town of medieval walls and cobbled streets wrapped inside kilometres of concrete blocks, is where I spent ten days assimilating the history, philosophy and operating principles of my new employer – the *In Your Pocket* travel-guidebook company – before being put on a bus to Krakow, Poland, to write a guidebook. On the Lithuania-Poland border, a goon in a gulag guard's kit examined all our passports. After that, finally, sleep. In the early hours, we were on the outskirts of Warsaw, a seemingly endless succession of mud-splattered concrete buildings. P.J. O'Rourke put it best: "Commies love concrete." Then I was on another train. After two hours of drab, flat farmland, the train pulled into Krakow. More cement ugliness on its outskirts, and the bed and breakfast I checked into that night had all the glamour of a washing line in a retirement home but, after a quick stroll into the old town, I found the oldest medieval square in Europe and emulsified my woes in the very good Polish beer. Seven weeks later, I was running dangerously low on reserves when I was called to a guidebook managers' meeting in Bucharest. In Bucharest, as the local *In Your Pocket* guidebook puts it, "You can't swing a cat without hitting a rabid dog," a legacy of the forced evictions of thousands of bewildered residents during the building of the obscene, 330,000 sq m "People's Palace." Smart, Parisian-style architecture and cobbled walkways share streets with pot-holes, packs of feral canines and concrete-slab eyesores']...

IT'S been used for centuries as a building material and you're likely to find it on any modern construction site... Strong, versatile and durable, concrete has become synonymous with permanence. We talk of decisions "set in concrete," of a "concrete proposal." The word came into English in the 15th century from the Latin "concentus," meaning growing together. Concrete was used extensively by the Romans for buildings and baths. They built the harbour at Putoli in 199BC with concrete made from the local volcanic sand and lime mortar and the 43m dome of the Pantheon in Rome is lightweight concrete made with crushed pumice aggregate. The Romans are commonly credited with the discovery of concrete, but... [a] large concrete floor 5000 years old has been unearthed in north-west China, and one even older in Yugoslavia on the banks of the Danube. A 4000-year-old mural at Thebes in Egypt also shows the various stages of making concrete and mortar. But the technology seems to have largely disappeared with the end of the Roman Empire. It re-emerged in the late 18th century, arriving in N[Z] with the early European settlers. The basic component of concrete is cement, a fine-ground combination of limestone and clay which is mixed with coarse aggregate (broken stone, brick or gravel), sand and water. The sand fills in the spaces around the coarse aggregate; the water starts a chemical reaction in the cement and makes the mix plastic. Portland cement was imported into N[Z] from Britain from the 1840s... With the local production of Portland cement, the use of concrete... increased... Since the turn of the century concrete has become central in the construction of everything from public and commercial buildings, hydro-dams, bridges and footpaths, to culverts, cow sheds and retaining walls, water tanks and swimming pools. When Auckland's Grafton Bridge opened in 1910 it boasted the largest concrete arch span (97.6m) in the world. Rotorua's impressive Government Bath House (1908), and art deco Blue Baths (1931), are both concrete. So are the many art deco buildings which went up in Napier in the wake of the disastrous earthquake. Puhoi Town Library, built in 1923, must be one of the smallest concrete public buildings in the country, barring public toilets... While concrete reinforced with steel forms the basis of most large buildings, its use in private housing is often limited to footings, footpaths and floors (a concrete slab makes an efficient solar heat trap.) Many people see concrete as heavy, grey and uninteresting – and timber frame houses are cheaper. Where concrete is used it is often disguised... Invermay, built as a farmhouse near Mosgiel in 1862 and now living quarters for University of Otago researchers, is thought to be the oldest concrete building in the country still in use... Several fine examples of... Auckland's first concrete buildings]... survive, including Water Lea at Mangere Bridge, two houses on adjoining sections in Grey Lynn, St James Presbyterian Church (now Hopetoun Alpha)... and the four-storeyed Clifton Tower in Epsom. Decorated with paired heads of rams, lions and Maori chiefs, Clifton Tower was added to Josiah Firth's existing home in 1871. [Josiah] went on to build the Matamata landmark, Firth's Tower, in 1882.

...Firth Industries believes it has enough cost comparisons to persuade architects, specifiers and home builders to move away from timber framing in favour of masonry. A gain in masonry use would be welcomed by Firth's parent... Challenge Building, which reported a 6.4[%] fall in hollow masonry production in the June year. However, the overall gain for the group would be reduced as masonry's gain would be partly at the

expense of other [Challenge] Building products. The Firth business manager... said this week that the company aimed to raise masonry's share of the house market from below 2[% to 10%] over the next three years. That would suit Europeans and the many recent South African migrants, who are used to the solidity of masonry construction. But advances in the use of concrete over the past three years might also promote a change in attitude among N[Z]ers used to a tradition of timber framing and lightly clad homes. The bare concrete block has been a staple of sausage-block flats construction since the 1970s and is a chilling feature of many a motel. Firth has found a way to warm the blockwork and also to better insulate concrete floors. Another improvement came recently with the licensing of a pre-tinted plaster, allowing a full finish during the initial construction period instead of having a wait for the plaster to cure before painting... [A] preliminary assessment was that "a 200 series Hotbloc wall [made of insulating concrete blocks] comes in about \$160 to \$170 a sq m..." Using the new Designertex acrylic-based finishing plaster system, the masonry wall was costed at \$164 a sq m, with extra savings in construction elements that were no longer required... [C]lay brick exteriors cost about \$140 a sq m and Cedar \$190. The nearest Hardie competitor in quality terms, Hardibacker, was \$159. "There are so many benefits in masonry that far outweigh the small premium you may pay, and we're finding masonry buildings are getting a much higher resale price." ...The Hotbloc version of hollow concrete masonry, introduced three years ago and used in Wellington's energy-efficient, Medallion award-winning Eco House, incorporates a polystyrene biscuit which doubles the insulation capacity from 0.3 of the bare bloc to 0.6 on the insulation scale. "What this house has that's so different is mass, and it's mass that enables the house to function as well as it does; it warms and cools in a much slower cycle than a standard timber house... The other key is the quietness in the house, both inside and from outside." The floor is another new feature. What looks at first like beaten earth or tile turns out to be a terracotta-tinted oxide colouring introduced to the building slab before the pour. The slab itself uses the self-insulating Ribraft system, which... increased the floor's insulation value by five times over conventional flooring. Polystyrene pods are placed in a grid pattern, with reinforcing steel in the spacers around the perimeter beam and in the ribs between the pods, reinforcing mesh over the polystyrene and concrete poured on top. Trenches are not required because the slab is on the ground rather than in the ground, the normal method of concrete slab flooring. "Compared to two weeks for the standard concrete foundation, this takes five days, and we're finding fewer floor cracks because of the Ribraft system... At the same time you are pushing the vapour barrier away from the living space." The showhome has also incorporated a gas-heated, reticulated water, under-floor heating system, which allows the temperature to be altered room by room. By using 150mm concrete blocks on internal walls and a unispun floor for the house's second level, sound is further reduced and fireproofing increased.

...More buildings deemed to be fire risks will be closed[by] the... Fire Service. The... Fire Service Commission chair[perso]n... says the service has not made enough of its legal powers in the past and is demanding that his staff take action... Legislation introduced in 1991 had given the Fire Service and local authorities the power to close unsafe buildings... Multiple fatalities, such as the fire at the New Empire Hotel in Hamilton two years ago which left six dead, could have been avoided if the unsafe buildings had been policed more vigilantly, [the chairperson] said... The Auckland City Council last night welcomed the move by the Fire Service. "We strongly support safer buildings and clearly the Fire Service has the expertise and a role to play and we are delighted they are going to pursue that," said a council spokes[perso]n... The legislation had been used successfully to bring about the closure of a boarding house in Symonds St, Auckland, and in Wellington this year the service evicted tenants from a commercial building being used as a block of flats. Also, improvements were made to Mt Crawford prison in Wellington because of fire safety concerns... [By the way, m]ost Rotorua residents find the city's trademark "rotten egg" smell distasteful, but does it harm their health? The gas, hydrogen sulphide, has long been known to cause headaches, eye and lung irritation, and even unconsciousness and death, but until now there has been little research into the effects of long-term exposure to low levels of the gas. Toi Te Ora Public Health, a division of Eastbay Health, has embarked on a year-long study to find out if the gas causes health problems. A medical officer of health... said Rotorua was unique because it was the only place in the world where 45,000-or so people lived on a geothermal field.

...WOOL and polyester is as effective for thermal and acoustic insulation as the more traditional materials like fibreglass... People wrap themselves in a woollen blanket or duvet to keep warm. They can do the same for the whole house. Wool insulation, chosen for its safe insulation and low health risks, was put in the walls and ceilings of... [the] "eco-house" in Wellington - and power consumption was half that of an average house. Insulation Products Ltd (IPL) supplies a range of wool blend and polyester insulation systems... They include Thermofleece natural wool blend insulation; Acoustifleece acoustic insulation for walls between rooms, flats, ceilings and floors or metal stud partitions; and Polyfleece, a tough, non-irritant polyester insulation. IPL says its products have been tested by the Building Research Association, Wool Research Organisation and consulting engineers Beca Carter Hollings & Ferner Ltd and Marshall Day Associates. • ...MORE than 150 N[Z] houses have been built with a reinforced concrete wall method using polystyrene blocks. Insulform and MRA Architects are releasing a new range of house designs, combining the unique features of Insulform's wall systems with modern European styling... The Insulform building system was developed by [a]Christchurch builder... about three years ago. [The builder] had looked at similar systems overseas and patented the most advanced system of its type which complies with N[Z]'s strict earthquake-code design requirements. The company has recently licensed its polystyrene block system in other countries. In Japan the commercial and residential building company Takehana Kogyo Co has bought the right to make and distribute the system[, which]... consists of two moulded polystyrene walls connected by a metal bridge that runs through the centre of each block. The blocks are bonded by a dovetail locking system on the inside for accurate placing. Metal reinforcing rods are put through the centres and concrete is poured down the cavity... The system can give a house the solid look that comes from thick walls and allows recessed windows, the possibility of curved walls and the ability to incorporate suspended concrete floors. Other features include a high insulation rating for temperature and sound.

...BUILDING houses with highly-compressed earth bricks can combine the atmosphere of times gone by with flexibility of design, good insulation and durability. The Excalibur Earth Brick Company says its building concept is a natural alternative to "a world of chemically-saturated building materials." ...Earth brick construction is designed as a "load-bearing technique" that allows design flexibility... Internal and outside walls are 300mm thick and need no framing or lining. Their density makes for insulation qualities that... can mean heat loss of only 3 deg C in 24 hours.

...Insultech Group Ltd, will diagnose and fix energy efficiency problems in Auckland homes under its "energy-wise homes" programme. With a grant from the Government's energy-saver fund, Insultech can offer an interest-free finance package for this service. "Typically, people contact us because their house is so cold and mouldy and uncomfortable to live in that in desperation they're thinking of moving,"... [the company's energy] efficiency troubleshooter... says... Insultech offers a range of products and recommends the one best for the job. That can mean, for example, selecting from five blanket types, seven spray-in types of insulation and up to 20 brands. Insultech's energy efficiency packages can include any number of the following measures: ceiling, wall, under-floor and window insulation; window and door weather-stripping; drape upgrades; water cylinder wraps and pipe insulation; efficient shower roses; and efficient lights which use 75[%] less energy... Thanks to the energy-saver fund grant, which Insultech won by competitive tender, more than 100 Auckland homes have already had energy efficiency retrofits. Funding has been extended for... [19]98 to allow Insultech to upgrade a similar number of Auckland homes, and a further 150 nation wide... The energy saver fund, which is administered by the Energy Efficiency and Conservation Authority... was set up in 1995 to boost energy efficiency in homes. So far, more than \$6 million has been allocated to 69 projects which will benefit more than 60,000 homes throughout the country. Applicants submit a proposal to the authority for funding for their projects. Other projects include... Otago University's project to insulate privately-owned flats occupied by students... the insulation of the Ranfurly War Veterans Home in Auckland... and... a local body plan to insulate pensioner flats near Wellington.

...New standards for insulating houses may not stop N[Z]ers shivering in heat-leaking homes. Labour has been calling for Government haste in approving awaited energy-efficiency regulations for new houses, but they will be minimum standards and will not guarantee winter warmth. Home

heating and insulation issues have come to the fore after research suggesting that the winter temperatures in N[Z] homes often slide below the W[HO] minimum recommendation of 16 deg C. The survey backed what N[Z]ers had known intuitively, said Labour's energy spokes[person]... who wants older Housing N[Z] homes insulated when they are redecorated. Behind the cold homes was a history of poor building standards for insulation. The research, coordinated by the Energy Efficiency and Conservation Authority, discovered that... homes were often below 14 deg C and... occasionally temperatures fell below 10 deg C... Researchers... also found that there was no correlation between energy use and average indoor temperature. "This appears to imply that houses in N[Z] are not able to achieve desired comfort and health temperature levels, and are more controlled by outside temperatures than by heating,"... The authority's programmes and standards manager... said yesterday that probably 60[% of NZ] homes had been built before the first insulation standards were introduced in 1977. "[But even]... those post-1978 are minimally insulated." The new standard, which was waiting for Government approval, was higher but was still a baseline standard... If political will or an energy problem was great enough, [NZ]... could go down the road of high standards... "[However, t]here's also the fact that if you don't heat a house in N[Z], by and large you don't die. But in the Northern Hemisphere you can die of hypothermia, so there's a much stronger focus on energy issues – and energy prices are much more expensive." People from colder climates can be unpleasantly surprised by the winter temperatures in N[Z] homes. Accustomed to... radiators... central heating and double-glazed windows, they arrive to find much chillier indoor conditions. "It's so much colder in houses here," said an English[person]... who arrived in April. "I used to find it easier to go outside to warm up." - 1997

THE Building Research Association is a third of the way through studying the effects of insulating a house – and the family in it say they already feel warmer. A year ago, sensors were placed outdoors and in each room of a house occupied by a family of four to record temperature, humidity, heat flow and electricity use. The house was left uninsulated and, at the end of 12 months, 155mm depth of fibreglass insulation was put into the roof cavity and 100mm under the floor. The walls will be insulated next year. A physicist with the association... [said the past] three weeks showed that heat loss through the roof had dropped by 26[%] and through the floor by 77[%], compared with readings at the corresponding time last year. There has been a 1C to 2C improvement in temperature and 4 to 6[%] less humidity.

...If cost is seen as a barrier for switching from fibreglass to user-friendly polyester insulation for homes, then... [the] insulation product manager at Autex Industries has some interesting information. "For only \$190 extra, N[Z]ers can have a healthier, greener home and still enjoy the warmth and comfort of good insulation... That's the difference in the cost of installing the new GreenStuf polyester insulation into the ceiling and walls of an average-size N[Z] home, rather than using fibreglass or loose glass fibre insulation. Once homeowners and builders discover the minimal cost to have GreenStuf insulation, rather than fibreglass, they generally go for the healthier option. We make no apologies for GreenStuf costing that bit more than fibreglass insulation, simply because the polyester raw material is more expensive. However when you analyse it, there is little difference in the cost. That fact is being recognised by more architects..."... GreenStuf... [- which] is supplied in pre-cut construction sizes for ceilings and wall spaces [-] ...can be installed more easily than fibreglass because the installer is not required to wear protective clothing, a face mask and gloves or have to take a shower and have their clothing washed separately to avoid contamination from the glass fibres. The US-based International Agency for Research of Cancer has classified all synthetic mineral fibres, such as fibreglass insulation, as 'possibly carcinogenic to humans' and many countries, including A[US], include health warnings on product labels. N[Z] has yet to follow this course of action.

...Waitakere City is finding it difficult to foster eco-friendly homes. A house the council built to promote the idea has finally sold after nearly six months. The three-bedroom house at Sunnyside, near Oratia, was an open home three afternoons a week [during that time]. Thousands went through it. But there were no offers when tenders were called in October and it was passed in at auction. The house finally sold for just over \$350,000 and the buyer has moved in. "We've learned a lot," says... [the] development manager of the council-owned company Waitakere Properties. "People aren't ready yet to pay the extra dollar for an environmentally friendly house. But they're not far away. I still believe young people want environmentally friendly living. As the green products become competitively priced, they will incorporate them in their new houses." The house includes as much chemically-free plantation timber as possible, a concrete floor to store solar energy and release the heat at night, double-glazed windows in bedrooms, thermal-resistant roofing, panels on the roof for water heating, water-saving taps and a rainwater storage tank. "The extra cost of such features is worth it in the long run when you see electricity charges and water rates going up,"... But the company is not including such extras in its present projects on the council's 70ha Harbour View Estate, on the Te Atatu Peninsula. One is a three-storey villa priced at \$465,000... that... looks like a mansion from the street. "With the price of land nowadays, we believe this is the way to go."

...Children living at the Ranui-based Earthsong Eco-Neighbourhood are brought up in a village atmosphere where everyone's lives are closely intertwined. The co-housing concept is inspired by developments in the U[S] where private homes are combined with shared areas. Residents of Earthsong's 17 houses, more are due to be built soon, don't live in each other's pockets, but... have plenty of interaction through communal amenities like a common house, community workshop and shared recreational areas. They also have the privacy of their own rammed earth home...

You could say an unorthodox North Canterbury home with an arching frontage, known locally as "the eyebrow" is, well, eye-catching. It's the \$700,000 dream home of [a] Rangiora couple... The eco-friendly building, still under construction, is unique not just for its contoured shape – its roof is also a lawn and [the owners have] already been mowing it. Ultimately, they want to grow tussock there. The idea of piling earth over the southern side of the house and on to the roof was inspired by the habits of hibernating animals and the knowledge underground temperatures are constant and warm. "I've been thinking of this concept for a long time, probably 20 years... It's designed to conserve energy – and I think with everything being privatised I'll be proved right." ...A former motor mechanic, with management and commercial property expertise, [the husband] worked on the plan with a local draughting firm... The home's glass frontage is angled to maximise the heat of winter sun. A solarium with dark floor tiles and thick interior concrete wall blocks painted aubergine [is] also designed to absorb the sun's heat. Polystyrene insulation keeps the heat in... Over summer, with the sun overhead, the house stays cool. Inside the house, the temperature is a constant 14°-15° all year round.

...If you intend buying a section or building or buying a house, you might first want to know how much sun it gets. It is not that simple to guess, because sunrise and sunset vary about 90 deg between mid-summer and mid-winter... [Our cheap] gadget... will help... find your place in the sun.

...A... 60-year-old Raetihi [resident]... isn't afraid of the big bad wolf – even though [it]'s building his home out of straw. The... possum trapper says it is the perfect building material for his home climate. "It's the best insulation money can buy... It will keep the house at a constant temperature – never boiling hot or too cool. We can get 10 degrees below frosts here and the old house was quite cold." [Hi]'s former home burned down 18 months ago when pine cones fell out of a wood stove and started a blaze. "But straw won't burn because it's too compact and won't let oxygen in to fuel a fire. It won't catch alight, it will only smoulder,"... [His] wife... and sons... 30... and 28, finished putting the straw walls into place last week. They will trim the straw back with a weed-eater, pack any holes with loose straw then place netting over the straw ready for plastering. They expect to move into the house in June. It will have cost them \$85,000 – including 300 bales of straw... [In related news, a] Blockhouse Bay student... is making her mark in an architectural field alien to her own background... [It] is among 100 students whose work was in the University of Auckland School of Architecture public exhibition... Her design, a traditional Japanese house for a site in Howick is far removed from her own experience. [The student who] was born in Sri Lanka, raised in Zambia and has spent her last few years in N[Z]... has never been to Japan. "Learning about Japanese architecture gave me an appreciation of just how diverse cultures can be in the way they think about design and living... I was fascinated by the way the Japanese integrate the internal and external in their homes to attempt to live as one with nature."

...THOUGH this house is two years old, it has never been lived in. It was purchased off the plans by an Asian-based buyer... The house is for sale with or without all the furnishings. It was built by Fyfe Homes Design and Build at a time when Winstone Wallboards were promoting new noise-insulation systems. Fyfe decided to make full use of the leading-edge technology, with the result that the house is superbly quiet... The technology was so new that the Auckland University engineering department has used the house for testing... Hidden luxuries include a central vacuum system[and] underfloor heating throughout... [The architect's] brief... was... to ensure the design answered N[Z]ers' needs for... easy family living.

...What sort of homes will we live in... in the first century of the third millennium...? ...[NZ] should dispense with overseas models to build the type of homes that reflect our society... The North Island's plentiful supplies of clay could be used to make modern rammed-earth homes. Making more use of natural light and solar energy by orienting houses to the sun would be another simple improvement... For a more radical vision, an Auckland University senior lecturer in planning... envisages new laws making it mandatory for people to build their own homes... Building standards will rise as people take more care and the cost of housing will drop as people will stay in their houses longer... The fabled N[Z] quarter-acre section will disappear, and increasingly crowded cities will mean the only way to live is up... according to Auckland architects... Not too far up, though... They see three-to-four storey apartment buildings as the homes of the future as more people move towards the inner city to avoid traffic congestion.

...George Court's building took five years to build and opened in 1924... The... store, on the corner of Karangahape Rd and Mercury Lane, was sold to DIC in 1984 and closed in 1989. It passed to FAI Metropolitan Life Insurance, then the Newmarket Property Trust which from mid-1995 offered some of the intended 41 apartments as shells while it was refurbishing and converting the building to strata title. Most of the top units were sold that way... Some units on the first floor are used as offices and all but three of the retail units on the ground floor are sold... An apartment on the first floor fronting Karangahape Rd, with two bedrooms and a study, sold recently for \$280,000. The apartments are around the outer walls of the building, with a balcony at all levels around a wide staircase winding up the centre of a four-storey atrium with glassed ceiling. The balconies have original jarrah floors and heavy beams supporting high ceilings... Noise from... traffic... and... surrounding buildings... [could have been] a problem, but... the Auckland City Council insisted on double-gibbing for soundproofing... [One new owner] runs his publishing business from the... ground floor, and the entrance to his two-bedroom apartment upstairs is through the office... [Another apartment was purchased by a couple who had] looked at villas in Kingsland – an old gem to refurbish, with a garden outside for the[ir] cats. "But even the nastiest 'tin shed' was out of our price range and the amount of work to make them livable was daunting. We decided to start looking at apartments instead. We saw an ad for this unit, fell in love with it and bought it the next day,"... They bought it as a shell a year ago, saved some money and by mid-year carpenters were in creating what they wanted... [When they] moved into their apartment... three months ago, their cats came with them. One prefers to take in the city from the window sill, the other wanders around the parapet and through the window of neighbours' places... "...They're city cats now. They enjoy watching the action on K Rd as much as we do." ...the second animal's great[est] joy is wandering down the street with her owners – preferably without a lead... "We thought we'd be in this place for a while, but..." [the] American, is taking her partner to the U[S] long-term... They want \$240,000 for the apartment... It does not have a car park, although one might be available for lease at \$30 a week. One floor up... are... [a couple who] moved in last year, paying \$220,000 for a basic fitout and then seeking an elegance with the decor and fittings. "We have both the old charm of George Court's and a modern feel,"... Their apartment has two bedrooms and a study over two levels. They have been living on Karangahape Rd for three years, choosing the eastern end of the building for the city views and because it has no road frontage.

...Aucklanders flocking to the highrise lifestyle are learning hard lessons. That panoramic view they paid... extra... for can quickly disappear – replaced by a rear view of someone else's apartment. As the stock of inner-city apartments approaches 10,000, many residents are finding that what they buy is not protected from the impact of newcomers... Good views can represent 30 to 40[%] of the price paid for an apartment, according to... [an] Auckland valuation company... That is how much an apartment's value can be cut by an obstructive neighbouring high-rise... but "it's the risk you take." ...Depending on the location, up to \$100,000 can be wiped off an apartment's value... Angry owners are demanding better planning controls to safeguard their outlook and privacy. But they are finding civic planners loathe to tinker with market forces... While suburban homeowners have some protection, such as rules on height in relation to boundaries, commercial zones in the city have no such safeguards. Building is often allowed from the boundary... In Newton, the owners of three apartments are appalled that a new three-storey block will be less than 1m from their bedroom windows. "We'll be able to reach out and touch them," said one irate owner... The Auckland City Council's team leader for land use concepts... says projects open to public objections in residential zones [can] be permitted as of right in business zones... The Newton owners were not told of the proposal by the Auckland City Council because the block was allowed by the site's zoning... [A p]lanning consultant... says... "Some [apartment-buyers] go into the business-commercial zone with their eyes open; many don't. The city wouldn't exist without employment. You can't make it too costly for business by trying to create a pristine living environment too." But the buyer beware approach does not impress some owners. "I believe that the council and developers don't care about us," said one. "They rely on people like us giving up because [we] haven't got the money to fight." Neighbours do fight sometimes, and councils are occasionally told they err by not informing them. The High Court recently rapped the Dunedin City Council over the knuckles for not notifying neighbours before approving an extension to a hospital. Last year, Browns Bay residents convinced the High Court to order the North Shore City Council to reconsider approving a five-storey apartment block next to the beachfront. In a turnaround, the council declined the project. But loss of amenity can happen to anyone, however well-informed: the Real Estate Institute's national office in Parnell has had half its view blocked by three-level townhouses next door.

...A room with no view... [The young Aucklander] is no different from many of Auckland's new breed of apartment dwellers. Until a few months ago, [it] would come home to his Parnell apartment, fix himself a drink, step on to the sun-drenched balcony and watch cruise ships on the harbour, or gaze across to the museum. At night [the young Aucklander] and his flatmates would sit in the upstairs lounge with the lights off, enjoying the bright lights of the Sky Tower and city office blocks. Now they stare at a four-storey concrete wall, built hard up against the balcony of their Cleveland Rd apartment. The all-enveloping wall is for a carparking and office building on what was a vacant site, used as a carpark. The development, nearly 15m high, has destroyed the view and shut out the main source of light to a row of three-storey apartments in the Cleveland Villas complex. The urban nightmare is just the latest planning debacle to emerge from an inner-city apartment boom encouraged since the late-1980s by the Auckland City Council... [A] decade on, planning safeguards to limit the impact of developments on neighbours are still some way off. And long-awaited district plan changes to tighten the rules will be fought through the courts by property developers who say the new rules threaten their return on investments already made. [The young Aucklander] feels sorry for the owners of his apartment who stand to lose thousands on their investment. But the tenants are seeking a rent reduction as they contemplate a dark, dank winter, and damp bedrooms on the ground floor of their unit. [An agent], speaking on behalf of the owners, confirmed they expected to lose tens of thousands of dollars. "I just could not believe, when I realised what was going to happen, that they could come up with a design that would block out light and totally spoil the living environment of so many people,"... But the owners and occupants never got the chance to object. As with a number of similar cases around town, the development is perfectly legal under the council's light-handed town planning regulations. The apartment boom on inner-city land once reserved for commercial use has exposed time and again the inadequacies of the district plan. Most of the conflicts are in the CBD – where there are few constraints on development – and on land flanking the CBD, zoned business 4, where commercial and residential developments are allowed to sit side by side... But property experts say Cleveland Rd is the most striking example yet of inner-city living ruined by neighbouring development that the public can do nothing about. The carparking and office building at the centre of the row is the brainchild of Samson Corporation, owned by [a local] property magnate... The development has not only created a wall of resentment with neighbours, it has pitched developer against developer.

Samson[']s general manager... says the impact on Cleveland Villas is "unfortunate – but we weren't going to decrease the value of our property because people didn't think ahead". [The general manager blames the] developer of Cleveland Villas, for building right up to the western boundary of his land when [it] knew the vacant lot next door would one day be built on. "It was just a greedy developer... Why should we limit what we can do just for his benefit?" ...[the developer] built on the western boundary to create room for an Italian-style internal courtyard, around which the apartments are built. "I thought I'd done something nice that people would enjoy. I could have done all sorts of things but I went for a low-intensity development."

...*High density bends the rules*... Developers may be offered incentives to house people in multi-storey housing blocks in Auckland, as plans to cram greater numbers into the city move ahead. The council is also considering allowing cheap houses to be built with one, instead of the normal requirement for two car parks per dwelling, and smaller areas required for stormwater drainage than the rules allow. The ideas are contained in a report to the council on ways to build affordable housing in Auckland City... Another idea for "density bonuses," which would allow developers to build more low-cost houses on a site than planning rules permit, has been ruled out. That is because council officers believe the same outcome can be achieved by rezoning whole suburbs for four, five and six-storey apartment blocks... The authors have predicted difficulties with some of the[ir] ideas, including community resistance to more intense housing, traffic problems and the possible effect on property values. A spokes[perso]n for the Panmure Community Action Group... said the report underscored the group's worst fears about multi-storey housing, social engineering and calculated manipulation of the property market... Angry public reaction in working-class Panmure last year forced the council to withdraw a draft "livable community plan" for a new style of multi-storey, high-density housing. Panmure is a test site for developers to tear down [existing] houses and replace them with low-cost housing. Other areas will follow the Panmure model to help squeeze a further 220,000 people into Auckland City... over the next 50 years, when the region's population is expected to double to two million... The eastern suburbs of St Johns, Glen Innes and Panmure, Otahuhu in the south and the western suburbs of Newmarket, Newton, Kingsland, Mt Albert, Avondale and Blockhouse Bay have been earmarked for the most concentrated development. Dominion Rd, Greenlane... and even areas around Remuera's Upland Rd... are other targets.

...For some Aucklanders, the spread of high-density housing across the city spells a threat to the N[Z] way of life. But for [one immigrant] and his family, a home among 300 other terrace houses in Ambrico Place, New Lynn, suits them down to the ground. The [family] are typical of a Waitakere City Council survey showing that many Asian tenants like living close to their neighbours, a lifestyle that reminds them of home. [The immigrant] moved to Ambrico Place a year ago after coming to Auckland from China six years ago. The laboratory technician says his \$190,000 home was cheaper and more modern than others [they had] looked at. It was also within walking distance of the New Lynn town centre and Lynnmall – a convenient factor for the... household, made up of [the technician]'s wife... their toddler and [the technician]'s parents. "This is more our cup of tea... Shanghai is a very crowded city. We are used to sticking together rather than being isolated. It is better for communication and we feel safer, especially when the burglary rate is high. For us, this is very quiet..." [Hi]s reasons for moving to the former brick-works site echo the sentiments of many Asian households who took part in [the] council survey of 50 Ambrico Place homes. Of the 50 households, 56[%] were Asian... Results of the research will be released to city councillors tomorrow and are tipped to prompt a review of planning policies for the city, which has 15 such housing developments. Throughout Auckland, the rash of terrace-housing developments have been criticised by residents' groups as future slums. Waitakere planners say they were surprised by the speed at which the two and three-storey terrace houses went up in Ambrico Place. Since then the council has been struggling to keep up with upgrading neighbouring parks, improving traffic safety and beautifying streets.

...HOMEOWNERS at New Lynn's Tuscany Towers housing development say Waitakere City Council must accept responsibility for the cracks in their buildings. T[h]e Tuscany Towers homeowners group chair[perso]n... says nearly all of the development's 97 buildings have cracked exteriors... [R]esidents noticed cracks up to 2 millimetres wide appearing two years ago... [S]ome cracks were fixed by the original contractor, but have since reappeared. The cause remains unknown. The homeowners group and some companies involved with the [four-year-old] development are seeking legal advice. But... residents also want compensation from the council. Its inspectors signed off some of the work. "In my opinion we're going to have to approach the council and say 'this is pathetic, what are you going to do about it'... It's a dog's breakfast." The N[Z] Building Code states interior walls and exterior cladding must last for at least 15 years. Waitakere City Council's manager of consent services... is concerned with the residents' complaints and admits a number of consents and inspections were carried out by the council's building inspectors. "It has become apparent that this issue may be widespread and it is, naturally, of concern to the council through its role as a regulatory body... At this stage it would be unwise to speculate on any one possible cause as there are a number of contributing factors, including proper attention to details at both the design and construction stages." Tuscany Towers developers, Ambrico Apartments, went into liquidation last year. Waitakere City Council was criticised at the time for failing to secure a cash bond from Ambrico Apartments to ensure the development's completion.

...WAITAKERE ratepayers will have to find about \$120,000 to pay for infrastructure work at Tuscany Towers in New Lynn. The developer... [went] into liquidation leaving road and drainage work incomplete. The Waitakere City Council is being forced to pay the bill because its bond arrangement with the company didn't guarantee it first claim on debt. The council is now queuing up behind other creditors and [its] public affairs manager... says it is unlikely to recover the money... The 97 terraced house development was seen as a medium density housing solution to cater for west Auckland's population growth. Liquidators say Ambrico Apartments Ltd did not anticipate the downturn in the market over the past two years. "Sales were slow and the interest costs marched on. The market continued to see a drop in prices and eventually the company did not have the cashflow to be able to continue to trade..." The company went into liquidation owing \$2.1 million to unsecured creditors. The writing was literally on the wall at Tuscany Towers at least six months ago. Graffiti is scrawled across the incomplete development, while overgrown lawns and building debris surround the unsold units. Residents who bought units at Tuscany Towers for up to \$330,000... say... the developer made many promises that have been broken. "The development is not finished. There's no sign of a promised swimming pool which we already paid for. The road is incomplete and has huge potholes... All we want now is to ensure the development is finished." ...[By the way, t]he company developing a \$450 million mega-housing project at Orewa has gone into receivership. The construction project is the largest and most advanced in N[Z] to go under. Kensington Park Properties had planned to build 750 houses on the former Puriri Park camping ground... Only about 60 have been built... Most of the site is a construction zone, and its future is now uncertain. Residents' expectations of lakes, a gymnasium, extensive landscaping, a swimming pool and other common-area facilities look to be pipe dreams... Money was borrowed from BNZ and Fidelity to finance the... project.

...Around 40 West Auckland homes lie in various stages of completion and unsecured creditors are owed \$2m following the collapse of a Glen Eden based developer. Thirty-three homes across Waitakere City have had to be abandoned after Paramount Homes Limited, along with its five associated companies, went into liquidation last week. And on Friday some 150 creditors met in two separate meetings at the Institute of Chartered Accountants' city offices to hear their plight from liquidators... [B]oth meetings were heated at times. "A lot of people have lost a lot of money." The first meeting was for purchasers of homes. Around \$209,000 in deposits have been put on homes that are now left unfinished. At [the other] meeting, builders, subcontractors and trades[people] met to hear how the collapse will effect them... "We don't really know why the company collapsed. It could be the result of taking too much work on," [liquidators] say... However, the collapse is not a result of the "leaky home" syndrome.

...The timber frames of a growing number of new houses are rotting, some only months after they are built, as the building industry squabbles over the use of untreated kiln-dried framing and cheap cladding. No one knows how many of the 20,000 new dwellings built each year – including 7500 in the Auckland region – could be affected. But the Building Research Association is so worried that it has set up a group to investigate. In

one case, a house frame was found to have rotted in seven months. The distributors of the kiln-dried timber frames say they are a good product, and blame bad work... by builders and poor cladding which lets in moisture... Others in the industry say the removal of expensive eaves on modern houses allows rain to leak into the frames. The issue is to be debated at a conference of the Certified Builders Federation in Hamilton today... [The] founding director of Auckland building inspection firm Prendos and president of the Institute of Building Surveyors, says that [him] and his brother... have been trying to alert the industry to the issue for three years. [They] want the untreated kiln-dried timber banned until cladding technology improves. [They] also want... it banned in high-risk structures such as balconies and cantilevered deck[s]. The... Consumers Institute chief executive says the institute has not received any complaints [it] knows of, but admitted to being sceptical about untreated kiln-dried pine. "You have to be so careful in handling the stuff... It's asking for a high degree of skill and knowledge on the part of the builder." [The institute] did not know how prevalent the problem was. "It's one of those things that's all covered up. It's only going to become apparent when the house starts falling apart." ...[however, a] study of 300 pre-purchase building reports from Prendos showed 80[%] of exterior claddings had some defect, and 60[%] let in moisture. The Building Research Association information services general manager... says the research is alarming. And... admits that the association does not know the extent of the problem. "We also don't know its geographic distribution,"... But most reports show the problem is surfacing most in Auckland, the powerhouse of the country's building industry... [T]he Timber Industry Federation says untreated kiln-dried framing timber now dominates the market because it is easier, lighter, cheaper and quicker than other materials. But [Prendos] says it is unrealistic to expect buildings to be completely watertight, and the problem is with the... framing. "You can't keep a building dry. It's an impossibility." Framing timber has traditionally been treated with boron, which also provided some rot resistance. A change in the building standards in 1996 allowed untreated kiln-dried timber to be used. The standards assumed buildings would not leak. But the change came with the disappearance of... eaves from new houses, some shoddy construction, and the rise of so-called chillybin claddings such as stucco, fibre-cement and polystyrene.

...[an Aucklander] would love nothing better than to move out of her "polystyrene" apartment and back into a plain, solid and practical state house. The solo mother and three members of her whanau pay \$176 a week to live crammed into a two-storey apartment with structural cracks, cockroaches and polystyrene window and door frames. Chunks of the polystyrene... are coming away, allowing water to seep into the apartment and posing long-term problems with rot and mould. "The apartment is breaking around us. It is unhygienic. It smells to high heaven from sewage fumes coming back up the toilet, and the polystyrene is weak. It's like living in a packing case... Initially when I moved in I thought how modern and excellent the place was. But it didn't take long for cracks to appear up the staircase..." [The solo mother] and other low-income state tenants live in rows of Coronation St-style terraced houses at Takawai Apartments, dubbed "Takeaway Apartments," at Church St in Otahuhu. Two blocks away is Greenstone Gardens, the notorious three-storey block of state flats... Some of the problems at Greenstone Gardens were put down to the age of the 1970s Housing N[Z] block. The same cannot be said about Takawai Gardens. The development is barely two years old and already it has been labelled a slum. The charge comes from... a Labour councillor on the Auckland City Council, who could not believe her eyes when [it] visited this week. A state housing tenant most of her life, [the councillor said it] was horrified at the quality of the building materials, peeling polystyrene around the doors and windows, a tiny playground in the middle of the carpark, small backyards that got little sun and a lack of fire escapes. "These so-called new developments are... the pits." ...What really scares [the councillor] is the plan to cram a further 220,000 people into Auckland [City]... over 50 years. "The council really needs to look at what they are planning... because what I have seen at Takawai Apartments and elsewhere is not on." ...Housing N[Z]'s chief... said the Takawai Apartments development was built under the policy of the previous National Government and was an example of terraced housing from which it "had been able to learn" lessons for future developments and community consultations. "I undertook my own assessment of that development – I think we can improve on that in future." ...although the apartments had been built to specification, [the chief] was not happy with some design aspects, including layout of the buildings and open space... Housing N[Z] had received no complaints from tenants of Takawai Apartments but [the chief] was concerned to hear about [the solo mother]'s problems... Housing N[Z] said in response to a list of written questions about Takawai Apartments that it was aware of problems with polystyrene but these were "non-structural." It was unaware of any structural problems with the 32 two-bedroom and 14 three-bedroom units. "The use of this product [polystyrene] in Housing N[Z] properties is in accordance with various building codes and standards." ...the education and information services manager for the Building Research Association, said that even without seeing the crumbling polystyrene it would appear it had not been applied correctly. [The manager] said polystyrene was a good material for the cladding of houses when it was a "proprietary" building product... That meant at least three plaster coatings, including one with fibreglass mesh reinforcing, and at least one coat of paint to give total covered thickness of 12mm to 15mm. The *Weekend Herald* saw chunks of polystyrene that had come away from the window and door frames with a paint coating of 1mm or less. There appeared to be no visible problems with the main fibre cement wall cladding.

...The building industry has called for a tough new national inspection system after revelations that many of the country's new homes are in danger of rotting inside because of design and [builder] failings... Failures in cladding and framing revealed by the *Weekend Herald* may also open the door to litigation as homeowners seek redress. Under statutory building codes, cladding should be durable for at least 15 years, and structural framework for 50 years. Liability for repairs could cover not only builders and subcontractors but certifiers and local authorities. Building industry officials said yesterday that the causes went well beyond the use of untreated kiln-dried timber and extended throughout a cut-throat supply and construction chain. They also said existing inspection and certification systems were not adequate to deal with dramatic changes in the materials, design and construction of houses over the past 10 years. The potential scale of the problem was shown in research presented to a Certified Builders Association conference at the weekend. It was told that a census of 287 pre-purchase inspection reports on... houses [built since] 1996... found 60[%] leaked to some extent. The owners of one two-year-old house worth \$450,000 faced repairs estimated to cost \$150,000.

...[the Epsom builder] pulled up in his ute, clomped over an exclusive Remuera cul-de-sac in his heavy work boots, and discovered a \$600,000 catastrophe. This Epsom builder with 29 years' experience under his tool belt had been called out by the recently arrived American owner of her N[Z] dream home. The original builder had vanished, leaving the two-storey, architecturally designed house unfinished. "It was a bomb site," says [the Epsom builder], now into his sixth month of sorting out the mess... [His] firm had originally lost out at tender with a quote about \$100,000 higher than the successful company. [The Epsom builder] could see where those costs had been cut as soon as [it] walked up the drive. The front wall which should have been filled with concrete was hollow. Further inspection revealed a depressing catalogue of defects. The home's concrete base was cracked because clay excavated from the swimming pool was used as a base instead of hard aggregate. In the two-storey lounge, \$750 sheets of poplar burr for the curved ceiling had been replaced by cheaper pine, and on the roof a whole series of small faults combined to let water in. Some of it spilled on to the ceiling, staining the pine, another torrent collapsed part of the garage ceiling, and a combination of a leak and paint applied without a sealer saw a waterfall down one wall. On her first day in the house, the owner watched water spill from a light fitting in the kitchen because an enclosed deck above had not been given enough drainage. [The Epsom builder] estimates the cost of repairs so far to be around \$150,000. There seems little chance of recovery because the [original building] firm's owner has disappeared and his company is reportedly broke. [The Epsom builder] says the problems illustrate the building industry's vicious circle – the demand for the cheapest price from owners, architects and developers being met by less skilled tradespeople using cheaper products. It is the same equation at work in last week's revelations that many lower-cost new homes may be rotting because of water seeping through new "chilly-bin" claddings into chemical-free, kiln-dried timber. And while some question the quality of the products, the wider question is: are our builders up to it? Part of the answer lies in our proud tradition as a nation of do-it-yourselfers since the early settlers clambered ashore at the top of the Kerikeri inlet and put up the first stone and wooden structures that

survive to this day. A N[Z]er's right to build his or her own home has meant the industry has never been regulated, unlike of plumbers or electricians. Anyone can call themselves a builder, whether they are qualified and experienced, or cannot tell one end of a hammer from the other... A North Shore builder... says at one job a carpenter [it] hired was putting up ceiling batons using a nail gun. When power was cut [the carpenter] asked the builder what [it] should do. "I said, just nail them in by hand. [The carpenter] says, I can't, I've never done it, I don't know how." His partner says some so-called builders rely far too much on silicon and other fillers to plug problems. Such products deteriorated within a few years, letting in water. "In the old days everyone took pride in what they did, now no one gives a damn. It's just get it finished and get the dollars... When I was a boy... I did night-school once a week and two block courses a year for four to five years. Now there is not much off-site training. There's a book [trainees] fill out. I'm a sceptic about it." In... 1992, the Government... did away with the apprenticeship training boards and launched industry training organisations... Among the plethora of organisations with snappy acronyms involved in the building industry, is the BCITO, or Building and Construction Industry Training Organisation, which runs the modern apprenticeship scheme for builders. Its chief executive... explains there are two routes into a building career. One is to get a job with a builder and begin on-site training. The other is to first spend six months at a polytechnic doing a pre-trade block course, at your own expense. The apprentice is... required to keep a record of the work they have done which is checked by their assessor, who is usually their employer. The [BC]ITO employs 22 training advisers who visit apprentices, check their records and assess their competency in certain tasks. But with 2240 apprentices currently in training, that is one inspector to 100 apprentices... The anecdotal skill drop has coincided with a change in building styles and products. Even through the years we called Britain home, the abundance of local timber meant we drew our building styles more from North America than... the British, who favoured brick. As any one who has lived in a draughty villa through the winter will know, one of the reasons they have survived for so long is that the wind is free to whistle through them, drying out the timber as it goes. But with the escalating energy costs that accompanied the energy crisis in the 1970s, combined with environmental concerns about burning fossil fuels, came the pressure for homes that would keep the heat in, not let it out. First came Pink Batts, followed by a raft of modern building technologies that were smarter, warmer and cheaper than timber. At that level, says... [the] founding director of Auckland... firm Prendos, what the scientists were producing raced ahead of the builders' understanding – a problem that has been worldwide.

...Some experienced observers fear N[Z]'s problems could turn out to be as bad as Canada's "leaky condo" scandal, which created a crisis of confidence among home-owners and in the building industry. In Vancouver, experts believe that close to 90[%] of the 800-plus three- to four-storey, wooden-frame condominiums built between 1980 and 1995 have serious leaks. Owners, often retired people, who originally paid about C\$150,000... now face C\$35,000... repair bills they cannot pay. Property values have plummeted by up to two-thirds and building consents are still less than half their previous level. A Vancouver commission of inquiry found that the units showed signs of decay in as little as three years and buildings were being repaired twice for the same problem – which many builders say is happening in N[Z]. It is now compulsory in Vancouver to install "drainage planes" – a gap between the cladding and timber frame allowing water to escape – in new condominiums... [The chairperson] of the N[Z] building industry steering group on the issue, said that the same measures might be introduced here... [A]n industry crusader against leaky buildings, has predicted in the trade press that the long-term repair bill for this country will easily top \$1 billion. Others believe it will be higher... "We are aware of hundreds of properties which have been affected and those would be representative of many thousands that have been built in... [recent] years. On that basis, we've only seen the very beginning of the problem." Scientists are also monitoring an increase in the growth of a potentially lethal fungus, stachybotrys, and other toxic moulds believed to cause health problems, including breathing difficulties and flu-like symptoms.

...An ugly explosion of green and black is crawling up the walls of a worrying number of N[Z] homes. It is not a common mould, and it may be responsible for unexplained ill health. [A] HortResearch microbiologist... is searching N[Z] homes for the toxin-producing fungus stachybotrys, which has been linked to... severe health problems, including bleeding of the lungs, memory loss... breathing difficulties... and deaths in the U[S]... But the research remains controversial. "It's like the smoking argument – for years you couldn't link it," said [the microbiologist]... Scientists say that stachybotrys outbreaks were rare 10 years ago. But [the microbiologist]... had already found many examples of it growing in damp N[Z] homes. "It's not just stachybotrys either – there's a lot of other toxic fungi too,"... Stachybotrys grows only when materials such as wood or carpet backing are saturated for an extended period... [L]eaking and rotting problems with many new homes were creating the perfect conditions for stachybotrys... An Auckland building repair expert... said [it] often found stachybotrys when... investigat[ing] leaks in new houses. "I've had cases where I've been brought into a job and people have explained that various people got sick during the process and they didn't understand why." [The repair expert] believed the mould was not a health hazard until repair work sent any toxic spores airborne. A senior public health adviser with the Ministry of Health... was not aware of any confirmed cases of stachybotrys-related illness in N[Z].

...the couple would lie] awake at night in their new inner-city apartment in Marion Square, listening to the sound of falling rain. When it grew too loud, they[would ge]t out of bed, grab... a couple of old towels and stuff... them hard up against the wall to catch leaks. It was the last thing the couple had expected when they bought the \$330,000 three-storey unit in the heart of Wellington's Cuba St district. The 40 muddy-grey, loft-style apartments were built around an inner courtyard on top of a three-storey car park in 1996. The following year they won a regional architecture award, but the owners were already finding problems. "Within about three months of moving into a brand new apartment we got water damage on the inside of the stairwell... There was mould and rot and the carpet was sodden." ...it took the developers, Ebert Construction, three or four attempts to fix the problem... The [NZ] Herald understands that a report by... Prendos, found that leaks in some apartments were so bad that entire wall linings had to be replaced. Many apartments were infected with a dangerous mould known as stachybotrys – not well-known in N[Z], but linked in several American legal disputes to a range of health problems... Most seriously, in Ohio, doctors have linked bleeding in the lungs of 45 children over the past seven years to the presence of the fungus. Sixteen of the children died. Research into the exact causes of the deaths continues, but all of them lived in homes where stachybotrys was found... Marion Square residents have now taken legal action against Ebert Construction. The chair[perso]n of the body corporate... confirmed the case was heading for the High Court. Ebert Construction did not return calls. In Ponsonby, the owners of one three-storey... terraced house on Rose Rd called in the lawyers when a double bed fell through the floor of a downstairs bedroom. "The bed was shortly followed by the washing machine," said [their] lawyer... "When the [owners] took up the floorboards, the whole underfloor area was saturated and completely rotten." ...other houses in the block shared similar problems, as water had attacked the buildings' substructure. "One [of the houses] is particularly badly affected and perhaps if this hadn't been discovered, it may well have led to the whole structure being condemned." The Rose Rd body corporate is taking its case to the High Court at Auckland next week, suing the builder and the Auckland City Council. [The lawyer] said the body corporate would allege that substandard work... was carried out and question whether the council exercised proper oversight of the building process. The council and the builder are fighting the allegations. Marion Square and Rose Rd are the latest examples of a leaky-building crisis gradually seeping into public view... Last month the Building Industry Authority, the Government body responsible for enforcing building standards, announced an inquiry to determine the size of the problem. Industry sources say the answer is thousands of new homes – including dozens of multi-unit developments... ON THE rural hinterland hugging Auckland's eastern suburbs, the Botany Downs shopping centre, the country's largest retail development, looms over the intersection of Ti Rakau Drive and Te Irirangi Rd. Just behind it lies a 153-unit development once described by the Auckland Regional Council as a vision of future housing areas. Called Sacramento to reflect the Spanish-Californian theme, the development's \$150,000-\$243,000 homes were pitched at first-home buyers and couples looking for a

comfortable condominium lifestyle. The developer, North Shore-based Taradale, specialises in these projects. By the time Sacramento was built, Taradale already had several showcase sites, including the 105 houses at The Grange and the 61 terraced houses and apartments at Vista Rosa in Mt Albert. Sacramento followed the style of Vista Rosa, but on a much greater scale. It is one of the largest housing developments in the country, complete with mission-style belltowers and archways, communal barbecue area, swimming pool, gym and tennis court. Now Sacramento has been struck by the leaky building blight. Owners considered legal action but have decided as a group to deal with the problem – for now – by talking with Taradale, which has assigned... an independent director on the board of Taradale Property, to manage the problem. “We are as dismayed as the owners are with what’s occurring because we are proud of Sacramento,” says [the independent director, who adds that] the problems at Sacramento will affect one or two other Taradale developments, but emphasises that not all sites were built the same way. According to the company, the problem has been caused by a failure of the jointing system holding the exterior cladding to the frame. Last year, as a temporary measure, Taradale and the two main construction contractors squeezed adhesive sealants around the joints and anywhere else there was a risk of water getting in... [T]he company and the builders were working on a way to fix the problem long-term, but have decided to wait to see if the B[IA] inquiry comes up with a standard answer. While owners believe the issue has dragged on too long, Taradale believes it has moved quickly. In some ways it had no choice. “Sacramento is very prominent. One of the things in this business is that you can’t hide,” says [the independent director]. Last month the... *Herald* revealed leaks in another high-profile Auckland housing development, the 93-unit Summerfield Villas on the old Sleepyhead factory site in Grey Lynn, which was finished only last year. [The developer’s m]arketing manager... blames the problem on inadequate flashings (metal coverings designed to seal joints) on the parapets placed at every second or third unit... Until the 1980s most N[Z] houses had pitched roofs, with eaves to keep out the rain. They were usually made of weatherboard, brick or perhaps stucco on an open, ventilated timber frame. The houses leaked but water had room to drain away or dry out inside the walls. The timber framing was treated for borer, which made it more resistant to rot as well. Over the past... five to 10 years... most of these conditions have changed. Mediterranean-style houses with flat roofs, no eaves and floor-level decks and balconies tend to let more rain in. New water-resistant, but slow-drying, stucco and fibre cement claddings, combined with compulsory insulation from the early 1980s, give this water nowhere to go in the tightly packed wall cavities... Whatever the reasons, the effects have been dramatic and are getting worse... [A]larmingly... a survey... found... half the houses built since 1990 leak... and these houses had more leaks at a higher failure rate than... older houses... The highest failure rate came from stucco. Prendos’ latest study into... multi-unit housing... found average repair bills of \$32,000... The growing question is: who will pay? ...[one] building repair expert... knows of one three-year-old \$1 million central Auckland property where the cost will be six figures... If the worst predictions are right, many N[Z] homeowners could end up like [the guy] whose multi-level Mediterranean-style Devonport dream home has turned into a nightmare. Water leaked from the balcony straight into the main bedroom and poured in through the back wall. Similar leaks have rotted the timber framing of the garage. [The b]uilder... says the 14-year-old house has had three owners and was sold before completion, but has offered to contribute to the repair bill, which [is] put... at \$12,000... [The owner]’s fed up with the endless repairs. “I bought this house by the beach and here I am spending all my time fixing bloody botch-ups...”

...Rising claims for leaking and rotting new homes are forecast to cost Auckland City ratepayers \$1.4 million this year. Hundreds of home owners are suing or planning to sue Auckland City and other councils for allegedly failing to oversee the building consent process, in the knowledge that councils have the financial resources to pay up. Local authorities hope an independent report on leaky homes will provide clear guidelines on their role in the building process and the growing risk of exposure. It is in Auckland that the combined effects of wet weather and poorly designed and built terraced housing and apartment developments are causing the greatest alarm. [The]Hamilton City Council chief executive... yesterday said his council had accepted partial liability for just one leaky building and had one more claim before it. Tauranga District’s acting environmental services manager... said his council was monitoring the crisis closely because of a housing boom running between 1200 and 1400 building permits a year, many for apartment and terraced houses. [The manager] said the drier climate was one reason there had been no claims so far. “It is a relief.” At Auckland City, the council has made more than 13 confidential settlements since 1995 and has more than 15 claims before it, including one from owners at the 5-year-old Quest apartment building in Queen St, which... was being stripped floor by floor in an \$800,000 repair job. The cost of negligence claims, most involving building and planning, has rocketed from \$459,000 four years ago to \$1.2 million in the last financial year... Auckland City’s finance director... said yesterday that the jump in professional negligence claims was clearly a concern. North Shore[’s] Mayor... said his council had about seven cases of leaking buildings on its files. Another five cases had been settled out of court. “Obviously considerable litigation could stem from this,” [the mayor] said... North Shore City’s compliance and monitoring team leader, said several new cases, including the leaking and rotting 105-unit Grange development in Albany, would “come to the council’s attention”. Manukau [City’s] Mayor... was not aware of any problem buildings that had been signed off by council inspectors. [Yet, Manukau]Council officers told the *Herald* in April that the council faced 15 cases... More than 150 owners at the \$30 million Sacramento development... in Manukau City are preparing to sue the developer... for faults that include mushroom-sprouting mould. Waitakere [City’s] Mayor... was unaware of any claims before his council. [The mayor] was “bloody pleased” that the council’s building inspectors, perhaps thought of as over-zealous, had been strict in applying the building code... [However,] several terrace house owners in the 97-unit Tuscany Towers development in... West Auckland... have spoken out about their leaky homes... [Unfortunately, i]ts developer, Ambrico Apartments, and builder, United Homes, went into liquidation last year... [Now] a Tuscany Towers’ homeowners’ group... were obtaining legal advice about enforcing their rights under the Consumer Guarantees Act.

...Cabinet will today consider ways of settling disputes over the liability for leaky homes as building certifiers warn of a collapsing house market if they cannot get insurance... [The PM] said... last night... the Government was unlikely to go as far as legislating for dispute settlement tribunals... “There may be other ways of facilitating movement... There are a range of interests. There is local government, insurance, master builders and the customers. The question is, how are people best brought together.” Building certifiers yesterday held an emergency meeting in Drury where they revealed that inspection work had stopped on thousands of jobs because of insurance risks. The Government has now been directly affected by leaky building syndrome, after one inspection company, A1 Certifiers, had to stop work at a 29-unit Housing NZ development. Hundreds of homeowners face mounting repair bills for leaking homes... but so far no one is admitting responsibility. A report commissioned by the B[IA] estimates that nationally repairs could cost \$240 million. It criticised many sectors of the industry, including architects, developers and poorly skilled builders, and also questioned building inspection procedures. [The PM] said yesterday that legal advice to the Government was clear... there was no Crown liability for the problems. [The PM] had read the officials’ advice accompanying a Crown Law Office opinion and it was “very clear” there was no Crown liability, even taking into account Crown agencies such as the B[IA]. At yesterday’s Drury meeting at the offices of A1 Certifiers, which was forced to close last week because it was unable to get professional indemnity cover for watertightness of buildings, inspectors warned of a catastrophe in the industry. The company has stopped work on 5500 properties, including a \$1.2 million Papakura home, which could leave a builder \$250,000 out of pocket... [T]he immediate past president of the N[Z] Master Builders Federation, who chaired the meeting, said the industry could grind to a halt unless urgent steps were taken to help building certifiers to obtain insurance. Building certifiers are private inspectors who are responsible for ensuring that houses comply with the Building Code. They sign off houses before they can be sold by issuing a code of compliance. They undertake about half of the 40,000 building projects each year in the Auckland area, with council inspectors doing the rest. “What we are going to see is unfinished houses, builders unable to get progress payments, bankruptcies and ultimately people unable to get their homes,” [the past president] said... The building certifiers have formed a fighting group and are requesting an urgent meeting with [the]Internal Affairs Minister...

Brothers at odds over heads to roll... One of two brothers who first warned about the leaky buildings scandal says it is time for [the]Internal Affairs Minister... to go... [The brothers] bombarded the BIA, politicians and the media with information about... leaking homes. The... [minister has said it] was not informed of the problem until April 30 and that [it] relied on his paid officials to raise concerns with him. [Brother one] said that this may be so, but that was no excuse for not taking notice of all the letters and countless articles in the *Herald* and trade magazines about the problem... [Furthermore, a] letter from a worried building firm, HiTex Plastering Ltd... sent to the Housing Minister... [was forwarded to the Internal Affairs Minister], who replied to HiTex on September 7, [last year], saying the industry had set up a weathertight building steering committee... to investigate problems with rotting homes... [(t)he letter... says the questions raised by HiTex will be addressed[, and]... is signed by... [the Internal Affairs Minister]. In addition, a]n open letter... from [the brothers' company]Prendos had clearly warned [the minister] and other industry leaders about the scale of the problem and that it would only get worse... It also was clear the Government had no confidence left in the minister because the issue had been handed on to the Minister for Economic Development... [However, t]he other brother says [the Internal Affairs Minister] was treated appallingly by the B[IA] and that its chief executive... is the one who should resign... "At the end of the day, if [the minister] went, so what."

...Ministers should own up... AS THE Government struggles to deal with the leaky building crisis, there must be no doubt about where ultimate accountability lies. It is with the Government itself. While the P[M] denies the Government has any legal liability, that is somewhat different to accountability for Governments' actions in introducing a system which includes the Building Act, the attendant building code and the regulations set out in the act. Central government is also responsible for establishing the B[IA], which approves independent building certifiers. Among the requirements for certifiers is that they carry public liability insurance – from which insurance companies are now removing themselves. There is nothing in the system to deal with this or to ensure home-buyers are protected financially from shonky building. The system of building consent and certification was set up by Labour in the late 1980s, and National tinkered with it... That makes the Government accountable, whatever its colour. If there has been a systematic breakdown, as the B[IA] report claimed, it is the system set up by the Government that has broken down. The chaos outlined in the report has developed because the system simply did not work. Even now, while the Government introduces voluntary mediation, it is still being pointed out that litigation is the ultimate recourse for those already suffering a leaking home. But still no clear guidelines are being set on who to sue. In some cases, there should be a clear target – where, for example, buildings are found not to have complied with the requirements of the building consent. Sue the builder, you would think. But what if the builder has been issued with a certificate of compliance by the local council? Sue the council, you would think. But what if the building was signed off by a private building certifier on the basis of which the local council, which may never have actually visited the building site, then issued a compliance certificate as required under the Building Act? Sue the private certifier? Or the developer? Maybe neither, because the council, once it learns of the problem, can issue a "notice to rectify" to the private certifier, who must then get his client – the developer or builder – to carry out remedial work. If that does not work, the home-owner can still take the council to court... The council issues the compliance certificate and should carry ultimate liability. That liability arises directly from obligations laid on local government by central government through legislation. Therefore, logically and morally, central government must be held accountable. Local and central government's role is to regulate for an orderly society in which people's rights are protected. That is why we have laws that cover our daily lives and create and develop the framework within which we can live at peace with our neighbours and go about our daily business within a fair and equitable society. When those laws prove inadequate, that framework is endangered. Such is the case with the leaky buildings crisis. The system has failed. It is now the responsibility of central government to give adequate financial help to owners of leaky homes. That help could include legal aid to sue builders, developers and anyone else who may have contributed. It could also include interest-free loans – or even grants in cases of dire need – to enable repairs to be carried out swiftly and efficiently. Such measures would ease the immediate burden of those people suffering the stress and hardship this systematic failure has induced. And what about the future? How can home-buyers be given confidence that they will not be subject to such a systematic failure again? The basic framework of building control relies heavily on the role of the local council acting under clear and operable legislation. This means th[ey]... should continue to have responsibility for issuing building consents, inspecting buildings and issuing compliance certificates. And the councils should continue to accept liability when they certify that buildings have been constructed in accordance with tried and approved materials and building methods. No council will ever admit, in individual cases, that such liability exists because... [it] would lead to cancellation of the council's own liability insurance. That is why many councils have admitted making "confidential" payouts to owners of faulty homes. They have recognised their liability. Introducing substantial changes to the present system must reinforce that legal responsibility. [1]st, all building certification should be carried out by fully qualified council staff. The law allowing private certifiers should be revoked. In conjunction with that, the number of inspections carried out by councils must be increased to reflect the defects currently under appraisal. There must also be flexibility to carry out, and charge for, additional inspections if necessary. [2]nd, all builders should be registered, and registration must require proof of appropriate skills and qualifications. Allied to that, anyone other than a registered builder must be prohibited from being allowed to carry out any construction work. Building consents would be issued only to registered builders. And all registered builders should be required to contribute annually to an industry indemnity fund to meet claims arising from faulty work. [3]rd, all property developers involved in constructing units and houses must also be made to contribute to the builders' indemnity fund, and be held accountable in law, with the builder, for building defects. [4]th, councils should have the power to call for a bond for any new development from developers and builders to provide security for possible costs to councils in pursuing rectification of faults. Finally, in relation to the standard and performance of building materials and products, a revised set of procedures must be introduced, including the requirement for new products to be performance-bonded for an appropriate number of years until proved reliable. These measures would add to the cost of new homes or reduce profits for builders and developers. But they... provide a much more robust system of building control and give greater confidence to home-buyers.

...Homeowners suffering from the leaky homes syndrome still face an uphill hike to get their problems sorted – despite [the]government's announcement of a new \$4m adjudication service to make builders front up. The process is no quick fix and it will take possibly years before settlements are made... But how much teeth will the... Construction Contracts bill... have? How will it nail builders, to say nothing of developers, when it comes to remedial work and getting the cash, [workers] or materials to complete the job? Homeowners must register (and there'll be a yet-to-be-set fee) to take advantage of the new disputes resolution service. Complaints will be screened to ensure they fit the leaky building syndrome criteria. If a case is accepted a registration form will be sent out and once returned an independent assessor will interview the homeowner; inspect the house; determine the cause of problems, parties involved and approximate cost of repairs. Anyone whose complaint involves repairs of less than \$7500 will be shunted off to the Disputes Tribunal where they could have gone in the first place! However, we still have limited liability companies in this country and it's a fair bet a lot of them will consider going to the wall – faced with the threat of massive bills to fix leaky homes.

*...Dozens of new-home owners are fighting through the courts against two high-flying developers who have... put up terraced housing across Auckland. Tension is growing between[the] property magnates... and people who have bought homes at some of their developments and claim they are substandard... The brothers set up shelf companies for each development, later liquidating them to avoid personal liability – a common building industry practice that has come under increasing fire since the leaky building crisis. Last night, a group of about 40 owners of homes in the new Ellerslie Oaks complex met to discuss what action to take over alleged incomplete work. The company that developed the site... was one of four... [the] brothers... put into voluntary liquidation last week. Owners of homes in the leaking Greenwich Park development in Grafton have named the brothers and their core company, Castlerock Property Holdings, in their \$3.5 million legal action – [NZ's] biggest known legal building lawsuit. The... *Herald* has also spoken to subcontractors who say they are owed money by the pair... A... business claims to have gone bust largely because*

the brothers did not pay a bill. Some contractors say they have settled for much-reduced sums after giving up hope of getting any money from the shell companies involved. The... brothers are listed as directors of at least 33 companies, 15 of which have either been put into liquidation or struck off the company register. Yesterday, [one brother said it] was upset at the allegations being made against him and asked: "Is this shoot-the-developer season?" [The brother] added: "We do not have one single creditor – every person who has done work for us has received payment to their satisfaction." ...[the brother] was proud of his developments... describ[ing] Greenwich Park as a "beautiful development, well done" and said any "ongoing matters" were between the owners and the construction company, which is also being sued. [The brother] acknowledged that one contractor had taken him to court, but the matter was contested. "If we are proved wrong, we will pay them any money outstanding – if they are wrong they are up for a massive claim against them." ...[a l]awyer... believed there was scope under the Fair Trading Act to "lift the corporate veil" and sue directors of "shell" companies – so long as there was still a core company that was viable to sue. [The lawyer] believed developers had a duty to ensure that proper care and skill were used in the building of houses, and that could not be avoided by delegation to independent contractors... [The brothers] have been prominent on the Auckland property scene for several years and their 10 Auckland developments range from top-of-the-line terraced homes to cheaper apartments... [One brother], 34, lives in a \$725,000 home in Parnell and drives a Ferrari, and his partner... who markets his homes, drives a new Range Rover worth \$175,000. [His b]rother... also lives in Parnell and has a Mercedes four-wheel-drive... Using the name 35 Ayr St, they [recently] paid \$3.5 million for the old Grammar Carlton Rugby Club property in Parnell, which they plan to develop. They also have development plans in Queenstown. A representative of owners of homes in the Ellerslie Oaks complex, who asked not to be named, said: "We didn't get what we paid for." Security gates were not installed, courtyard fences were not finished, some appliances were not installed and remedial work was not finished... Subcontractors have told the... *Herald* that a lot of work has not been finished because they were paid late or not at all... The Building Subcontractors Federation wants the Government to tighten company law to crack down on developers "hiding" behind shelf companies... A spokes[person] for the Companies Office said it was not illegal to set up shelf companies to limit personal liability. "The whole nature of a limited liability company is to ultimately restrict your responsibility..." But... action could be taken against company directors who had had more than two failed, including liquidated, companies within five years, where the failure could be shown to be their fault... ■ [A]... team of Government ministers have been working on a plan to resolve the rotting homes problem that could involve repairs costing up to \$2.4 billion. A part of the solution package is the new mediation and adjudication service announced by [the Deputy-PM]... last month. A website and toll-free phone number have been set up so that homeowners can apply to take part in the dispute resolution process. The Government will today release more details about how the mediation and adjudication service will work, including the costs for homeowners. The *Herald* understands homeowners will pay a fee of \$200 to use the mediation arm of the disputes service. If mediation fails or if one of the parties involved refuses to take part, the homeowner can pay a further \$200 to use the adjudication service. Adjudication would be compulsory for all those involved, including the builder or property developer. If the case goes straight to adjudication without going through mediation, homeowners will pay a \$400 fee. The judge handling the case will have the power to award costs when issuing a decision, so homeowners could be reimbursed... About half of the 541 calls to the toll-free number have come from the Greater Auckland region... Internal Affairs has received 151 registrations from homeowners...

All new leak-prone houses in the Auckland region are now required to use wall cavities and treated timber for protection against leaks and rot... [T]he stricter system ha[s] been in use for about six weeks... Other councils around the country are expected to follow Auckland's lead soon, rather than wait for a decision from the Government or the B[IA]. The combined changes are expected to cost about \$1000 for an average house. However councils predict the numbers of affected homes could be relatively small, as builders and architects are already going back to more traditional designs... The council moves are identical to those proposed by... P[rendos]... in a letter to the B[IA] two years ago. At the time the authority's architect... dismissed the cavity plan as "an unjustified increase in cost to the industry" and a return to treated timber as "a backward step". The authority is now on the verge of introducing compulsory treated timber for outside walls and is considering compulsory use of cavities.

...Home builders and renovators will soon face a new challenge – tighter red tape. Stricter building rules through changes to the Building Act are set to come into force, partly in response to the leaky homes crisis. The rules are intended to ensure all buildings are constructed or altered properly. While the new rules are being welcomed by some, others are warning it could damage the DIY industry and put a dampener on a much-loved Kiwi hobby. Under existing rules, do-it-yourselfers need a building permit for some structural work, the work needs to comply with the building code and it has to be signed off by the local council. Under proposed new rules, all work over \$10,000 must be supervised by a qualified builder before it gets approved by the council... Further proposed changes to the Building Act will see some building methods and designs banned...

An Auckland structural engineer says many pre-cast concrete high-rise blocks built in N[Z] since 1994 do not comply with sound engineering practice and would collapse in a big earthquake. The engineer... has written a report documenting 26 examples of bad practices and described one fault on a multi-storey building as "tantamount to conspiracy to commit mass murder". [The engineer] says the "leaky buildings" syndrome is "only the tip of the iceberg" of declining standards... The Institution of Professional Engineers... has appointed a group to look into the allegations... High-rise buildings would need to be assessed structurally through the same kind of exercise that the Government was funding for leaky homes.

...The owners of up to one in 10 N[Z] high-rise buildings face... higher earthquake engineering standards. Costs could run into [\$]billions... and some buildings may have to be demolished. [The]Commerce Minister... put the construction industry on notice to lift its performance[, and]... said the Building Act would be changed to toughen provision for earthquake-prone buildings... The act is already being revised after the leaky buildings scandal to require the licensing of all builders, architects and building engineers and to certify that new buildings comply with the building code.

...*First leaks, now weak wood*... N[Z]'s biggest timber supplier has admitted selling under-strength wood, after three of its sawmills were raided in a Commerce Commission investigation. C[HH] acknowledged yesterday that its MGP10 grade Laserframe brand timber was not strong enough to meet the advertised standard and said the product would be regraded... CHH... has [also] been found guilty of misleading advertising... The Advertising Standards Complaints Board found C[HH] guilty on two counts of misrepresenting its Laserframe product in a free brochure available from retailers for the last two years. C[HH] won its appeal against a third brochure... CHH... stressed there had been no reports of timber failure.

...Israeli Army rescue experts yesterday searched for survivors in the rubble of a multi-storey banquet hall which collapsed during a wedding party, killing at least 20 people... 300 people were injured... [O]fficials at the scene said an engineering fault... not an Arab attack, was responsible for the collapse of the... hall, in the Talpiot industrial park of Jerusalem... [Ironically, the] young couple's fear of terrorism led them to make the decision that turned their wedding into a national tragedy... [They] had planned to marry at a kibbutz near the West Bank, but changed their mind at the last moment because they feared the recent violence in the Palestinian territories. Instead, they booked the Versailles Wedding Hall, in suburban Jerusalem, where the dance floor collapsed under the weight of their 620 guests... Despite its grand title, the Versailles Wedding Hall is scarcely distinguishable from many other modern, concrete block buildings in the rather soulless suburb of Talpiot, which is little more than a collection of car dealerships, electronic stores and factory outlets. And, like many of those buildings, it was put up in the 1980s using a cheap, lightweight construction method which has since been banned... The inventor of the method... which used... thinner layers of cement... appeared on Israeli radio... insisting the technique was safe. A few hours later, [it] was arrested. Another [person] was arrested at Jerusalem's city hall a few hours after the disaster as [it] tried to break into a document room. Ten people have been arrested, including the owners of the building and the builders. The wedding couple were among the survivors, more than 166 of whom remain... in hospital... including 16 who were in a serious condition. The moment celebration turned to tragedy was captured in a terrifying wedding video. The tape, broadcast repeatedly worldwide,

showed smiling faces on the packed floor, and then, seconds later, hundreds of dancers suddenly dropped into a giant abyss of orange sparks and smoke.

...Enjoy your breakfast, home handy[people] – then get to work before your castle collapses around you. It may be Father's Day weekend but for 1.4 million homeowners this is no time to put your feet up. There's borer under the floorboards, rising damp, peeling paint or a timebomb in the roof to fix in an alarming number of our homes, new research has found. And most owners are either oblivious to the problem or prefer to turn a blind eye. The Building Research Association of N[Z] (Brnz) says one in four homes are in poor condition, with a fifth having a serious defect raising immediate health and safety concerns. In a blow to our do-it-yourself tradition, Brnz says the average Kiwi house needs \$4000 spent on it just to return it to moderate condition. But owners are spending only \$1500 a year on average on maintenance. And the longer defects are ignored, the more costly they become to fix. These sad truths have emerged from the N[Z] House Condition Survey, released this week. The 142-page report follows 465 on-site inspections and 500 telephone interviews in Auckland, Wellington and Christchurch. Poor ventilation beneath timber floors, corroded fastenings, inadequate clearance between ground and wall claddings and problems in the roof space are the most common serious defects. Dampness was a problem in 30[%] of houses surveyed. The findings add to suspicion that many first-home buyers don't know what they are getting themselves into when they sign up on older homes. Although newer homes feature low-maintenance materials, the typical Kiwi dwelling remains a timber-and-corrugated iron affair needing continuous care as it ages... [The] Auckland manager of Quotable Value, says some [DIY]ers have been destroyed financially after striking unexpected problems which they can't fix themselves. Others hire a builder who discovered rotting framing, and in no time at all, their budget spirals from \$20,000 to \$80,000. But... experts doubt that the findings will stop first-time buyers from falling in love with that character villa or bungalow. It seems many are genetically programmed to spend their time and money on such bottomless pits.

...[a t]elevision DIY expert... has fears for the future of building in N[Z]. "Given the way the industry and the government over the years has managed to completely muck up the apprenticeship system it's a wonder there is anybody left with any skills at all," [the DIY expert] told *TV Guide* as [it] prepared to host *The Registered Master Builders House Of The Year Show*. "You talk to older builders, and they wonder what will be the case in 10 years' time. The industry has become so competitive some builders feel that they can't afford to carry an apprentice. And if the industry as a whole doesn't keep bringing new talent on then it will reach a point where it doesn't have any." The talented ones it does have get to show off their wares every year in the *House Of The Year Show*, which is judged in eight categories. The categories are split into six new houses starting with an under-\$140,000 class and rising to an over-\$400,000 class and there are two restoration categories. Restoration seems to be a speciality of Wellington builders, due to the limitations on new house building in the capital. But when it comes to overall skills, [the DIY expert] says some of the best builders can be found in small towns. [The DIY expert] recalls filming a house renovation in the Mackenzie Country where the Auckland architect was worried about finding skilled crafts[people]. "The architect] said to me afterwards, in that tiny place they were so used to turning their hand to anything they did a better job than [the architect] could have got done in Auckland. So it's not just native skill, it's attitude, I guess."

...On Sunday they "packed down" their wagons and stalls for their Monday morning departure from Henderson. The 45 gypsy families are moving on to Orewa for the weekend, after spending last week at Lincoln Rd selling their wares at the Gypsy Fair. [The fair's o]rganisers... have to be the first at the next destination – which they have to arrange. In the big cities it is getting harder to find places to stay... "In somewhere like Auckland it's not that easy." Each week the gypsies are in a different town. From September to February they travel through the North Is selling their wares and performing, and till mid May they loop around the South Island. The travellers have stopped at Henderson for a while each year since their village started 10 years ago with 10 families. Since that time the gypsy village has grown to the point that there is now a waiting list. But not all families are allowed on the waiting list. People have to be experienced road travellers, and they have to know a trade or something different to draw people to their wagon or show, says [one of]... the village's co-organiser[s]... Her trade is in luck and legends, which [the co-organiser] became interested in while travelling in the U[K]. "This was designed for gypsies already living on the road. People really have to go out and learn to live on the road. It's quite hard work. It was started up because[we] all... were actually living on the road, but we needed to earn an income. It enables us to continue travelling but earning as well,"... [The co-organiser]'s been travelling for over 30 years of her life, and her home is her wagon.

...THE Henderson Community Board wants to get rid of Tui Glen camp ground. They say there's no room for caravan and cabin accommodation in the Henderson ward and they want it gone as soon as possible. Tui Glen was the last home of murder victim Justin Dyne, a transient whose decomposed body was found in Henderson Valley in September. The Waitakere City Council is reviewing the fate of the camping ground which provides emergency accommodation and permanent homes. [One b]oard member and councillor... says Tui Glen is a "blot on the landscape of Henderson. There's absolutely no place for camping grounds and caravans in a public park in any city... It's a crying shame to see historic trees and a beautiful landscape not being available to the wider public." ...Tui Glen was the first camp ground in N[Z] and is listed as a category two heritage item. Five of its residents have lived there more than 17 years. The council's lease to Tui Glen expired last year but is being renewed on a monthly basis until a decision is made. The camp[']s... future is being considered as part of the Henderson Creek reserves management plan.

...TUI Glen Motor Camp will be closed in eight months but... councillors have yet to decide what will take its place. Councillors voted to close the camp... during annual budget deliberations, despite a petition from 43 people who want long-term residents to remain at Tui Glen. A report... says... [the c]amp has had several breaches of its lease – up to 30 extra caravans over the limit of 48 on site, and residents staying beyond the maximum of three months. At least 34 people have been living at the... camp grounds for more than three months... [A c]ouncillor... says the camp does not have a "long-term life" because of its proximity to the aquatic centre and Henderson's main street... [Plu]s the... site has many potential uses, including recreation or extra car parking for the aquatic centre. Options for future use of the site are due back to the council over the next few months. [Another c]ouncillor... says they'll have to involve government agencies quickly to ensure those living at the camp... can find other homes. "A lot of people have lived there a long time... The worry is if the owner does decide to make changes really quickly people could be left homeless in the shortterm."

...ABOUT 100 million of the world's children live on the streets, where many become the victims of abuse and even killings by security forces, the U[N] was told yesterday... [By the way, w]ith its world's tallest building nearing completion... [-] due to be finished next September... it stood at a "new record height" of 688m at the start of last month... [-] Dubai is embarking on an even more ambitious skyscraper: one that will soar [over]... a kilometre high... Babel had nothing on this place... About 150 elevators will carry employees... to the Nakheel Tower's more than 200 floors... Foundation work has already begun... The tower... will be the centrepiece of a sprawling development... located between two of the city's artificial palm-shaped islands, which... will include... 40 additional towers up to 90 floors high... "It does show a lot of confidence in this environment" of worldwide credit problems and a souring global economy, said... Standard Chartered Bank's Dubai-based regional head of research.

...The U[S] Government hopes to have a plan ready this week to buy US\$700 billion... in "toxic" loans clogging the financial system and threatening the global economy. It will be the largest bailout since the Great Depression... More than 2.3 million homeowners coast-to-coast faced foreclosure proceedings last year, an 81[%] increase from... the... [previous year]. Analysts say that number could soar as high as 10 million in the coming years, depending on the severity of the recession... [In local news, t]axpayers are unlikely to have to pay for a big bank bailout under the Government's deposit guarantee scheme, but they could get the bill for finance company failures, says [the]Reserve Bank Governor...

Lender GE Money has told investors in failed finance company Blue Chip to pay up or it will sell their homes... Blue Chip left thousands of investors out of pocket after its collapse in February. Many of them had borrowed money against their homes... [A lawyer] said the Government

should have done something to protect the worst-off investors instead of bailing out the big banks. "These people... will never recover. They'll never be able to get another house..." [The]Finance Minister... announced a deal on Saturday to guarantee banks' overseas borrowing.

...A clandestine meeting at a public library has resulted in two suitcases full of original Blue Chip documents being handed in to the Serious Fraud Office. An unidentified [person] had offered the apparently stolen papers for sale to [the]property consultant... who is acting for victims of the Blue Chip collapse... when 22 of its companies were placed in liquidation owing around \$84 million... Meanwhile, in what's fast becoming a game of cat-and-mouse, Bridgecorp's receivers are searching in vain for the failed finance company's former chief in order to serve a bankruptcy notice on him... The receivers began bankruptcy proceedings last week... Bridgecorp collapsed a year ago owing \$458 million.

...The finance company meltdown claimed its 25th and biggest scalp yesterday when Hanover Finance froze repayments to 16,000 investors owed more than half a million dollars. The company – whose TV ads claimed it had "the size and strength to withstand any conditions" – was heavily exposed to the crumbling property development market and dependent on retail debenture funding, which has now largely dried up... Despite the freeze on Hanover funds there were positive developments in the finance company sector... as Spiers Group and Allied Farmers said they would merge their finance operations to create a stronger \$400 million company. Also, Marac announced it had secured \$104 m... in long-term funding.

...Despite an extra \$187m... [being allocated] for state housing... [- of which t]he Government has earmarked \$122.7m for maintenance... [-] some tenants in west Auckland remain disillusioned. [One] has lived in her four-bedroom Helensville home for 12 years and says Housing N[Z] has not looked after the property. "Nobody's spent one dime on it. The only thing I got was a new stove. I reckon I need about \$5000 to do it up." The mother of seven was paying \$240 rent a week when [it] first moved in, and is now only paying \$200... But... a by-product of cheaper rent is that tenants are expected to repair damages themselves. "The only time I see my officer is when I stop the rent... I should be renting to own that house, but I'm not." However, Housing N[Z]'s spokesperson says emergency repairs are responded to within four hours, and non-urgent repairs within 10 working days. Any problems that tenants have should be taken up with their tenancy manager or area manager.

...people have died and one child is admitted to hospital daily because they live in rundown housing in some of the poorest parts of [NZ]... The homes of... two elderly... people who died were on a list of more than 1000 houses waiting for urgent upgrades promised by the Government.

...A record fine imposed on two people who leased out an unsanitary building has been upheld by the High Court. [The pair] were fined \$40,500 in the Waitakere District Court in May last year after they rented out their converted garage in Rathgar Rd, Henderson... [to a couple] and up to four children for \$180 a week... for four years... Waitakere City Council officers found rats, cockroaches and water could enter through holes in the outer wall, food storage was poor... and electric fittings gave electric shocks when touched... The[pair] were no longer leasing out the building.

...The Government says it is to chase up bad landlords, but what about the other part of the equation, the tenant? ...Residential landlords – are they heartless exploiters of the needy or noble providers of a social service? The morals and motivations driving the home rental business have been in the spotlight this week. As the Government unveiled a proposal to crack down on bad landlords, it emerged that a property managed by one of its own ministers... had been declared unfit by the Gisborne District Council. Then Invercargill['s] Mayor... found himself under attack for offering a [person] free accommodation in a dilapidated property with the advice: "There are no keys, so just climb in through the window." Days earlier,[the] Housing Minister... announced that the Government was considering toughening up the Residential Tenancies Act to include hefty penalties for landlords who failed to comply with work orders under the legislation. According to [the]Monte Cecilia House manager... substandard housing is rife across Auckland and many families are living in slum conditions because landlords can get away with it... [T]he Monte Cecilia House Trust has tried to help people by talking to landlords about the problem, only to have the tenants evicted. "The landlords don't even worry about it. They say that for every person who challenges them about the house, and who they then evict, there are 10 or 20 more people who would happily live in the same conditions." But the president of the Auckland Property Investors Association... says most landlords keep their properties well maintained because it is in their interests to do so. "By not doing so they end up with larger repair bills, make the property difficult to let and do not maximise the achievable rental price for the property. That is why, out of approximately 300,000 rental properties in N[Z], there are only 300 applications to the Tenancy Tribunal every year from tenants wanting landlords to conduct repairs." ...By contrast, every year the tribunal gets about 24,000 applications from landlords seeking rent arrears and around 3000 applications wanting tenants to repair damage they have done. That does point to there being quite a lot of irresponsible tenants... But... although 60[%] of applications to the Tenancy Tribunal come from landlords seeking rent owing, there are no penalties for tenants who do not comply with orders to pay up. "The Government should look at addressing this inequity as a higher priority than extending penalties to a few bad landlords." ...[Incidentally, a] house in Ponsonby for which tenants are paying just \$6 rent a week to Housing N[Z] looks destined to remain a mystery. To protect the tenants' privacy, Housing N[Z] has not even revealed the Auckland location to [the]Housing Minister... And [the]Opposition housing spokes[perso]n... who uncovered the anomaly last week, [also]... does not know where it is. The cheap rent was the result of a transitional measure brought in by [the Government] in 1994 to amend the effect of its market rent policy on people over 55, and the rent for the tenants was struck at \$156... Winz, however, paid the tenants an accommodation supplement of \$150, which had been based on the full market rent of \$350, leaving a net rent of \$6 a week. The transitional measure was to end this year, but when [the Government reintroduced]... its income-related rents policy, instead of ending it, cemented the cheap rent, [the Opposition spokesperson] said. "No one begrudges anyone enjoying these lower rents... but if it is an anomaly it should be fixed rather than cemented in." ...[the minister said that i]n a year, the rent would begin to be increased until it reached the income-related level.

...Law changes to help landlords more easily find tenants with rent arrears... are... acceptable, says [the]Privacy Commissioner... The Government has announced a set of initiatives which include... ■ Improving access to Tenancy Tribunal orders so landlords and tenants can check each other out ■ Addresses passed on to... Courts to enforce... Tribunal orders ■ Rent... owed by beneficiaries can be paid directly by W[inz]...

It's still possible to live rent-free in one of the world's most expensive cities... I have lived rent-free in London for... two years. My flatmates and I have been evicted from two squats after amicable court cases and I have now moved into a third. My first squat was occupied by friends when I moved in. Getting into the second one was more daring. My prospective... flatmates and I... tackled the front door at 3am one icy winter morning... Once in, we changed the locks and got stuck into fixing up our home sweet home. That house lasted a year. The current squat, set up by friends, has been going nine months so far. *The Little Oxford Dictionary* defines a squatter as a "person who takes unauthorised possession of unoccupied premises" or an "A[US]n sheep farmer". Dags aside, squatting is a loathsome, dirty word and sounds close to squalor. It brings to mind life on the dole queue and dirty matted hair, grubby faces, ragged clothing and an unholy smell. In reality, the people I have shared my homes in London with have all been professionals. They have included a chef, an accountant, an occupational therapist and a landscape gardener. Under English law there is nothing criminal or illegal about squatting, but it is "unlawful". Being unlawful means it is a civil matter and a dispute between squatters and the landlord must be dealt with in a civil court. The police have no jurisdiction over such cases. So long as you do not cause damage when you enter a property and you arrange for and pay the electricity, gas and telephone bills, the whole business remains a civil matter. Ironically, while squatting is not a crime, attempting to evict squatters by using force is, so landlords are generally careful about going through the proper legal procedures. People are always fascinated when I tell them I am a squatter and being able to live like this is still a concept I find quite bizarre. An *Economist* magazine survey in June found London to be the 13th most expensive city in the world to live in (Auckland and Wellington were 34th equal), with rents here averaging £80 a room... a week. In theory, squatting is an insecure life, because you can be served with court summons any time the owner discovers you are there or decides to take action against you. But I do not fret about being kicked out and... so far... I have done less moving about than many people who rent here. Squatting has certainly made living in London more affordable, allowing me to take time off work

to travel. My flatmates are a [NZ nurse, NZ] computer programmer and a French receptionist. Our home is an old south London dry-cleaning shop, with accommodation above, 15 minutes from the West End. We have a two-level roof garden, four stories of living space above the shop and three lower stories for storage. The squat is not perfect and there are bare floorboards in several rooms, but it is in a tidy condition and more seemly than many a student flat I have seen. Our neighbours, also squatters, were not so lucky when they moved in. Their house had a leaking roof, smashed eggs in the toilet bowl, curry powder smeared over the kitchen floor, mouldy clothes half a metre deep on the bedroom floors and a pigeon colony in one of the rooms. My friends and I have always squatted in council or housing agency houses rather than those that are privately owned. Somehow, this seems more morally sound and you usually have a longer tenure, as local authorities often run out of money to keep their houses in an officially habitable condition, so board them up and forget about them. The first recorded instances of squatting in England date back to a peasant revolt in the 1830s. Historically, squatting has been a family affair, it is only now that it has become associated with new-age travellers and society fringe dwellers. "Cottars" and "borderers" are ancient English names for squatters, while "diggers" were famed for squatting on land after a revolution in 1649 made little difference to the lives of the poor. This century, squatting movements built up after [WW1 and WW2], when returned service[people] found themselves and their families homeless. A London Squatters Campaign was set up in 1969 and dedicated its first squats to homeless families. Through the 1970s, single people living in large communal squats joined the campaign. Squatting fell off during the 1980s but the 1990s have brought increased numbers of homeless, increased numbers of empty houses and therefore an increased interest in squatting. The London-based Advisory Service for Squatters (ASS) estimates around 20,000 people are squatting in London. Housing and homeless advocacy agencies say there are around 152,000 empty properties in the capital, with some 75,800 people last year classified as homeless. But to be classified as homeless you must have approached a local housing authority for help, so many more homeless people and street people do not show up on official figures. The ASS deals with around 60 inquiries about squatting each week. "For a lot of people it's finding a home, but, even more than that, it's finding a space where they can take control of their own life and not be dictated to by landlords or stuck in single bedsits cut off from friends," says [an ASS spokesperson]... The volunteer organisation covers England and Wales and has a huge computer database on squatting, legal information and a library. The service has a 70% success rate in getting court cases against squatters delayed or adjourned. In squatting terms, a delay or adjournment is a major victory as it gives you a few more weeks or months in a place. Money is the main motivation in squatting for my... [French flatmate, who] used to... pay... £60 a week for a room half the size of her one in the squat. Winter is a downer for squatters, [the]... hotel receptionist... says. Most squats have had their heating systems ripped out by zealous councils or anxious landlords. "...Winter is freezing cold, but apart from that it's like a normal home, everything works and we have hot water." ...[the] computer programmer... took up squatting for the experience and adventure, rather than as a cost-saving exercise. "It's one of those things I always thought would be fun and... make a good story to tell... One disadvantage is I'm probably compromising on the area I would choose to live in. Another is that because it's free people feel a little more at ease to invite themselves to come and live with you. That can put you in an awkward position... I own my own property back in N[Z]."

...Business tycoons, bankers and gentry in some of Paris' wealthiest areas are bracing themselves for what they fear is an invasion of the unwashed. The city's Socialist mayor... has embarked on an ambitious – and costly – experiment aimed at housing some of the 100,000 people on its waiting list and at easing a growing problem of ghettoisation. [The mayor] is spending the equivalent of tens of millions of N[Z] dollars to buy or rent luxury property in some of the swankiest streets in Paris' western suburbs, where homeless families from the poorer eastern quarters will be housed. Many of the beneficiaries of this largesse will be single-parent families and Arab and African workers. Under a new law, 20[%] of homes in cities of more than 50,000 people must be earmarked for low-rent accommodation by 2020. Cities will be fined 150 euros... a year for every home short of the threshold. [Paris' mayor] has enthusiastically embraced the law as a means of bridging the widening gap between eastern and western Paris. At present, 14[%] of Paris' housing stock is rent-controlled, but this varies from 30[%] in the city's eastern arrondissements (districts) to less than 1[%] in the ritzy west and the centre... [T]he first Socialist head of Paris in 130 years... succeeded a series of conservatives who presided over a demographic hollowing out of Paris, as young families fled the city for the suburbs, unable to cope with the city's high rents. This bred a commuter culture... The French state offered Paris low-interest credit or grants to provide cheap accommodation but this allocation was never taken up in its entirety before [now]. According to the Socialists, the conservative mayors had wanted a bourgeois electorate, rather than a proletarian one. How the city administration dished out its rent-controlled accommodation became a huge controversy, with accusations that [one French President]'s conservative Rally for the Republic party allocated flats in the Left Bank to its cronies. Last month, the state and city hall signed an agreement under which both sides will give 500 million euros... [over] five years to build or refurbish 3500 homes for low-income families each year. "A lot of social difficulties will be avoided if we can do a better job of distributing council accommodation across Paris," [the mayor] said.

...A FRENCH [citizen]'s body was left in her house for almost seven years before it was found in her dining room.

...Starved of water and food, Tabitha Cox lay down on the living-room floor next to the body of her... mother, and drifted towards death. Mother and daughter lay there for days, undisturbed, until police and social workers broke into their flat in... Melbourne... [17]-month-old Tabitha took up to a week to starve and dehydrate to death after Joy Cox, 42, died from an unknown cause. Victoria police said Joy... was from N[Z], but they did not know from which area or how long [Joy] had lived in A[US]. Her sister in N[Z] is believed to be flying to A[US] after the deaths. Her mother is thought to be living on the Gold Coast or Sunshine Coast and is ill with cancer. The grim discovery has shocked A[US] and placed Melbourne's social services under scrutiny. But behind the finger-pointing and accusations is the story of a quiet, lonely [person] with such pride in her daughter that [it] often entered her in baby shows. Joy Cox also had a dark side – drug, alcohol and domestic violence problems that thrust her into the arms of welfare agencies... The Age newspaper in Melbourne said Joy... and Tabitha had lived in the flat for seven months after fleeing an abusive relationship. Joy... was polite but private... One person Joy... did speak to was a [guy who is] thought to be the last person to see her alive. [The guy] told the Herald Sun newspaper that mother and baby were "both lovely people" and that Tabitha was a beautiful and happy toddler. "Everyone loved her. [Tabitha] was an angel." [The guy], who lived in the same block of flats as the pair, said Joy... told him 10 days before her body was found that [it] needed time to herself. After several days of not seeing her, [the guy assumed Joy] had flown to N[Z] to see her sister. Instead, [Joy] and her daughter were dead or dying in their flat... [W]elfare officers from Doncare, the agency assigned to monitor the family, last visited them [a fortnight before their bodies were discovered]. Doncare left 12 messages on Joy Cox's phone after [Joy] missed a welfare appointment a week later. By [the end of the following week], the Department of Human Services was alerted. The bodies were found the next day. The Age reported that the deaths had shocked welfare workers and raised questions about the contracting of child protection to non-Government agencies such as Doncare.

...New and rigorous research into the health of lone mothers paints a sad, and highly disturbing picture... STRESSED, hard-up and doing a job meant for two, single mothers are sicker, both mentally and physically, than their partnered sisters[– according to a] new research paper by [a]... fellow... from Otago Medical School... built on data from the N[Z] Health Survey of 1996-97 with references to nine other substantial pieces of research... The... [fellow]'s interest in the subject was sparked after her husband was away for three weeks when her younger child was three months old and [the wife]... found it difficult to cope. [The fellow] suggests the stress on lone mothers (...the term now fashionable in the U[S]) is underappreciated by the wider public. "I have an awful lot of advantages, but [my baby] was a poor sleeper. And by the end... [when her husband returned] I was a cot case. [Mothers] on their own don't have that option. I know how desperate you get..." Although a great deal had already been written on social and economic status and... [a] longitudinal study in Dunedin constantly updated information on lone parent families, there was absolutely no data looking at the realities of life from a single parent's point of view... Lone mothers are more likely to be Maori, have lower incomes... low educational qualifications and live in more deprived parts of N[Z]. They're also more likely to smoke and be hazardous drinkers than

[mothers] supported by a partner. Surprisingly, in one of the few findings not supported by similar overseas studies, they are also twice as likely to have taken hypertension medication as mothers who are part of a couple. Most predictable, but also most worrying, was the high incidence of mental disorders and psychological distress found among lone mothers. The report highlighted five reasons for... [thi]s: lack of social support (lone mothers have a higher risk of isolation); lower socio-economic status; the stress of losing or being abandoned by a partner; lower perceived control over their lives; and the high physical and emotional demands of raising children alone, which may result in poor health both directly and through higher rates of risky behaviours such as smoking and drinking. Even worse is the inter-generational roll-on effect. "Children raised in low socio-economic conditions are... disadvantaged in terms of survival, mental and physical development, educational achievement and future job prospects... They are also more likely to become... pregnant at an early age. This means that the cycle of deprivation is likely to continue into future generations. Considering the high proportion of families headed by a lone parent, this is a major public health concern." Overall, says the report, lone mothers are so vulnerable they should be targeted for special consideration to address health inequalities... As for solutions, [one]... strategy is to reduce the number of lone parents in the community, especially very young mothers... But how? Stopping young [gals] from getting pregnant is a complex problem as [the]Minister of Social Services and Employment... points out. "We either do what ...America's most dangerous conservative... – a recent guest of the Business Roundtable – says and condemn them, or we become very active in the area of parenting skills and making sure they don't get pregnant in the first place." ...The options, according to [the USer,] are: abortion, putting their babies up for adoption or asking the [mother]'s family and the baby's father for support. All this... will work just fine if young [gals deny guys] sex and instead demand marriage. [The minister] takes a very different line. "We need to get young people focused on their ambitions and aspirations" making early pregnancy the unattractive option for disadvantaged girls that it is for the middle-class [girls] who leave motherhood until 30 or later. For those who do get pregnant, [the minister] has a web of community incentives to get them back into education and employment... [The minister] is also determined to find the 15,000-odd fathers who have abandoned their children to the DPB – and either terrified or coerced their former girlfriends into refusing to name them to Work and Income authorities. "It's reinforcing the whole idea that we have to be responsible for kids... Fathers have to realise that that child is theirs for the rest of their lives."

...*Life in the future* "The modern home of 2000 will be waterproof inside and out so the lucky housewife can do all her cleaning with a hose," claimed *Popular Mechanics* magazine in 1957. According to a Nasa prediction in 1980, there would be... 1000 people living on the moon by 2001... According to [the author of *2001: A Space Odyssey*], writing in *Vogue*... in 1966, "Houses will be able to fly by 2000. The time may come when whole communities may migrate south in the winter." ...[By the way, the] latest report from [Auckland's] regional growth forum... goes into detail on how the compact city approach would enable [an] extra 550,000 people to live within the... region in 30 years, focusing on that rather than the possibility of an extra million in 50 years. A key point in the planners' strategy is one most feared by developers: prescription. A second key point is a suggestion that local bodies set up property development companies to help the process along. The report on intensification of urban areas was released this week along with one on the impacts of urban growth on social infrastructure, the stage two evaluation of natural and physical resource constraints and a summary of consultation processes. The new reports emphasise that the strategy proposals are not a one-day affair but a continuing process. The regional growth forum, so far an informal cooperation between councils and some elements from the private sector and led by the Auckland Regional Council, wants quick comments by the end of [next month], those with more detail lodged by next March and adoption of a strategy by August... The clear preference in forum documentation is for the compact city rather than continuing greenfields development on the fringes of the region. While some "leakage" is acknowledged as inevitable, the proposed strategy is for 70[%] of population growth to be housed within the present metropolitan urban limit – a line north and south which one opponent of prescriptive and contained growth described as the border between the city "and a national park." ...On the way to implement intensification, the forum's follow-up report (derived from... techniques tried in... British[, US and AUS]n cities) says the first task is to set the big picture. It [also]says the question of... urban limits... is complex... [To start with, there are] some automatic barriers to growth: price and section size. "Once you get below... 530 sq m... you get buyer resistance. Our preferred range is 550 to 700 sq m and the average section is 610 sq m. If you make sections larger, people won't pay any more for them... There's normally resistance between \$120,000 and \$140,000. If it wasn't for this fence [the urban limit] we could put sections on the market for \$20,000 less," says the... general manager of greenfields housing specialist Wilbow Corporation... But... [his] resistance levels are not part of the implementation proposal. The strategists... favoured a hierarchy of development nodes along major transport routes and high-intensity corridors: • In Auckland's central area... 34,000 more residents... • 10 sub-regional centres with populations exceeding 28,000... • 32 town centres with populations exceeding 11,000... • 64 neighbourhood centres with populations exceeding 2000... In the nodes and corridors the number of dwelling units a hectare would range from 30 to 80 net – "still low compared to North American intensification studies." Neighbourhood suburbs would keep their present densities, up to 15 a hectare net, and up to 100,000 people would live in each satellite centre outside the metropolitan area.

...[★ According to the 1996 census, NZ is now] the fourth most urbanised country in the world – following Singapore, Israel and Britain – with 85.4[%] of us living within town or city limits[(the figure in '1901 was 45.6%')]... Because we are having fewer children, the number of people in an average house has dropped steadily over the past 40 years from about four to three. The most popular arrangement behind the front door is to have one family occupying home, sweet home. They make up 62[%] of all household[s]... The next largest group are the growing number of us who live alone. More than 250,000 N[Z]ers live by themselves... Given that our home is our castle, it comes as little surprise that of our 1.27 million private dwellings, more than two-thirds are owned – with or without a mortgage – rather than rented. [★ In Japan a company has introduced a rent-a-family service: trained "families" can be hired to go on picnics, movie outings, even intimate dinners, providing all the affection a real family would. ★] In 'the Middle-West USA state' of 'Kansas, limestone mines have been turned into an underground commercial district called "subtropolis"'...

Before America turns into one giant paved-over subdivision, people are fighting back. Is there hope? ...Once a wilderness, [Atlanta is] now a 13-county eruption... the fastest-spreading human settlement in history. Already... 180 km across, up from just 105 in 1990, it consumes an additional 200 hectares of... farmland every week. What it leaves behind is tract houses, access roads, strip malls, off ramps, industrial parks and billboards advertising more tract houses where the peach trees used to be. Car exhaust is such a problem that Washington is withholding new highway funding until the region complies with federal clean-air standards. On a bad traffic day – basically any weekday with a morning and evening in it – you can review whole years of your life in the time it takes to get from Blockbuster to Fuddruckers. "We can't go on like this," says Georgia[']s Governor... a "smart growth" Democrat who was elected last year. [The Democrat] has proposed a regional transportation authority that can block local plans for new roads that encourage development. But dumb growth is not confined to Atlanta. Half a century after America loaded the car and fled to the suburbs, these boundless, slapdash places are making people want to flee once more. "All of a sudden, they're playing leapfrog with a bulldozer," says [the US Vice-President], who wants to be the antisprawl... [champion now] that... suburban overgrowth has become a national headache. Instead of just fleeing the sprawl (and thus creating more of it), people are groping for ways to fight it. Last November there were no fewer than 240 antisprawl ballot initiatives around the country. Most of them passed. Some stripped local authorities of the power to approve new subdivisions without voter assent. Others okayed tax money to buy open land before the developers get it. In the largest of those, New Jersey[']s Governor... successfully pushed a referendum to use sales-tax money to buy half the state's undeveloped land – 400,000 hectares. "Americans are finally realizing that once you lose land, you can't get it back," [the Governor] says. Twelve states have already enacted growth-management laws. Tennessee just adopted one of the strictest, requiring many cities to impose growth boundaries around their perimeters. In Maryland, counties get state money only if they agree to confine growth to areas... the state has designated as suitable. But managed growth is not a win-win proposition.

When laws make it harder to build in the countryside, new development is pressed into more expensive land closer to town. That can mean higher home prices, so the single mother who manages a doctor's office or the couple who make \$38,000 a year must choose between a tiny apartment close to work and a 90-min. commute to housing they can afford. Limiting growth also means dealing with a profound conflict between the good of the community and the rights of the individual. For a lot of people, the good life still means a big house on a big yard. Who's to say they shouldn't get it? Yet smart growth envisages a nation packaged into town houses and apartments, a country that rides trains and buses and leaves the car at home. Everybody hates the drive time, the scuffed and dented banality, of overextended suburbs. But are we ready for the confinement and compromise the solutions require? Maybe not, according to a recent TIME/CNN poll. It showed that most people like greenbelts but don't trust government planning... [and 69% believe the] ability of individuals to do what they want with land that they own... is more important... [than the] ability of government to regulate development for the common good... [USers] do believe in property rights – including the right to profit by selling. So the farmers and ranchers who feel squeezed out when tract housing plunks down next to their pasture often think about cashing in. "You get people waving millions," says... a rancher in Colorado's Eagle County, not far from the exploding area around Vail. "Some days you just think about taking the money and taking off." One way to solve the problem, being used in parts of Colorado, is "development rights," which let builders put up houses more densely near town in exchange for payments to outlying farmers and ranchers to keep land open... If America's detonating metro regions were the result of population growth alone, sprawl would be a problem without a solution. But they are equally the result of political decisions and economic incentives that lure people even further from center cities. For decades, federal highway subsidies have paid for the roads to those far-flung malls and tract houses. Then there are local zoning rules that require large building lots, ensuring more sprawl. Many localities fiercely resist denser housing because it brings in more people but less property-tax revenue. Zoning rules commonly forbid any mix of homes and shops, which worsens traffic by guaranteeing... you burn a quart of gas to find a quart of milk. Even more important, localities routinely agree to extend roads, sewer lines and other utilities to new suburban developments built far from downtown, while existing schools and housing stock are left to decay. "Impact fees" on developers cover just a fraction of what services for newcomers actually cost. These incentives to expand help create cities that widen much faster than their populations grow. Between 1990 and 1996, metro Kansas City spread 70%, while its population, now 1.9 million, increased just 5%. In that period greater Portland, Oregon, spread just 13%, the same growth rate as its population, now 1.7 million. For a long time Portland has been the laboratory city for smart growth. In 1979, as part of its compliance with a groundbreaking statewide land-use law, Portland imposed a "growth boundary," a ring enclosing the city proper and 23 surrounding towns... though the growth boundary has [since] been widened... WITHIN THAT CIRCLE, THE Portland-area metro council, the only directly elected regional government in the U.S., controls all development... Orderly growth comes at a price. Smaller towns within the ring are submerged by crowding they might otherwise zone out. And within the dwindling buildable space of the ring, average lot size has shrunk almost in half over the past 20 years, from 1,200 sq m to 620. Yet the median price for a single-family home has more than doubled in just 10 years... Once ranked by the National Association of Home Builders as among the most affordable U.S. cities for housing, Portland is now the third most expensive, just a bit cheaper than San Francisco... [Despite] that, the "great wall of Portland" is very popular with area voters... Since development tends to pop up any place it finds a foothold, the battle to contain it never ends. In Shelburne, Vermont, McCabe Brook meanders through... [a] farm. A developer liked the place so much that [it] planned to build 26 houses on its 50 hectares. But... a bushy-bearded organic tomato-farmer, and [a] dairy farmer... both of whom had been working to preserve other open spaces in the area, helped organize public gatherings to discuss the fact that the development would require taxpayers to finance firehouses and classrooms. "My tomatoes don't go to school," [the tomato-grower] says. "I think that woke people up." When Shelburne approved the development anyway, a neighbouring town took Shelburne to court, arguing that it would suffer costs from the project... In December 1997, the embattled developer sold the property to the Preservation Trust of Vermont... Keeping land open is just half the battle. The other half is keeping downtowns livable and affordable so people stay happily bunched there. That way new construction tends to cluster within developed zones and use existing roads, schools and utility lines. But for the centerless "edge cities" that connect around major highways, the problem is to create a downtown in the first place. So in Tysons Corner, Virginia, just outside Washington, county officials have just approved an instant town center – a 7-hectare collection of small office buildings that will also house shops and restaurants around a plaza... Endlessly elastic suburbia "is not a way we're going to be building in the future,"... predicts... [the chairperson] of the Congress for the New Urbanism, a group of architects and city planners who believe sprawl can be remedied in part through better town design – a return to sidewalks, narrower streets that don't encourage fast driving, a mix of homes and shops... The revival of downtowns in places like San Diego and Denver – and, for that matter, Atlanta – and the reaction against suburban sprawl among the suburbanites who spawned it may also be signs, as [the chairperson] says, that the problem can be fixed. But sprawl is mostly indelible ink... The best way to fight sprawl is to stop it before it starts.

...*Brakes go on rich urban sprawl*... [The Microsoft chairperson's] 6038 sq m compound is likely to stand as an isolated monument to the high-tech boom after the local authority moved to halt the spread of sprawling homes. A six-month freeze on building projects has been declared by [the] Mayor... of Medina, the Seattle suburb on Lake Washington that is home to Microsoft's [founder, the] Amazon founder... and a cluster of other billionaires. New buildings will be limited to 1254 sq m, said [the mayor]. "Someone has to put a stop to these houses." Restrictions will also be put on garden structures, frustrating one [citizen's] wish to build a replica of the Taj Mahal, and on the size of swimming pools to conserve water. [The Microsoft chairperson] will not be allowed to extend the [artificial] salmon stream at his \$277.5 million home[, which]... used 17.7 million litres of water [last year]. The average household uses 30,300... [In addition to water use, s]o-called mega-houses have put a strain on Seattle's infrastructure.

...The shift in world population patterns... over the past 100 years... manifested itself most spectacularly in the mushrooming of megacities, huge sprawling agglomerations – virtual city-states – with populations in excess of 10 million and economies larger than those of many nations. U[N] demographers are predicting that the move to the cities will continue well into the 21st century. They warn of serious problems arising from overpopulation, but other experts... downplay the link between rapid urbanisation and urban poverty... One of the biggest spurs to urbanisation this century was decolonisation, notes... the director of the Human Settlements Programme at the International Institute for Environment and Development in London. Once the colonial powers who controlled the right to live in cities pulled out, new leaders adopted the capital cities as the focus of their nation-building efforts, concentrating their administrations and much of their economic investment there. Urban growth is largely a consequence of economic development, [it] stresses, noting that more than one third of the world's million-plus cities are located in the five largest economies... [But the director] was dismissive of UN projections suggesting that cities such as Tokyo, Bombay and Lagos would swell to 25 million or more by 2015[, because by]... the 1980s... the rate of urban growth was slowing down in most of the largest cities... with, in many cases, more people moving out than moving in... [– often to find a more peaceful lifestyle. Unfortunately, r]emote houses can attract unwelcome criminal attention...

Rural folk in [the] central North Island are locking their doors and sleeping with guns under their beds as police hunt a roving band of killers who have terrorised two towns. Two attacks this week, on families at home in Reporoa and Ohakune... left one [person] dead and three other people nursing wounds. Families living in remote settlements are worried the killers may strike again... [Kids] are sleeping in their parents' beds; adults are scared to stay home by themselves... [R]ural folk are banding together to protect themselves... Reporoa's local reverend says the attacks are "an expression of a spiritually bereft society," but that small-town [NZ] is capable of fighting back... "Underlying it all is an incredible degree of anger." Ohakune residents... cannot understand why such violence would descend on their peaceful town. "Oh hell, we've been freaking out all right," says [one Ohakune resident]. "We've been warning our kids; our relatives have been ringing, worried." [A] Reporoa dairy farmer... was shot

dead in her home on Monday after four [guys] forced her and her husband... to reveal the PIN number for their cashflow card. Two of the robbers then drove to Taupo in... [her] Ford Laser and withdrew more than \$2000. [An Ohakune resident] thrust her fingers into the eyes of an axe-wielding robber when three [guys] burst into her... home on Thursday. [The robbers,] who had a pistol, beat her, her husband... and son... Police suspect the same [people] were involved in both attacks. Federated Farmers wants rural people to take "all possible measures" to protect themselves and their property. [The group's] Waikato president... says rural residents are "doubly appalled" at the brutal slaying of [the dairy farmer] because it shows they are just as likely to be hit by violent crime as city dwellers. No figures are available on trends in rural attacks, but dozens of family homes have been invaded by armed robbers in the past five years... [Police suspect that many rural home invasions] go unreported because they are drug-related. Some victims, such as the [Ohakune family], are fighting back. Last December, a [Waikato] Bible College student unleashed a flurry of martial arts kicks on an armed robber who burst into her home; and in July, [a] farmer... sent three masked [would-be-robbers] packing from his home in Drury. While police privately say they admire such acts of bravado, they are worried that some homeowners may go too far to protect themselves. [A] Taipa farmer... went to court... after [it] shot dead a [robber] who broke into his farmhouse and held a gun to his partner's head. A High Court judge said there was not enough evidence to convict... [the farmer of murder. Legal advisers] say... citizens cannot protect themselves with guns unless there is an "immediate and apparent threat." ...But people can use "such force as is necessary" to protect themselves during a robbery, and can use force to make a citizen's arrest if criminals resist... [During other] recent attacks in rural areas[, three guys]... armed with a shotgun, rifle and tomahawk rob[bed] the occupants of a rural home nearRotorua[- a 40-year-old gal was] smashed on the head with an axe[; four guys kidnapped two gals]... at gunpoint from their home in the forestry settlement of Kaingaroa[; armed robbers stole]... guns after storming a farmhouse at Reporoa while seven family members [were home; elderly]... couple John and Josephine Harrison [were] gunned down at their home in Te Akau...

Small town N[Z is] dying... SLOWLY but inevitably the life is being squeezed from small towns... in rural N[Z]. While the process might be unfortunately more advanced in the south it is undoubtedly a national trend, part of the March of Progress, perhaps. Not that those affected accept such sophistry. Part of the reason is self-evident. The scattered nature of the southern rural population, and the distances between small centres is a part of it. The squeeze of the market economy, with its insistence on the bottom line is another part... This has been emphasised in Otago recently by the decision of the BNZ to close three branches in strategic small towns... [that generated insufficient profits] to justify head office criteria. And this is at a time when BNZ is upping its transaction charges as it seeks to divert customers to tele-banking and machine facilities stuck in nearby walls. But for the smaller towns there are not even [ATM]s. The banks are not alone in putting on the squeeze. The major fuel companies are also exerting pressure by refusing to replace 30-year-old underground tank facilities at small outlets. Central Otago lost petrol outlets at places like Wedderburn and Lauder (though local residents came up with the cash to provide tanks at the latter village). But in Southland the impact is being felt where Shell and Caltex have used the R[MA as an] excuse because of the danger of prosecution if leaks occur in ageing tanks. The replacement cost for a three-tank underground system is... \$100,000 a time and the fuel throughput is not there, it is claimed. Southland motorists will simply have to better plan their longer journeys. From Queenstown... it is 40km to petrol at Kingston and, with Garton losing its tanks, a further 40km to Lumsden. Waikaka has lost its tanks and Otahuti is now dry and awaiting removal of its facilities. Relatives of mine who farm[near] the Pigroot... between Palmerston and Ranfurly, [have] had fairly regular calls from stranded motorists seeking petrol [but are] seldom able to meet the requests because it [is] an all-diesel operated farm. All these changes are cumulative, following the closure some years ago of small town Post Offices... Certainly, commercial reasons can be advanced, but people a longish distance from mainstream services recognise this while comparing it with their own sense of being under siege. The case of oil companies it seems is that facilities have to be able to stand economically alone: The days of the profitable subsidising the unprofitable as a service are gone... The shrinkage of services causes a shrinkage of population in the longer term, which means... local schools close, shops are unable to turn a profit, transport costs rise to meet the additional distances to be covered... Soon there[']s only]... one commercial operation... - the hotel, or social meeting place. I can... name a dozen villages where this has already occurred. And then what happens if the government goes on to change the method of funding roads? Taking Central Otago as an example, the roads probably carry as much tourist and holiday traffic as they do service traffic... Who pays when the population declines to even more minuscule numbers?

...If its steep population decline continues, Russia could, by [the middle of the 21st] century, be incapable of [ru]nning its industry, supporting its senior citizens or defending its long Siberian frontier, analysts say. "Russia is on the verge of a democratic crisis because we don't have very many children being born," says... [the] head of the Russian Academy of Medical Sciences. "If this trend does not change within 20 years, we will face very serious economic and social difficulties." Russia's population has been plummeting for almost a decade, owing to a post-Soviet cocktail of bad news: spiralling poverty, disease, pollution, accidents, alcoholism, war and political instability. "People are in a bad mood, and thinking only of survival," says... an analyst with the Institute of Social and National Problems in Moscow. "Health indicators are dropping. Few want to bring children into this." In the past eight years, Russia's population has shrunk by 2.8 million, or more than 2[%], and now stands at 145.6 million. Projections suggest there will be as few as 130 million Russians by 2020 if the trend continues. Experts say Russian [gals], who are well-educated and emancipated from tradition, are following their Western sisters in putting off childbirth into their 30s and then having fewer offspring. "We have this crushing paradox of First World family attitudes combined with [Last] World economic conditions... It is creating a terrible squeeze." ...■ [NZ gals]... are being warned they may be leaving motherhood too late as the country's birth rate continues to drop and the average age of first-time mothers rises. Birth statistics for the year ended September... show there were 54,000 live births in N[Z, 3%] fewer than in [the previous 12-month period]. The median age of... giving birth [for the first time] is now 30.1 years, compared with 28.1 in 1992 and 24.9 in the early 1970s. Statistics N[Z]... said the drop in births was "largely due to a decrease in the number of [gals] in prime childbearing ages and partly because fewer of these [gals] are having children." ...A low birth rate across the Tasman has sparked calls for the Fertility Society of A[US] to teach high school girls about the risk of delaying motherhood after the age of 35. A study this year by Griffith University in Brisbane found that 82[% of girls] were prepared to delay having their first child until they were 35 or older, with a third ready to wait until they were older than 40.

...Go forth and multiply urges EU... Make more babies - that is the energising new message... sent to the bloc's 380 million citizens at the end of a two-day summit. Faced with labour shortages in key economic sectors, including the high-tech industry, the leaders of the 15-nation block also said... Europeans should work until they were older and called on more [mums] to enter the workforce... Opinion polls show... most Euro... couples want... more children but [a]re put off by the challenges of balancing jobs and family life... [□ The] world's population grew more slowly in 1997 than in other years... a population study says[, although it still grew by]... 80 million people... The growth rate has slowed because of lower fertility rates in countries in Asia, Africa and Latin America, the Population Institute said. In Bangladesh the fertility rate... dropped to 3.57... children born per [gal]... from 6.2. In Turkey the fertility rate fell to 2.5 from 4.1; and in Kenya it dropped to 4.4 from 7.5... The global average is 2.96. Increased use of contraceptives, delayed marriages and a rise in death rates in many countries contributed to lower fertility rates, the report said... And most of the world's countries have passed laws to move towards giving [gals] the same rights as [guys], which is seen as a key goal in cutting population growth. However, [overpopulation remains]... a problem particularly in [Last World] countries... with almost 98[%] of the increase in population occurring there... About 80[%] of the world population lives in [Last World] countries and 74 of these countries are on a course to double their populations over the next 30 years... China, India, the U[S], Indonesia, Brazil and Russia are the five most populous countries in the world.

...*Baby, it's going to be crowded...* By the time [a]... five-day-old... of Mt Roskill... turns 70, [it]... will be one of 9 billion humans on Earth. But her grandchildren are likely to grow up in a world with a declining population. From 2070, the global population is expected to start dropping, from a high of 9 billion to 8.4 billion by 2100, says a new study from a team of international scientists. That is one billion fewer than U[N] predictions.

...*On or about October 12 the person who will take the world's population to six billion will be born...* U[N] numbers-crunchers say the six-billionth world citizen will probably be born in Africa or India and... is destined to be poor, illiterate and ill-housed, with a life expectancy of perhaps 55 years... The... world population has doubled since 1960, with the last billion added in the past 12 years... [T]he good news is that overall population growth has slowed in the past five years... "The down side is that in some parts of the world, there's desperate population growth and it is increasing poverty greatly, especially in sub-Saharan Africa and the Indian subcontinent," says a report from the U[N] Population Fund... The report projects that world population will reach 8.9 billion by 2050... with 40[%] of the population in 62 countries under the age of 15. Worldwide, more than a billion people are between ages 15 and 24, just entering or in the midst of their prime reproductive years... [The] president of the UN Foundation... discounted claims that the world could comfortably support such an expanding population. "The aspiration to an unfettered Western lifestyle... is going to destroy the globe... You can't have six billion people living the way people live in Manhattan or Los Angeles." ...money problems[are compounding the situation]. A global conference on population in Cairo in 1994[– which 'desired to stabilize the number of people at 7.2 billion' –] judged that \$US17 billion... would be needed annually by the year 2000 to pay for such activities as global family planning. By 1997, the total had reached less than \$US10 billion. International donors, including the U[S], were supposed to contribute a total of \$US5 billion annually, but in 1997, they offered less than \$US2 billion. Washington, while still the leading donor for population activities, has significantly reduced its level of support... Unless funding rises sharply the shortfall threatens to cause more unwanted pregnancies, abortions, maternal and child deaths and an even faster spread of HIV/Aids... Relatively modest spending to curb explosive growth in the poorest countries would help the environment, ease the flow of migrants out of [such] nations and help the global economy. "With such a small investment they can do so much to change the quality of life of people and the future of so many countries in the world," said the fund's director... More than 350 million [gals] did not have access to a range of safe and effective contraception... [D]ifferences with conservative Catholic and Muslim countries... continued to trouble international talks on population growth. Negotiations in New York in July pitted a handful of Catholic and Muslim states against more liberal countries, with disagreements holding up a final document until the last minute. "It's still as bad, [but] at country level they are losing ground. Individuals are thinking for themselves,"...

The billionth Indian was born sometime last weekend, one of 30 babies produced every minute in the country, according to U[N] population experts – who]... said it was not an event to celebrate. If the present growth rate was not halted, economic, social justice and ecological security would remain a mirage for a majority of Indians. "It's about time we woke up to the fact that population management necessitated adequate planning," said... the Population Council in New Delhi... India was one of the world's first... countries to launch a family planning programme in 1952. But officials said it had been taken over by politicians who equated numbers with "vote banks" to woo during elections and encouraged large families. The 19-month-long Emergency, declared... in 1975, dealt a severe blow to the family planning programme from which it has still not recovered. So vicious and widespread were the forced sterilisations that once respected doctors became feared "body snatchers." Ever since no party has dared to get overtly involved in family planning work, considering it politically suicidal... India adds... 15,678,000... people to its population... each year, a figure nearly equalling A[US]'s total population... [B]y 2001 New Delhi, bursting with over 13 million residents will be an overcrowded, powerless slum buried deep under garbage unless immediate measures to contain pollution, overcrowding, crime and chaotic traffic conditions were implemented. The National Capital Regional Planning Board said city slums that presently comprise 28[%] of the capital will encroach on all available space in two years and create a situation where 57[%] of people will have no water, 41[%] no sewage facilities and 40[%] no power.

...Shanghai, like Bombay, has always proved magnetic for the more adventurous citizens of a vast nation who sense the promise of a better and more interesting life. They arrive and settle every day... Despite its colourful past, and even with the one-child policy, the city seems incredibly young. On the evenings when Nanjing Lu is closed to traffic and families socialise in the street, the brash, confident Little Emperors (as the inevitably indulged single offspring are known) hurtle towards and around you on skates with infectious glee... Precocious 12-year-olds will tackle tourists to practise their English, drawing a good-natured crowd a hundred strong with nothing more profound than, "I am well, how are you?"

...*Spoiled brats call the shots...* CHINESE families' penchant to spend heavily on their "little emperors" – the spoiled products of Beijing's one-child policy – has become a pole star for marketing strategy in the country. Fast-food giants, computer companies and apparel designers alike are increasingly attuned to the obsessive concern and pampering heaped on the single offspring by parents and grandparents with far more money to spend than in past decades. The spending tastes of the children themselves are also increasingly a force to reckon with, as the first wave is now reaching the age of 16... "They're pulling money out of their pockets that their grandparents might not have made in their lives,"... [a] San Diego State University business and marketing researcher... says, adding that the money is being spent on items like sodas, snacks and magazines. Like the West's post-war baby-boomers, the little emperors also represent the first media-marketable generation, says... a Fulbright scholar in China to research a book about the phenomenon. Because they have television and other national communications technologies that create a unified pop culture, advertisers can more readily grasp and speak to China's youngsters. Targeting the group is especially crucial for Western food and food-service companies which are introducing products unfamiliar to the Chinese palate. Fast-food chains such as McDonald's have deliberately used cartoon characters and child-oriented promotions as a means of pulling in those who would otherwise be unlikely to sample such alien cuisine... The temptation of Western fast-food proved the 176kg downfall of [a] 19-year-old... awaiting a regime of acupuncture... 320 million children have been born since 1983, the first year China strictly enforced the one-child policy, but officials have struggled to enforce family-planning rules in poorer rural areas. Official estimates put out last year put the number of little emperors at 53 million, mainly in coastal cities where the country's new wealth is concentrated. With each child moulding the spending behaviour of up to six adults – [the] parents and two sets of grandparents – the economic impact is several times greater than any population figure suggests... In cities like Shanghai, Beijing and Guangzhou "they're spending in the realm of 40[%] of family income on child-rearing,"... [the] president of China-based Babycare, which makes pre-natal and child-development products... says, adding that the figure can rise to 50[%] in smaller cities where average earnings are lower... Families vie for "face," or status, based on their children rather than adult status symbols... "They look at the child next door." As a result, children go out on weekend family outings "decorated like Christmas trees" in expensive garments emblazoned with brand names, cartoon characters and corporate logos.

...The headline was from the present but the reminder was of the past... "Spoiled brats call the shots", the headline said above a discussion on the problems prompted by China's one-child family policy. It talked of "obsessive concern and pampering heaped on the single offspring by parents and grandparents". The "Little Emperors" it called them... Reading this, I remembered a hospital bedroom in Beijing nearly 20 years ago, and an afternoon spent there talking to the hospital's VIP patient, N[Z]er and China icon Rewi Alley. [Rewi] predicted grim social and economic effects of the one-child family rule and told wryly how his sceptical views had caused a breach between him and some communist planners. [Rewi] predicted a breakdown of old values and customs, of loneliness for both young and old. [Rewi] talked of future children dominating parents and grandparents and living in an environment without cousins, much less brothers and sisters. [Rewi] shook his head in obvious concern and prophesied – using exactly those words: "Spoiled brats". Rewi Alley was right. And now, the communist government agrees that [Rewi] was. The policy is being softened, allowing more categories of Chinese to have more than one child. State leaders were finally swayed by the distortion of

economic trends, by a rash of student suicides, breakdowns and family murders brought about by what are described as unbearable pressures on lone children. They carry the expectations of entire families on their shoulders. Significantly, under the one-child policy the ratio of Chinese baby boys to girls is widening – 120 to every 100 girls. In a community where infanticide of girl babies was an earlier accepted reflex, new ultrasound technology allows their abortion instead. Many rural families escape the dilemma. They simply don't register daughters, meaning they have no citizenship rights, access to education or to jobs. Non-people. In the long term, China will face generations where millions of [guys] cannot find a wife. The elderly – for millenniums the accepted responsibility of their children – are at risk if accident or illness robs them of their sole child. Rewi... foresaw all of this... [Y]ears later, the Beijing social experimenters and directors are seeing the light. But they still defend the original policy, claiming drastic action was needed and that the plan saved the world having to feed an extra 300 million. Which begs the question I realise now I did not ask Rewi...: "What was the alternative?" The whole process provides a valuable lesson to any community – even one like ours which by Chinese standards is only the equivalent of a small provincial city: Social engineering can go badly, producing totally unexpected outcomes. Don't let the political or social reform theorists dictate the future without careful and long-term study of the possible outcomes of their opinions. Even when their dogmatic arguments seem backed by some form of logic. ★ [China's]... one-child policy d[id] not apply to minority nationalities.

...In case anyone from the Government asks... the grocer has only one child. That's what [it] told the latest census-takers who canvassed his neighbourhood on the outskirts of Beijing. "Why invite trouble?" says [the 35-year-old] father of three... [T]he grocer seems more than happy with his three daughters[, even though it] and his wife had really hoped No 3 would be a son... "But now we love her just the same." ...The oldest, 12, is registered properly and living with her grandmother in Shandong province. The others, 7 and 8, were born in the crowded anonymity of Beijing. On paper they don't exist. [The grocer] could be fined... \$1200 and his house demolished if China's family-planners choose to make an example of him. That's not likely. There's no way to get a precise count, but [the grocer says ove]r... half of Beijing's 18,000 migrant children are unregistered. Nationwide, there may be 5 million... They pay extra to attend school ([the grocer] pays \$36 a term for each of his two young ones). When they get older it can also cost more to rent an apartment or get married without official papers. Meanwhile, the parents decide for themselves how many kids to have, far from the population police. "When you're not under the nose of family-planning officials, it's easy," ... Age has mellowed China's one-child policy. Its ruthless enforcement shocked the West when the campaign began in 1980... [But t]he policy was effective. The fertility rate has plunged from 5.8 births a [gal] in 1970 to about two today... In a Government survey covering city and country areas, 70[%] of respondents said if all limits were abolished they would want two children[– though]... Chinese views on family size are changing, especially in the cramped, expensive cities. "The young generation is totally different," says [the grocer]. "Some don't want any children and many don't want more than one."

...AROUND the globe, birthrates are falling and the one-child family is becoming the norm. That's good for the planet, right? So why is everyone so worried? On sunny days, elderly [Italians] in the working-class Rome neighbourhood of Testaccio bring their grandchildren to the local playground to socialise with other kids... [One] watches warily as her 3-year-old grandson... tussles with a playmate over a dump truck. "[My grandson] doesn't have any brothers or sisters or cousins," [the grandmother] laments. "We did wrong by having only one child. I keep telling my son to have another, have another." But [her] son and daughter-in-law seem disinclined, no doubt in part because they still live with her. "It used to be that Italian families had lots of kids... But now the mothers work and don't have time to have big families. It's a shame." It's more than just a grandmother's worry. With an average of 1.18 children per [gal], Italy has one of the lowest birthrates in the world. That means there are fewer births than deaths each year, resulting in what demographers call "subreplacement fertility." At that rate, massive immigration is the only way to maintain the total population. With the national pension system deeply in debt, [a] demographer... of the University of Rome says the country is already becoming dependent on immigrants to bear the economic load. And that, [the demographer] says, puts the future of Italian culture at risk. "Italy will no longer be Italian... It will be the end of society as we know it." That may be an overstatement. But at the very least, it's the end of the big, boisterous family crowded around the dinner table – and not just in Italy. Family size is shrinking in many places around the globe.

...*One child is enough for career-minded mothers* The trend to single-child families is worldwide, and N[Z] is right up there with the best... Statistics N[Z said NZ gals]... were averaging two births each, just shy of the 2.1 the population needed to replace itself. Maori and Pacific Islanders, who tended to have bigger families, were keeping N[Z] ahead of other Western countries, such as A[US], which had a birth rate of 1.75 children [per gal], Canada with 1.55 and England and Wales at 1.7... Maori [gals] averaged 2.7 births each, Pacific Islanders 3.5 each and Pakeha [gals] had 1.8 apiece... Projections show that if the fertility rate drops to 1.85 children... N[Z]'s population will peak in 2031 before beginning the downward trend... [A Rotorua couple] are representative of... [the] trend towards smaller families... [The wife] was six months pregnant when [it] was promoted to a senior management role at Rotorua Public Library. During the interview for the job, the 32-year-old was acutely aware of her heavy stomach and concerned it would speak louder than [her mouth] could. "I'm very career-oriented and I'm the main income-earner for the house[.]" the 32-year-old told the interviewer. The 32-year-old [took only three months' maternity leave and her husband... aged 33, a self-employed painter/decorator, became the primary caregiver, a role [it] loved. That was two years ago and the small family is delighted with how things are working out – although it still hurts when people tell them [their daughter] needs a brother or sister. [But their daughter] does not seem to notice, having made firm friends at daycare, where [it] is regarded as a social butterfly... The [couple] have no plans for more children, intending to offer their daughter the best education and childhood they can. [Their daughter] takes swimming lessons, will join a dancing class when [it] turns 3 and enjoys weekend "adventures" with her parents. But the couple are careful not to spoil [their daughter], fearing her status as the star of the family could turn her into a wilful child who expects to always be the centre of attention. "[Our daughter gets what it] needs, not what [it] wants."

...Many gals] these days think long and hard before... starting a family. [One Brit], on the other hand, is preparing for the birth of her 20th child – at the age of only 40. The newest member of the... brood, a boy due [in 9 weeks], will make her Britain's most productive living mother. Even more remarkably, [the 40-year-old] and her husband... may not stop there. "I'm just as thrilled about this baby as... the first. I might even have another... Though I've been pregnant for most of the last 20 years, every time I discover I'm going to bring a new life into the world I feel an overwhelming sense of joy... I love the feeling of being pregnant. There was never a question of contraceptives or getting sterilised. There are no religious reasons – we simply never discussed it..." says [the] former nurse. Amazingly, the family manages to meet their hefty \$1200 a week shopping bill without any state handouts... [– although dad], a self-employed joiner, works 12 hours a day, including weekends... And [mum] has no nannies or childminders to help her with the immense workload... Keeping track of the comings and goings of the lively... children[, aged]... 21... 19... 18... 17... 16... 15... 14... 13... 12... 11... 10... 9... 8... 7... 6... 5... 4... 3... [and] 18 months... is no easy task... The four eldest... offspring have left home and are doing well. But that still leaves a rugby team at home competing for the house's one bathroom and one shower room... "It's first come first served in the bathroom. There are always queues with lots of shouting..." ...[Mum] gets up at 5.30am, serving breakfast in three shifts, organised by age group... Evening meals are also dished up in three sittings, often with a different menu for each... "The first thing I do [each day] is stick the washing machine on..." ... There is a daily marathon of washing to keep 600 pairs of socks, 250 shirts and 100 pairs of trousers clean, dry and ironed. "We've got eight clothes lines and a tumble dryer, but we pray for good weather. And all those socks provide an ideal punishment for the little ones. If they're naughty... I make them put the pairs back together again." The laundry is rarely quiet with three washing machines churning through nine loads each day. The family also owns two fridges, a freezer and no fewer than 28 vacuum cleaners have bitten the dust. The couple admit it's a struggle to give each child enough attention. "But they all get lots of love," says... [dad, who'd] have been happy to stop at six children but was talked into each new addition by his wife... "All I wanted was a flat, a fast car and a quiet life... But if you make your bed you lie in it."

...Not many people know that... a... Russian [mother] had 69 children[– hopefully all to the same father...

Mothers whose] second child is fathered by a different [guy] than the first have double the risk of having a pre-term or small baby... researchers say.

...One in six mothers has a favourite child – but would never admit to it, according to a survey by... one of the... parenting websites in the UK.

...WHEN [a] Californian... broke up with her husband in the late 1980s, they had two toddlers. Her husband left home to live in a beach house with his girlfriend but missed the children. So [the wife] moved into a rented apartment... and [with]her husband took it in turns to look after the children in their old house. There was no name for it then, but they were pioneers of what has become an increasingly common arrangement in American families where the parents have split: “Birdnesting” – where mum and dad flit in and out of the marital home while the [kids stay put.

...NZ’s] Government is to tighten the definition of a family so it can[’]t include criminal gangs, but its new Families Commission w[on’t] rate the nuclear family better than any other kind... Solo parent families are just as good... as the mum and dad type. And to think I’ve wasted all these years doing the traditional father-husband... thing... I could[’]ve been out there spreading my seed, adding to the list of solo parents, propped up by the ever-expanding welfare system... As I write this, I am again in tears. For the [kids] yes, but also... for mothers who have abandoned mothering.

...[the journalist] has absolutely no desire to fatten up a Hansel or a Gretel and pop them into a pot of witch’s brew. But [it] does live far, far away in the forest of New York’s Catskill Mountains, and... has taken on something of the role of the old hags in fairy tales. Children and their parents beware. The computer is her cauldron and, in a house made of wood and glass rather than gingerbread, [the journalist] has come up with a potent incantation for the rebels in America’s latest culture war: the clash between the “child-free” and the “breeders” they resent and despise. Her book, *The Baby Boon, How Family-Friendly America Cheats the Childless*, has become the manifesto of the “child-free” movement. However daft it may sound, this really is a movement, and one with potential impact at the ballot box... There are now an estimated 14 million [US gals] who have chosen to avoid motherhood, and serious newspapers are printing articles about the “backlash” against rug rats, ankle biters and sprogs. These young humans are accused of disturbing the peace in restaurants and on the beach and, worse, actually taking money in taxation from the wallets of those smart enough to avoid the troubles and expense of reproduction. Why, the child-free want to know, should the peace of their weekends be interrupted by the babble of the future generation on the loose in the garden next door? Why should they foot the bill for “tax credits” so someone else can afford both the children and the shiny, new seven-seater people carrier? It is not surprising that the argument between the groups can become very heated, very quickly. Breeders take umbrage at attacks on “family values” and see [the child-free apostle] as a demon figure in a black conical hat. “People accuse me of hating kids... I don’t. I am not at ease with young children. That has always been true, and I have never wanted any of my own. But I love teenagers, and get on very well with them.” When word surfaced that, for her latest project, [the journalist] had spent last year with the children of Prior Lake High School in Minneapolis, it sounded as if some divine intervention had placed the apostle of the child-free in purgatory. But [the]... university professor-turned-journalist, went voluntarily, to investigate the mentality and the frustrations that could produce a Columbine High-type massacre, and... found herself sympathising with the teenagers. They share, after all, an objection to their parents, the breeders. “These kids have less and less room to breathe and that is enough to make them blow up at school... Even if you rebel, you just become a label. After all, even MTV was invented by their parents’ generation. Whatever you do, the Baby Boomers will just absorb you.” Given the ferocity of some of her views about parents, I am surprised to find myself sitting with a [perso]n who is full of smiles and jolly repartee. “I really do not miss having kids at all and that is a starting point for this debate... What we are seeing in the conflict between people with children and people without is really a consequence of the second wave of feminism. We chose not to have kids, and we have not been left on the shelf. We were the first generation of [gals] who could avoid having kids and still have sex. There is a subset of childless people now who have simply chosen a different way of life.” This life has advantages. [The journalist] has paid about the same for her 32ha of hillside and custom-built house with two studies – one for her and one for her husband – as [it] would for a small, two-bedroom flat in Manhattan. But... Margaretville... at the far reaches of weekend-cottage territory... is three hours from New York City, and about as far from the nearest first-class hospital or school. “I could not live here if I had children. I am lucky. Because I work on my own and because I am child-free, and because of computers and telephones, I can live as a writer just about anywhere I like.” So what is the beef with families with children? The problem has its roots in the mass movement of [gals] to the workplace, combined with the “me-first” attitude of America’s post-war Baby Boom generation. “We struggled to liberate [gals] from the home. Now who handles taking care of the house and the kids when we are at work? We thought [guys] would do more. But [they] did not come through.” There are few who would argue with that. Entire careers in journalism, management, law, social science and politics have been founded on debating the problem. The new twist... is that as America struggles to accommodate these structures of work and family, the child-free have been building up at least as big a grudge as those struggling to raise children and pay the mortgage. “Why should I have to work extra hours because you have had to rush out of the office to collect a sick child?” [the journalist] asks, in what amounts to a peric of her manifesto. “Why should I have to pay extra tax so that you get cash allowances to have children? Having children is a choice: people should pay for their choices. You have to make sacrifices, but... [w]hy should I make sacrifices for your choices?” Oh, dear. In many ways, this sounds less like an argument than the latest symptom of the aggressive individualism of the “Me Generation,” which is widely blamed for a collapse of the American community. Can the child-free really expect to live in a parallel world in which they are removed and protected from the private and public costs of raising a new generation? [The journalist] chuckles at this, for [it] relishes a good controversy. Her protest has scored a few points. As more and more [couples]... decide... they have no desire or need to have children, America is finding another faultline along which to divide. It is time, says [the journalist], to pay less heed to the me-and-mine lobby, and more to the me’s. “...You should be grateful to us, the people who don’t bring yet more... children... into the world.”

...[between 1900-1910, sex] was for procreation only. It was not an act of pleasure, especially for [gals]. A considerate husband took a mistress to spare his wife. [Between 1911-1920, f]amily planning advocate Margaret Sanger introduced the words “birth control” and set up the first US birth control clinic. [Sanger] was sent to prison... [Eventually birth and population control became acceptable to mainstream US society – no one was sent to prison for writing, printing or selling the] 1960s novella... *Logan’s Run*, ...in which the human age limit is set at 21[; or for making or screening the movie of the same name, about an enclosed]... futuristic city where pleasures are unending, [but citizens (who are produced artificially and raised without parents)] are not allowed to live past the age of 30[– at which age they enter a fatal process they’ve been coerced into believing will result in their going on to a wonderful afterlife.] Those who try to escape to the outside and live their full lifespan are chased and ‘terminated’ by special police... [By the way, US] health officials have approved a pill that causes an abortion early in pregnancy, clearing the way for its sale after 12 years of battles that kept it off the US market. In a move hailed by abortion rights groups as the beginning of a new era that might increase privacy and improve access to abortion, the F[DA] yesterday cleared the pill, known as RU-486, or mifepristone. The drug debuted in France in 1988 but abortion opponents fought its entry into the US. Fears of anti-abortion violence and boycotts kept the big drug-makers from pursuing the pill. The identity of the current manufacturer has been kept secret... Danco, a private firm set up to market the drug, said it should be available in a month... [but] has not announced a price. Opponents said they would work to discourage use of the drug, and the... President... call[ed] the decision “wrong.” His father... forbade the import of the pill in 1989. Mifepristone causes abortion by blocking a hormone needed to sustain pregnancy.

...N[Z gals] may soon be using the abortion pill commonly known as RU-486. [The]Health Minister said yesterday that there were unlikely to be any safety issues stopping its registration, and the Ministry of Health’s Medsafe agency would consider... an application to register the pill... [–] the first abortion drug to go on sale in America... [– in six months time. The minister said NZ] law allowed for medical as well as surgical abortions, so there would be no need for a law change if the abortion pill were approved. “This drug will give [NZ gals the choice gals] in other countries have.”

...N[Z] has the world's highest rate of vasectomy, but the procedure still raises questions... A family planning specialist[– who ha]s performed... 5500 vasectomies[– has]... heard all the jokes before, of course, usually spluttered out by nervous blokes just before dropping their trousers. But the good doctor can be relied upon not to titter. [It has] a nun-like vision of tranquillity, politely ignoring the wisecracks and waiting for the laughter to subside before calmly continuing the job at hand. But all that hysterical nervousness about vasectomy is the reason [the Dr] has teamed up with [a] similarly experienced family planning specialist... to produce a book called *Vasectomy, Practical Information and Advice*... Without wanting to actually promote the procedure... the book is an attempt to allay fears. Scanning through the chapter on the history of vasectomy, it's easy to see why there is so much unease about the procedure. In the past the procedure has been used (quite pointlessly) to treat everything from chronic masturbation to enlarged prostates. It became a favourite tool, so to speak, of the eugenics movement... popular throughout Europe and the U[S] in the 1930s... Recent bad press originated in India where a well-meaning effort at population control went mad and an estimated seven million vasectomies were carried out – thousands of them at vasectomy camps in northern India where people were at best coerced, at worst forced, to have the snip. Incidentally, it was in India [that the nun-like specialist] carried out her first vasectomy. [The Dr had] observed the procedure many times in England while on sabbatical in 1976 but because of rules (since repealed) preventing non-surgeons from performing vasectomies, was not allowed to perform one. "A colleague arranged for me to go to India on my way home from England and I actually did my first... in a converted bus in the slums of Bombay." [The Dr] stresses there was no coercion in the programme in which [it was involved. After returning to NZ it] was instrumental in starting the first Family Planning vasectomy clinic in Wellington. Despite all the unease... about 25% of N[Z] couples in their 40s... [use vasectomy] as their method of contraception. Even in the family planning mecca of China, only 8% of couples use the method. "I don't think we know exactly why N[Z]'s rate is so high but it's partly because we also have a very high Pill-taking population. [NZ gals] don't want to stay on the Pill too long and once their family is complete people have worries about the side effects and the risks [of blood clots]... highlighted in the media recently,"...

DOCTORS have been fobbing off... concerns in the wake of publicity about deaths relating to the use of oral contraceptive pills, says [a gals'] health campaigner... Thousands of N[Z gals] have contacted their GPs and Family Planning doctors... seeking advice on the risk associated with oral contraceptive use... since the *Sunday Star-Times* last month revealed six [NZers] had died from blood clots caused by using third-generation oral contraceptives Femodene, Minulet, Marvelon and Mercilon... However, [doctors said their patients]... were not panicking and just wanted information[, although some patients have]... changed the brand they used. But [the campaigner] said many doctors had told [their patients] there was nothing to worry about, or that they didn't know what advice to give because the Ministry of Health had not given any directions. "...Doctors are not rising to the occasion. It's not their job to tell [gals] what they shouldn't worry about, it's their job to give [gals] information so they can make up their own minds. It's time the ministry did more to get a handle on the situation and gave doctors some advice." [The campaigner said NZ gals] were not being given information about blood clots so were unaware of the symptoms. [Gals] have also told her doctors have criticised her for creating a "pill scare", saying [the campaigner] would be personally responsible should more of them get pregnant because they stopped taking their pill... [A] ministry medical adviser... said the ministry had dispensed advice to doctors as late as last December in its *Prescriber Update* magazine.

...Who's to blame for pill deaths? THE whole nation's attention is focused on the tragic death of young Kirsty Bentley[, whose raped and murdered body was recently found in bush near the rural community where the teenager lived]. Spare a thought too for other families grieving the untimely deaths of daughters. I am referring to the news, buried in the Ministry of Health's *Prescriber Update* publication, that six... [NZers] aged between 19 and 32... have recently died as a result of blood clots while taking third generation oral contraceptives... They were healthy young [gals], responsibly using contraceptives to prevent unwanted pregnancies. Most had few symptoms of the impending calamity. A pain in the leg in two [cases], a recent knee injury causing immobilisation in another. My question is: who is accountable for these deaths? Is it the drug companies, who raised the spectre of legal action against the ministry when it planned to issue warnings when the risks of these pills were first known? Is it the medical groups who pressured the ministry by saying they would disassociate themselves from the advice? Or is it the various officials of the Ministry of Health who caved in under the pressure...? ...Finally, did the young [NZers] who died make an informed choice to take the risk that ultimately cost them their lives? Will anyone be held accountable...? Somehow, I doubt it... The Ministry of Health first knew about the increased risk of potentially fatal blood clots in users of third generation OCs in... 1995... The news was third generation pills had double the risk of blood clots compared to other OCs. The drug companies had done such a good job of selling these brands to N[Z] doctors that... 175,000 [NZers]... were using them, an astonishing 75-80% of all [NZers] on OCs. This is the highest rate in the world, which tells us something about the too-cosy relationship between doctors and drug companies in N[Z]. In AUS, only 5% of OC users were on the suspect pills. The scale of the problem was embarrassing and probably explains the foot-dragging that followed, but it also meant this was no minor health scare, but a major public health problem. Blood clots are rare in young [gals] but at this rate you could expect... 35 cases of blood clots in users of third generation OCs each year... 1-2% of which were expected to be fatal. In October 1995 I was asked to sit on a ministry working party to discuss what to do. I should have seen the writing on the wall when I saw seven drug company bosses lined up around the table, including marketing managers. I was the sole consumer rep. In March 1996 the ministry's own advisory group, the Medicines Adverse Reactions Committee (MARC), gave its advice. It unanimously decided doctors should review their prescribing practices and "preferentially prescribe" brands of OCs other than those containing desogestrel and gestodene. MARC said this advice to doctors was urgent. All hell broke loose. The drug companies bombarded GPs with dossiers contradicting the studies that had shown the risk. Legal action against the ministry was threatened. Then the Royal N[Z] College of Obstetricians and Gynaecologists proclaimed it would publicly disassociate itself from the advice. Family Planning went about saying the studies on which MARC's advice was based were affected by biases so... the results couldn't be trusted... [Consequently], a member of MARC and a WHO expert on hormonal contraception, complained to the Director-General of Health about the delay and "the extent to which the pharmaceutical industry is able to influence key decisions in N[Z]". Through all this ran claims that unless the whole thing was damped down, the media would blow it into a "pill scare"... [MARC's expert] commented on the "exaggerated fear of the news media", noting [NZers] would act with commonsense as long as they were given adequate information. Nevertheless, the ministry bowed to the pressure. The MARC communication to doctors was pulled back from the printers and shredded. In the revised version the information was watered down. Instead of advising doctors to prescribe other brands, the advice was now only to "consider prescribing" other brands. The leaflet produced for [users] was so bland and reassuring it would not have rung any alarm bells. Thus [NZ gals] were left unable to protect themselves, to the extent they were not even informed by the ministry of what the symptoms of blood clots were. In mid-1996 when this advice appeared, the ministry predicted there would be one death every 1.5 to 2.5 years of N[Z gals] on these pills. Now it is known four... died in the 18 months from January 1997 to June 1998. (Another two died earlier.) An "unexpectedly high number", says the ministry. There may well be even more... as the ministry says it is unlikely all cases have been reported. The reason for the high number is unclear. As the ministry failed to put in place any mechanism for monitoring the impact of its actions in 1996, it was unable to tell me whether there had been a fall in the use of third generation OCs. Fortunately I was able to learn this from elsewhere. Pharmacia was able to tell me the decrease in use of these pills in 1996... was only 19%, followed by a tiny 3% decline [in 1997]. Third generation OCs still make up 65% of [NZ's] total OC market.

...A SEVENTH N[Zer]... is dead and another severely brain-damaged from using popular brands of oral contraceptive pill. News of the latest death... – which occurred last year... [but has] been reported only because of publicity about the pills in the last month... – has prompted the

husband of one of the dead... to ask how many [NZers] need to die before the pills are banned... "It makes you wonder how many other unreported cases there are and that this situation may be worse than we even know now... What's going on? ...[NZ gals] are being treated like guinea pigs and it's about time the ministry did more to warn them how dangerous this is." The ministry's toll-free information line starts today.

...The Ministry of Health's latest advice on the pill, "Oral contraceptives and blood clots," is now available from doctors' surgeries, pharmacies, family planning clinics, midwifery clinics and Plunket... [- whose toll-free helpline, coincidentally,] reopens today... The Government is giving Plunket the money to resume the service... established... in 1994... from midday until midnight, seven days a week.

...[the Royal NZ] College of General Practitioners yesterday issued prescriber guidelines to GPs... warn[ing] that they could be sued if they fail to adequately advise [patients] of the risk of clotting from contraceptive pills... There have been 40 non-fatal reports of blood clots associated with third generation OC use since 1987, and nine involving other pills... [All of the relevant drug] manufacturers... failed to respond to requests for interviews. However, [a senior Ministry of Health medical adviser] said... they were concerned, but... did not believe they needed to take any action. "In 1996 we asked them to put warning statements in their data sheets and they did. We were the only country in the world to get that action."

...British doctors have done a turnaround and now mirror [NZ advice to patients] about third-generation contraceptive pills... A new review, by the United Kingdom Medicines Commission, of all available information had concluded there was a small difference in the risk of blood clots between second[-generation OCs - which were 'developed in the 70s (first-generation pills are no longer used') -] and third-generation pills. But it found the difference was so small that doctors could prescribe the pills as long as [patients] were fully informed of the risks... [I]n 1995... the... UK Committee on Safety of Medicines suggested... [a third-]generation OC... brand... change... but... [drug] companies discussed legal action... [In local news, the married] 30-year-old... from Nelson who died in March after taking the third-generation version of the Pill should never have been prescribed it because of her family history of blood clots, an MP says... The MP said the... family had approached her as they wanted to support the call that... [the MP and the Gals'] Health Action group, had made for an inquiry. They want a public investigation of the Ministry of Health's advice to doctors and other prescribers... The ministry is not commenting on their call, which follows its confirming that the blood-clot death toll from users of the pills has risen to nine in six years... [The MP said more than one] death was avoidable... "Both [of the latest confirmed victims] had known risk factors. One... was obese... and the mother of the other, and possibly her maternal grandmother, had died of pulmonary embolism..."

...The contraceptive pill may be the cause of breast sizes growing in recent years. Auckland bra manufacturer Bendon has said that sales of D cup bras between 1995 and [last year grew 4%] and DD cup sales increased 6[%] while sales of A cup bras fell 6[%]. Most notably... lingerie stores were being flooded by teenagers with very large busts. "Our shop assistants have noticed younger girls' breasts are getting bigger at an earlier age - far more teenagers are now wearing a 10D-10DD sized bra... slim girls coming in really full cup sizes." ...[an] Auckland Hospital endocrinologist... said that as N[Z]ers continued to grow taller and put on more weight... breast sizes increased. Larger [gals] tended to have larger breasts, but this did not explain slim young [girls] with big busts... A more likely alternative was changing sex habits. More and more... N[Z] girls from the age of 13 were on the pill... "It's well known that oral contraceptives increase breast size..."

...O[C]s can damage... gums, making them more vulnerable to gum disease... "Gingivitis... (inflammation of the gums)... was 32[%] more common in... [gals who used OCs compared to gals] who did not take the pill," says a report in *New Scientist* magazine... The researchers said... [h]ormones in the pill might dilate blood vessels and alter cells in the gum lining... [In spite of the report, a] Japanese Health Ministry committee has given its approval for the sale of birth control pills... The Central Pharmaceutical Affairs Council will submit its recommendation to the ministry in [three months], meaning the pill could be available by this autumn... [T]he Health and Welfare Ministry refused to comment. The reports come as [gals'] groups voice outrage over a ministry decision... to approve the... impotence drug Viagra, after deliberating for just half a year. An application to approve the pill... languished in the Health Ministry for nine years... Resistance to the pill in Japan has largely come from doctors, who say they are worried about side effects. They also want to promote condom usage to stem the spread of the Aids virus. But [gals'] groups say doctors do not want a reduction in the number of abortions, which at... 100,000 yen... are a lucrative business in a country where the national health programme caps fees for most other operations. Unwanted pregnancies are common in Japan, with official statistics showing one-in-five pregnancies end in abortion. Japan's per capital abortion rate is far higher than European nations, although somewhat lower than that of the US. Medical opinion outside Japan is generally in favour of the pill. A major study published last month in the *British Medical Journal* found no long-term ill-effects.

...Japan refused again to approve the birth control pill yesterday, only weeks after the blockbuster impotence drug Viagra was approved. The decision means Japanese [gals] still cannot get their hands on the pill some 40 years after it was introduced in the West.

...Timid Filipinas too frightened to talk about sex have found a novel way of avoiding unwanted pregnancies - by colour-coding their love lives. Instead of complaining about headaches... 300,000 [wives] across the country are now sending their husbands simple, yet intimate, messages about their menstrual cycle with... green or white clothing. "Green slippers would signal her readiness for a romantic evening in - but a white hairslide may be saying her [husband] should spend the evening out with his friends," said... [the] director of the Philippine Federation of Natural Family Planning, which devised the scheme... [In related news, gals] who think they can predict the days of the month when they are most fertile should think again. Researchers at the National Institute of Environmental Health Sciences in Durham, North Carolina, said yesterday that a [gal]'s fertile window - the six days each month when [it] is most likely to conceive - is extremely difficult to predict. Only 30[%] of gals... who took part in a study had the window entirely within the six days mid-cycle. [Couples] trying to avoid pregnancy were advised not to use the calendar month.

...Nuvaring, a revolutionary contraceptive ring going on sale in the U[S] this year, is as effective as the pill, despite delivering substantially less hormone... The flexible plastic device, which is inserted into the vagina each month, fits around the cervix and releases a steady flow of progestogen and oestrogen to prevent conception... Nuvaring... is not the first contraceptive ring but it offers a significant advantage over previous versions which released only progestogen, resulting in abnormal bleeding... In addition to convenience... Nuvaring's low dose would be a major plus for [gals] worried about high hormone levels in the pill... The ring, which is around 5cm in diameter and is folded before use, can be inserted and removed by [users] themselves. It is designed to be kept in for three weeks, followed by a one-week ring-free menstruation period, although in future it is possible it could be used continuously to stop periods altogether[(a 'pill that cuts the number of periods to four a year' is already available)].

...It is the future of sex, and it is already here. Just ask... a married couple who have resorted to the most popular method of contraception to make sure they do not become parents. But this time it is [the guy] who is on the pill. [The guy], aged 32, is one of the first [people] to take a newly developed... contraceptive pill. And for him it has been a revelation. It is the most significant breakthrough in a quest that has dominated the lives of small but determined groups of scientists around the world for the past decade. This week a new milestone was reached when a team based in Scotland announced it had made a pill which not only had a 100[%] success rate, but was also free from side effects. "A lot of people doubted this could be done... But we are... ready to take that work forward even further. We could have a... pill [for guys] on the market within five years." If [the Scots] achieve... that goal, it would be the biggest development in the sex lives of humans since the original... pill revolutionised contraception 40 years ago. There is no doubt that in scientific terms the invention of a little tablet which effectively fools the brain so the body stops producing sperm is a remarkable achievement. But even if future clinical studies are successful the researchers will face a barrage of criticism from outraged moral guardians. Then they will have to persuade [guys] to actually take the pill... The last point is not lost on big pharmaceutical companies who have not exactly been breaking [the] door down to buy the rights to the new drug. They have... been sceptical from the start. So far they have resisted pouring money into the pill's research and development. First, they simply did not think it could be done. Now they have to be convinced [guys] will take the pill, particularly when most people believe [gals] should be responsible for birth control... [An] agony aunt and columnist on

Scotland's biggest selling daily newspaper, the *Daily Record*, could not be accused of sitting on the fence. "It will only work if they dissolve it in the lager... I think this is the biggest waste of research money going. There's a perfectly good... contraceptive [for guys] at the moment which is the condom. Responsible [guys] will use the pill... Irresponsible younger guys will say: 'Don't worry love, I'm on the pill.' But they're all lying toads."

...Researchers at Monash University have found a way to block conception for up to 24 hours, devising what effectively amounts to a morning-before sex pill. The developers of the pill, based on the hormone progesterone, hope to test their findings on Melbourne [gals] by the end of the year. [AUS's] Family Planning Association president... said the main obstacle to the programme was a tough ethics committee, which could be troubled by the prospect of unwanted pregnancies resulting from voluntary testing. But the new method could be seen as more morally acceptable as it blocked sperm from getting to the egg rather than destroying a fertilised egg... herald[ing] a "whole new area of contraception."

...South African state-owned television communications utility Telkom has ordered 5 million condoms to help protect its workforce... 1700 people [in the country are] estimated to contract the virus which causes Aids every day... [□ Researchers] at Canada's Laval University... recruit[ed] prostitutes and other [gals] for clinical trials of microbicide gels known as "invisible condoms." ...an international conference on HIV and Aids... [was] told... that the research would determine if the gels protected against [STD]s and prevented pregnancy... [I]t would take up to two years for the gels to reach consumers. [Canada's] Health Minister... said the Government... g[ave] \$US235,000... to Laval for research of the vaginal gels.

...[as a consequence of] a Health Funding Authority contract which came into force this month, [NZers]... under 25 and those with a community services card can now get free contraceptive and sexual consultations from Family Planning Association centres.

...Infertile lesbians and single [gals] nationwide will now be entitled to state-paid fertility treatment under new rules about to be introduced. The Health Funding Authority will this month implement national guidelines on fertility services, which have just received a \$3.7 million boost to remove inequalities and reach more people... The new criteria have been welcomed by lesbians but criticised by the Act party... Under the new criteria... lesbians and single [gals]... would, like all candidates for the taxpayer-paid services, have to have tried for some time to conceive... [By the way, most gals] have only a 20[%] chance of getting pregnant each cycle, a figure which decreases as the[y] age, but according to one husband his wife "[...] is one of those rare [gals] who can release eggs at any time... We were... advised not to have unprotected sex..."

...[naturopaths advise parents to 'cleanse their body and environment 4 months prior to trying to conceive if they want a healthy and intelligent baby']...

Couples wanting to start a family are best advised to sneak home from work early and have sex between 5 pm and 7 pm, according to the latest British research. A study of more than 50 [guys] attending an infertility clinic has found that the amount and quality of sperm peaks in the late afternoon, the same time that [gal] fertility hits its optimum level... More than three-quarters of the [subjects] were found to have substantially higher, faster-moving levels of sperm in the afternoon. The findings, which have shocked medical experts, are being welcomed as good news for couples experiencing difficulties conceiving... ■ [Some]... Auckland medical researchers are holding out new hope for couples unable to have babies for unknown reasons. In a study of unexplained infertility, National [Gals'] Hospital specialists are flushing some [patients'] internal reproductive organs with a liquid used in taking x-rays. Of 15 [patients] who have received the treatment, about five have become pregnant and at least one has given birth... Thousands of [NZ] couples suffer from unexplained infertility. A sixth of couples have a fertility problem and in up to a quarter of those the cause is not known. The study involves flushing... fallopian tubes with an oil-soluble substance called lipiodol... Lipiodol... flushing as an infertility treatment was the rebirth of an old idea. "For a long time, GPs and gynaecologists have had a hunch that [gals], after they had their fallopian tubes tested – and that was done by flushing – may stand an increased chance of conceiving in the few months afterwards." The role of lipiodol was unclear but there were several theories, including that the flushing action removed debris in the tubes that was impeding eggs or sperm. But the National [Gals'] laboratory was investigating whether lipiodol caused changes in the cells of the endometrium, the uterine lining, which made it receptive to an embryo... [T]he study's one-in-three pregnancy rate mirrored the results of small trials overseas. This rate might be as good as or better than the rate for IVF. Lipiodol flushing cost several hundred dollars, compared with at least \$5000 for one cycle of IVF.

...Through my private practice I have seen a lot of couples go through the stress of IVF and... tear them apart. It is sometimes the case that by the time the fertilisation has occurred the relationship is irreparably damaged and there is no loving environment for the children to be a part of.

...THE movie *Maybe Baby* made fertility treatment look amusing. [The hero] remained besotted with his gorgeous wife despite her urgent demands for sex at short notice and their private lives seemed to flourish – for a while at least. But the reality is far less attractive. It is a rare [gal] who, when propped up on pillows with her legs in the air, looks as good as [the film's heroine]. And even the most swashbuckling young husband can be reduced to a quivering wreck when presented with a warm jar, a copy of *Ralph* and asked to deliver. But that undignified fate, says Auckland's band of world-class fertility experts, is where many couples are heading as they wait longer and longer to start their families. Today one in six couples experience some form of infertility and the problem is growing... [In a] homely, rather cramped building on the old Green Lane Hospital site, one floor below the Epsom Day Hospital where most of the city's abortions are performed, a team of dedicated doctors, scientists and nurses will this year carry out around 250... IVF... procedures – half of them paid for by the State. Down the road at the elegant new Ascot Hospital ...is... a second, much swifter, clinic, Fertility Associates... [– whose owners, NZ's] glamorous pioneers of high-tech infertility services, carried out Auckland's first IVF procedure in 1984. Although they left National [Gals'] Hospital in 1997 their Fertility Associates team still does half the publicly funded and most of the private work in Auckland, carrying out around 400 IVF procedures a year... Last year government fertility funding doubled to \$5.9 million, so allowing all [gals] under 40 who score 65 or more in a complicated points test, to have one course of state-funded IVF or four non-IVF treatments. Why the surge in infertility? Two main reasons says... the doctor who heads... Fertility Plus... "Each decade the maternal age for reproducing the first child goes up by three years. The average age for a first child in N[Z] is now 30." While 30 may sound young to start a family and we have all heard stories of 60-year-olds giving birth, from our ovaries' point of view, 30 is getting into amber light territory... "If a group of [gals] started trying at 20, between 90 and 93[%] of them would get pregnant in the end... By 38 that chance drops significantly." ...By the time [gals] get to 42 even the most brilliant procedures have just a 5[%] chance of success... [60%] of embryos from a [gal] of 40 will be too abnormal to implant – and only 20[%] destined for success... The second major problem, which affects half the couples [Fertility Plus] sees, relates to a fall in [guy] reproductive health – that is, the proportion of malformed and dead sperm produced by modern [guys] plus a higher incidence of [guys] with distended testicles. The sperm problem is relatively new. Ten years ago a [gal] was put through a battery of tests before fertility experts even started looking at her husband's sperm quality, now doctors carry out simultaneous... tests of... sperm... and... eggs. "We have pretty good evidence... from America and England that [the drop in sperm quality] relates to environmental issues... [T]oxins are going to turn out fairly relevant to [guy] fertility." In other words some scientists say that insecticides, fungicides, chemical oestrogens and PCBs are possibly getting into the... reproductive system, killing and maiming sperm. It is a problem... that when combined with things such as endometriosis, smoking and maturity add up to serious trouble. But for the high-tech specialists, sperm quality is one of the easiest fertility problems to overcome... "There's such a big reserve – so many spare in there. Nowadays, as long as a [guy] has as many sperm as his wife has eggs, that's all you need."

...[guys] who log up 4800km or more a year on their mountain bikes suffer scrotal damage that could reduce their fertility. A report, based on examinations of 40 "extreme" bikers and 35 non-cyclists... [by the] University Hospital in Innsbruck, Austria... suggests that [guys] who spend the most time on their bikes should invest in shock absorbers and suspension systems. Scrotal examinations of the bikers found that 88[%] had cysts, calcification, varicose veins and other abnormalities compared with 26[%] of the non-biking group. Sperm samples showed that the extreme bikers

had a count that was only a third that of the non-cyclists while bikers' sperm had less motility or movement than non-bikers... [● A breakthrough in IVF] used for the first time in N[Z] last week could double pregnancy rates for infertile couples. The IVF blastocyst transfer technique involved growing fertilised embryo longer in the laboratory before implantation in the... womb... Embryos are normally implanted two days after fertilisation, but the latest technique sees the embryos implanted after five days... It meant the embryo was more developed and the pregnancy had a greater chance of success... They cannot be grown longer because after five days, the embryos need to embed themselves to the uterus lining... [B]lastocyst had other advantages. It reduced the likelihood of multiple pregnancies because just two embryos were implanted instead of three as in normal IVF treatments. Because pregnancy rates were likely to double to 40%, [patients] should need less courses of IVF treatment... Two [patients] were... implanted with blastocyst embryos at Auckland's North Shore Fertility Clinic. It will be two weeks before it is known if the[y]re pregnant.

...A Singaporean researcher has improved the odds for people trying for a baby with [IVF] by growing the embryo in a lab for longer before it is implanted in the womb... [The researcher] developed a technique that mimics a [mother]'s body with a variety of laboratory cultures, including cells from the inner lining of the Fallopian tubes. "The embryos are kept in place by a layer of oil, which also keeps them warm and cosy like blankets,"... [U]nder the procedure about half of the [patients] seeking IVF treatment became pregnant versus the global average of... one in four.

...The star of *Veronica's Closet*... is... ready to spend \$US1 m... on fertility treatment to have a baby by [her] boyfriend. The 48-year-old... is considering a revolutionary technique specially designed for older [gals] where an embryo is put into the [mother]'s own womb lining in the lab. It means the baby has a more natural environment in which to grow. [The scientist], who earns \$US18 m... a year and adopted [two kids with her] ex-husband... and had a miscarriage, said: "For a long time I've felt God was mad at me because I couldn't have a natural child. But now I'm confident I can... spend... [\$US1] m... for the pregnancy... [to succeed]." ● 'US gals considered "too old" to adopt are being given donated eggs to mix with their husband's sperm then be placed in their uterus – even though they've had menopause (the process has a 37% success rate among 50 to 65-year-olds')...

When the 25-year-old] cradles her six-month-old daughter [it] looks like any other doting first-time mum. Her face beams with love as [mum] snuggles and plays with her precious little girl. '...our little miracle baby,' smiles... the former child star of the popular '80s drama series *Sons and Daughters*. After a long and frustrating battle to become a mum, [the] heartbroken and desperate [actor] turned to an extraordinary fertility treatment that uses nuns' urine. Within days, her pregnancy test came back positive and [the actor] and her husband... 33, wept for joy. 'I couldn't believe it when the clinic told me the treatment involved being injected with an extract from nuns' urine. I know it sounds crazy, but I didn't care – I just wanted to have a baby,' says [the gal], who had been collecting babies' toys and clothes since [the age of 11]. 'My husband] and I were so keen to have kids, we even bought a bassinet... weeks after we got engaged,'... Back in 1989, doctors discovered [her] chronic stomach pains were caused by... polycystic ovaries. 'I'd had problems with my periods for years. There were times when I didn't have a period for about a year and other times when I'd have heavy bleeding for up to 80 days. I also had a small tumour on my pituitary gland, which didn't help matters. I'd never had a regular cycle and that made it much harder to fall pregnant since I couldn't predict when I would be ovulating.' When the couple finally sought advice about their fertility doctors discovered th[e wife] wasn't ovulating at all. For a girl who was always a high achiever ([apart from being] a star as a child [it] started a career as a futures trader at the tender age of 16) the news brought her down to earth with a thud. 'My doctor told me I was infertile and... I would never have a baby without some sort of assistance. I was devastated.' After being referred to a specialist clinic at Sydney's Royal Hospital for [Gals, the wife] began a course of drugs designed to stimulate ovulation. 'I took these tablets for six months and still had no luck...'... It was then that doctors introduced her to the unusual therapy involving nuns' urine. The treatment, called Ovulation Induction Therapy, involved daily morning visits to the clinic, regular blood tests and two injections of a solution made from a derivative of either nuns' urine or the urine of menopausal [gals]. The secret is that both are rich in the natural follicle-stimulating hormones that help trigger ovulation. 'You are closely monitored the whole time and they can pinpoint exactly when you ovulate... I remember getting a call from the clinic saying: "Okay... today's the day. You're going to be ovulating, so get busy." So [my husband] and I had a couple of lunchtime rendezvous, where we'd both dash home from work...'... Fertility Associates in Auckland says [OIT] has been widely used in N[Z] for... 20 years... In the past two years, synthetic drugs (not derived from biological material) have begun to be used as an alternative. However this method is a lot more expensive therefore not as widely used... A[US]n studies indicate 75[% of gals] ovulate following therapy, and... there is a lowered risk of multiple births compared to other fertility treatments – around 70[%] of pregnancies resulting from this therapy are singular. ● The Pope has reportedly condoned the use of nun's urine.

...They are far too young to understand the fuss, but [the] 18-week-old miracle twins... have become celebrities in Murupara in the Eastern Bay of Plenty and an inspiration for childless couples nationwide. The girls were born to a mother whose body could not sustain a pregnancy and a father who could not produce sperm. After 18 months of hormone treatment, two stillborn babies and two miscarriages... seven years of hope and heartache paid off with the birth of the twins in May... The couple received congratulatory cards and gifts from strangers throughout the country, after an article appeared in the N[Z] *Herald* about the birth. "A lot were saying how they've been through what we've been through, and it's good to see someone's made it... I wouldn't have thought it would have touched so many people," said... [the twins' mother, who] has now had a hysterectomy... The couple wanted to thank the... staff in Ward 55 of Waikato Hospital and acknowledged the support they had received from... their community. "One day we went out with the pram. It took us nearly an hour to go to the shops – five minutes from home – and an hour to get back again,"... Apart from a slight dose of colic, the twins are doing well... [In related news, a] world-beating medical break-through could offer hope to [gals] who suffer multiple miscarriages. Until now it was thought that many foetuses died in the womb because clots in the mother's blood supply blocked the flow of nutrients to the unborn baby. But research by... Auckland University's department of obstetrics, suggests that the real cause is... an antibody called anticardiolipin... produced by some pregnant [gals] which interferes with the formation of cells in the placenta... These cells kick-start placental growth by invading the arteries of the uterus and increasing blood flow to the placenta so the baby can grow... [It is hoped the] discovery could lead to the development of new drugs that could spare [gals] the heartbreak of repeatedly miscarrying their babies... [The] discovery also questions the effectiveness of existing treatments where anticoagulants are given to at-risk [gals] to prevent blood clots forming... The findings... have generated international interest and could revolutionise existing treatments for the multiple miscarriages that affect one in 100 [gals] in the Western world... Up to 20[%] of all pregnancies end in a miscarriage, with multiple miscarriages affecting several thousand... [NZers] each year. In such cases, most babies are lost before 11 weeks... "Losing one baby is bad enough, but repeated miscarriages are extremely upsetting and traumatic for both partners. But what's amazing is how many times people will keep on trying to have a baby."

...[by the time I reached the age of 39, I had] suffered the tragedy of miscarriage ten times. Then the TV news led [m]e... to an amazing discovery... I was allergic to my husband... Then I... [heard] about a new treatment available for recurrent miscarriage... known as immunotherapy... – so we went through the procedure... to give me the immunity I needed... [and the result was our first son, born] in 1990, and then [our second son, born] in 1993.

...American scientists... have stumbled on a genetic quirk that helps to explain a... medical mystery: why some [gals] suffer recurrent miscarriages. Otherwise healthy [gals] can have an X chromosome defect that is lethal to [boy] foetuses. In a way this is good news – if the foetus is [a girl], the pregnancy should be fine. Miscarriages are common, occurring in about 20[%] of pregnancies. Most of these [gals] later have babies, but 1 to 2[%] suffer repeated miscarriages. Doctors discover a cause, such as uterine abnormalities, for... half of these miscarriages, leaving the rest with no explanation and no treatment. Enter... an expert on the genetics of Duchenne muscular dystrophy, one of the most deadly inherited

diseases. It usually hits boys, but [the expert] diagnosed it in a girl. Her mother asked 53 relatives to consent to genetic testing to better understand why her daughter became sick... Boys have an X and Y, and girls two Xs, one inherited from each parent. Cells need only one active chromosome, so every cell of a girl's body turns off one of those Xs. Typically, half the cells use the mother's X and the others use the father's. But [this] patient was using only her father's X chromosome, and half the [gals] in her extended family had the same abnormality. More intriguing, the large family had only half the boys expected from normal reproductive patterns – and many miscarriages. “We said, ‘Uh-oh, what’s going on?’” recalls... [the] head of genetics research at the Children’s National Medical Centre in Washington... [His] laboratory tested 100 miscarriage sufferers for whom every other cause had been ruled out, and found 14[%] with the X flaw. In contrast, only one in 100 mothers who had never had a miscarriage had the genetic flaw... Other specialists caution that if [the] findings are confirmed, the X flaw would still explain only a fraction of repeat miscarriages.

...One day – a day probably no more distant than the first wedding anniversary of a couple who are now teenage sweethearts – a [guy and a gal] will walk into an [IVF] clinic and make scientific history. Their problem won’t be infertility... Rather, they will be desperate for a... child who will elude a family curse. To create their dream-child, doctors will fertilise a few of the [gal]’s eggs with her husband’s sperm, as IVF clinics do today... then... inject an artificial human chromosome, carrying made-to-order genes like pearls on a string, into the fertilised egg. One of the genes will carry instructions ordering cells to commit suicide. Then the doctors will place the embryo into the [gal]’s uterus. Left without the artificial genes, if her baby is a boy, when [it becomes older the boy will], like his father and grandfather before him... develop prostate cancer. But the cell-suicide gene will make his prostate cells self-destruct... And since the gene that the doctors give him will copy itself into every cell of his body, including his sperm, his sons, too, will beat prostate cancer. Genetic engineers are preparing to cross what has long been an ethical Rubicon... “Life would enter a new phase... one in which we seize control of our own evolution[.]” says one genetic engineer from... the University of Southern California... Since 1990, gene therapy has meant slipping a healthy gene into the cells of one organ of a patient suffering from a genetic disease... When the pioneers of gene therapy first requested Government approval for their experiments in 1987, they vowed they would never alter patients’ eggs or sperm. That was then. This is now... Judging by the 70 pages of public comments... received since [the Californian] submitted his proposal... to use gene therapy on a foetus that has been diagnosed with a deadly inherited disease... the overwhelming majority of scientists and ethicists oppose gene therapy that changes the “germline” (eggs and sperm). But the opposition could be a boulevard wide and paper thin. “There is a great divide in the bioethics community over whether we should be opening up this Pandora’s box,” says a [science-policy scholar... of Tufts University. Many bioethicists are sympathetic to using germline therapy to shield a child from a family disposition to cancer... or other illnesses with a strong genetic component. As... [the] president of the Cold Spring Harbor Laboratory and co-discoverer of the double-helical structure of DNA, said at a recent UCLA conference, “We might as well do what we finally can to take the threat of Alzheimer’s or breast cancer away from a family.” But something else is suddenly making it OK to discuss the once forbidden possibility of germline engineering: molecular biologists now think they have clever ways to circumvent the ethical concerns that engulf this sci-fi idea. There may be ways, for instance, to design a baby’s genes without violating the principle of informed consent... Presumably few people would object to being spared a fatal disease. But what about genes for personality traits, such as risk-taking or being neurotic? If you like today’s blame game (it’s mom’s fault you inherited her temper) you’ll love tomorrow’s game: [mom] intentionally stuck you with that personality trait. But the child of tomorrow might have the final word about his genes, says [one] UCLA geneticist... The designer gene for, say, patience could be paired with an on-off switch... The child would have to take a drug to activate the patience gene. Free to accept or reject the drug, [the child] retains informed consent over his genetic endowment. There may also be ways to make an end run around the worry that it is wrong to monkey with human evolution. Researchers are experimenting with tricks to make the introduced gene self-destruct in cells that become eggs or sperm... confin[ing] the tinkering to one generation. Then, if it becomes clear that eliminating genes for, say, mental illness also erased genes for creativity, that loss would not become a permanent part of [humanity]’s genetic blueprint... In experiments with animals... the University of Utah has designed a string of genes flanked by the molecular version of scissors. The scissors are activated by an enzyme that would be made only in the cells that become eggs or sperm. Once activated, the genetic scissors snip out the introduced gene and, presto, it is not passed along to future generations... (Of course, preventing the new gene’s transmission to future generations would also defeat the hope of permanently lopping off a diseased branch from a family tree)... There is no easy technological fix for another ethical worry, however... It isn’t hard to foresee a day like that painted in ...[th]e... film *Gattaca*, where only the wealthy can afford to genetically engineer their children with such “killer applications” as intelligence, beauty, long life or health. “If you are going to disadvantage even further those who are already disadvantaged,” says a [bioethicist... of Albert Einstein College of Medicine, “then that does raise serious concerns.” But perhaps not enough to keep designer babies solely in Hollywood’s imagination... The necessary pieces are quickly falling into place. The first artificial human chromosome was created last year. By 2003 the Human Genome Project will have decoded all 3 billion chemical letters that spell out our... genes. Animal experiments designed to show that the process will not create horrible mutants are underway. No law prohibits germline engineering. Although the National Institutes of Health now refuse to even consider funding proposals for it, the rules are being updated. And where there is a way, there will almost surely be a will... As [the scholar] says, “We know where to start.” The harder question is this: do we know where to stop?

...Twenty children have already been born in what critics warn could be the first step towards designer babies. Figures on the controversial technique are revealed in a public consultation document from the British Human Fertilisation and Embryology Authority about whether genetic screening of embryos should be extended. The technique involves selecting embryos and checking for genetic defects. Only defect-free embryos are implanted in the womb. All the 200 [gals] on whom the technique has so far been tried wanted to avoid passing on serious genetic disorders in their families, including cystic fibrosis and Huntington’s chorea. But pro-life groups say the technique is meddling in human evolution and could be used to select qualities like intelligence and sporting prowess. They fear advances in the technique will trigger growing demands from parents seeking the “perfect” child. [However, t]he embryology authority said: “This isn’t about the creation of designer babies, but it is about helping families avoid passing on serious genetic diseases... They would not be allowed to select embryos for social, physical or psychological characteristics.”

...THE WORLD’S first genetically altered babies... are healthy. The technique used to “make” the 30 children has been widely criticised as unethical. Genetic finger-print tests on two one-year-old children confirm they contain a small quantity of genes not taken from either parent. The extra genes were taken from a healthy donor and used to overcome the mother’s infertility problems. The additional genes the children carry have altered their “germline”, or their collection of genes that they will pass on to their off-spring. Altering the germline is the thing most scientists see as unethical because of lack of knowledge. It is illegal in most countries and the American government will not fund experiments into it.

...Genetically altered babies may have been born... [in the US] under the revolutionary treatment that came to light at the weekend... [U]p to 30 children could be carrying genes from three people – father, biological mother and [the] egg donor. The technique has been used since 1997, but has only now attracted attention after researchers checked for the first time to see if the children ended up with genes from both [mothers]... New Jersey’s Institute for Reproductive Medicine and Science at St Barnabas... treated 30 [patients] who gave birth to 15 babies. But another 15 have since been born after the use of the technique at other facilities in the US... The treatment is used for a rare form of infertility in [gals] who have fertile eggs but whose resulting embryos die before they can be implanted in the uterus. Researchers at St Barnabas injected donor DNA that contained mitochondria, tiny self-contained structures that use oxygen and nutrients to create energy cells, into the defective eggs... The view of most experts was that the children were in no danger from having their eggs manipulated in this way... Having DNA from a donor implanted into the mother’s egg would make “absolutely” no difference to the genetic make-up of the children. The genes in the mitochondrial DNA were the same ones the children would have had anyway, because they were the same in everyone. In the US, clinics which do not receive Government funding are

legally able to carry out ground-breaking research with in-house approval from their own ethics committees... The technique would theoretically be legal in N[Z], but would have to gain approval from the National Ethics Committee on Human Assisted Reproduction... an independent body set up to advise the Government on fertility issues. It is unlikely such approval would be granted... Two bills dealing with reproductive technology are before Parliament's health select committee... One of Australasia's leading fertility experts, [the]... medical director of A[US]n fertility clinic Sydney IVF, said... fertility researchers in A[US] were "reluctant" to begin carrying out this kind of treatment until it was better understood.

...The American doctor who trumpeted a fertility treatment using three genetic parents failed to disclose that along with 15 healthy babies it produced two fetuses with a rare genetic disorder. Experts are horrified because the fault can be passed to future generations... The first unborn foetus was aborted and the second miscarried after both developed... Turner's Syndrome, a rare disorder in which an entire chromosome is missing. Two out of 17 far exceeds normal statistical expectation... [The doctor had] denounced as "hysterical" growing criticism of his claims that the research posed no risks... "Many of the techniques I carry out in America are illegal in Britain but that does not mean they are immoral."

...A decision to let a British couple use [IVF] to create a "designer baby"... is under fire from ethical campaigners. The move was a "dangerous precedent" that could be commercially exploited, said... Britain's Medical Ethics Alliance. The Human Fertilisation and Embryology Authority has ruled that... [a] couple... from Leeds, can use "pre-implantation genetic diagnosis" to "create" a baby whose cells could then be used to cure their son... who suffers from a rare blood disease. The *Independent on Sunday* has established that more than 50 [Brits] are pregnant with so-called designer babies, conceived to help cure an older sibling with a life-threatening disease. It is understood two N[Z] families were among parents at a Melbourne unit who wanted to have genetically engineered babies to save their seriously ill children... In Auckland, the Starship's clinical director of haematology and oncology... said N[Z] specialists would always take a keen interest in new medical developments and carefully assess the results achieved. Whether such a programme would be appropriate here... require[s] careful ethical consideration. Fertility Associates medical director... was not aware of any such applications to the... National Ethics Committee on human-assisted reproduction... and specialists here did not regard it as a high priority... [By the way, a] high proportion of [NZ gals] know that folic acid can prevent birth defects such as spina bifida but comparatively few take it. Research... found that 91[%] of the 191 pregnant [people] studied had heard of folic acid and 62[%] knew taking it was important in preventing... birth defects. However, only 17[%] actually took folic acid in the crucial time surrounding conception, compared with 31[%] in AUS]n and British studies... [Although the] Christchurch Medical School researchers who conducted the [local] study say their findings can be partly explained by the high rate of unplanned pregnancies – 55[%] – among the participants[, they also] say their findings emphasise the need for an effective public health strategy to ensure all [gals] of child-bearing age have an adequate folic acid intake... The Ministry of Health recommends... all [gals] of child-bearing age consume a daily 0.8mg folic acid supplement [a] month before and 12 weeks after conception to reduce the risk of a child being born with a "neural tube defect." ...The [chairperson of NZ's] Medical Association... says that taking it before pregnancy is important as neural tube defects occur 25 to 29 days after conception when many [gals] are unaware they are pregnant... Foods containing a large amount of folic acid include whole-wheat breads, spinach, broccoli, liver, lentils and kidney beans. It is also in some vitamin pills... In the U[S] folic acid is added to all grain products, in Britain it is added to certain foods, and "selective fortification" might be introduced here.

...A British hospital is pioneering a technique that allows HIV-positive [guys] to father children with virtually no risk of passing the infection to their... partners or the foetus. The technique, known as "sperm-washing" has been performed at London's Chelsea & Westminster Hospital, Britain's leading centre for the treatment of HIV. The first pregnancy from this treatment has already been confirmed... The washing is possible because HIV is carried mainly in the seminal fluid and non-sperm cells, not the sperm... To wash the sperm, a semen sample is spun for 20 minutes at high speed in a centrifuge. The force pushes the sperm through the fluid, leaving the infected semen plasma and non-sperm cells at the top. The sperm is mixed with another solution and centrifuged again. The tube is incubated and after about 30 minutes the sperm try to swim up the tube. An HIV test is done and, if the result is negative, the [partner] is artificially inseminated with the washed sperm. The treatment, for which most patients pay more than £1300... is regarded as the safest of its type available... [Incidentally, two NZers] have won approval to be inseminated with their dead husband's sperm, and a third... application is being considered... But unlike the British case... which made world headlines last year, the [NZer]'s husbands willingly provided the sperm and gave permission for it to be used after their deaths...

[In the] first known birth of its kind, a... California[n] has had a baby using sperm extracted from her dead husband. [The mother], who is in her 20s... was impregnated last July with sperm taken from her husband, Bruce, 30 hours after [Bruce] died suddenly of an allergic reaction. The couple had no other children. Acting at the widow's request, [a] fertility specialist... led a team that went to the coroner's office, made an incision in [Bruce]'s scrotum and extracted the sperm from the epididymis... The sperm was kept frozen for 15 months before [Bruce's wife] became pregnant. "I just did it because the family was in so much stress and so much grief," said [the specialist, who] has performed or supervised postmortem sperm extractions about a dozen times since 1978, when [the specialist first] took sperm from a [guy] killed in a car... [The] director of the Centre for Bioethics at the University of Pennsylvania knows of at least 45 cases in which someone has requested sperm be taken from a dead [person. ■ 'A US mother wants to use her eggs and her dead son's sperm to create his child which would be born via a surrogate then be adopted and raised by the mother']]

...A British clinic is considering helping an infertile [person] have her brother's child through artificial insemination. The [sister] is being assessed at the Bridge Centre in London and discussions with the regulatory body, the Human Fertilisation and Embryology Authority... should be concluded in the next few weeks, the clinic's director said... The HFEA was not available for comment... *The Sunday Times* said the case had shocked the IVF community and created deep divisions over the morality of treating the [sister]. Some specialists had condemned it as a form of social incest, although the [sister] would use a donor egg, the newspaper said. The [sister], who is 47... did not wish to discuss her decision, or whether or not [it] had a partner who could have fathered the child... The newspaper quoted [the] clinic director... as saying: "I do not consider this case to be any different from a [patient] receiving an egg donated by her sister. It is not incest..."

...Sperm banks for elite athletes could be the next step in society's push to win at any cost, an Adelaide academic has predicted... [The academic], of the University of S[A], said it was only a matter of time before gene pools, offering an athlete's sperm or eggs were set up as pressure mounted to produce bigger and better athletes. "There's going to be the temptation to try... A lot of ability comes from genes. The[top athletes a]re born with a tremendous potential and obviously they capitalise on it. Elite athletes are going to be offered money for their sperm in the same way that models are offering their eggs." ('Couples who want beautiful children – and have at least \$NZ28,000 – can now bid for the eggs of models via the Internet.') The academic, who... spent six months in the U[S] last year studying the effect of selection pressures in sport on the size and shape of athletes... said already in the US a sperm bank existed specifically for people with high IQs. "There are several Nobel prize winners who have admitted to donating their sperm. You have to be part of Mensa to donate and to receive sperm. It's an elitist group... It hasn't happened yet in sport but... [s]ports stars earn so much more money than scientists and they're so much more recognisable than scientists."

...My IVF baby is a genius! When [the husband] gripped his wife's hand and gently whispered, "It's time," [the wife] braced herself for the most terrifying minutes of her life. Her long, exhausting and fearful wait was almost over. At 53 years old, [the wife] was about to make medical history by becoming the oldest mum in the world to be fertilised successfully with her own egg using... IVF... Tears flowed freely as [the couple]... celebrated the magic moment when [their daughter] arrived weighing 3.3kg. [The wife] – whose first IVF baby was born two months premature and lived just 16 hours – had feared the egg might not develop properly because of her age. "The odds... were a million to one," says [the wife], now 55. Two years on, not only is [her daughter] a healthy toddler but also intelligent to the point it astounds her proud parents. "[Our girl]'s a right little

genius,” says [the husband], 43. It’s not just dolls and building blocks for [their daughter, who] uses the household computer, recites the alphabet backwards and loves science and astronomy. [The daughter] could read street and shop signs by the time [it] was one – and not only in English, but in [her mother]’s native Thai as well... As for the fact that [the mother] will be 70 when her daughter turns 17, it is of little consequence to them. “[My wife] is biologically exceptional herself... To still be producing eggs at her age is amazing. It’s not that I think a typical [gal] in her 50s should be trying to have babies. It’s more a case of [my wife] not being a typical [gal] in her 50s,”... says [the husband. The wife] points out that her mother was 54 when [it] was born, and lived to be 92. And although [the wife] would dearly love one more child, the [couple] have decided against it.

...An Auckland clinic has been given approval to take ovaries from would-be mothers and freeze the eggs in case the [cancer patients] want to give birth later on. Until now, no one in N[Z] has been permitted to carry out the experimental practice... Fertility Associates... applied more than a year ago... to get the necessary consent from the National Ethics Committee on Assisted Human Reproduction... The would-be mothers have a piece of ovary surgically removed and frozen in the hope that scientific advances will eventually allow eggs to be matured in a laboratory... This week[a] 9-year-old... cancer patient at the Starship children’s hospital in Auckland, went to Melbourne for similar surgery to keep alive her chances of later having children. [Fertility Associates] knew of two others who had [also gone to AUS] for the operation. [The] clinic had... had 12 requests in the past three months, including one from [the 9-year-old]’s parents... The ethics committee approval was restrictive and it declined to fast-track a request to include children. It was only for [gals] aged 16 to 35 who were about to receive treatment that had a significant chance of leaving them sterile. “In future it may be that we get a medical student coming to us and saying, ‘I don’t want to have babies till I’m 45 and professor of the department; put an ovary in the freezer’... But at the moment, that’s nowhere close to where we’re at.” ...A few pregnancies, mostly in Italy, had resulted from [IVF] of thawed, mature eggs... But there had been none from thawed, immature eggs extracted from ovarian tissue. Researchers had successfully matured animal eggs in the laboratory, but not human ones... The scientists were still trying to determine the optimum temperature and mix of nutrients, hormones and saline solution. Eggs contained in fluid are harvested using a fine needle inserted through the vagina to the ovaries. Tissue is obtained by partly or wholly removing ovaries either during surgery for the cancer or with laparoscopic surgery – through narrow tubes inserted into the abdomen... [In related news, a]n internationally known [IVF] expert accused of stealing... eggs was fired yesterday from the University of California at Irvine. [The expert] was one of three doctors who ran the Centre for Reproductive Health... [One colleague] was fired in March and [the other] was an untenured professor whose contract was not renewed. The centre was closed in 1995 after patients claimed their eggs were taken without their consent and implanted in other [people], resulting in an estimated 15 babies of uncertain parentage. [The expert and the professor] fled the country after the scandal broke. [The expert] is in Mexico and has not returned to face charges that [it] stole patients’ eggs. [The professor], accused of insurance fraud, is in Chile. [The other colleague] tried to save his job... [by] telling the board [it] was “not the despicable person described by the administration.” [The colleague] was not accused of stealing eggs but was convicted in 1997 of federal mail fraud in connection with clinic billing practices. The university is suing all three..., trying to recoup some of the \$US17... million paid out to settle lawsuits.

...Triple error... A COUPLE have won compensation from a [British] fertility clinic after the w[ife] had triplets instead of the twins [it] wanted.

...Colour-blind stork delivers shock... A white couple have reportedly had black twins after a mix-up at a fertility clinic. The IVF-blunder, thought to be the first in Britain, could lead to a court battle over who are the twins’ legal parents. The couple, who have not been named, went to the National Health Service clinic for IVF treatment after trying for years to have a child... During the process, sperm [was] provided by the [husband] and eggs from the w[ife]... The blunder could have been caused by the clinic using a black [donor]’s sperm to fertilise the... w[ife]’s egg, or by a black couple’s fertilised egg being implanted in the w[ife. An NHS] source, who would not be named, said: “Great steps have been taken to ensure that this sort of thing never happens. It must be a one-in-a-million chance. The big problem now is, who are the real parents of the twins?” About 27,000 couples use IVF... each year in Britain. Previous mix-ups have been recorded in the U[S] and the Netherlands.

...When [the Dutch wife] gave birth to twin boys in 1993, [the mother] and her husband... who are both white, were “unbelievably shocked” to discover that one of the babies was black. An investigation found that the Netherlands fertility clinic... in Utrecht had erred in a basic matter of hygiene. [The wife] had been injected with a pipette which had not been properly cleaned and contained sperm from her husband and a[nother guy]... DNA tests confirmed [the husband] was the biological father of one boy... and a black [guy] from the Caribbean island of Aruba was the father of the other twin... The black [guy] received counselling but... did not wish to make any legal claim to see his son. Under Dutch law, the [white couple] were deemed the parents of both boys. [The wife] said: “When I first learned the truth, my first reaction was to feel as if I had been raped. My biggest fear is that [my black son] will grow up and think his whole existence was the result of a mistake. We love our babies equally, but when you discover that one had another father the shock is unbelievable.” ...[Meanwhile, the white British] mother who gave birth to black twins... is facing a legal challenge to keep the children. The mix-up involves a black couple also trying for a test-tube baby at the same time, the *Sun* newspaper reported, quoting a source at the authority which runs the fertility clinic involved. No confirmation was available from health officials, who instead swiftly circulated a gagging order imposed on them by the High Court. The injunction also forbade naming the two sets of parents involved or the clinic... Although experts insist such mistakes are extremely rare, the case will do little to reassure the tens of thousands of British would-be parents who go through IVF treatment each year. “It’s always there at the back of your mind – what if they’re not mine?...” said... [a mother] who gave birth to IVF twins after six years of trying to conceive. “It’s just awful that somebody’s mistake has made a mess of a lot of lives... This has been noticed because the babies were black. What if it had been two white couples?” A Department of Health source admitted there had been a “seriously unfortunate error”... “It’s our worst nightmare,” said [the person] in charge of the London Fertility Centre’s laboratory... A court hearing has now been scheduled... to determine who is the biological father of the twins. After the white mother gave birth, the twin babies were clearly dark-skinned and the couple were horrified to think something could have gone wrong. But they are determined to keep the children.

...The practice of giving infertile [gals] hormone treatments to increase the chances of pregnancy carried such a high risk of multiple births that doctors should avoid the treatment... [A doctor at] the Centre for Human Reproduction in New York, and his colleagues... spent 2 1/2 years studying 1494 [patients] who received the gonadotropin hormone treatments, which spur egg production in the ovaries. The team was trying to find a way to use the hormone without creating multiple births, but... concluded it was not possible. Multiple birth babies are frequently premature, low-weight infants in need of expensive, neonatal intensive care. Of the 441 [patients] who became pregnant, 9[%] had triplets, quadruplets, quintuplets or sextuplets. The natural rate of such multiple births is 0.01[%]. The researchers said a better alternative might be [IVF] because, with the test tube baby technique, doctors could implant just two fertilised eggs at a time. This procedure dramatically reduces the risk of a [patient] having more than twins... □ N[ewborn] twins from the Colombian U’Wa tribe who risked being sacrificed by their tribe because of a belief twins are demonic, are now in social care. The... boy and girl were born in the border state of Arauca, close to Venezuela. They owe their lives to the fact that they were born in a clinic and were immediately placed in care, said the Colombian Institute for Family Well-Being. According to U’Wa tradition, twins... have to be put to death to protect the community from punishment by the gods. Ordinarily, twins are drowned in a river or left to be eaten by ants.

...Months ago, Peruvian doctors gave [a couple]... the worst possible prognosis for their twin boys joined at the spine – sacrifice one of their lives so the other might have a chance to live. The boys shared intestinal and urinary organs and had a minimal chance of survival... [However,] a team

of... 20 surgeons... at Miami's Children's Hospital performed a successful 13-hour operation that separated... [the twins], a risky procedure that included disconnecting the fused spinal cord the boys shared... Doctors predict they will be able to walk, run and play like any other children.

...AN operation to separate Siamese twins – killing one child – can go ahead, a British court has ruled. The ruling goes against the wishes of the six-week-old twins' parents, who say God should decide if the girls should live and for how long. Doctors say without separation, both will die within months. Separating them will kill the weaker girl, who depends entirely on the other for blood. A panel of three Appeal Court judges in London voted unanimously to allow the separation, backing an earlier High Court ruling. Lawyers say the family hasn't decided on an appeal.

...British surgeons... succeeded in separating three-month-old Siamese twins, sacrificing one girl... so her stronger sister might live. The surgery ended weeks of legal wrangling over the ethics of operating on the sisters and went against the will of their Maltese Roman Catholic parents, who... came to Britain seeking medical help... A spokes[person] for St Mary's Hospital in Manchester said the [stronger] baby, known as Jodie, was in a critical but stable condition. "Unfortunately, despite all the efforts of the medical team, Mary... died." ...the next 36 hours would be critical for the [surviving] baby, as her organs adjusted to operating within a much smaller body mass... The girls... were born... joined at the abdomen and with a fused spine. They shared a heart and a pair of lungs. Doctors said before the operation that Mary... would suck the life out of her stronger sister unless they were parted. Thus the 20-strong operating team had to set out expressly to save Jodie by ending Mary's life: a stance fiercely opposed by Catholics and anti-abortion campaigners. The... Pro-Life Alliance accused the hospital of hypocrisy for claiming it had tried to save Mary.

...T[he 39-year-old] had a nightmare last week. [The American] woke up sobbing, relieved to find her sister... right next to her where [it] has been since the Siamese twins were born... "In my dream, [my sister] and I had been separated," [the dreamer] says, shuddering. "I felt so terribly lonely." The[y]... are the rarest form of Siamese twins. They have separate brains and bodies but share skull bone, tissue and blood vessels which bond [one sister]'s upper left temple with [the other]'s just above their left eyes. At the top of their shared scalp, [the dreamer]'s brown hair fades into [her sister]'s auburn. They look in opposite directions and can see each other's face only in mirrors. The effect is like watching two people in a permanent headbutt. In conversations, the twins, always polite, rotate their bodies so the one talking faces the visitor. [The auburn twin] has spina bifida and, at 150cm, is 10cm shorter than [her sister. When the taller sister walks, the shorter one] rolls alongside on a wheeled stool. "It's the easiest way for us both to get where we need to be,"... Both twins are adamantly opposed to any thought of separation, despite huge advances in surgical techniques since their birth and the fact that whenever [the taller one] bends down to open a cupboard or pick up a magazine, [it almost yanks the shorter one] off her stool. As children, they endured years of vicious teasing. As adults, they still get plenty of rude looks, yet they passionately supported the parents off the Maltese] Siamese twins Jodie and Mary... The rich life [the 39-year-olds] lead is powerful evidence for their argument against separation... Although it might seem they ought to agree about everything, they emphatically do not. For instance, [the taller twin] doesn't drink coffee. [Her sister] has to have a cup before work... as a country and western singer. Seven years ago, [the shorter twin] passed the first phase of exams required to become a doctor but medicine was not her biggest dream. [The twin] always wanted to be a star and, in 1993, her singing was heard by an agent from Nashville. A contract followed, [the twin] changed her name... and soon had a list of concerts. In 1997, [it] was named Most Promising Newcomer at the US Country and Western Music Awards... When [the singer works, her twin] sits on stage but plays no part in the proceedings. [The singer] does the same when [her sister], a trained nurse, takes jobs in local hospitals. All the elements of their daily routine have been worked out... The twins say their survival has depended on learning to live as two while being essentially just one. Nowhere has this been more challenging than in their love lives. "I like to date," [says the taller twin]. "I am a red-blooded American [gal]." "And you like a red-blooded American [guy]," says her sister] as both... dissolve into laughter. [The red-blooded twin] has had two serious boyfriends and, although [the gal] will not discuss it, the relationships included physical intimacy. Given the close proximity [the smaller twin] is forced to share with any of [her sister]'s boyfriends, it might be expected [the singer] would have a veto but that was not so. "I do not feel [like my sister] has to like my boyfriends... [My sister] actually has no say." [Her twin] is quick to agree. "When [my sister] is with a boyfriend, I am in my own world. I don't even know... [the guy is there." The taller twin]'s last serious relationship continued for more than two years and almost led to marriage. "I would like to have children... [My] fiancée... wanted them as well but we couldn't agree on where to live..." ...The sisters share an easy sense of humour and are philosophical about their situation... They... know if one of them dies the other will die soon after. "We came into this world together and we will go out that way... There is nothing on earth which would persuade me to separate..." ● [The 27-year-old Iranian Siamese twins who said they'd rather die than stay joined together, died following their operation to be separated.] Editor's note: 'The chances of a NZer having Siamese twins are 1-in-250,000. In India and Africa the chances are 1-in-16,000.' Normal twins]... occur once in every 80 births['the chances of having twins increases with age' and '60% aren't identical.' 'Identical twins are amongst the most studied people in the world.' 'We don't know exactly why twins occur, but their genes predispose them to lead identical lives and seek out identical things' ('growing evidence confirms that how twins turn out has more to do with genetics than their upbringing').

...Each year thousands of twins converge on the tiny town of Twinsburg, USA, hoping to meet, marry and live with another perfect matching twosome.'

...a set of NZ twins... are so in tune they've run neck and neck in their last three races. Even a photo finish couldn't split the Wanganui 14-year-olds as they went head and stride three times over the past fortnight over 200m and twice over 100m. Neither is bothered about not being able to shake off her perpetual shadow. "It's just real weird," said [one]. "We don't plan it to happen." ..."When you actually watch it, they are trying to beat each other,"... their father... said... "There have been quite a few twins who were close, but there is nothing about dead heats," said... [an athletics statistician, who] would forward details to the *Guinness Book of Athletics Facts and Feats*.

...Close-up siblings one for the book... [A pair of] Palmerston toddlers... have cracked a world record – their birthdays are closer together than any other siblings from separate pregnancies. [The boy] was less than seven months old when [his sister] was born, just 208 days after him, on March 30 last year. The previous *Guinness Book of Records* entry was 209 days. Their parents... say claiming the record is "just a bit of fun", but their other children, [aged] 10, and... 9, are thrilled. The couple received verbal confirmation of the record last month. But it's a record that wasn't easy to achieve, and it's still not all plain sailing... [Although the youngest child] is growing, walking and trying to talk, [it] carried the legacy of her premature birth. [The girl] was born at 24 weeks and weighed just 700g. "[It] really just looked like a baby bird. Her eyes weren't even properly formed,"... Photographs from those early days, when her parents didn't expect her to survive and arranged a hasty baptism, show [her mother]'s wedding ring fitting over... [her arm. The tiny child] was in care in Auckland for about seven months, a heart-breaking separation for the family... [Now the girl's at home it] still requires technical care and attention... [The girl]'s still just 8kg, and has a tracheotomy tube in her throat to keep her breathing passages open. "Her throat's tiny – the size of a grain and a half of rice,"... The tube needs changing once a week, and often needs to be suctioned to keep it clear. Twice in three weeks over winter the tube blocked and [the girl] turned blue and nearly died. When [the girl] is 4kg heavier [it] will need another operation to rebuild her throat and replace the tube with a metal one. Meanwhile, [the determined girl] eats what every other child enjoys... can make a range of noises, or use a mechanical voice box, or use sign language to communicate. It is hoped her throat can be repaired for her to talk normally. [● In 1997, 'an Englishperson gave birth to time-lag twins who were conceived a month apart. The Leicestershire housewife, aged 38, was the first recorded case in Britain of a mother conceiving naturally during different monthly cycles.']

...An Italian... is due to give birth in a hospital in Rome this week to a... girl – before returning three months later to have triplets. If both deliveries are successful, it is thought... this will be the first such case in history. [The mum], aged 20, denied suggestions that [it] might have had hormone or fertility treatment... "When I was at the sixth month of my pregnancy and went to see the doctor for the usual tests and scans, [it] noticed that, apart from [the 6-month-old foetus] there were another three babies... I remember asking ...h[im] to make sure because I just couldn't

understand how it was possible.” [A p]rofessor... of the London Fertility Clinic said it should not theoretically be possible... to be pregnant twice at the same time. “Normally when you are pregnant you switch off your ovulation, and you don’t then ovulate again and you have no periods until your child is born and you are at least part the way through breastfeeding...” [The p]rofessor... said the condition, known technically as superfecundation, occurred rarely in animals[, but that] it was unheard of for a [member of our species] to conceive naturally and then to spontaneously ovulate three eggs again.

...It was a case of double and triple trouble yesterday when... Auckland twins and triplets met at National [Gal’s] Hospital for celebrations marking Multiple Birth Awareness Week. Each year about 700 sets of twins, 12 sets of triplets[(‘there is a 1-in-6000 chance of a human having triplets’)] and one of quads are born in N[Z], and the incidence of multiple births is rising. This is not so much due to fertility drugs as the fact that [gals] are having babies later in life, when the likelihood of producing more than one egg increases.

...To outsiders, it seemed the... quintuplets of N[Z] had everything. Believed to be the world’s first naturally delivered quintuplets, they were the darlings of our nation. We watched them grow up. The media covered their every milestone, from their first step to their first day at school. Even the Queen sent a telegram and... [NZ’s PM] paid a personal visit after [the four girls and one boy] were born on July 27, 1965. And if looks are anything to go by, the... quins... would still seem to have it all. Blessed with good looks and sporting brilliant smiles, they could be the cast of a glamorous US sitcom. But life has been anything but a sitcom for the[m]... Their parents... divorced. By the time the children were [9 years old, their mother] Ann – a former beauty queen – desperate to establish a secure family life, had wed [a]painter and wallpaper hanger... Far from creating security, however, Gary tore the close-knit family apart. His erratic mood swings plunged their suburban world into one of violent beatings, drunken fights... and... emotional manipulation... From the age of [9 to the age of 13, one girl] was sexually abused by Gary. “I ran away from home when I was 14. I had had enough of the abuse... I hitchhiked to Waihi. I got myself into a real state... I had been drinking since the age of 13. It wasn’t until I saw... mother on television pleading for me to come home that I realised what I had done...” At 15, [the runaway] left home again. Every time her mother tried to find her, [it] moved on... Unlike her siblings[, one of the quins] was thrilled when Ann remarried. But her happiness was short-lived. Soon after... [the honeymoon, this quin] caught her new stepfather kissing another [gal. The quin] innocently told her mother, who confronted Gary. That night, [Gary] went berserk. “Gary took [Mum] into the bedroom, and we heard yelling, bangs, crashes. I knew something bad was happening. Gary kept her prisoner there all night... I used to lie in bed shaking; my nerves were so edgy. I no longer woke happy. I would fret about what Gary’s mood would be.” ...before Gary... [the quin’s] early years... were happy ones. Growing up on four hectares at Auckland’s then developing Hobsonville was “heaven”. They didn’t have a lot of toys, but relished the freedom of playing in wide, open fields... When Gary shot [her] cat in front of her, [Gary] manipulated his apology to gain her comfort. “[Gary] was lying on the bed sobbing, saying [it] felt bad and wanting to say sorry. I thought I should comfort him, but [Gary] took that attention and, in a sick way... took advantage of me. People need to know... sexual abuse is not acceptable. I have no shame because it was not my fault. When I found out it had happened to [one of my sisters as well], I felt doubly betrayed.” ...[another of the girls says, “Everything changed when Gary arrived. Gary] wanted Mum because [Ann] was so beautiful... But after they married, Mum wasn’t there for us. [Gary] would take her to work with him and not come home in time for dinner. [Gary] didn’t let her out of his sight... Mum became so sad. [Mum] tried to give us her love, but it was hard. [Mum] didn’t know what [it] was in for. Some of her friends knew what Gary was like, but... [n]o-one warned her.” ...This reign of terror lasted seven years, until... Ann... decided to leave Gary... [But] Gary, an untreated manic depressive and alcoholic, shot Ann dead in front of her [kids], then turned the gun on himself. It was the day after St Valentine’s Day, 1982. The quins were 16. Racked with grief, the quins and their older sister... scattered to escape their tragedy. For the next decade their lives were a rollercoaster of self-destruction. It wasn’t until their birth father... became terminally ill that they were reunited... [■ One of Canada’s] three remaining... quintuplets, has died of cancer. The 1934 birth of Yvonne and her four identical sisters to an impoverished couple in the small town of Callander... was hailed as a medical miracle. At the time, they were the only known quintuplets to survive more than a few days, their combined weight being only... 6.5kg... When the Ontario provincial government deemed the... parents unfit to care for their... girls, the quins were put in a specially built hospital – Quintland – where they became a moneymaking tourist attraction during the lean Depression years. More than five million tourists viewed the girls there through one-way glass. All the girls survived to adulthood... One sister, Emilie, died in 1954; another, Marie, died in 1970... The three surviving... quins eventually sued the Ontario government for separating them from their family and putting them on display. They received a \$US2.8 million... settlement... in 1998.

...A 27-year-old... has given birth to the first known set of surviving octuplets. The six girls and two boys, who weighed from 311g to 708g, were in critical condition and on ventilators at Texas Children’s Hospital... “When you get to these high-order multiple pregnancies, the uterus is so large it’s unusual to be able to keep a pregnancy to the point where you deliver and the babies become able to survive... It will be a remarkable feat if all the babies do survive,” said... one... doctor... Each baby added to a pregnancy tends to shave... three weeks off the time a... uterus can hold out before going into labour... The mother, [a]Nigerian immigrant... spent the last two weeks of her pregnancy reclining virtually upside down to keep pressure off her lower body... One of the girls was born vaginally on December 8, 12 weeks premature. But labour was delayed and the other seven were delivered yesterday by caesarean section, 10 weeks early... [The mum, who] had taken fertility medicine... was in a stable condition. The octuplets were the first children for her and her husband... They had been trying to have a baby for some time and earlier this year... miscarried triplets.

...The world’s only living octuplets are winning their fight for life and are expected to be taken off a mechanical ventilator by today, doctors said yesterday. “Today we stopped sedating them, and we gave them all caffeine to improve their breathing,” said... [the] head of the neonatal unit at St Luke’s Episcopal Hospital in Houston... All the babies are already on basic room air... except for Baby E, the smallest. The four-day-old girl, whose name... means “God has my life” in the parents’ Nigerian Ibo tribal language, is still on... 75[%] oxygen... The babies’ father... was still stunned...

THE birth of octuplets... has reignited debate about the ethics of a... risky multiple-birth boom. The boom is driven by aggressive fertility treatment and results every year in thousands of miscarriages, stillbirths, infant deaths and disabled children... The births may be a miracle, but whatever the outcome, it’s not a miracle that physicians or ethicists would like to see repeated. “I think it’s yet another wake-up call that brings into question the relatively unregulated practice of infertility treatment in the U[S],” said an] ethicist... of Case Western Reserve University in Cleveland. Doctors don’t rule out the possibility that someone will manage to push the envelope even further. “Yes, you could have nine or 10. But I suspect the outcomes would be horrible. What infertile couples want is to take home a healthy baby, not to have a baby die or... who’s significantly impaired,” said... a specialist in maternal and foetal medicine at Hutzel Hospital in Detroit. Even fertility doctors say treatments leading to [7- and 8]-foetus pregnancies are out of line. “Obviously we wish the [octuplets] and their family the greatest good luck, good health and fortune, but we cannot as a medical community be at all happy that this event took place,” says... a fertility specialist in Washington who is on the board of the American Society for Reproductive Medicine... The octuplets... are part of a trend that began in the 1970s when fertility treatment became widespread. Births of triplets or more have quadrupled since. And the trend has accelerated in the 1990s... The pressure to get babies leads doctors “to do risky, dangerous and inexcusable things”, said [a spokesperson for] the University of Pennsylvania Center for Bioethics. “The first goal has got to be the health and safety of babies, not success rates, not the numbers of babies.” ...Even in the best circumstances, such births put an extraordinary burden on families, physically, emotionally and financially, said... a specialist in high-risk newborn care at University Hospital at Stonybrook, New York. There’s upwards of a 90% divorce rate if there’s a damaged baby in the house... One thing doctors could do... is to more aggressively promote selective abortions... a “horrible, miserable choice” but often the best available... But fewer couples would get to that

agonising decision point if doctors were less aggressive in efforts to achieve pregnancy. Leaders in the... field agree some doctors are irresponsible but say most are doing their best with imperfect technology and pressures from potential parents to make the most of each costly treatment cycle...

Weak but radiant with pride, the mother of the Houston octuplets has gone home from hospital, saying the pain and fear of her pregnancy gave way to wonder and gratitude the moment [it] gazed upon her eight babies. "When I saw them for the first time, I was so amazed at what God blessed me with,"... The 27-year-old... was wheeled out after visiting her seven surviving children, who remained in hospital in a critical but stable condition. If all goes well, they could join their mother at home in two to three months... There was no welcome-home gathering of the couple's neighbours. Some said they would do what they could to help, but many admitted they did not even know the couple and were first introduced to the new parents with the rest of the world... Plenty of aid is already pouring in. As with the septuplets of Carlisle, Iowa, companies have donated baby products, food and other goods and services... The... nurses... bestowed on the new mum eight silver spoons and eight baby bibs.

...A BABY was offered for auction yesterday on the eBay Internet site, a magnet for world wide web auctions, but no bids were received. The starting price for the... boy due to be born this month, was \$US100,000... eBay... said the offer would be removed from the site. The company has not put in place any automatic mechanism to stop prohibited articles like firearms or animals from being placed for auction on its site. According to the advertisement for the unborn baby, his parents are law students in Chicago. A judge would preside over the transaction. Selling babies is illegal in the U[S - where an]... Arizona couple in their 50s yesterday became the legal parents of six boys and four girls, aged... 4 to 17... one of the largest groups adopted in the U[S]. "Everyone thinks we're crazy, but the pros outweigh the cons," said [the new] mother... "The kids are the best things in my life." ...[the couple] spend \$US1500... a month on groceries, [and] have converted a garage and dining room to create a six-bedroom house with three bathrooms and 11 televisions. Police found the children in April 1995 after their mother abandoned them in a rubbish-strewn house.

...An alarming rise in children abandoned by penniless parents has forced South Korea to confront one of its most vexatious social issues - the adoption of its children by foreigners. Thousands of children were left at orphanages and other shelters last year - the sad legacy of a savage recession which has fragmented countless traditionally tight-knit families. For this reason they are called "IMF orphans," after the International Monetary Fund which bailed out Korea's crippled economy in 1997 and is blamed by some for the slump. For cultural reasons many parents never retrieve these children, and most Koreans are reluctant to adopt as they believe it taints their family bloodlines. As a result, the children live as orphans despite having parents. "Parents leave their children here for up to six months promising to return. But 90[%] don't...," says... the director of a children's home in Kyonggi Province... Her centre cares for 80 children. In desperation, the Health and Welfare Ministry is considering taking the extraordinarily sensitive step of lifting the annual cap on the number of "orphans" available to foreign parents. The limit was imposed a few years ago after an outcry at the country's growing reputation as an exporter of unwanted children. The cap stands at about 2000, but in the first half of last year alone nearly 5000 children were left at shelters, usually by an unemployed father whose wife has fled. Child welfare workers say the true number could be up to triple that. Only 3500 found new parents in Korea and overseas last year. The step will anger many Koreans who see foreign adoptions as a national shame. But as a ministry official said: "Domestic adoption is rare in Korea. It is best to send the children abroad where they will be loved and wanted." It is unlikely the limit will be scrapped altogether. But the fact that lifting it even slightly is even being considered suggests the orphan problem is worsening. Orphans are social outcasts in Korea. "Orphans here are non-existent, non-human," explains... [the person] who last year started the country's first foster-parents association and cares for three abandoned children in her home. "You can't get married... can't get a good job. Here you don't marry a person, you marry a family and try to get financial advantage." [It] believes abandoned children numbers have jumped by 30[%] since the recession began... Most Korean orphans have at least one parent. Nonetheless, they remain orphans because their parents will not find a new partner as long as they have a child from another bloodline... Foreign adoptions began as the country recovered from the 1950-1953 Korean War. The bustling trade went virtually unnoticed until the 1988... Olympics, when... Seoul... was anxious to put its best foot forward. Dog restaurants were outlawed, and the orphan trade was hushed up. The cap was imposed a few years later.

...SIX years after the fall of the Soviet empire opened the floodgates to adoptions of children from the former Eastern Bloc, a small but growing number of American couples are giving up the children they adopted there. The parents in these cases say their adopted kids[- who usually]... came from warehouse-like orphanages[where they were rarely] touched or held as infants... [-] have psychological problems too difficult to handle. They cannot bond to their caregivers. They are destructive, often dangerous. And they are unravelling the lives of their new families... Several doctors who have worked with adopted East[ern] Bloc children say about one third have serious problems and another third have less severe problems such as learning disabilities or development delays... Others say the fault lies with the new adoptive parents, many older, first-time parents. They say these new parents have unreal expectations. Whatever the case - and each case is unique - the issue sparks heated passion, and much controversy... [One couple] were desperate to become parents after struggling with infertility for years. They considered surrogate motherhood and adopting in the US[, but eventually]... decided the former Eastern Bloc provided the best hope. They were thrilled when the director of a Missouri adoption agency told them [it] had found an adorable child in Romania: [a 2-year-old who is] "perfectly healthy, very beautiful and hugs everyone..." ...The adoption cost \$25,000, but as soon as the [couple] saw their new daughter, they knew something was wrong. "[The child] was totally mute... never made eye contact with anyone... gnawed on everything... would lick the floor, chew on people's shoes... was in constant motion, spinning in circles, flapping her arms, banging her head,"... [They took the child] to a developmental psychologist in Kansas City[, who] told them their daughter was profoundly retarded and suffered from a bad case of [FAS] caused by her mother drinking during pregnancy. After 150 trips to doctors and therapists... and another \$15,000 in medical fees financed by selling their car, spending their savings and taking out loans, the [couple] decided they had no choice but to give up... Now again childless, but also guilt-ridden and heavily in debt, Mrs [Adoptive] says it was "the worst thing that's ever happened to me in my life"... About 3700 children were adopted by Americans from Russia and eastern Europe last year. Most of these adoptions end happily.

...When [an Auckland couple] gave up their adopted baby, they never thought they'd be parents again... The moment when a father first holds his newborn baby in his arms is always emotional, but for one Auckland [father], it was particularly special... [R]eaders will remember the tragic story of how [the couple]... gave their adopted son... back to his birth mother last January, after seven months of loving and caring for him. The [birth-mother] had changed her mind about the adoption and, rather than continue the legal tug of war over his custody, the couple decided to give their much-loved son back. The heart-breaking decision left the couple shattered but they always held firm to the belief something good would come of their unselfish act. And it did. The joy [their own] four-month-old... has brought into their lives is more than they could ever have hoped for... After losing [their adopted son], they decided to rebuild their lives, accepting their future would never include children. So the couple, who had been told they could not have children naturally and had tried fertility treatment - including IVF - before turning to adoption, couldn't believe it when they discovered [the wife] (40) was pregnant... [While on the topic of adoptions,] local police confirmed that [a]... five-year-old boy from Papua New Guinea's Western Highlands has... been sold... for \$NZ2200 and 17 pigs... to a... [guy] from Bundi, in Madang, who had four wives but no children.

...The British couple who bought twin babies over the Internet were yesterday fighting a losing battle for public credibility. It has emerged that they complained of an evil spirit in their home and are negotiating with a Hollywood studio about a film of their story. Flintshire social services are investigating the adoption... amid claims that the [couple broke US] law. The twins have been taken into social services care... The [couple] paid an internet firm £8200 to adopt the babies, but they had already been sold to [an] American couple... who claim they were duped by an adoption agent into giving them up. [US] lawyers yesterday predicted that US courts would order the return of the babies to California, where they were born.

...[the]y are just six months old but they have been bought and sold twice over the internet... The twins are at the centre of an international tug of war which has revealed a seamy side to internet adoptions and pitted two couples desperate for the children against each other. The saga began when the twins' natural mother... [-] a 28-year-old hotel receptionist from Missouri [-] decided to give the girls up for adoption and arranged for an agent... from the Caring Heart agency, to advertise them on the internet. A couple from California... paid \$NZ13,725 for the pair. They looked after the girls for two months in San Diego. But as the [California]ns were finalising the legal adoption paperwork, the girls' mother took the twins back, claiming [it] wanted to say a final goodbye. Instead, [the birth-mother] handed them to a British couple... who were willing to pay more. The couple had paid... \$27,603 as a "non-refundable arrangement fee." They took the twins... and set off on a 3000km drive across the US, pursued by the [Californians. First the British couple] drove to St Louis, Missouri, to get the babies' birth certificates. Fearing the [California]ns would take the twins back, they made a dash to Arkansas, where looser adoption laws allowed them to quickly complete the adoption papers. They later flew out to their home in north Wales with the twins, who have been with them since. Now a transatlantic row is in full flight between the British and American couples over the right to the twins... Things became heated when the competing couples had an angry confrontation by satellite link live on British television... The British Government and the FBI are investigating the adoption. In the latest twist, [the British wife has admitted it] lied on adoption forms. Her admission could mean that the adoption is invalid, and the girls would have to go back to the U[S]... The British Home Secretary... has labelled the way the girls were traded "revolting." "It is illegal, completely illegal, in Britain for people to buy and sell babies or children..." N[Z] laws also ban buying or selling children. A *Herald* search of the internet found it took only a few minutes to source foreign adoption agencies.

...[a 'couple who adopted a 6-year-old have won compensation for being denied crucial information about his behavioural problems.' In further news from Britain, t]he... couple at the centre of a tug-of-war over twins adopted on the internet have vowed to keep fighting for the babies in a court battle that could run for months... [Hubby] said: "We have right on our side. I am convinced of that. Whether that is enough remains to be seen."

...Adopted children are the hottest fashion accessory for career-minded gals in LA who can't spare nine months out of their hectic schedules.

...ADOPTING children is not like shopping – best to discuss thoroughly before purchase. The divorce petition [a US actress filed against her actor] hubby... will be her [second] and his fifth. According to [the wife's] petition, the couple separated... just weeks after adopting a Cambodian orphan.

...[the Maori]'s mum and dad got her when they went on a "shopping" expedition. [The child] was only a few weeks old, and those people [it] now calls mum and dad were, in fact, her aunt and uncle. "My aunt and uncle didn't have any children so they just went shopping, going to all the people who did have children... They said, 'I'll have that one, that one, that one.'" Her uncle was the head of the whanau, her aunt the tribe's peacemaker. [The niece] was given into their care so [it] could inherit those roles. [Another Maori child] was 14 days old when her mother's second cousin... [who] couldn't conceive... walked into her parents place in the bush near Waitangi and carried her away in a flax basket... "The old people got together, then my foster father approached my real mother and said, 'That next baby you're going to have, I'm going to have it'. [Mum] said, 'Okay, if that will make you happy'." That relations were willing to hand over their children – and still do – will shock many Pakeha, just as many struggled to understand how [a prominent lawyer]'s sister... could have given her daughter... into her aunt's care. As the kidnapping of [the lawyer's adopted] baby... was discussed around the country, conversations often turned to how [the sister gave her daughter to the lawyer] as a replacement for the child [the lawyer] had lost when... seven-and-a-half months pregnant. [The sisters'] parents had decided that the next baby born in the family would be placed with [the wealthy lawyer and her husband], the papers said. A nation fearful for the baby was also curious about the family's arrangement. There was confusion: was it legal? Concern: what about the poor birth parents? Indignation: what about the baby? Disapproval: that isn't right. Horror: give away a baby? The practice, as we learned, is called whangai, which translated means, in context, to foster or adopt or, more generally, to feed and nourish. Another word used for the practice is atawhai, one of two phrases used to translate "the grace of God". While not as common as in previous generations, it is still frequently practised by Maori... Nearly all cultures have had adoption, and there is evidence of it as far back as 2800BC. But its form has always varied... In contrast to old-fashioned Western adoption, whangai does not involve severing ties, secrecy or even permanency. Whangai is always open... The origins of whangai are obscure, but in her 1995 study of the whanau in modern N[Z, a] former associate professor at Victoria University wrote that it developed to meet the need[s] of a whanau-based, pre-industrial culture. Maori lived close to nature with all its inherent dangers, and in a warrior culture, so children could not expect their parents to survive into old age. [The associate professor] says it was only common sense to nurture wider relationships. Whangai was welfare, counsellor and court rolled into one... No research has been done from a sociological or child health point of view. But [the professor]'s anthropological work suggests the system works in most cases. Most of the whangai... interviewed "recall their homes nostalgically as happy, caring places"... Whangai children are often treated or think of themselves as a bit special... I have never ever heard of a neglected whangai... [A] Rotorua journalist whose mother and sister were both whangai... interviewed 28 Tuhoë whangai for her research paper and found only one who felt rejected by her birth parents. Some of the birth parents... expressed great sadness in having to give their children up, but few regretted it. They saw it as normal, and the ongoing contact meant that any sense of loss was not as great as in a legal adoption, where the birth parents can be cut off. In the past, birth parents seldom had a choice – whangai were typically organised by kaumatua and kuia for what they saw as the greater good. That's changed, and while birth parents can still come under immense pressure to accede to the whanau's wishes, they almost always have the right of veto... The main reasons for whangai today are to deal with teenage pregnancies, or if couples are poor. Often a family member will take the child for a few years then return him or her.

...WHO'S YOUR daddy? In a victory for [gals] everywhere... Florida's "Scarlet Letter Law" will be struck down this week. The law requires mothers who don't know who fathered their children to advertise their sexual history in local newspapers before placing the children for adoption.

...A three-day-old oryx antelope calf "adopted" by a lioness was rescued yesterday and transferred to a private game sanctuary. Kenya Wildlife Service staff grabbed the calf, separated from its mother by a lioness... in central Kenya's Samburu game reserve. The baby oryx... was... immediately separated from the mother... [after it] was born... by the lioness, who defied nature for a second time to turn the calf into her adopted cub. Kenyan newspaper reports said wildlife officers snatched the starving calf from its foster mother as [it] went out hunting. They gently loaded it into a vehicle that took it to Lewa Downs private game sanctuary on the slopes of Mt Kenya. A team of researchers, conservationists, veterinarians and wildlife rangers unanimously decided to cut short the three-day relationship between [the oryx calf] and its adopting mother... "[The calf] had starved since birth on Thursday and, because the lioness had nothing to offer as food, it would definitely have died[.]" one wildlife... officer... said... The lioness first made headlines early last month when, much to the surprise of wildlife experts, [it] adopted her first oryx calf. For 17 days, [the lioness] starved while the baby antelope made regular visits to its lactating mother, and keeping away a family of cheetahs that tried to kill the calf. The oryx was eventually killed by another passing lion after a fight with the foster mother. Animal behaviourists at first said [the lioness] had probably mistaken the calf for a lion cub, but with the second adoption [the lioness] showed full awareness of its species.

...A lioness... has taken in another oryx calf, the third in as many months... [O]fficials might let nature take its course... leaving the calf to starve or be killed by other predators. [In related news, 'an 8-months pregnant Colombian says the baby was snatched from her womb after kidnappers drugged her and performed a rudimentary caesarean.' And a USer 'was so desperate for a baby that it killed her pregnant neighbour and stole her unborn child.']

...One in 4000 [NZers] dies during pregnancy or childbirth ● Around... one in 50 pregnancies... [results] in... detached placentas... They can kill both mother and baby... ● [During a]... birth at Lower Hutt Hospital... [a] wee boy inhaled meconium, a green substance that forms in babies' bowels while they are in the womb. It is not usually passed until after birth. However, [the boy] had not only passed the meconium into the waters around him but... had breathed it in as well, causing serious damage to his lungs... [The good news is it]'s now a happy, contented seven-month-old.

...A [patient] was set on fire during a caesarean delivery at Waitakere Hospital's maternity unit at the weekend. The fire... left the [patient]... with burns to the lower part of her body... The [patient] was last night resting in a comfortable condition in Middlemore Hospital. Her baby boy was not hurt and is with her... The Waitemata District Health Board said the fire was a freak accident... Hospital authorities and the Fire Service have launched separate investigations into how the fire started... [O]ne possibility is that an alcohol-based swabbing solution, used to sterilise parts of the body for surgery, may have been accidentally ignited... Fire services said diathermy equipment, used to cut through skin and cauterise any bleeding, was a possible source of ignition... [The board's] general manager of communications... said the baby was still in the uterus when the fire started. Staff in the operating theatre, including an anaesthetist and obstetrician, are believed to have smothered the fire on the [patient] who was anaesthetised with an epidural (a local anaesthetic injected into the region around the spinal cord). They performed the caesarean immediately... "We do extend our deepest sympathy to the mother and her family. It must have been extremely distressing. It's been extremely distressing for staff. People are pretty devastated... What happened was outside the experience of anybody in that operating theatre and... [t]hey were not young people." ...The hospital is now using an iodine-based s[wabbing s]olution, which was non-flammable, while the investigation was carried out... [The] deputy chief fire officer for the Waitakere City Fire District, said the incident was of national significance and was very unusual.

...A second case of a hospital patient being set on fire during surgery has emerged... A 24-year-old... suffered... burns during an appendix operation at Middlemore Hospital last month... A... 17-year-old was set alight during a caesarean delivery at Waitakere Hospital on Saturday.

...Waitakere Hospital is investigating a sharp rise in the number of babies being born by caesarean section... [O]ver the last three months caesarean... deliveries have gone up to 21[%], compared with... 18[%] in the past... [I]t's the decision to have a caesarean... once the [mother] is in labour that's becoming more common. "We know the rate is too high. But the reason is not clear so we are now developing a clinical audit function to determine the cause and identify the relationship between practice and outcome... All doctors practice differently and some are more likely to do a C-section... What we have to ascertain is whether there is a clinical need for it – or is there a change of practice?" ...various factors influence the [C]-section rate – induced labour, distress to the baby during labour or a threat to the mother's health... The most common reason for [C-sections for mothers] having a first baby are failure to progress and foetal distress... [O]ver the last three months 47[% of mothers] having a first baby at Waitakere... had a [C-section. "13% of mothers] having a second or subsequent babies had a [C]-section while 63[%]... had a repeat [C]-section,"...

The continuing rise in caesarean births adds weight to a British doctor's prediction that half the [mums] giving birth will choose the surgical option by the year 2010. Statistics show caesarean rates are soaring, both here and around the [First W]orld. But they also show that [mums] are not choosing surgical births purely for convenience and lifestyle reasons. At an A[US-NZ] Perinatal Society congress last week, [the]... professor of foetal and maternal medicine at Queen Charlotte's and Chelsea Hospital in London, said the risks were finely balanced between caesarean and vaginal birth[, and i]t was wrong to deny [a mother] the choice when research indicated that attempting a vaginal birth could be riskier for ...he[r or the]... baby... In 1994, the international health watchdog the W[HO] suggested that the global rate of caesarean births should be no higher than 15[%] of the total. Here, the Ministry of Health's National Health Committee has suggested the surgical procedure be "subjected to clinical audit to ensure conformity with best practice," in other words, reviewed by specialists to make sure the caesarean is being performed in the best way for the best reasons. To do this, the committee has suggested the development of caesarean guidelines and work on these is continuing. In 1989, 12[% of NZ]'s births were by caesarean... but by [this year] that figure had reached almost 20[%]. The rate was 25[%] last year at National [Gals'] Hospital – Australasia's largest maternity facility – and 27[%] at North Shore Hospital. One private hospital in Christchurch had a percentage of more than 30. At Waikato Hospital the rate, taking in total births from the greater Waikato region, is around 20[%], but would be higher if only births in the hospital itself were counted... Middlemore... comes in at just 13[%]. The assumption that a caesarean is somehow an "easier" option ignores the fact that it is a major operation and is still up to nine times riskier than a natural delivery. Without complications the procedure will take up to an hour. An incision of around 14cm is made through the skin before fat, tissue and muscle are pushed aside to allow access to the abdominal cavity and the uterus. After that, locating the baby and lifting it out are normally straightforward steps. Recovery can take several days or weeks, depending on the level of complexity... North Shore Hospital[']s maternity services manager... says... lifestyle choice and the convenience of giving birth on a certain day are not unknown... but the number of [mums] choosing a caesarean for these reasons is so small [it] can remember only a couple of cases over the past few years. When it comes to childbirth, [the manager] believes, no option should be eliminated... "Of course, if nature intended all [mums] to give birth that way they would have been designed with a zipper or a pouch – like a kangaroo." Middlemore[']s... group manager of [gals'] health... believes the rise in caesareans can be attributed in part to the evolution of modern medicine. As medical procedures are developed and improved, the risks decrease. "The risk [with caesarean] is gradually lowering to nearer the same as a natural delivery. But that leads to the question, what happens when the risk is lower than that for a natural delivery?" ...But there are still serious risks. For instance, [mothers] having a second or subsequent caesarean face the risk of haemorrhaging so badly that their uterus will have to be removed... [A] Massey mother-of-two... [- both] delivered by caesarean section... in South Africa... [-] says there is a far greater acceptance of the caesarean option... [t]here... "It seems... that in N[Z] caesarean is a last resort. I find it frightening that risks like developing toxemia (high blood pressure and enlarged tissue) are not enough to put people off having a natural delivery. There's a mindset that you must have a natural birth come hell or high water. I think that has to change." Natural birth often seems to be regarded as a competition – "it's as if you get Brownie points for the longest, most gruelling labour. It's not a contest to see who can be more of a [mum]. People just have to realise it's not the only way, and if you are considering a caesarean because you feel it's safer... there should not be a problem with your decision."

...Almost half of all [mums] who give birth to their first baby by emergency caesarean section do not have another child, a... study shows... [1-in-3] suffers long-term infertility... [due to] a ruptured womb [or] placental problems... and [1-in-5] are too traumatised to go through childbirth again.

...Nuevo Leon is Mexico's richest state... [- where ATM]s offer the country's highest daily withdrawal limit. And Nuevo Leon holds another nationwide distinction: king of the caesarean... Half of all the state's babies are born surgically. In private hospitals, the proportion is 73[%] – the highest in the country and... five times the international norm. [Nuevo Leon mums] want the operation to avoid the pains of all-night labour, and over-worked doctors are happy to oblige with a half-hour insurance-paid procedure before breakfast... [T]he state capital... Monterrey[-] a city of 1.1 million, where C-sections are scheduled like hair appointments[-] ...may be C-section central, but it is hardly the exception. Across Mexico – and much of Latin America – the number of caesareans is on the rise... There are several explanations: better early detection of pregnancy complications, fear of malpractice suits for not having performed the surgery in deliveries that ended tragically, the idea... that a C-section is somehow more civilised than a natural birth, and the desire of doctors to maintain a large number of patients without the telephone ringing at 3 every morning. "Any doctor who says [it] doesn't do unnecessary caesareans is lying," says... a Monterrey gynaecologist, who delivers at least three babies a week – 65[%] of them by surgery... A recent study in the *British Medical Journal* concluded that 850,000 C-sections are needlessly performed throughout... Latin America... each year. Yet the real problem is the distribution of C-sections along class lines. While, urban, well-to-do [mums] chose surgery – unworried about increasing their risk of delivery complications – many poor, rural [mums] who need the operation don't get it. "There are still lots of [mums] dying at childbirth because they didn't have access to C-sections," says... a professor at Harvard Medical School who has studied the rates in Mexico. "That is the big irony." ...[In local news, j]unior doctors and midwives have a "frightening" ignorance of the anatomy involved in a small incision often made to ease childbirth, a specialist says... [I]t surveyed a sample of colleagues at

National [Gals'] Hospital about which muscles should be cut in an episiotomy. This is an incision in the perineum, the tissue between the vagina and the anus, and it is stitched up after birth. At National [Gals' last year], it was performed on 1367 [mums]... Of the 71 health workers and students who were asked which of nine muscles should be cut... – the superficial transverse perineal muscles and the bulbocavernosus... [– only t]hree of the 41 midwives answered correctly, two of the 20 registrars and house officers, and none of the 10 medical students... [The] obstetrician gynaecologist, said yesterday that the survey, published as a letter in the latest *Medical Journal*, revealed a lack of basic knowledge. Practitioners' knowledge of what they were doing was "quite frightening"... But tutors of doctors and midwives said getting the names wrong did not prove practitioners were performing the procedure incorrectly... [T]he Auckland University of Technology midwifery programme leader, said midwives only infrequently performed episiotomies, so [it wasn't] surprised they were unfamiliar with the... names. The Nursing Council... said midwives ought to be able to name the muscles, but [i]t... had received no complaints of badly handled episiotomies... Long-term complications of episiotomy and spontaneous tearing of the tissue can include faecal and urinary incontinence, and pain during sexual intercourse... Overseas research had found that up to 5[% of mums] who delivered babies vaginally later suffered altered bowel function, through damage to nerves or the structure of the anal sphincter. A significant number... returned to hospital for corrective surgery to a badly repaired episiotomy or vaginal laceration, although no statistics were collected...

[Pregnant people] who suffer from morning sickness should be treated with drugs to allow them to lead as normal a life as possible... Treatment would also prevent either the [mums] or their unborn babies' health being endangered as a result of regular vomiting or dehydration, the International Federation of Gynaecologists and Obstetricians' conference in Washington was told. More than 300 doctors voted for the widespread introduction of a drug called Diclectin, which prevents nausea and vomiting in pregnancy and allows m[um]s to lead a "normal daily life" from the beginning of their pregnancy. Diclectin has become "the drug of choice" for all pregnant... Canad[ians] and has been used to treat... 33 million [mums] in the past 25 years. It has undergone full clinical trials and has no effect on the unborn child. The drug is about to be approved for use in the U[S]. At the conference, British doctors called for Diclectin to be approved as soon as possible for use in Britain. Two-thirds of British [mums] suffer... morning sickness during pregnancy, usually beginning in the fourth week and lasting until three months... 8.6 million work days are lost each year from [employees] taking time off for morning sickness. There has been much reluctance to give any medication to pregnant m[um]s since the widespread use of Thalidomide in the 1960s... But in about 3[%] of cases morning sickness is so extreme that [mums] are unable to feed their babies because they cannot eat properly, and suffer weight loss and severe dehydration. They are put in hospital to ensure they get enough nutrients and to prevent dehydration. Research has shown... about 50... British [mums]... a year... have morning sickness so badly they seriously consider ending their pregnancy... [□ For many] decades doctors and scientists have tried to come up with a cause for cot death. But the... documentary *Sudden Death* on TV1 at 11.30pm, Thursday, reveals how a US doctor... devised a convincing new theory about Sudden Infant Death... after studying [a]... family, in which five babies supposedly died in their sleep in the 60s and 70s. Twenty years later it was discovered that, in fact, [the] mum... had murdered her children... "My colleagues have a saying: 'One SID is SID. Two SIDs, big question mark. Three, you're dealing with murder'," says... [the forensic pathologist who] examined the evidence... It's a fascinating and tragic tale which exposes the weaknesses that can exist in the medical world.

...A sleep wrap invented to prevent cot accidents is helping babies with flat or misshapen heads. Over the past two years [an] Auckland craniofacial surgeon... has referred more than 40 babies with positional plagiocephaly (where babies' heads are deformed because of constant pressure on one spot) to [the] Safe T Sleep inventor... as an alternative to using an orthotic helmet or performing surgery. The Safe T Sleep fits around a cot or bed mattress and wraps around the baby to give stable back or side sleeping positions. Using the surgeon's instructions, the wrap and specific bedding and wrapping techniques, all the babies have showed improved head shape. Cases of positional plagiocephaly have jumped around 300 percent over the past few years, especially since the "back is best" message has been promoted to reduce the risk of cot death... As well as helping prevent head deformities, the Safe T Sleep has been proven to help prevent suffocation (more than a quarter of cot death babies are found with their faces and heads covered), dangerous creeping and cot accidents... "One in five children under two are hospitalised after falls from cots, beds and bunks every year. Stopping it became my mission in life," says the inventor. When the inventor couldn't find a product to keep her son safe while sleeping, [it] invented her own prototype... The wrap, which has been clinically trialled and is used in hospitals, can be used from birth to age three, and can be used on bassinets, cots, beds and bunks. More than 60,000 Safe T Sleep wraps have been sold in N[Z] and overseas, with no deaths or injuries reported... ■ WE HAVE FOUR BASSINETTE-SIZE SAFE T SLEEPS TO GIVE AWAY, VALUED AT \$24.95 EACH.

...Babies who sleep on their backs are more likely to skip crawling and go directly from sitting to toddling, overseas experts have found... Lying on their backs means babies are not so readily lifting their heads, turning over or getting mobile on hands and knees at six to eight months, when baby books say they should. But there is nothing wrong with tots thinking they can walk before they crawl, say paediatricians. Although parents worry about physical milestones, failure to crawl doesn't indicate a baby is less intelligent or able. In fact, it could be the contrary. An estimated 10 to 15[%] of tots are "bottom shufflers" – part of the normal variant of child development. They don't crawl, and they walk later than the average 10 to 12 months, but they are generally more advanced with talking. Although no studies have been done in N[Z], the... professor of paediatric and child health at the Dunedin School of Medicine, says overseas research shows that babies who regularly sleep on their backs crawl two weeks later, on average, than those who sleep on their tummies. Conversely, babies who sleep on their backs develop language skills two weeks earlier than their face-down counterparts... "Sleeping on your tummy is a bit of a Western thing." ...For years, doctors advised parents to put infants to bed on their tummies, fearing they could choke sleeping on their backs. But then came the theory that sleeping face-down brought a risk of sudden infant death syndrome... Plunket advice these days is to sleep infants on their backs and there is no evidence to support the choking worry, says the society's general manager of clinical services... "But when baby is awake, we recommend tummy time. These things are all about getting a balance."

...A toddler was rushed to hospital in Wisconsin yesterday after being found outside his rural home in frigid cold hours after his father had started a videotape for the boy and his brother to watch... The father h[ad h]ad the children with him in the barn until [it] finished milking about 2:30 am, then took them into the house, where [it] fell asleep as the children watched... [the video. At some time the toddler], aged 2, wandered outside... The outside air temperature was minus 18deg... His father found him in the snow near the house about 6.45 am... [His son] was unconscious and not breathing. The boy was taken to the local hospital and from there to St Mary's Hospital and the Mayo Clinic in Rochester, Minnesota. The[hospital]... said no information on his condition would be released until [later] today... It was the second such incident in the U[S] in five days... In Edmonton, Alberta, this week, a 13-month-old girl survived several hours outdoors in bitter cold. Yesterday the little girl, nicknamed Miracle by staff at Stollery Children's Health Centre, Edmonton, moved from the intensive paediatric unit to a normal hospital room... [The] director of the hospital's paediatric unit, said the toddler was interacting with her mother and being playful... The baby girl, wearing only a nappy, wandered from the home where [it] had been sleeping with her mother and 2-year-old sister... [T]wo outstanding concerns remained: whether any of her frostbitten toes and fingers would require amputation, and whether [the baby] would suffer any serious brain complications.

...Children fathered by older [guys] may run a much higher risk of developing schizophrenia – evidence that [guys, like gals], have a "biological clock" when it comes to having children. The new research findings blow a gaping hole in the commonly held belief that while older [gals] run a higher risk of having babies with birth defects, [guys] face no risk when fathering children at an advanced age. A child's risk of developing the devastating mental illness rises dramatically and steadily as the age of the father increases, say... Columbia University College of Physicians and

Surgeons, New York University School of Medicine and Israel's Ministry of Health. They reviewed the records of 87,907 people born in Jerusalem from 1964 and 1976. They found that [guys] between the ages of 45 and 49 were twice as likely as those under 25 to have children who developed schizophrenia. [Guys] 50 or older ran three times the risk of the fathers under 25. The study said 26.6[%] of the schizophrenia cases could be attributed to the father's age, while the age of the mother appeared to play no role... [T]he findings augmented a growing body of evidence of an increased likelihood of health problems for children of older [dads]... The findings may help explain long-standing mysteries about schizophrenia. The fact that it is remarkably persistent in human populations over time puzzles experts because those with the disease are less likely to mate and reproduce, presumably because of the social effects of the illness. In addition, its incidence is strikingly consistent across... populations. The study suggests that in each generation fresh genetic mutations replenish the genes for schizophrenia and keep the incidence stable... As [guys] age, their sperm cells continue to reproduce through division. Each division introduces a slight risk of error in the genetic material of the new sperm...

A way to fertilise human eggs without using sperm threatens to make [guys] redundant. The technique – which uses cells from any part of the body, rather than sperm – has already been used to create embryos in mice. The research by Melbourne's Monash University aims to help [husbands] who have no sperm, or even sperm-making cells, to father babies that are their own genetic offspring. But it could also... in theory at least, enable... lesbian couples to have baby girls that are genetically their own... with one [partner] contributing an egg and the second a cell to fertilise it. There are theoretical problems to overcome in combining the genes of two [gals], because aspects of development are controlled by a paternal gene when a maternal copy is turned off, and vice versa, as a result of a process called imprinting. "But we have no proof yet that it is or is not a problem," [the head of the Monash team] said... Once offspring from animals have been born, the team will test their genetics, behaviour and ability to reproduce and give birth to healthy offspring for a few generations... [The head of the team] admitted that any technique which allowed babies to be created without [guys] could open an ethical can of worms... The Monash team's work is just one of a number of startling breakthroughs in reproductive science recently, all of which raised ethical questions. ■ Last year, a similar proposal to enable homosexual[s]... to have their own children made headlines. It was proposed that a "[guy] egg" would be created by removing the DNA from an egg donated from a [gal] and replacing it with that from sperm... ■ Gals seeking fertility treatment could one day be offered donor eggs grown from the tissue of an aborted foetus. In an experiment that raises the prospect of babies with "unborn mothers", ovarian tissue was removed from seven dead fetuses and kept alive for four weeks... ■ Scientists at the Wisconsin and Illinois Universities in the U[S] are working on a device to automate the process of [IVF]. They believe the technology may eventually be able to test embryos for genetic flaws[(note that 'tests of the fluid in a mother's sac are performed via a needle; the hole normally repairs but in hundreds of cases each year the fluid leaks out; while some doctors repair the hole, others recommend termination')]. They have designed a device that mimics conditions inside a [gal's] reproductive tract... Colorado State University in Fort Collins, said the work could represent the first step to IVF becoming the norm... ■ A technique has been... pioneered... in New York... that allows [doctors] to transfer genes from an infertile [human] egg into another egg, fertilise it with sperm and place the resulting embryo into the womb. The doctors used a technique similar to the one employed by Scottish scientists to clone Dolly the sheep, but the process itself is not cloning since the child would have genes from a mother and father. The new approach, which could allow infertile [gals] to have genetically related babies, is the first to mix significant amounts of DNA from two different [human] eggs into a single egg, the *Washington Post* reported. The resulting child would have two genetic mothers, although one... would contribute much more and could be identified as the biological mother... [T]he New York University doctor leading the experiments... said his colleagues had tried the method on two infertile [patients]. The first failed to get pregnant, while the second, who underwent the procedure last week, is not scheduled for a pregnancy test until next week. The university's scientific and ethics advisory board has given the team permission to perform the technique on five [patients]... "There are a lot of concerns about this. A lot of issues... But it's not like we did this thoughtlessly." ...the goal was to provide options for infertile [gals]. While some... infertility was caused by... inability to produce eggs, other [infertile gals] had eggs that might be defective, not because of the DNA but because of the fluid around the DNA... [The] team removed the nucleus of the DNA from the infertile... egg... and injected it into a healthy donor egg, which already had its nucleus removed. The... [team] said the procedure was similar enough to cloning to be illegal in California and possibly other states with broad anti-cloning legislation.

...A Chicago-area scientist [whose name means 'the unit of reproduction of a plant',] is poised to start experiments on cloning human beings to create babies for infertile couples, National Public Radio reported yesterday. It said... a physicist who has done fertility research in the past, was proposing to set up a clinic that would clone babies for would-be parents. "It is my objective to set up a human clone clinic in Greater Chicago, make it a profitable fertility clinic and when it is profitable to duplicate it in 10 or 20 other locations around the country and maybe five or six international,"... [The physicist] proposes using... the... same technique... [employed] by scientists at Scotland's Roslin Institute and the associated PPL Therapeutics... Th[is]... involves taking an unfertilised egg... removing the nucleus, which contains most of the genetic information, and replacing it with the nucleus of an adult cell... The radio said [the physicist] was working with a medical doctor who declined to be named, but who... would not go ahead with experiments unless the American Society for Reproductive Medicine cleared it. The group opposes human cloning. [The US]President... proposed banning such research for five years, saying it was morally unacceptable and could undermine society's respect for human life... While the legislation is pending... the ban on using federal funds to clone humans would stay in effect and [the President] called on the private sector to voluntarily refrain from it... [The President] said the legislation, which would have to be passed by Congress, would not prohibit the cloning of human DNA or of animals, arguing this did not pose the same moral questions and could lead to great medical and agricultural advances... Polls taken shortly after the announcement of the cloning of Dolly the sheep showed 90[% of USers] opposed human cloning.

...[a US p]hysicist... foresees as many as 200,000 human clones a year once his process is perfected, at a price for each clone far lower than the \$1 million the first one will cost... [I]t would take 40 seconds to implant the embryo, with no anaesthetic[the physicist said yesterday. Patients]... would be in and out of the office in 20 minutes... "When I was seven years old I was brilliant and crazy. I don't mind being called crazy," the 69-year-old... told his first formal news conference since... startl[ing] the world by saying... [his un]named... medical team... was ready to clone a human.

...IF [A]CHICAGO entrepreneur... has his way... [(and receives) the... \$3.57 million [it needs] to make his dream come true[)]... the waiting room at his Human Clone Clinic will be filled with childless couples seeking to have babies – and not just any babies, but clones of one of the parents. Still others, [it] hopes, will be parents of children with leukemia and other immune diseases. These people would pay big sums for [hi]s technicians to "reprogram" ordinary skin cells, transforming them into healthy white blood cells to replace cancerous ones... For most scientists, ethicists, physicians and theologians, th[e entrepreneur is "... a person on the fringe seizing an issue for his own purposes." What is his purpose? "...I wouldn't mind having 5000 patients lined up – or having more money, and I'd like to be the first to clone a human." Anything else? "I've always wanted to win the Nobel Prize." For patients desperate to have a child – or save a child battling cancer – there is something Messianic about a [guy] who has what sounds like an answer to their most fervent prayers... [However,] researchers familiar with the complexities of cloning say [it] faces daunting challenges: Overcoming technological barriers; assuring the cloned infants are born without... defects; doing this at a price people can afford; and silencing critics who call human cloning unethical. But [it] won't be swayed. "The first person to produce a healthy human clone will be the winner of the Super Bowl. The second person will be the loser. New things of any kind frighten everybody... We went through this with [IVF], embryo transfer, artificial insemination – we went through this with the automobile." ..."[The entrepreneur is] quite eccentric,"... said... [the]

chief of obstetrics and gynaecology at the University of Chicago's Weiss Memorial Hospital, [who worked with the entrepreneur and physicist] in the 1970s on embryo transfer.

...A Chicago physicist who provoked controversy... by announcing plans to clone humans says the first person [it] will try to copy is himself... [H]is wife... has agreed to carry an embryo that would be created by combining the nucleus of one of his cells with a donor egg... "I have decided to clone myself first to defuse the criticism that I'm taking advantage of desperate [infertile gals] with a procedure that's not proven," the 69-year-old said at a meeting of the Association for Politics and the Life Sciences, a group of academic researchers. [The physicist, who has 3] Harvard degrees, including a PhD, but no medical degree, no money and no institutional backing... described... his wife... as "post-menopausal." ...[the physicist claims to have] received hundreds of calls, some from parents of dying children who want to clone them[, and says his team]... has been invited to set up research laboratories in two other countries and that [it] will move his Human Clone Clinic to Mexico if the US Congress forbids his research.

...A[US] scientist... wants to clone humans – himself first. Is [it] a latter-day Frankenstein, a prophet of the new age or just a sad old [geezer]? ...IT IS from a small brick bungalow in the quiet Chicago suburb of Riverside that... the world's foremost advocate of cloning, spends his days dreaming up a biological vision of a future world. "You should have figured out by now that I am a genius," [the mad-scientist] barks, scarcely minutes into our meeting... By mid-morning... [hi]s irrepressible mind has raced past the scientific quandaries of human cloning; wrestled with the possibility of achieving eternal life by way of resetting the genetic body clock to end the ageing of cells; and has now alighted on what [it] holds to be the exemplary candidate for trans-species (animal-to-human) organ donation. "I think the ideal choice is the bonobo,"... The what? "The bonobo. You're illustrating your ignorance, your rampant lack of knowledge of the world around you... It's sometimes called a pygmy chimpanzee... It's an entirely separate species, they don't cross breed and it's the closest relative of [humanity]." ...As offbeat interviewees go... the Demon Seed... surpassed expectations. On t[v] a few days ago, [the physicist] not only looked like an Old Testament prophet, [it] had the delivery to back it up. "God made [us] in his own image," [it] intoned. "And God intended [us] to become one with God. Cloning... is merely the first serious step in becoming one with God." ...[it] comes from a long line of medics and scientists. His father was a prominent Chicago surgeon who helped to introduce blood-banking. His two brothers... are surgeons, while... [it] is a physicist by training... [Last week, it] announced that to defuse criticism... his first cloning candidate would be himself... But surely, to believe oneself worthy of replication is just a bit grandiose? "If you're not worth replicating then you shouldn't breathe, you shouldn't start in the first place," [the scientist] harrumphs. "And if it's worth you breeding with your wife then it's worth your replicating yourself... and her." ...his wife of 28 years, is keen on cloning too... "My wife has been interested in having a clone because [my wife thinks it] made serious errors in her life and if [it] had a clone [it] could convince her clone to avoid them." His children are less convinced. "[Dad]'s nuts," says his son... T[hat dad] has been married three times and had [7 kids] should not come as any surprise – particularly not in the case of someone so obsessed with the need to propagate the human species. His second wife... recalls him as a maddening husband who wanted to be cryogenically preserved. "I would have pulled the plug," [the ex-wife] told the *Washington Post*. "I'd have not paid the electricity bill and quietly let the lights go off." What is intriguing is [hi]s attitude towards the results of his handiwork. For it seems his [7 kids]... have not lived up to his expectations. [Dad] believes that, had his own gifts been recognised from the start, had [it] not wasted 10 years of his life in school as a misunderstood, unpopular student, things might have been very different – [it] might have been a Nobel Prize-winner. And, like all parents with a sense of personal failure, [it] has transferred his ambitions on to his [kids]. "I didn't have any kids who were smart enough to get into Harvard... I had [7] kids and not one who could get in... It was a terrible disappointment." There is a genuine note of despair in... [hi]s voice as... all at once the bluster collapses entirely. "Yes, I've had more failings than successes... [W]hen you have such a high opinion of yourself it's very easy for your reach to exceed your grasp but I genuinely believe that there is nothing I can't do... I want a clone to educate him, to... encourage him to go into biology and, at the age of 16, launch a major research project into any one of the subjects we have discussed." If the plan played out, not only would his clone win the intellectual respect [its dad] so much desires, but "what really ticks me off... is that [my clone] would be immortal too".

...Scientists who cloned six cows say the technology appears to offer a true fountain of youth... [It] seems to have turned back the ageing clock in the cells of the six heifers, which show signs of being younger than their actual ages... [I]t might be possible to use cloning to create organs that are nearly immortal for use in transplants, or create tissue to treat diseases of ageing such as Alzheimer's, a[n]d a[r]thritis... "We could take one young cell from a patient and make hundreds... of young cells and put them back into the patient and give back a young immune system or young knee cartilages..." said... [the] leader of the Advanced Cell Technology team that... included researchers from the Lankenau Institute in Wynnewood, Pennsylvania, and Thomas Jefferson University in Philadelphia... The scientists will have to wait to find out if the cows will outlive their natural lifespan of about 24 years. The findings... are surprising because the most famous cloned animal, Dolly the sheep, appears... older than her... age.

...The discovery that Dolly the cloned sheep has arthritis has raised fears that the cloning process may cause premature ageing, calling into question the ethics of producing animals destined to suffer unnecessarily. [The p]rofessor... who led the scientists at the Roslin Institute near Edinburgh in cloning Dolly in 1996, said it was unusual for a sheep... [her age] to develop arthritis in the rear legs and it could be the result of her being cloned from a 6-year-old ewe. "We know already that there's an unusual incidence of death of cloned animals around the time of birth... What we need to go on studying is whether diseases like arthritis... occur in a normal way or whether the incidence is changed. That Dolly has arthritis at this comparatively young age suggests that there may be problems..." Dolly became lame in her left hind leg a few weeks ago... and x-rays confirmed [Dolly] has arthritis in the hip and knee of that leg. [Dolly] is being treated with anti-inflammatory drugs... The history of cloning research is littered with examples of the "inefficiency" of the process, which translates into failed embryos, oversized fetuses, stillbirths and congenital abnormalities. Dolly herself was the result of 277 cloning attempts... Dolly... was the first mammal to be cloned using an adult cell. Her makers... found that when [Dolly] was born, her cells appeared to be the same age as the cells of the 6-year-old ewe from which [Dolly] was cloned. They calculated this by looking at the telomeres, which are little caps on the ends of the chromosomes that carry the genetic blueprint inside cells. Each time a cell divides, the telomeres become a little more worn. When they are frayed beyond repair, the cell dies. This stage is known as senescence. Dolly had old telomeres. But the six heifers[produced by Advanced Cell Technology were] cloned from cells taken from a 45-day-old foetus[. They] have exceptionally young telomeres... [They were also created] using a slightly different cloning process to the one used to make Dolly.

...The British scientist who created Dolly, the world's first cloned sheep, hopes to file an application to clone human embryos within six months.

...Japanese researchers who cloned a dozen mice reported yesterday that nearly all of the animals died early. Their report casts more doubts on the safety of cloning. It also suggested that the technique used to clone an animal can have an impact on its ability to live a normal lifespan... Labs that have cloned animals have reported that the cattle, sheep, and goats that make it to adulthood are normal in every way that can be measured. One big glitch has been in Dolly, the sheep that... has been put to death... at... half the life expectancy of her breed... after premature aging and... lung disease... marred her short existence... [T]he National Institute of Infectious Diseases in Tokyo reported... on 12... mice they cloned that looked normal at birth, although certain liver enzymes, used to monitor liver activity, were abnormal... [The researchers later found that their] cloned mice had abnormal livers, lungs and perhaps some immune system anomalies. Two of the clones are still alive and might live normal lives... It might be that the genetic makeup of the clone's "parent" is [the] key to healthy survival, the researchers said. They also noted that clones may be born "old"[– in other words, may be born with] shortened telomeres... "The possible negative long-term effects of cloning, as well as the high incidence of spontaneous abortion and abnormal birth of cloned animals, give cause for concern about attempts to clone humans for reproductive purposes..."

British scientists are to be given the go-ahead to clone human embryos... [P]ermission for the use of so-called Frankenstein technology... may ultimately mean that cells from embryos can be cloned and used to grow new tissue for medical use... By taking cells from the embryos, scientists

will not only be able to grow new brain tissue to replace damaged material, but also new skin for burns victims and ultimately new organs, such as hearts, kidneys and livers. Cloning will also allow creation of “tissue banks” to deal with any illness from lung disease to diabetes. Eventually, whole limbs could be grown in laboratories. It will mean an end to waiting for donor organs, a situation that often ends in the death of patients... Initially, however, scientists will be allowed to clone embryos only for research purposes... The decision will allow British scientists to take a world lead in cloning research. Although the news will be greeted with delight by the scientific community, it will plunge the Government into a new battle with pro-family groups and religious organisations who argue that using embryos is tantamount to sacrificing one human being’s welfare for another... [A spokesperson] for the Catholic Church, said: “We are fundamentally opposed to any such development. A human embryo is a human life. It is creating a human life for the purposes of cloning.” ...Cloning embryos was banned two years ago because Government ministers feared a public backlash against scientists who were accused of playing God with people’s lives. The technique involves taking cells from adults, creating an embryo and injecting it into a... donated... human egg... Last year the Government asked the Chief Medical Officer... to investigate the issue. His report, sent to ministers [last month], and yet to be published, is thought to back cloning with certain ethical safeguards. Scientists will not, for example, be allowed to use cells taken from aborted human fetuses. The cloning of whole people will also remain banned.

...FIRST there was Dolly the sheep. Now fertility doctors say the first cloned human baby is just two years away. [An] Italian doctor... said that [it] has already been approached by 600... people who would like the treatment. [His] technique involves taking cells from the infertile father and injecting them into the egg of the natural mother rather than using donor sperm. [The Italian] said the result is a child that has the same physical characteristics as the father... But Britain’s Human Fertilisation chair[perso]n... warned the procedure was illegal and should remain so.

...“The genie is out of the bottle.” With those words, an American doctor announced that [it] and an Italian colleague plan to clone babies. Childless couples are already being selected for... the much feared, much talked about leap forward for science and medicine... The weekend declaration prompted renewed calls for legislation outlawing cloning and controversy about the ethical dilemmas in N[Z] and around the world... The technique used to clone a child would resemble that used to clone animals such as Dolly. The team said it planned to produce the babies in a Mediterranean country. Italian news agency ANSA quoted [the Italian colleague] as saying it would “very probably” be Israel. The German news magazine *Der Spiegel* said the venue would be Caesarea, an Israeli coastal resort. As reproductive techniques become increasingly sophisticated, world Governments are having to wrestle with the moral and ethical questions raised by cell research. While fertility specialists and scientists in N[Z] believe it is only a matter of time before a cloned human being is produced, they do not see any urgency to bring in laws on cloning here.

...A controversial Italian doctor... whose clinic in Rome enabled a 62-year-old... to have a baby in 1994, said up to 200 couples from several countries, including eight from Britain, were being selected for the cloning project and would be treated free... The [doctor]... acknowledged that international hostility to cloning meant [his team] could be forced to work in a remote country, or even on a ship in international waters.

...In the face of fierce opposition from fellow scientists, [an] Italian... yesterday reaffirmed his determination to push ahead with plans for the first human clone within weeks. Even if his experiments fail, scientists believe someone will create a human clone... within 10 years. But many renowned scientists say human cloning is unethical and [his] experiments are likely to lead to dead or deformed babies because the techniques are not advanced enough. The breaching of the frontier of human reproduction is forcing humanity to confront the most basic of ethical dilemmas as scientific advances collide head-on with beliefs about the sanctity of human life... [T]he... embryologist sometimes known as “Dr Miracle”, and his [US] partner... appeared before a high-powered U[S] scientific panel yesterday to explain their plans, sparking a storm of international protest. The normally staid National Academy of Sciences... which is gathering information on the science and ethics of human cloning, descended into chaos as [the Italian] faced a barrage of questions from his peers... The... 55-year-old was even mobbed by journalists outside the toilet, and heated debate raged in the corridors after the meeting. At the same meeting, another organisation, Clonaid, claimed it had already started the process of cloning a human. Clonaid was founded by the Raelian Movement, which believes extra-terrestrial beings created humans by genetic engineering.

...U[S] federal investigators have uncovered a secret laboratory where members of a religious sect were experimenting with human cloning... [T]he Raelian sect... believes scientists from another planet created all life on Earth, according to a *US News and World Reports* article. The Raelian chief scientist... along with [an] Italian gynaecologist... and US doctor... lead an international consortium that has announced plans to clone a human being. Clonaid... seeks to reproduce by cloning a 10-month-old baby that died during heart surgery, at the request of the baby’s US parents. Human cloning is forbidden in all but four of the country’s 50 states although no federal law exists barring private financing of such research.

...Family and admirers of U[S] baseball great Ted Williams expressed revulsion yesterday at reports that his body is being frozen in the hopes of one day selling his DNA or cloning him... William’s son had flown the body to a cryogenic warehouse in Arizona... [d]ays after the former Boston Red Sox player died at the age of 83... [H]is eldest daughter... told a Boston TV station... [that] her half-brother... had shipped her father’s corpse to the Alcor Life Extension Foundation in Scottsdale, Arizona, hoping the family could cash in on his genes. “[My half-brother] said we can sell Dad’s DNA, and people will buy that because they’d love to have little Ted Williamses,” [the daughter] said in the... interview from her home in Florida... [The daughter alleged her father had] wanted to be cremated – a claim backed up by at least one of his former team-mates. “His desire was to be cremated and buried next to his dog, Slugger... Maybe [his boy] knows more than others, but I wouldn’t think that Ted would go for that. Ted didn’t even want to have a movie made of his life.” ...The possibility that Alcor has Williams’ body has sparked a buzz among cryonics advocates, who often find themselves lumped with alien abductees and Big Foot researchers in the grey zone between fact and fantasy. “The more members we get the better off we are going to be when it comes to being treated seriously,” [one advocate] said... last year. “Sometimes all I think it would take is one famous person who would let us use his or her name and the floodgates would open.” Alcor is the largest of a handful of places that charge US\$30,000... to US\$150,000 to preserve a body – or just the head – for “reanimation” when it becomes possible. The company has 49 whole bodies or heads in its “patient care centre”... 580 people from the U[S] and other countries have made reservations so that when they die, their bodies can be rushed to the centre and stored in liquid nitrogen... The controversy dominated news coverage in Boston wh[ile, elsewhere, scientists were reacting]... with scepticism and shock to a report that a [patient] taking part in a controversial human cloning programme for infertile couples was eight weeks’ pregnant. [The] Italian... who... announced his intention to create the world’s first human clone, [and] [has been quoted as saying one [patient] in his programme was pregnant... has since refused to confirm or deny this... There was no information as to where the [patient] was, or from whom the foetus was cloned, if it was. However, the *Sunday Telegraph* in London reported that the cloned baby is the son of a rich Arab. [The Italian] had said that the embryo was the clone of a VIP and... [his team] had been experimenting to produce human clones in an Islamic country. The... [Italian] had told... *Il Tempo* newspaper in Rome, that the pregnancy was real and... [his team] had a “limitless supply of money”... Fertility and cloning experts expressed doubts over the pregnancy report... [The] professor of biology and a leading cloning scientist based at the Whitehead Institute at Massachusetts Institute of Technology, said [it] was extremely angry at the news but very sceptical[– adding that] the scientific community would have no way of verifying whether the baby, if it existed, was a clone or a normal child. “It is totally outrageous and irresponsible to attempt cloning of humans when we know there is a very high probability of severe abnormalities, even if the baby survives to birth, which is extremely doubtful. In fact, death before birth would be the best outcome.” ...[the Italian]’s plans have been condemned by the scientists who produced the world’s first successfully cloned mammal, Dolly... [The] assistant director of Scotland’s Roslin Institute, has said any attempt to clone a child would be wholly irresponsible. [The Italian]’s move prompted the U[N] to set up a panel... aimed at drafting an international treaty to ban the cloning of human[s]...

Six couples trying to become the parents of the first clones will be flown to an unnamed developing country by a leading fertility expert before the end of the year, says a Scottish weekly. One of the six couples[– an]American... who is in her mid-40s, and [her husband, who is] in his 50s[–]...told the *Sunday Herald* the experiment would be led by [the]American fertility expert [who is the partner of the controversial Italian fertility expert].

...The world's first cloned baby will be born in Belgrade [next month, says the] controversial Italian gynaecologist... "I think we have made a revolution in the field of genetics and Serbia will be one of three countries which will go down in history," [the Italian] said in an interview in... *Nin*.

...Clonaid... claims an American... has given birth to... the world's first cloned human... and... four more will be born in coming weeks in Europe, Asia and North America. Baby Eve was born by caesarean section in Miami, weighing 3.1kg and was the exact genetic duplicate of her 31-year-old mother... The claim has drawn widespread scepticism, and moral disgust from governments and religious leaders. [A Vatican spokesperson]n... said "the announcement is the expression of a brutal mentality, devoid of any humane or ethical considerations". [The]President... of France said cloning a human... should be made a worldwide crime. Human cloning was "contrary to human dignity and criminal". [The]US President... called for Congress to pass legislation banning cloning. One... leading specialist on the ethics of human cloning... believed the world would react with "revulsion and disgust" if Clonaid's claims were true. "There is a global race by maverick scientists to produce clones, motivated by fame, money and warped and twisted beliefs,"... One of Clonaid's biggest immediate problems is to overcome the overwhelming distrust of the announcement made by... a French chemist and a bishop in the Raelian sect, which believes that humans were cloned from extraterrestrials who came to Earth 25,000 years ago. [The chemist] said an independent journalist... would monitor verification tests on the mother and baby. But experts are dubious that any proof will be given... US genetic research firm Advanced Cell Technologies said Clonaid had no research experience in cloning.

...The company that claims to have created the world's first cloned human says the baby, nicknamed "Eve", is coming home to the U[S] today... with her family... two days after [it] announced the child's birth. [The chemist, who] is chief executive of Clonaid... offered no scientific proof, provided no photographs and did not produce the child or the mother... The US F[DA] said its regulations forbade human cloning without permission, and it had launched an investigation into whether Clonaid illegally performed any work on US soil... Although human cloning is not illegal in the US, any kind of human trials would have had to[have] obtained FDA approval as of 1998... [The] founder of the Raelian religion... says the goal is to create eternal life through cloning – and make a lot of money doing it. In an hour long interview, [the founder] said Clonaid, the company [it created] in 1997, had a waiting list of about 2000 clients willing to pay US\$200,000... each to have themselves or a loved one cloned. [The founder wouldn't]t profit directly because [it] had distanced himself from Clonaid, but... would not turn away donations from the company... Speaking at the home of a follower in a gated community near Miami, the Raelian leader... [–] dressed in white, space-age clothing from head to toe... [– said it] would advise... the [chem]ist and close associate who orchestrated the alleged cloning... not to identify the child until [it] was an adult to protect her privacy... For someone so passionate about the truths of science, [the founder] offered little more than verbal accounts of his alleged encounters with extraterrestrials – the very basis of his religion. [The founder said it] was on his way to work as a journalist at a car racing magazine in a town outside Paris on December 13, 1979, when something prodded him to drive to a volcanic crater nearby. There, [it] saw flashing lights and a 7m flying saucer in the sky. When it landed, a 1.2m tall alien emerged, renamed him Rael and told him [Rael] was the son of Yahweh and the brother of Jesus. The alien visitor said life on Earth was created in extraterrestrial laboratories by the Elohim, an advanced people from space. [The visitor] said humans would one day be gods themselves, creating life, travelling throughout the universe and spreading to other planets... [Rael said it] communicated with the extraterrestrials through telepathy once a year, and they told him to focus his missionary efforts... i[n] China...

A UFO cult says the world's second cloned baby has been born to a Dutch lesbian couple, but cloning experts swiftly dismissed the claim as a baseless stunt. The Raelian group... also claimed an earlier cloned birth to an American... but has not provided scientific evidence of either.

...Human clones and extraterrestrials are more than a sci-fi movie for some N[Z]ers – they've become reality. The Raelian... movement, which claims 60,000 members in 84 countries, [are]... gaining followers in N[Z] after claiming that two human babies have been cloned... [A local] representative for the sect, said [it] had been inundated with media, critics and supporters. The Hamilton fitness trainer said the Raelians were about to launch a campaign informing Maori about religion before European settlers arrived in N[Z]. The Raelians believe Maori legends refer to gods (known as Elohim) coming from the sky – giving weight to their belief that extraterrestrials used genetic engineering to create life on Earth...

An executive with Clonaid... has been subpoenaed to appear in a Florida court, and the company ordered to disclose the whereabouts of... a human clone... and her mother. The witness subpoena and summons were approved at the weekend by a court at the request of a[n a]ttorney... who has filed a lawsuit asking the state to appoint a guardian for the child. The papers were delivered to... a Clonaid vice-president, before [it] spoke at the Money World... conference in Fort Lauderdale... [However, doubts remain over whether a US court has any jurisdiction to intervene – assuming the child exists!] Since its inception, Clonaid, originally registered in the Bahamas, has stirred up hope, outrage and scandal. The company – and the movement behind it – entered the political mainstream... when [the movement's founder and the company's chief executive] testified before a US congressional committee about the future of cloning. The... [chief executive], who was a visiting assistant of chemistry at Hamilton College, in Clinton, New York, shocked congress members with her account of Clonaid's effort to clone a baby for a West Virginian couple who had lost their 10-month-old child to a heart defect... "We will do all that is humanly possible to bring the belated twin of this boy back to life and healthy," [the French chemist] testified. "If it becomes impossible to do it in this country, Clonaid will go elsewhere." Clonaid's venture was partly financed by... the Charleston, West Virginia, parents who put up US\$500,000 to create a cloning lab in a former high school in the nearby town of Nitro. The Justice Department and the F[DA] considered stopping Clonaid in court, according to published reports. But when federal investigators inspected the lab, they concluded the company was years away from attempting to clone a human. [The Raelian sect founder] said the Nitro lab was merely a "decoy" and that the real research was taking place elsewhere... "Stopping science is a crime against humanity," [the founder] testified.

...THOSE damned scientists are at it again. A new book by a couple of Canadian evolutionists is set to upset families around the world. The researchers from McMaster University claim, generally speaking, step-parents aren't as good as genetic parents when it comes to raising kids. They don't love their inherited children as deeply as they do their own, say... [the researchers] in *The Truth About Cinderella*. And there's little the substitute mums and dads can do about it, because this is the law of the jungle. Take lions. These largest members of the feline family lead relatively social lives. They hang out in prides, they hunt together and defend together. But the lion blokes have some pretty anti-social habits. Like attacking another pride, killing off all its [rival]s and taking over the [lionesses] and children. And these over-sized cats don't make great step-dads. Shortly after the coup they systematically hunt out all the cubs and kill them[– thus readying the lionesses for mating]. And why wouldn't they, argue [the Canadians]? In the survival-of-the-fittest world of nature the only purpose to life is to make sure as many of your genes as possible get into the next generation. Why would any sensible species waste time and energy feeding youngsters carrying someone else's chromosomes? Better to get rid of the competition's kids and replace them with their own. And it's not only lions that have this slash and burn approach to marriage. Birds break their predecessor's eggs and monkeys do a disappearing trick on their step-kids very quickly after meeting them. This sort of infanticide is hardly surprising, say [the Canadians]; Mother Nature actually rewards it by spreading the perpetrator's genes more widely. Really it's more of a mystery why every species doesn't wipe out its opposition's young. Now comes the disturbing bit. We humans evolved in the same Darwinian world as these ruthless beasts. If Nature endowed them with a tardy attitude toward step-parenting, why didn't [it] do the same with us? The answer is simple say the politically incorrect scientists: [Mother Nature] did. In stone-age times, when there was no government to

intervene, maltreatment of the steps was probably a relatively common affair. As evidence, take a look at some of the people still leading this lifestyle today, they suggest. It is not unknown for Yanomama... (Venezuelan indigenous people) [guys to abduct gals] from a neighbouring community. If any of them are feeding infants at the time it's customary to have the offending offspring killed. In a study of Paraguay's Ache, 43% of the community's step-children failed to reach the age of 15. We naked apes have lived this hunter-gatherer lifestyle for 99% of the time we've been around. So a more enlightened approach to step-parenting can only have developed very recently. But how much more enlightened are we really these days? Many studies show that child abuse is more common when step-parents are involved. Physical, sexual and emotional maltreatment are many times higher than for genetic parents. And the statistics for the most severe abuse of all – killing a child – are the most staggering of all. Children are around 100 times more likely to be murdered by a step-parent than a genetic child by its parents. One hundred times! And it's a myth that surrogate dads are more likely than mothers to be the perpetrators. It is true statistically that step-fathers are responsible for most of the mistreatment. This is because there are so many more of them living with children. Take away this bias and the figures reveal [step-fathers and step-mothers] are equal abusers.

...When hospital staff deliberately handed two newborn baby girls to the wrong parents... little did they know of the heartbreak which would result – not just for the babies and their families, but for the next generation, too. The story... has made headlines since the deception was revealed more than 10 years ago. Now [one of the girls] is in the news again, facing charges of abusing her own child. The trauma [this mum] suffered as a result of being swapped as a baby is being blamed for her current behaviour. [The mum is] accused of neglecting her 22-month-old son [by] leaving him hungry and dirty in his cot... and of once slapping him so hard, [it] left red welts on his back. [The boy] has been taken away from her and placed in foster care. Her natural mother... says... “This is a girl who was so emotionally abused, by what I believe was a criminal act[, that it]... has become an abuser.” The sorry story began at 5am on 29 November, 1978, when two baby girls were born in the Hardee Memorial Hospital near Sebring, Florida. When one of them... was found to have an incurably deformed heart, staff were horrified and not for the usual humane reasons. [The baby's parents] were very wealthy and members of the local “ruling class”... [Indeed, money from the wife's family... had helped build the hospital. Panic-stricken staff decided to switch the sickly infant with a healthy girl just born to... a cleaning lady, and... a railway clerk. [The cleaner and clerk] called the child given to them Arlena... But after Arlena died, aged nine, genetic testing showed [it] could not be [the poor couple's] child. When the swap was revealed, the [poor couple] received \$6 million from the hospital. Now out of business, the hospital also had to compensate [the couple's real daughter] with \$4 million. What happened next was to make the child's world even more confused. A judge ruled [the child] could decide her own future and, at 14, [it] was allowed to formally “divorce” herself from [her natural parents] and continue living with [Arlena's natural parents]. But just a year later, [the girl] fled to the [home of her natural parents, saying it] had been bullied into making loving statements about wanting to live with... [Arlena's natural family, which] strenuously denies... ever bull[ying] her. When the girl]... came to live with her natural parents, it wasn't to a poor home. Part of the settlement from the hospital had been spent on a seven-bedroom house with a swimming pool. But it was perhaps inevitable that neither [the girl] nor her new family could satisfy the other's hopes for each other. The US courts had told [the girl that it] was in charge of her [own life and, consequently, the girl] intended to do exactly as [it] wished. At night, [it] would sneak out of the house and indulge in alcohol, marijuana and, says [her natural mother], “sex, sex, sex”. Just as worrying was [her self-violence. “Our daughter would] bang her head against the refrigerator, claw her face and pull her hair out when things went wrong...” It broke [the natural mother's] heart to see her insecure 15-year-old colouring in *Snow White* colouring books, the sort meant for seven-year-olds. [The girl] was torn by rival loyalties to the [two families and when the girl learned that her natural parents] were planning to divorce... decided [it] could solve the problem by getting out of their lives. [The girl] ran away to the farm where... [Arlena's natural father, who allegedly had] both physically hit [her and made her] feel stupid and lazy[, was living with]... his third wife... [The natural mother recalls her daughter once saying it] would never have children because they might suffer as [their mother] had done.

...Two 10-year-old girls at the centre of a Timaru baby-swap case have the right to choose their own destiny and who they live with, says... [the Children's Commissioner. The commissioner... was speaking yesterday at the inaugural N[Z] College of Practice Nurses conference in Dunedin. The conference theme was “Our Heritage. Today's Children, Tomorrow's Adults.” In a speech on children's rights, [the commissioner] referred to a report published yesterday saying that the two girls had been living together for nearly 18 months. The *Sunday Star-Times* article said a Wellington solo mother had reluctantly given up the girl [it] had raised for eight years after the girl decided to live with her biological parents in Timaru... After the conference, [the commissioner] said the... case... was... “very, very sad”... “There's an acknowledgment worldwide that your biological relationships mean something to you,” [the commissioner added]... The girls were mistakenly swapped soon after their births in Timaru and taken home by the wrong parents... The swap was not discovered until 1992... The Timaru couple were now applying for custody...

BARCODES containing newborn babies' fingerprints are being used to prevent mix-ups over identification... [at] La Zarzuela Hospital in Madrid, Spain... As soon as babies are born their fingerprints, and those of their mothers, are stored in electronic barcodes... w[orn] on their wrists.

...Until [a 29-year-old] came into her life, [the 31-year-old] had resigned herself to never giving her husband... the child they so desperately wanted. After eight miscarriages, a shattered [wife]... had tearfully cleaned out the nursery they had kept waiting. Now, thanks to [the 29-year-old's] decision to act as a surrogate... the Ngatea couple's lives have been transformed by their baby... whom they will formally adopt... After recent bad publicity about surrogacy, the two families say they are proof it can work... [The surrogate], who has a six-year-old son... from a previous relationship, is even planning to repeat the experience when [it] finds the right couple. “What greater gift could you give somebody?” asks [the surrogate], whose mother... was unable to have more [kids] after two ectopic pregnancies. [The 31-year-old], who has only half a uterus, had investigated adoption, but few [kids] were available. “I thought, ‘[my guy] has ...his 12-year-old daughter from a previous relationship... we'll be a family together’...” Then [the wife] spied a magazine article about another surrogate... who passed them on to [the 29-year-old]. When they met... the couple bonded quickly with [the 29-year-old], but friends and family were sceptical. “We heard so many horror stories about mothers changing their minds... But we knew [our prospective surrogate] – they didn't.” H[is wife, who was] herself adopted, is adamant [her daughter] will grow up knowing her family history... There is no law against surrogacy in N[Z], or any laws that specifically govern it. However, the... legal rights of the people involved are determined by the Adoption Act, the Children Amendment Act, and the Guardianship Act. But because those acts were not designed with surrogacy in mind, the legal position of the parents is complex. The surrogate... is always the legal mother of the child, unless or until the child is adopted. Although a surrogacy arrangement is a contract, it is unlikely to be enforceable in N[Z] and couples have little recourse if the surrogate mum backs out.

...A British [citizen] hired by a California couple as a surrogate mother is suing, saying they backed out because [it] was carrying twins and refused to abort one. In a lawsuit filed in San Diego Family Court, [the Brit is suing the Californians]... for breach of contract and fraud in what some legal experts say is a novel action... [The Brit], a legal secretary and single mother of a 7-year-old boy, said [it] would be unable to care for the twins and asked that the court order the San Francisco Area Bay couple to pay unspecified damages for medical expenses and emotional suffering. [The Brit], aged 26, struck the surrogacy deal with the couple... [and] subsequently gave her verbal consent to undergo an abortion procedure called “selective reduction” before the 12th week of pregnancy if there was more than one foetus, court papers said. The following month, [the Brit] was impregnated with [the husband's] sperm and a donated egg. The would-be parents were to pay her about \$US19,000... for carrying the baby to

term. During the eighth week of her pregnancy, [the Brit] told the couple [it] was carrying twins and... alleged that they waited until the 13th week before instructing her to abort one of the foetuses. [The Brit] refused and later moved to San Diego to give birth and pressure the couple to take responsibility for the babies... [T]he couple contacted [the Brit] through a lawyer, who said they were not interested in taking the children and that [the Brit] should assign her surrogacy agreement to other parents. [The Brit]'s lawyer said the couple made it clear that they wanted one child or none at all. It is unusual and difficult for a biological parent to legally reject a child, said... a surrogacy law expert in San Diego. "If you conceive a child through a medical procedure, and you set that process in motion, you are the parent – whether you want to be or not."

...in England, a surrogate mum aborted the embryo implanted in her womb because [it] doubted the commitment of the baby's would-be parents. Another British [gal] was arrested on deception charges after refusing to give up her surrogate child, or the \$10,000 [it] was paid to have the baby. [A gay couple's adoption of a US-produced surrogate baby was unrecognised by customs officials when the threesome returned to Britain ('currently about 30 gay couples a year are having children through surrogate mothers'). And in AUS], the Family Court ordered a couple to return their baby to her birth mother after a surrogacy arrangement between life-long friends went sour. Surrogacy... may be a last resort for couples desperate for children, but it can have heart-breaking consequences. As surrogacies are approved in N[Z], debate about the legal, medical and ethical issues surrounding one of the country's newest baby-making techniques is hotting up. On Friday, experts gather in Auckland for a two-day symposium to thrash out the issues. There are no laws in N[Z] governing surrogacy. It has gone on informally for years, with [surrogates] carrying the biological babies of friends and relatives – having been naturally or artificially... inseminated with the semen of the commissioning father. Couples overseas have advertised here for surrogate mums and Kiwi parents have gone off-shore to rent a womb. Since the National Ethics Committee on Assisted Human Reproduction approved altruistic surrogacy using [IVF] as a treatment in July 1997, 11 couples have sought permission. Just three have been successful. All the [commissioning mothers] are medically unable to have a child; all the arrangements non-commercial. It is understood in two cases, the [commissioning mothers] were born without a uterus... [Now a]pplications for surrogacy are set to increase, with one or two couples a month turning up to fertility clinics seeking medically-assisted surrogacies. The surrogate mother, who carried the embryo of the commissioning parents, is always chosen by them and could be a friend, relative or stranger but [the surrogate] and her husband should have completed their own family. The advantage of medically-assisted surrogacies, according to Auckland Fertility Associates['] director... is that the commissioning parents get a baby which is genetically theirs. But there is always the possibility... the birth mother will want to keep the child. The baby is legally hers and the commissioning parents must adopt the child, even if it is genetically theirs. [The director] believes the birth mother's right to keep the child should be protected. "It's a thorny issue and some may not consider that the right answer. But the birth mother has carried the child for nine months and developed a relationship with it. The surrogacies going wrong overseas always hit the headlines, but data from the U[S] shows as few as 1 or 2% of birth mothers want to keep the child. It's a very complex procedure for all parties and people have gone into it very aware of all the dangers. There are certainly problems, but they shouldn't be put in the too-hard basket." Several hundred babies are born annually to medically-assisted surrogates in the UK and [US]. New problems arise every year... [The] director of the bioethics centre at... Dunedin School of Medicine[says]: "It's getting to the stage in the U[S] where the commissioning parents want to have some control over the lifestyle of the mother carrying the child. They want to tell her what [a surrogate] should eat and that [a surrogate] shouldn't smoke or drink. Is it fair? Well, if I was the commissioning mother I'd think that was fair... That would be my child in her womb and I don't want her doing things I wouldn't. I want the goods I've ordered and I don't want them to be soiled or spoiled. On the other hand, we don't license parenthood for people who can conceive without medical help. The state doesn't stop them conceiving if they don't meet a licensing procedure and fertility experts are against demands being made on infertile couples that are not made o[n] ordinary parents." ...medically-assisted surrogacy raised many other untested moral and social considerations. "The moral judgements of doctors has not been tested. It's against the ethos of medicine to make moral judgements, so can a doctor refuse to take part in the commissioning of a child if [the doctor] thinks that child would be brought into a morally-unsound environment? For example, if a doctor took the view that lesbianism was an evil thing and a lesbian... wanted surrogacy, could the doctor decline her?" [The director] said the surrogacy and genetics debates were similar. "How far do we go in creating children? If we can genetically engineer children in such a way that we're able to rectify genetic flaws... nobody would object. But what would they think if [someone] wanted to enhance a child, say a boy so [it] 'd turn out to be six foot six, 16 stone and extremely athletic in order [that it will] be able to [play for] the... All Blacks...?" [The director said NZ] needed to act quickly to ensure the interests of the yet-to-be-born children were protected in medically-assisted surrogacies. "But even that's difficult, because we're talking about the interests of people who don't yet exist, so how can we know what's best for them? And there could be so many people involved – the genetic, gestating and social mothers, and the genetic and social father – who all have their own interests and rights..." ...The Chief Family Court Judge... will address this week's symposium with the message new legislation is needed to protect the children... "As far as the court is concerned, we need some clear laws to work within. My main concern is the children. They should grow up knowing who they are." A[n A]uckland legal firm... has begun... developing "legal arrangements" between the parties involved... [The] head of the company's medical law team, said it was only a matter of time before the procedure became more common, especially as the number of children available for adoption dwindled. The legal agreement[may] contain... a basic outline of what is going to happen: [Gal] A will carry the embryo created by [Gal B and Guy] A. It will also include what the commissioning parents will pay for and the logistics of the pregnancy... [(although NZ] law indicates that surrogacy should not be advertised and cannot be for profit or reward... payment of the surrogate's expenses and general maintenance is permitted)].... Some could also include the commissioning parents' input into the pregnancy and what the child will be told about its origins... The... director for the Auckland University Centre for Child and Family Policy Research... remembers an 11-year-old girl... who spoke at an A[US]n fertility and genetics conference... in May. [The girl] was conceived from her mother's egg and a donor's sperm and gestated by her aunt. "People made predictions in newspapers and on t[v] about what would happen to me as I grew up... One thing was that I would be taunted at school because of my origins. It has not happened. I am teased only because I do not use a lunch box. One person said I would resent what my family did to get me into reality: fat chance. They said I would feel that I was given away. Pigs might fly. I am happy to have been born. I know I have only one mum and one dad[, who]... have looked after me since the age of 10 seconds. It is far too corny to say we make a real family, but I know exactly where I come from."

...An A[US]n... is suing his former partner to recover A\$18,247... spent on a little girl... after DNA tests showed the girl was... not his daughter... "I want it all back – every cent..." said the [AUS]n, who can't be identified for legal reasons. The claims include McDonald's takeaways for more than five years, four visits to an amusement park, three Barbie dolls, a play tent, a day of skating, and child support payments.

...A[n AUS]n has been left legally marooned after a couple... [the] sperm donor... helped have a baby refused him access to the child despite a written contract. Now two High Court judges say legislation is needed urgently to cover the rights of fathers and children in cases involving artificial insemination. The case occurred when a Family Court refused a Sydney [resident] access to the Auckland-based child [it] willingly fathered for a lesbian couple, via artificial means but not in a clinic. The trio had drawn up a detailed written agreement, including giving the father access to the baby boy for at least a fortnight a year. But the friendship broke down. The father, a gay... in a stable relationship, applied to the courts for contact with the child but the mother and her partner were reluctant. The Family Court ruled against the father's wish to have access partly because the Guardianship Act 1968 states that the biological father has no rights when a child is conceived artificially... Two High Court judges dismissed parts of the... appeal under the Guardianship Act. But, calling it a "complex and difficult" case, [they]... called for the current review of the act to look at the situation urgently. The judges say the law should appreciate that adults who use artificial reproduction could reach their own agreements with sperm donors over responsibilities for the child. "It is unreasonable that the father and children in the

situation should be left legally marooned.” ...agreements could not be enforced like commercial contracts but they should be given weight, especially when they were drawn up by “informed and intelligent adults (after what appears to have been careful thought)”. In this case, the lesbian couple had approached the [AUSn], who was their friend, twice before [it] agreed to become the donor. The... judges also said that... the Status of Children Amendment Act 1987 envisaged that the [perso]n... who conceived the baby would have a ma[sculin]e partner or husband who would be the father... After dismissing the... appeal and sending other aspects of the case back to the Family Court, the justices said the court was aware anecdotally that artificial insemination procedures were used by lesbians and homosexuals “to bring about the conception of children without heterosexual contact”... ■ About 150 children are born each year in N[Z] as a result of donor insemination... Before the mid-1980s few records, if any, were kept about donors, making it virtually impossible for children to make contact with their fathers... About six years ago fertility clinics in N[Z] voluntarily agreed to accept sperm donations only from [guys] willing to be identified when their child turns 18.

...*The Government wants to register sperm donors*... Few experiences could match providing sperm for test-tube reproduction. In most cases, there is only the obvious method to provide it. While the end process is the birth of a happy, healthy baby to an even happier couple, it is the beginning of this particular path to life which dwells on the minds of many: masturbation. How can they do it? Why do they do it? You can see the questions play across faces at the merest mention of the matter. Few [guys] can provide the answer because few [guys] are providers of sperm. Auckland’s Fertility Associates, for example, has just 180 on its books after 15 years running a donor insemination service. And those who provide “technical assistance,” as one donor puts it, remain in the main as curtain off as the little room with the mags. [A]Canterbury University associate professor... says although the sperm donors are on the path from obscurity to acknowledgment, it is important to recognise that the shadowy nature of such [guys] is related to the obscurity that has tended to surround donor insemination in general. This obscurity can be tracked back to medical paternalism. In his chapter on semen providers in a book [the associate professor] co-edited, *Donor Insemination: International Social Science Perspectives*, [it]... says that anxiety surrounding the practice led to a desire to protect donors. “Given that many early semen providers were medical students, there was a sense in which the profession was also protecting itself and its members.” Step back a couple of generations to see what [the associate professor] means. In the 50s, a N[Z] gynaecologist inseminated a [patient] with his own sperm after forgetting to obtain a sample from a friend. When [the gynaecologist] reported this to his wife[, his wife insisted that her husband] have a vasectomy, which [it] did. But the matter didn’t end there. Two years later the [patient] and her husband were asking for further donor insemination to have a sibling for their child, and specifically requested the same donor. The doctor explained that the “donor” was no longer available. [The doctor] reported being much relieved that this was the case because [it]’d experienced “unusual feelings” on seeing the couple and “his” child seated in the consulting room. It’s a yarn which echoes the first known instance of donor insemination using human sperm, which was reported by one Addison Hard... Hard was a student of a Dr William Pancoast who, while teaching a class at Jefferson Medical College in 1884, discussed a couple unable to have a child but of which the [wife] was perfectly capable of bearing children. The class suggested that a “hired [husband]” solve the problem, and Pancoast then took a semen sample from the “best-looking member of the class.” In 1909, Hard headed to New York to “shake the hand of the young [perso]n” who had been born of the donor insemination. It doesn’t take a Harvard PhD to conclude that Hard must have been that youthful donor 25 years before, though this remains speculation... Fertility clinics no longer use medical students for genetic material. Indeed, [nowadays NZ] sperm donors... tend to be older and married with children. Yet they remain unseen and unheard, and everyone involved in donor insemination has a theory on just why. But a century on, it mainly still involves one of the last great taboos. “Certainly it’s not the kind of thing a lot of [guys] talk about at dinner parties. It’s a complicated and difficult issue, but masturbation is a central part of it,” [the associate professor] says.

...*Secrecy over sperm donors exercise in maternal egoism* SO FINALLY the sperm barrier has been breached with the opening of a British-based service providing fresh sperm to anyone, but specifically to lesbian couples seeking a child. Using the services website, mannotincluded.com, couples will be able to order sperm online, stipulating physical characteristics of the child they wish to conceive. The site, which received 8000 registrations (3000 lesbian couples and 5000 donor[s]) in its first 48 hours of operation, asks its clients to imagine a world where no one has to ask a friend for a sperm sample, a place where discretion is paramount. It declares that you can now choose your child from the comfort of your own home (as if baby picking were as easy as eBay), and the company promises a world where the creation of a child can be completed in absolute anonymity, with no chance of the sperm being tagged to a real live [donor. The site’s owner said it] expected criticism from people who did not approve of the idea of helping lesbians to become parents. “If a child is going to be loved and cared for, to me it doesn’t matter if it is two [gals or two guys] bringing it up,”... And [the owner]’s right. A mother’s sexual orientation is irrelevant. But [the owner] is missing the point. By focusing the argument in this direction [the owner] is simply generating great PR by inducing moral outrage, while ignoring the real issue raised by his secret sperm service: anonymous children. In many ways this latest attraction on the reproductive road-map echoes the closed adoptions of the 1950s and 1960s, when the ideology of environmental supremacy (environment always overcomes heredity) reigned supreme. Back then they believed that only a complete break with the past would enable adoptive parents fully to shape an adoptee’s life. But, instead, these beliefs were found to be deeply flawed. Adoptees who wanted to know their origins were characterised as pathologically dysfunctional misfits. Nowadays we understand the power of genetic inheritance, with the right to know one’s origins considered a fundamental building block of human development. But the anonymous sperm donor is even more dangerous to the future emotional health of children than any closed adoption. The basis of adoption, closed or otherwise, was to benefit children deprived of their natural parents. The secrecy was designed to protect the child from the slur of illegitimacy that existed in society at that time, and adopting parents understood they were essentially receiving a surprise package. But this latest reproductive development is anything but altruistic. It has a far more insidious motivation. [The owner] says that knowing half your child’s genetic heritage could lead to complications for both sides in the future. So the secrecy is not to protect the child but to relieve the parent of the inconvenience of another adult, particularly a [guy]... Secrecy in any assisted reproductive technique, be it top-of-the-line technology or turkey baster home kits, is a smokescreen for selfishness – an opportunity for a parent to create a child in her own image. A certified blank slate. A creature unencumbered by heritage or past life baggage. A child without even a pesky mythical father to imagine. It is an unparalleled form of egoism, one that sees a child as a possession and parenting as a right. Many countries, including N[Z], have legislation pending to make registration of sperm donors mandatory. This will mean no guarantee of secrecy for sperm donors or room for a mother to imagine that the product of her conception is immaculate. But that is within the established fertility community. With the permeable borders of the worldwide web, the relative ease of servicing both supply and demand of sperm and the increasing commodification of everything, including our children, there is no way to legislate what people do with a turkey baster in the privacy of their own homes. So perhaps for once in history it is up to [guys] themselves to exert some control over reproduction; to limit the supply of that essential raw ingredient; to value their sperm as sacred and not to sell it into secrecy, condemning their anonymous offspring to grow up with the indelible knowledge that half a genetic heritage does not a whole person make.

...*Children born through fertility programmes are growing up – and going in search of their identity*... [One NZer] was eight when [the boy] asked to meet the [guy] who donated the sperm from which [it] was conceived. The request could have rocked his parents – an Auckland couple who had battled the Baby Gods for five long years before their precious son was born. But they were ready for it, and so was the sperm donor. In reality, [the donor] had little choice. Because, for the past five years, sperm donors have had to agree to be identified should their biological children want to meet them. N[Z] is the only country in the world to have such criteria for donors without requirement by law... Just this year, behind closed doors in suburban Auckland, [the] sperm donor and his son were introduced – by his mum and dad. The hour-long meeting went well; [the former-8-year-old] thought his father was “a really nice [guy]”. The boy]’s parents didn’t feel threatened. There might’ve been the odd tear, but they knew

they would still be tucking their son into bed that night. The meeting was necessary to satisfy [the boy]’s curiosity, to fit the last piece of his genetic jigsaw puzzle into place. After all, his parents had been open with him since [their son] was a toddler. [The boy] grew up knowing someone else had been vital in his creation, it was only natural [the boy would] want to know exactly whom. According to Fertility Associates[’] director... the issue is the latest moral dilemma facing Kiwi parents who have had children by donor insemination. (DI). It’s a problem which has needed addressing only now... For older children conceived by DI when donors were anonymous, the news is bleaker. Those children, now in their teens and... 20s, are frustrated and angry. They have no rights to information about their biological father and many have struggled to find out even whether records exist. In many cases, fertility clinics used a mix of sperm so the father’s identity wasn’t known. And after insemination, some couples were told to go home and have sex, and pretend the child was theirs... [The director] suspects many parents did not tell their children how they were conceived, meaning they had no reason to trace their biological background... “A lot of people said choose someone in their late 40s so [the donor’]ll be dead by the time the kids want to meet him...,” said... [a] Wellington couple... The pair chose their donor from five profiles[, and the prospective father] eventually picked a [donor] in his mid 20s, because there were physical similarities between them... THE first recorded instance of human insemination dates back to English doctor John Hunter in 1790, who inseminated a patient with her husband’s sperm. The first use of a donor is credited to... the U[S] 100 years later. In N[Z], doctors first sought funding for insemination in the early 1970s but a mixture of money and public unease saw it refused. University medical schools stepped in, and the first Kiwi clinic opened in 1972... but [DI] did not formally begin until 1983. Since then, an estimated 1000 DI children have been born here. But as technology advances, [DI] is becoming the least likely option for the estimated 2400 N[Z]ers who seek fertility treatment each year... Only 15% of couples choose DI... The technique is best used for a couple with low or no sperm count. Donor sperm is injected into a... uterus, with a 15-18% chance of pregnancy... It’s not known how many N[Z] children born with the help of [DI] know their origins, but in A[US] studies show 95% of DI children (about 9500) don’t know how they were conceived... A study here in the early 1990s showed 90% of DI parents intended telling their children how they were conceived... [By the way, m]others are considered by adolescents to be the most dependable source of sexual information, research shows. Studies conducted by the A[US]n Research Centre at Melbourne’s La Trobe University found, however, that young people want more information from their parents than they are getting. After their mother, adolescents would turn to school before approaching their father, for information on sex...

Washing your hair after sex... clos[ing your] eyes during sex... doing it standing up or on a boat or drinking Coca-Cola – these are just a few of the ways some teenagers believe you can avoid getting pregnant. A British survey of... 1000... GPs has found teenagers have a poor understanding of contraception and conception. But while N[Z] teenagers might not be as ignorant as their British counterparts when it comes to sex and pregnancy, there are still plenty of myths doing the rounds... The survey by *Doctor* magazine... found teenagers’ ignorance sprang from embarrassment about asking for advice and fear that their confidentiality would not be respected... The level of ignorance has surprised health workers and young people here, but they acknowledge myths and misconceptions are alive and well. Such as the one that you can’t get pregnant the first time you have sex. Or that... plastic film could be used instead of condoms... [A] Waiheke Island High School sixth former[, who is]... a member of the Peer Sexuality Support Group, said... it was vital teenagers had access to information from the time they were 12... The support group, run at 19 schools by the Auckland Sexual Health Service, trains teenagers to provide accurate advice to others... Sometimes families perpetuated myths[, and sometimes doctors.

...a schoolgirl], of Upper Hutt... battled almost constant pelvic infections from the age of 11. “I was in agony from the time I started my periods,” says [the schoolgirl], who’s just turned 18. “It was horrible, made me feel sick, faint and cold. I lost weight, could hardly walk and was always bent over to one side. I kept telling the doctors I wasn’t sexually active, and tests for chlamydia, which is the usual cause of pelvic inflammatory disease, came back clear... I’ve since found out you can get... PID... without being sexually active, although it’s quite rare. I felt nobody would listen to me, and couldn’t cope with the almost constant pain. I became a horrible person and my schoolwork suffered.” At the age of 14, [it] was seen by a doctor who recognised severe [PID]. The schoolgirl] was sent for immediate exploratory surgery. “The doctor found lots of scarring and everything stuck together... I lost an ovary and my fallopian tubes were very damaged. There was infection everywhere and things looked bad for my fertility. That was hard to take. I was still a kid myself, and it didn’t really sink in at first. Every time I had an episode of [PID], the damage got worse. I wish I had been diagnosed earlier.” Despite the effects of the disease, [the then]... 15-year-old... became accidentally pregnant to her first serious boyfriend... Because of the damage caused by the disease, her pregnancy was a miracle – and probably her only chance to ever have a baby... When [her] mum... and dad... found out... their reaction was to arrange an abortion. “But after thinking hard... we knew we had to let [our daughter] have her chance,” says [her mum]. “It was a huge decision. The hardest time was going out with [our daughter when it] was heavily pregnant. Some of the looks we got were terrible. But we knew this might be [her] only opportunity to have a child.” ...Since [her son’s birth, the schoolgirl] has got her life back together. The pregnancy helped her ...PID... and [it] now has episodes only once a month... [The young mother] has returned to school and wants to become a beauty therapist... But [the schoolgirl] is clear about one thing – [it wishes it] could have waited until her mid-20s to start a family... “It’s not easy having a baby so young. I can’t go out with my friends or spend money on things I want, like other girls my age.” ...[Incidentally, t]he number of teenage pregnancies in the Nordic countries... like Norway, where there are strong youth sex education programmes and sexual and reproductive health services... is amongst the lowest in the world... A report reviewing 73 controlled studies of more than 250 pregnancy prevention programs across the US has found those which emphasise frank discussion of sexuality, and education about contraception and disease prevention, have[the] greatest impact on delaying sexual experimentation and preventing pregnancy in teens. British studies have also found that good sex education programmes in schools to not encourage teenagers to have sex earlier...

Most of us hold the belief that... sexual development occurs at the time of... puberty. But... sexual maturation starts from birth and, in fact, the initial hormonal processes of puberty are now believed to begin around the ages of six to eight! Parents can help to shape a healthier sexuality in their children if they understand and accept the normal sexual landmarks from birth on... Try to display a positive attitude to sexuality, but too much parental nudity, overt sexual displays between parents or making love in front of a child, all go against the message that sexual activity is a private experience... School age children have learnt that sexual feelings and activities are private. Primary school children channel sexual energy into school, sports, friendship and hobbies. Romance is not uncommon and children can ‘fall in love’ with a teacher, a movie or rock star, or a classmate. Children will be curious about the opposite sex, and secret looking and showing may take place... If your child engages in sexual exploration with another, calmly ask them both to get dressed and guide them towards another activity. Be available to discuss sexual issues with your child... ■ [The NZ]... Government is planning to make sex education compulsory in schools as part of the health and physical education curriculum.

...Schools will be forced to teach sex education, but parents will retain the right to withdraw their children from it, under measures to be introduced into Parliament this month. [The]Education Minister... said changes to the health and physical education curriculum “would remove the ability of schools to decide not to teach the sexuality aspects of the curriculum... The development of the legislation was based on the need to address some of the youth sexual health issues while retaining the paramount right of parents to determine the sexual education aspects of the curriculum that their child participates in,”... Allowing schools to opt in and out of the curriculum... could see a minority of parents with strong views or a principal determine the outcome for the whole school... The new curriculum covers primary and secondary schools.

...A DRAMA group teaching students about safe sex has been banned at some schools because parents don’t want their children putting the lessons into practice. The Theatre and Health Education Trust employs actors to tour primary and secondary schools performing theatre-based

health education skits. The group is funded by the Health Funding Authority. The actor's use young people's language, music and humour... The... group had performed N[Z]-wide over the last 10 years... But... some... Bay of Plenty... parents had taken offence at the theatre group's references to certain types of sexual activities. Several schools... ha[ve] banned the show. "It's a shame because the group is really effective in getting the safe-sex message across to students," [a BOP]... health worker... said. [The health worker] disagreed with parents' concerns that the theatre group was putting ideas into student's heads. "Every school has a sex-education programme and the theatre group just compliments this,"...

AN American teacher was suspended after it was discovered nine students engaged in sex acts in class while [the teacher] did paperwork.

...*THE FACTS OF LIFE*... During the average human lifetime we will... [f]all in love twice... [and h]ave sex 2580 times with five different people.

...[concerning teaching the] facts of life Dr Spock... [said]: "Sex education starts early, whether you plan it or not." The truth is a better answer than the stork "because [the child isn't] going to be fooled for long, and then you have him knowing that you lied to him". [Another commentator said in] 1997: Answer their questions, but don't get carried away. Telling all in response to the first query is akin to telling the child interested in a cow "the whole story of dairy farming, the nutritional components of milk, and how it's marketed"... *Toilet training*... Spock, 1946: "It seems sensible... to leave (the baby) in peace until [the baby] is old enough to know a little of what it's all about. I would wait until [the baby] can at least sit up steadily alone, which will be around seven to nine months." [A children's] advice writer... 1989: "If you start later, [the child] will learn faster and reach the same point at the same time." ...ParentTime Web site, 1998: "Tell your child the store is out of diapers" and let [it] play bare-bottom in the yard.

...*Going potty over toilet training*... T[ODAY]'S... fast-track... toddlers... sing "I love you" at one, know their ABCs by two, manipulate a [computer] mouse by three. And they do it all... in nappies. Much to the horror of many grandmothers – but with the approval of many child-development experts – the age of potty-training seems to be edging upward. [US] studies suggest that while 90% of kids were out of nappies by two-and-a-half in the '60s, not even a quarter are trained that early now... USA TODAY... [produced figures in 1997 which showed that 0.4% of] kids are trained... [by 18 months; 3.9% by 24 mths; and 22.6% by] 30 mths... The largest recent study, conducted in suburban Philadelphia, found half of boys and 30% of girls weren't potty-trained by three. "When [my youngest boy is ready, it's] ready," says [a mum from] South Dakota, whose three-year-old son... still wears nappies. [The boy's mum] says friends and family have no problem with [the boy] taking his time. In fact, [this child is] following in the footsteps of two brothers who trained well after their third birthdays. But not everyone is pleased with this growing army of droppy-drawered big kids. "It's not unusual these days to find children who are ...4 years old who are not trained, and this is atrocious," says[a] family psychologist... a self-proclaimed traditionalist whose advice column runs in 200 newspapers in the US. [The psychologist] blames liberal child-rearing experts... [A] grandmother of four who runs three child-care centres is similarly aghast: "I've been in this business for 30 years, and when I started, there was absolutely no question. It never occurred to me that a three-year-old would come walking in the door who wasn't potty-trained." Less appalled are the makers of major disposable nappy brands. "No matter what your friends and family say, your baby knows best when it's to potty-train," says a magazine ad for Pampers' newest product, a "size 6" nappy that fits "babies" over 16 kilos – the size of an average three-year-old. Huggies nappies and Pull-Ups (basically underwear-shape nappies for "big kids"[]) are about to come in larger sizes, too. "We're already seeing that in... Pull-Ups, the largest size is the best seller,"... [a] researcher... says. Only three years ago... mediums were more popular, an indication, [the researcher] thinks, that go-slow potty training is gaining ground. Some observers suggest that the disposable-nappy companies are driving the trend, not responding to it. "What they're trying to do, obviously, is sell nappies," [another researcher] says. And... adds, busy parents with little time for laundry and "accidents" are easy targets. But the US's best-known child-development expert... not only approves, [the consultant]... appears in American TV ads for the larger Pampers, telling parents: "Don't rush your toddler into toilet training or let anyone else tell you it's time. It has to be [the toddler's] choice." A consultant to Pampers since 1996, [the consultant] has been promoting a child-led approach to potty training for nearly four decades. [The consultant] believes kids are less likely to develop problems such as bed-wetting and chronic constipation if parents avoid potty power struggles. And [the consultant] says kids who learn at their own pace gain a sense of accomplishment that's lost when parents take over with training-in-a-day schemes and bribes... "In any case, I think by four or five, if a child isn't ready, you wonder if they're trying to tell you something... And you address whatever that underlying problem is." It's often, [the consultant] says, a fear of growing up... [A parenting adviser agrees, although] the... parenting adviser... [suggests] it's sometimes busy parents who don't want their babies to grow up... [The adviser also] warns... that kids don't always co-operate with grown-up plans. "It's not like the kid is a tube of toothpaste you can put on the toilet and squeeze,"... [The family psychologist, a] 50-year-old grandfather of two advises parents simply to take nappies away from potty-shy preschoolers. Doing otherwise "just extends the child's dependency; it extends the child's immaturity"... The American Academy of Paediatrics... tells parents not to worry about training at a particular age. But the academy's advice book *Caring for Your Baby and Young Child*... says most children are ready to start the process around two. Then there's also the fact that many US daycare facilities either won't take children in nappies or won't allow them to progress beyond toddler classes if they aren't potty-trained.

...UNLIKE their [US counterparts, NZ] parents who want to wait a bit longer before toilet training probably won't strike a roadblock from their local daycare centre... Having small potty training groups, such as those at Paddington's Preschool in Christchurch, seems to be the extent of any different treatment... "They're not babies for very long, and I don't consider potty training to be very important compared to all the other things they have to learn..." says... [someone] who has worked in KinderCare centres for 24 years... The term toilet "training" is a misnomer anyway, says [a spokesperson for] Auckland's Kids' Kampus. "A child can't learn about using the toilet until they're neurologically ready, and then it's a case of training the parents to give them the opportunity. A child can be ready anywhere between the ages of 18 months and three years, typically at around two, but we've encountered parents who haven't got around to giving them the chance to use the toilet." [The spokesperson] thinks that toilet training may have slipped down the list of parents' priorities now that many mothers are working and their stresses lie elsewhere. Disposable nappies and automatic washing machines also mean it is no longer so important to get rid of the nappy washing chore... "To parents who are anxious about when their child will become toilet trained we say 'don't worry, no one ever goes to university in nappies'." Auckland University Creche[']s supervisor... agrees... but... [suggests a] sensible... approach... "Some parents... put off training until summer when it's much easier..." ...□ 500: Number of years that "disposable" nappies take to decompose in rubbish tips...

[During the average lifetime a human will produce] 40,000 litres of urine and spend more than six months on the toilet.

...*I am sick to death of hearing members of my own sex moaning about [guys] who don't put the toilet seat down. Why should they? You never hear [them complaining that we] don't put the seat up for them. Am I out on a limb here? Personally, I'd ban toilet seats completely – they just make for extra cleaning. Pan-sy, North Shore. Good Lord, [sister], what's with this nonsense about democracy – in the toilet or anywhere else? They should put the toilet seats down, they should open the doors and they should be encouraged – nay, expected – to do every little thing they can in the way of good manners and deference to make up for the vast debt that they... owe [us]. On the suggested removal of toilet seats altogether, P, I'm not with you there either. I like to be sure of where all my ends are at any given point and don't approve of one of them having to hover over a hole in the floor, thank you very much. Now, let's not be having any more talk about toilet seats[– except to point out that a local inventor has 'developed a mechanism which automatically lowers the seat when the flush button is used']*.

...*It could only happen in Japan*... Japanese subway commuters can now whip out a plastic-bag-like number and (discreetly) hold it in position while attending the call of nature. Chemicals use the urine to crystallise in less than 12 seconds – no mess, no smell and it's easy to throw away!

...A judge in Santiago has agreed to look into a lawsuit against the builders of an art project glass house where a [gal] undressed and showered near Chile's presidential palace... [A lawyer] alleges... the project breaks part of the Constitution that prohibits immoral conduct. As part of the Government-funded project, [a]student... aged 21, slept, used the toilet, ate, brushed her teeth, and talked on the phone inside the one-room transparent house in a bid to accustom Chileans to seeing such daily actions... [In related news, w]hen *Neighbours From Hell* first screened in Britain in 1997, it grabbed the attention of 11.7 million viewers and scared them half to death. They watched people hurl abuse and bricks... and since then they've been exposed to more violent confrontations on BBC's *Neighbours At War*. Both "nasty neighbour" documentary series have made viewers realise that people aren't necessarily safe in their own homes and a quiet suburban street can turn into a war zone. But now some people are asking if television has gone too far in exposing viewers to behaviour so despicable it drives victims from their homes... [D]o such shows explore a serious social problem – one in 14 British households report their neighbours to the police – or are they just using victims' misery to frighten viewers? "If people are suffering, their problems should be looked at, and my job is to tell that story in a way that rivets the audience," argues [the person] who directed the first *Neighbours From Hell* before defecting to the BBC to make *Neighbours At War*... The scariest cases aren't screened, says [a]*Neighbours From Hell* researcher... who sees both sides to get them to talk to the cameras. "More than half of the neighbours swear at me, one... has been leaving obscene messages on my answering machine and another had his rottweilers chase me down the street... It makes you realise that it must really be hell to have a person like that as a neighbour."

...*Houses From Hell* [(TV1, 7.30pm Friday) is a d]ocumentary looking at some of the most horrifying and bizarre house horror stories featuring very unlucky people for whom home is where the heartache is... [Speaking of housing heartaches, o]ld folk are owed [\$]thousands... after a rest home [wa]s sold... \$100,000 of [a] 94-year-old's life savings disappeared when the historic rest home where [it] was expecting to pleasantly live out her days failed... Despite paying the substantial sum to occupy a unit at the Valmai Rest Home in Cambridge, [it] had to pack up and find somewhere else to live... [Her] contract said the money for her unit would be returned if the contract was terminated for any reason, but [the 94-year-old] has received only about \$20,000... [T]he Consumer's Institute[said]... cases like this happen "far too frequently" and warns old people and families to be extremely careful before signing over money... [Valmai's owner] received \$300,000 when [it] sold the business. [It] used the money to pay debts.

If the housing industry within each district was united as one ministry it would be able to control what is built and where, and even who lives in each house. In a moneyless society each house will have to belong to the community, with the Housing Ministry being responsible for property management (including routine cleaning of building exteriors – but not interiors). Residents won't have to pay rent but they would be expected to conduct themselves in a responsible manner with regards to the way they treat the property and also how they behave as neighbours. There should be fewer reasons for neighbours to clash when they don't own their homes and sections but, in the event that tensions arise between neighbours which can't be resolved, it will be the ministry's responsibility to arrange for one neighbour (probably the most recent arrival to the neighbourhood) to be shifted elsewhere – a simple process, unless there is a threat that the problem might just be transplanted. However, if residents all behaved like humans, there wouldn't be any problems – i.e., only HBs act like bad neighbours, and mistreat public property or are content to live in messy, unclean conditions. HBs also believe houses should all be different, since they consider material objects to be extensions of their personality (or confirmation that they are individuals) – probably because they consciously, or subconsciously, know that their personalities are too weak to stand out on their own (or have failed to appreciate that: they are individuals by virtue of their personal or 'separate existence' – i.e., every life is unique; and weak personalities can be strengthened mentally). To help eliminate this belief from society, the specifications of every house could in future be the same and, assuming those specifications adhere to a minimum standard of comfort, no one would need to complain.

Changing to a moneyless system could be a relatively easy process for the Housing Ministry, at least in First World countries. For example, the majority of NZers already live in houses that are at or above what should be considered *a minimum standard of comfort*. Furthermore, there is probably enough vacant housing – especially if holiday homes and self-contained motel units (plus similarly appointed hotel suites) are taken into consideration – for every homeless NZer, and most of the tenants currently living in sub-standard housing, to quickly be placed in suitable premises. Any people who can't be moved from sub-standard housing (because no more suitable housing is available), or who prefer not to be moved, can be placed on a list – headed by the most urgent cases – of housing to be renovated. New houses that are already under construction can be completed but, initially, districts in countries like NZ should only begin to build more new housing if they don't already have enough. Since that is unlikely, building materials currently sitting in the yards of wholesale and retail builders' suppliers, plus recyclers, which aren't needed for renovations or to complete unfinished houses, and new materials being produced in First World districts, can, during the immediate future, all be shipped to Last World districts – to address their dire lack of proper housing and building materials.

People ought to have the freedom to remain in their current residence for as long as they like, but anyone who has more space than it needs (e.g., a single person living in a house which has two or more bedrooms) could be given the opportunity to move into something more appropriate – thereby allowing the Housing Ministry to move a family which has less space than it needs into a larger space (in some instances tenants might agree to simply swap homes). However, people who live in mansions should be forced to leave if they don't volunteer (but, because they won't be able to employ servants to do the cleaning, few are likely to resist), so their former residence can be converted into apartments – one of which they may inhabit – or be used for other purposes. While the range of housing stock remains varied, couples who once owned their luxurious houses – excluding mansions – could be permitted to keep them in the hands of family members for as long as those houses remain habitable.

The Housing Ministry has to achieve maximum utility from its housing stock. In order to do so, it can aim to eventually have just two types of housing unit – multiple-bedroomed homes for families and single-bedroomed apartments for single people or couples. However, while trying to achieve maximum utility, each district ought to also aim to have slightly more homes and apartments than it actually needs at any given time. This would enable the Housing Ministry to move citizens whenever necessary – rather than placing citizens onto waiting lists and moving them only when they have reached the top of the list and a unit has become available. It would also present citizens with a choice of locations to move into – they can then choose the one which suits them best (e.g., which is closest to their work or other facilities that they use frequently, or to relatives and friends). There should be no need for the ministry to find house-sitters for empty accommodation and, because the ministry is responsible for finding accommodation for everyone, there is unlikely to be any problems with squatters (but the ministry can arrange for empty accommodation to be checked regularly for any signs of unauthorised tenants or vandalism; note that currently some new homes are vandalised – sometimes via strangers holding unauthorised parties in them – before the owners have moved in, and during their construction builders often arrive at work to find building materials or white ware has been stolen during the night).

People who rent properties have to allow their landlords to periodically inspect the premises. Although it shouldn't be necessary for the Housing Ministry to conduct periodic inspections of every property – under normal circumstances, the ministry should only have to enter an accommodation unit if the tenant says that it needs some maintenance – the ministry would need to inspect premises before tenant moves are confirmed; and conduct a second inspection shortly before a tenant's date of moving arrives to confirm that its accommodation unit is being left in a satisfactory condition (and the tenant has corrected any non-maintenance-related problems identified during the first inspection). Because the Housing Ministry manages both the property a tenant is leaving from and the one the tenant is going to, it will be easy for the ministry to block a tenant's move until it is satisfied with the condition of the premises to be vacated – unless the tenant is being evicted, in which case the ministry would have to be responsible for tidying up the evictee's former accommodation unit, if necessary, before it offers the unit to another tenant (such tidying up could be conducted by the same people who perform maintenance work).

Excluding evictions, citizens should only need to move if they are: school-leavers (or work trainees) who feel ready to stop living with their parents and, therefore, require an apartment; a couple currently living in separate apartments who wish to share an apartment (one of the partners would vacate its apartment in favour of the other's); someone who has to move out of a shared apartment because of a failed relationship; couples who are ready to move out of an apartment into a home because they are expecting a child; middle-aged couples who can be moved from a home to an apartment (separate apartments if requested) because all of their children have also moved into apartments and they don't intend to take in an elderly relative – one who is not so able to care for itself, but doesn't need full-time rest home care. There may also be instances where a citizen needs an apartment because it has separated from the person it had children with while still living with those children, but such instances are likely to become less frequent as citizens become more humanlike in their behaviour (and money or other property issues cease to be a contentious issue for partners) – anyone who has a failed relationship with someone it produced children with is likely to be an HB because humans not only work hard to make child-producing relationships work, they avoid producing children with potentially incompatible partners in the first place (which means that humans don't participate in arranged, forced, or underage marriages; don't participate in the mail-order bride business; and are unlikely to try to find a compatible partner with the aid of props – such as the *'love-geki'*, a handheld electronic toy purchased by at least 400,000 Japanese people). This also means that humans avoid having casual-sex relationships – but, even if they do have a casual-sex relationship (or a long-term relationship with someone that they don't love enough to produce children with), they are able to avoid unwanted or unplanned pregnancies without contraceptives because they have a thorough knowledge of the reproduction cycle, plus the imagination and self-control to use that knowledge properly ('if intercourse is to [be avoided], try forms of lovemaking that don't include penetration'), be they a guy or gal. Note that humans enjoy sex as much as HBs – if not moreso – it just isn't something that they 'spend all of their time thinking about.'

Parents ought to cover the basics of human reproduction, but school curriculums should ensure that every pupil receives enough sex education to understand what constitutes appropriate and inappropriate sexual behaviour, and to avoid an unwanted pregnancy if it behaves in a responsible manner when engaging in sexual activities. Regardless of whether or not they have received a proper sex education, most children and teenagers will refrain from sex at an early age if they are happy – or aren't continually bored – and have been convincingly taught that the most responsible manner is to wait until you and your partner are both physically and emotionally mature enough to be sexually active. Schools wouldn't have to worry about gaining parental consent for each child before it can undertake sex education classes – children are not a parent's possession, and any parent who objects to its child receiving a sex education at school obviously doesn't understand, or care about, what is best for that child! Some of the sex education curriculum should be covered by primary schools (i.e., before the children reach puberty – such classes could simply be designed to ensure that pre-pubescent pupils have been taught the basics, although some pupils may already know more theory if, for example, their parents or older siblings divulged more sexual information; and some, particularly those who have been sexually abused, will already have some practical knowledge) while the remainder can be covered by secondary schools – and it might be practical to segregate boys and girls for sex education classes. It isn't necessary for school sex education classes to teach pupils everything they can do while having sex with another person, but everyone should be able to calculate the days of a gal's cycle when unprotected intercourse is ill-advised (even if her cycle is erratic) – unless pregnancy is the desired outcome. Preferably aided by observing their own parents, every pupil should also have a perspective of what makes a relationship either successful or unsuccessful, thus helping to prevent unsuccessful ones. While it is probably expecting too much to assume everyone in future will be able to achieve what might be considered the ideal relationship – one in which two virgins fall in love and spend the rest of their lives together – or be interested in achieving it ('with dating experience and contact with many different kinds of people, young people gradually acquire a better understanding of others'; and it is hard to fully understand another person until you have lived with that person for a while, or to form a successful relationship without having any practise beforehand), more children than now might try if they accept that such a scenario will ultimately bring them the most personal happiness. However, it is neither practical nor essential for people to get married.

A number of animal species mate for life and remain loyal to each other without confirming their relationship via the exchanging of rings, vows, and the signing of contracts, etc. These practices were adopted by our species because of the need to confirm ownership of property. However, if a society doesn't recognise private ownership of accommodation, it follows that private ownership of most material objects would also be unrecognised. Therefore, the obligation to get married for legal reasons is largely removed. Furthermore, a formal exchange of vows is only necessary if one or both partners has reason to doubt the validity of the other's commitment – but, assuming that humans only commit themselves to someone they genuinely love, and are capable of showing it (while also refraining from 'chatting up' strangers or other people's partners – thereby dissolving the purpose of wearing rings on the 'third finger of their left hand'), they should be able to prove their love and commitment to a partner without ever needing to participate in a formal ceremony. That doesn't mean couples won't engage in commitment-confirming ceremonies in future, but these should only be informal – which means that society doesn't need to provide marriage-related services such as registry offices, marriage celebrants, wedding dress-makers, etc.

marriage, status, especially as recognized by law or custom, of a... [couple] living together as husband and wife, or legally united as such... In most societies marriages are negotiated by the families of the bride and groom, who often close the agreement with an exchange of property. Marriage laws in the U.S. differ somewhat in the different states. The legal and civil ceremony is all that is required... in addition to the securing of a license (civil registration). A marriage is a form of legal contract which requires process of law to set aside (...divorce). In some states a common-law marriage (by mutual consent) is recognized... The form of trial marriage called companionate marriage, which is marriage without legal obligations, was widely advocated in the 1920s, particularly by Judge Ben B. Lindsey, who argued that the initiation of people into the experience of married life before marriage would result in more stable marriages... Some form of marriage existed in prehistoric times... [but the] theory that the early type of marriage was group marriage wherein a group of [guys] married a group of [gals] is now generally rejected, since such marriage has rarely been observed in any primitive or advanced culture ([note that there is a 'Chinese region near Tibet where gals own property, handle money and choose husbands – who live with their mothers, while their children live with the children's mother' and are identified with her]).

...name, word by which a person... is identified... Personal names have had a long history. They began, simply, among primitive peoples with a birth name. Among the Romans a person usually bore three names: first name... gens name... and family name. In later Christian Europe, the first name was that which distinguished a person and was often a saint's name. As surnames came into use, in the Middle Ages, they developed along several lines: patronymic (Williamson), occupational (Miller), descriptive (Smart), and provenience (Melville). Though in most Western countries a child takes only his father's family name, in the Spanish-speaking countries [a child] often adds his mother's name, sometimes preceded by y ("and"), to his father's. Thus, Pablo Ruiz (patronymic) y Picasso (matronymic), whose exclusive use of the matronymic name is contrary to custom.

A child's surname (last name) should be the same as its mother's – if for no other reason than that mothers do most to produce children (r:p1021, ln3). The father's family name ought to be the child's middle name. That means parents only have to think up a personal (first) name for their children. Incidentally, if parents can access a computer record of the names of everyone living in their district, they could ensure that their child's full name will be unique (at least within that district). It isn't essential for every one of a district's citizens to have a unique full name, but would be practical. By the way, for most of our species' history the majority of families shared the same cave or one-bedroomed house (only the rich minority could afford to have more than one bedroom per family) – which means most children received their sex education by observing their parents in action! The ability to teach children about sex via words makes this unnecessary, but that doesn't mean it is necessary for members of a family to sleep in separate bedrooms. Indeed, only a bad parent (i.e., HB) would want its children – especially younger ones – to sleep in another room to itself.

ONCE THE LIGHTS are out and Mum and Dad have said good night, a child's bedroom can become a scary place. Ghosts hover inside a three-year-old's wardrobe. Escaped killers lurk outside an eight-year-old's window... Childhood fears are a normal part of growing up. "This does not mean that fears are of no concern," explains [a]psychologist... "Cavities are also normal, but we don't ignore them." - What Your Child Fears Most

A human wants its child to be and feel safe, but can't be sure that its child is safe at night – be it from imaginary fears, from illness or from other people – if the child sleeps in another bedroom (be it alone or with siblings). This means that a human prefers to have its children sleep near it. Therefore, a human family only needs a two-bedroomed house: one bedroom for the family to sleep in; the other for guests to sleep in, for sick family members to sleep in (if their condition is contagious or disturbs the sleep of other family members), for the parents to use if they want to have sex while the children are home (they can use any room if the children are at, for example, school or their grandparents') or privacy for any other reason, and for parents to sleep in permanently (or whenever they don't have overnight guests) when all of their children are old enough to not be scared to sleep without having a parent nearby (and are mature enough to behave in a responsible manner without direct adult supervision). Furthermore, the main bedroom only needs to have enough space to fit a double bed and two single beds. This is because bunks can be used if a couple has more than two children. However, humans are only interested in having two children – because a single-child is less likely to develop worthy social skills, while three or more children might increase their species' population (which is not just unnecessary but potentially catastrophic for this species and others)!

Apartments don't need to have separate living and sleeping quarters (i.e., the main living space can be open-plan, containing a double-bed – which doubles as a lounge suite during the day – dining table, two dining chairs and kitchen facilities), with an en suite toilet and bathroom, and perhaps another internal door to access a wardrobe/closet space. They also don't need private gardens, which means they can be constructed in soundproofed multi-storey blocks – which share communal gardens and other facilities (e.g., laundry equipment, general cleaning equipment). Ideally, these blocks would be in one-apartment-deep rows – so each apartment can have front and rear windows (and access – via a rear window – to an emergency escape ladder; access to the front door could be via a verandah which runs the length of each row, with lifts and staircases at each end) – but they shouldn't be positioned so that one block blocks sunlight from another (i.e., in future there should be restrictions on the height of apartment blocks and their proximity to other buildings). Furthermore, apartment blocks and family homes should be grouped separately – as opposed to having a mix of each in one area (i.e., all of a suburb's public buildings and amenities, industrial sites and apartment buildings should be located in its centre, with the remainder of the suburb's land being dedicated to family housing, parks and the occasional school; the centre of a city should only contain industrial sites or offices, public buildings and apartment blocks). A city's apartment blocks could: (1) all be segregated into those accommodating either young people or older people; (2) all accommodate mixed ages; (3) or there could be some age-segregated and some mixed-age blocks. The second option would be the easiest to manage – from the perspective of placing tenants – but the third option will be better from the perspective of personal choice (if someone wants to have similarly-aged neighbours, but no suitable apartments are available, it could be given a temporary apartment until a preferred apartment becomes available).

Initially, cities like Auckland wouldn't be able to justify building any new apartment blocks because there are already more office blocks than required (apart from the existing vacant office space, there would be all of the multi-storey office buildings used by industries which have been made redundant by the shift towards a moneyless society, and remaining industries should have a decreasing requirement for office space as they shake off economic practices). If industries were to co-operate in shuffling office workers so that there are only completely or near-full office blocks and completely empty office blocks – rather than having lots of partially-full office blocks – the completely empty ones could systematically be converted into apartment blocks. As new apartments are completed, groups of flatmates can be moved into them, thereby freeing up more multi-bedroomed housing for families or couples who are expecting their first child. Note that if a district's population is able to be maintained at a relatively constant level in future, with approximately equal numbers in each age group, the total number of accommodation units required by the district (and the ratio between numbers of apartments and homes) would be *relatively constant*.

In order for districts to best meet most of the needs of their own citizens, each district's productive land area has to be sufficient to support most or all of its population. Unfortunately, because some districts are currently so densely populated (especially where a city has a population over 10 million), it would be very difficult to immediately divide the world into districts having approximately equal population (r:p1865, ln59). It should, however, be possible to divide districts into approximately equal land areas, then encourage people to move from densely to less-densely populated districts, while preventing anyone from moving in the opposite direction. This process of managing the movement of citizens between districts (or between states) could continue until the population of every district is *approximately equal*. However, while trying to decrease the size of large cities, each district should also aim to eventually have most if not all of its citizens live in one urban location – so the remainder of the district's land only needs to be interrupted by a minimum number of roads, buildings and other facilities that aren't directly related to production of food, collection of raw materials or other industrial purposes. In some instances, it might be more sensible for a district to have twin cities, but there ought to be no justification for any district to have more than two urban areas. People shouldn't be forced to move from a rural home to an urban one, but new housing and other construction can just be built in the designated urban area (if a district doesn't already have a city, the most suitable location for one to be built would have to be identified – taking into consideration issues such as land fertility, proximity to flood plains, volcanoes and seismic activity). Some rural homes can be shifted to the urban area after they have been vacated, while those that can't be shifted – or utilised by other industries – ought to be dismantled and any trace of their existence removed.

From a purely utilitarian perspective, it is better to live in large communities (cities) than small or non-existent ones; to live near to other people rather than be isolated from them – because it minimises the use of land (and transport) while maximising the use of public services and infrastructure. In addition, a person is more likely to find a compatible partner if it has a large mix of people to choose from (and larger gene pools are healthier for society). This means that, in theory, people who live in cities are more likely to form successful relationships than those who live in the country or small towns.

Apart from being separated into 50 unequal states, the US is also divided into '3,043 counties, of which 167 have populations of more than 250,000 and 698 fewer than 5,000.' Some of those 698 counties might be able to cater for a much larger population than 5,000, but many are probably regions of largely uninhabitable and unproductive land whose citizens could, eventually, all be shifted elsewhere – or have died – thus creating areas of land which aren't inhabited by any humans or utilised for productive purposes. If we were to substitute the word DISTRICT for COUNTY and, hypothetically, each was to have a population of 1 million, the area currently known as the USA would need to be rearranged into about 260 districts (r:p1461, ln1-2). 260-or-so million humans may be close to the maximum carrying capacity of the land area, which means that while there could continue to be justification for moving people between USA counties, more people ought to only be allowed into the area if they are replacing people who've moved out of it. In comparison, AUS (which has a total land area of almost 7.7 million sq km to the USA's over 9.3 million sq km) is a part of the world that, despite containing expansive deserts, could support more than 16 million humans in its coastal areas, plus inland areas adjoining major rivers and lakes. Likewise, NZ's land area (which is currently divided into 12 regions – or districts) ought to be able to carry more than a current population of about 4 million (r:p1973, ln566-70). Most of NZ's districts have average populations of less than 250,000 (only the districts which incorporate the cities of Auckland, Wellington and Christchurch have populations greater than 250,000 – r:p373, ln26-7), but they may all be able to support a population nearer to that of Auckland – especially if the productive land is properly managed. If, for example, all of the productive land within a 1-hour-drive radius of central Auckland (the nearest cities to Auckland – Whangarei and Hamilton – are, respectively, about 2-3 hours away to the north and 1-2 hours away to the south) was dedicated to producing for that city – instead of also producing for other parts of NZ and, especially, for export – it is possible this area of land could supply the 1 to 1 1/2 million people who inhabit the district with all of their food and most, if not all, of their raw material requirements (the possibility would increase if all of the district's citizens were to be accommodated entirely within the current limits of Greater Auckland).

EAT

Under primitive agricultural conditions the farmer had few insect problems. These arose with the intensification of agriculture – the devotion of immense acreages to a single crop... Single-crop farming does not take advantage of the principles by which nature works; it is agriculture as an engineer might conceive it to be. Nature has introduced great variety into the landscape, but... [humanity] undoes the built-in checks and balances by which nature holds the species within bounds. One important natural check is a limit on the amount of suitable habitat for each species. Obviously then, an insect that lives on wheat can build up its population to much higher levels on a farm devoted to wheat than on one in which wheat is intermingled with other crops to which the insect is not adapted. The same thing happens in other situations. A generation or more ago, the towns of large areas of the U[S] lined their streets with the noble elm tree. Now the beauty they hopefully created is threatened with complete destruction as disease sweeps through the elms, carried by a beetle that would have only limited chance to build up large populations and to spread from tree to tree if the elms were only occasional trees in a richly diversified planting... THE THIN layer of soil that forms a patchy covering over the continents controls our own existence and that of every other animal of the land. Without soil, land plants as we know them could not grow, and without plants no animals could survive. Yet if our agriculture-based life depends on the soil, it is equally true that soil depends on life, its very origins and the maintenance of its true nature being intimately related to living plants and animals... There are few studies more fascinating, and at the same time more neglected, than those of the teeming populations that exist in the dark realms of the soil. We know too little of the threads that bind the soil organisms to each other and to their world, and to the world above. Perhaps the most essential organisms in the soil are the smallest – the invisible hosts of bacteria and of threadlike fungi. Statistics of their abundance take us at once into astronomical figures... With small green cells called algae, these make up the microscopic plant life of the soil. Bacteria, fungi, and algae are the principal agents of decay, reducing plant and animal residues to their component minerals. The vast cyclic movements of chemical elements such as carbon and nitrogen through soil and air and living tissue could not proceed without these microplants. Without the nitrogen-fixing bacteria, for example, plants would starve for want of nitrogen, though surrounded by a sea of nitrogen-containing air. Other organisms form carbon dioxide, which, as carbonic acid, aids in dissolving rock. Still other soil microbes perform various oxidations and reductions by which minerals such as iron, manganese, and sulphur are transformed and made available to plants. Also present in prodigious numbers are microscopic mites and primitive wingless insects called springtails. Despite their small size they play an important part in breaking down the residues of plants... The specialization of some of these minute creatures for their task is almost incredible... They macerate and digest... leaves, and aid in mixing the decomposed matter with the surface soil. Besides all this horde of minute but ceaselessly toiling creatures there are of course many larger forms... Some are permanent residents of the dark subsurface layers; some hibernate or spend definite parts of their life cycles in underground chambers; some freely come and go between their burrows and the upper world. In general the effect of all this habitation of the soil is to aerate it and improve both its drainage and the penetration of water throughout the layers of plant growth. Of all the larger inhabitants of the soil, probably none is more important than the earthworm... In... a book entitled *The Formation of Vegetable Mould, through the Action of Worms, with Observations on Their Habits*... Charles Darwin... gave the world its first understanding of the fundamental role of earthworms as geologic agents for the transport of soil – a picture of surface rocks gradually covered by fine soil brought up from below by the worms, in annual amounts running to many tons to the acre in most favourable areas... Darwin's calculations showed that the toil of earthworms might add a layer of soil an... inch and a half thick in a ten-year period... At the same time, quantities of organic matter contained in leaves and grass (as much as twenty pounds to the square yard in six months) are drawn down into the burrows and incorporated into the soil... ['Estimates of earthworms to the acre have been as high as 3 million. Without their continual action in aerating, pulling down leaves and throwing up worm casts, the earth, or at least uncultivated land "would soon become cold, hard-bound, and void of fermentation; and consequently sterile", as Gilbert White wrote in 1777, a time when "gardeners and farmers express(ed) their detestation of worms". Darwin pointed out, however, that the action of earthworms can sometimes be harmful on sloping ground and assist in denudation, the soil brought up being washed or blown downhill. Worms occur in the highest numbers in grassland, where there is plenty of food and no disturbance, and the population declines drastically if the ground is dug or ploughed. There is a limit to the earthworm's toleration of soil acidity and, if this is exceeded, vegetation accumulates on the surface as a mat which eventually becomes peat.' Worm burrows also] keep... the soil... well drained, and aid the penetration of plant roots. The presence of worms increases the nitrifying powers of the soil bacteria and decreases putrefaction of the soil. Organic matter is broken down as it passes through the digestive tracts of the worms and the soil is enriched by their excretory products... What happens to these incredibly numerous and vitally necessary inhabitants of the soil when poisonous chemicals are carried down into their world, either introduced directly as soil 'sterilants' or borne on the rain that has picked up a lethal contamination as it filters through the leaf canopy of forest and orchard and cropland? Is it reasonable to suppose that we can apply a broad-spectrum insecticide to kill the burrowing larval stages of a crop-destroying insect, for example, without also killing the 'good' insects whose function may be the essential one of breaking down organic matter? Or can we use a non-specific fungicide without also killing the fungi that... aids... in extracting nutrients from the soil? The plain truth is that this critically important subject of the ecology of the soil has been largely neglected even by scientists... Chemical control of insects seems to have proceeded on the assumption that the soil could and would sustain any amount of insult via the introduction of poisons without striking back. The very nature of the world of the soil has been largely ignored. From the few studies that have been made, a picture of the impact of pesticides on the soil is slowly emerging. It is not surprising that the studies are not always in agreement, for soil types vary so enormously that what causes damage in one may be innocuous in another. Light sandy soils suffer far more heavily than humus types. Combinations of chemicals seem to do more harm than separate applications. Despite the varying results, enough solid evidence is accumulating to cause apprehension on the part of many scientists... Apart from any directly toxic effects, curious indirect results follow the use of certain herbicides. It has been found that animals, both wild herbivores and livestock, are sometimes strangely attracted to a plant that has been sprayed, even though it is not one of their natural foods... Poisonous range weeds, for example, have suddenly become attractive to livestock after spraying, and the animals have died from indulging this unnatural appetite. The literature of veterinary medicine abounds in similar examples, swine eating sprayed cockleburs... lambs eating sprayed thistles, bees poisoned by pasturing on mustard sprayed after it came into bloom... [Humanity] is... dependent on these wild pollinators... [yet even farmers] seldom understand... the value of wild bees and often participate... in the very measures that rob [them] of their services. Some agricultural crops and many wild plants are partly or wholly dependent on the services of the native pollinating insects... Without insect pollination, most of the soil-holding and soil-enriching plants and uncultivated areas would die out, with far-reaching consequences to the ecology of the whole region... Although the Food and Drug Administration permits no residues of pesticides in milk, its restrictions are not only inadequately policed but they apply solely to inter-state shipments. State and county officials are under no compulsion to follow the federal pesticides tolerances unless local laws happen to conform – and they seldom do... The contamination of milk and farm produce in the course of the gypsy moth spraying programme came

as an unpleasant surprise to many people... Some leaf crops were so burned and spotted as to be unmarketable. Others carried heavy residues; a sample of peas analysed at Cornell University's Agricultural Experiment Station contained 14 to 20 parts per million of DDT. The legal maximum is 7 p[pm]... Growers therefore had to sustain heavy losses or find themselves in the position of selling produce carrying illegal residues. Some of them sought and collected damages. As the aerial spraying of DDT increased, so did the number of suits filed in the courts. Among them were suits brought by beekeepers in several parts of New York State. Even before the 1957 spraying, the beekeepers had suffered heavily from use of DDT in orchards. 'Up to 1953 I had regarded as gospel everything that emanated from the U.S. Department of Agriculture and the agricultural colleges,' one of them remarked bitterly. But in May of that year this [apiarist] lost 800 colonies after the state had sprayed a large area. So widespread and heavy was the loss that fourteen other beekeepers joined him in suing the state for... [\$0.25] million... in damages. Another beekeeper, whose 400 colonies were incidental targets of the 1957 spray, reported that 100[%] of the field force of bees (the workers out gathering nectar and pollen for the hives) had been killed in forested areas and up to 50[%] in farming areas sprayed less intensively. 'It is a very disturbing thing... to walk into a yard in May and not hear a bee buzz.' The gypsy moth programmes were marked by many acts of irresponsibility. Because the spray planes were paid by the gallon rather than by the acre there was no effort to be conservative, and many properties were sprayed not once but several times. Contracts for aerial spraying were in at least one case awarded to an out-of-state firm with no local address, which had not complied with the legal requirement of registering with state officials for the purpose of establishing legal responsibility. In this exceedingly slippery situation, citizens who suffered direct financial loss from damage to apple orchards or bees discovered that there was no one to sue. After the disastrous 1957 spraying the programme was abruptly and drastically curtailed, with vague statements about 'evaluating' previous work and testing alternative insecticides. Instead of the 3 1/2 million acres sprayed in 1957, the treated areas fell to 1/2 million in 1958 and to about 100,000 acres in 1959, 1960, and 1961. During this interval, the control agencies must have found news from Long Island disquieting. The gypsy moth had reappeared there in numbers. The expensive spraying operation had cost the Department dearly in public confidence and good will – the operation that was intended to wipe out the gypsy moth for ever... had in reality accomplished nothing at all. Meanwhile, the Department's Plant Pest Control [officials] had temporarily forgotten gypsy moths, for they had been busy launching an even more ambitious programme in the South... In 1957 the... D[OA] launched one of the most remarkable publicity campaigns in its history. The fire ant[... which]... seems to have entered the U[S] from South America by way of the port of Mobile, Alabama... suddenly became the target of a barrage of government releases, motion pictures, and government-inspired stories portraying it as a despoiler of southern agriculture and a killer of birds, livestock and [humans]. A mighty campaign was announced, in which the federal government in co-operation with the afflicted states would ultimately treat some 20,000,000 acres in nine southern states. 'U[S] pesticide makers appear to have tapped a sales bonanza in the increasing numbers of broad-scale pest elimination programmes conducted by the U.S. D[OA], cheerfully reported one trade journal in 1958, as the fire ant programme got under way. Never has any pesticide programme been so thoroughly and deservedly damned by practically everyone except the beneficiaries of this 'sales bonanza'. It is an outstanding example of an ill-conceived, badly executed, and thoroughly detrimental experiment in the mass control of insects, an experiment so expensive in dollars, in destruction of animal life, and in loss of public confidence in the [DOA] that it is incomprehensible that any funds should still be devoted to [the Department]... The chemicals... used were dieldrin and heptachlor, both relatively new. There was little experience of field use for either, and no one knew what their effects would be on wild birds, fishes, or mammals when applied on a massive scale. It was known, however, that both poisons were many times more toxic than DDT, which had been used by that time for approximately a decade, and had killed some birds and many fish even at a rate of 1 pound per acre. And the dosage of dieldrin and heptachlor was heavier – 2 pounds to the acre under most conditions, or 3 pounds of dieldrin if the white-fringed beetle was also to be controlled. In terms of their effects on birds, the prescribed use of heptachlor would be equivalent to 20 pounds of DDT to the acre, that of dieldrin to 120 pounds! Urgent protests were made by most of the state conservation departments, by national conservation agencies, and by ecologists and even by some entomologists, calling on the then Secretary of Agriculture... to delay the programme at least until some research had been done to determine the effects of heptachlor and dieldrin on wild and domestic animals and to find the minimum amount that would control the ants. The protests were ignored... A million acres were treated the first year. It was clear that any research would be in the nature of a post mortem. As the programme continued, facts began to accumulate from studies made by biologists of state and federal wildlife agencies and several universities. The studies revealed losses running all the way up to complete destruction of wildlife on some of the treated areas. Poultry, livestock, and pets were also killed. The [DOA] brushed away all evidence of damage as exaggerated and misleading... [H]owever, ...statements made by D[OA] witnesses seeking appropriations were not in accord with those contained in key [DOA] publications... The 1957 bulletin *Insecticide Recommendations... for the Control of Insects Attacking Crops and Livestock* did not so much as mention the fire ant – an extraordinary omission if the D[OA] believes its own propaganda... Against the D[OA]'s undocumented claim that the fire ant destroys crops and attacks livestock is the careful study of the Agricultural Experiment Station in... Alabama. A[lt]hough 'fire ants cause damage to electronics in southern USA', a[cc]ording to Alabama scientists, 'damage to plants in general is rare.' ...an entomologist at the Alabama Polytechnic Institute and in 1961 president of the Entomological Society of America, states that his department 'has not received a single report of damage to plants by ants in the past five years... No damage to livestock has been observed.' ...fire ants feed chiefly on a variety of other insects, many of them considered harmful to [hu]man... interests. Fire ants have been observed picking larvae of the boll weevil off cotton. Their mound-building activities serve a useful purpose in aerating and draining the soil... The claim that the ant is a menace to health and life also bears considerable modification. The [DOA] sponsored a propaganda film (to gain support for its programme) in which horror scenes were built around the ant's sting. Admittedly this is painful and one is well advised to avoid being stung, just as one ordinarily avoids the sting of wasp or bee. Severe reactions may occasionally occur in sensitive individuals, and medical literature records one death possibly, though not definitely, attributable to fire ant venom. In contrast to this, the Office of Vital Statistics records thirty-three deaths in 1959 alone from the sting of bees and wasps. Yet no one seems to have proposed 'eradicating' these insects... In 1959... the State of Alabama, alarmed and angry at the damage done by the chemicals, refused to appropriate any further funds for the project. One of its officials characterized the whole programme as 'ill advised, hastily conceived, poorly planned, and a glaring example of riding roughshod over the responsibilities of other public and private agencies'... In the same year... perhaps in an attempt to offset the growing dissatisfaction with the programme, the [DOA] offered the chemicals free to Texas landowners who would sign a release absolving federal, state, and local governments of responsibility for damage... After three years of heavy doses, [the DOA] abruptly reduced the rate of application of heptachlor from 2 pounds to 1 1/4 pounds per acre... later to 1/2 pound per acre, applied in two treatments of 1/4 pound each, three to six months apart. A[DOA] official... explained that 'an aggressive methods improvement programme' showed the lower rate to be effective. Had this information been acquired before the programme was launched, a vast amount of damage could have been avoided and the taxpayers could have been saved a great deal of money... Effective and inexpensive methods of local control have been known for years. The mound-building habit of the fire ant makes the chemical treatment of individual mounds a simple matter. Costs of such treatment is about [\$1] per acre. For situations where mounds are numerous and mechanized methods are desirable, a cultivator which first levels and then applies chemical directly to the mounds has been developed by Mississippi's Agricultural Experiment Station. The method gives 90 to 95[%] control of the ants. Its cost is only \$.23 per acre. The [DOA]'s mass control programme, on the other hand, cost about \$3.50 per acre – the most expensive, the most damaging, and the least effective programme of all... Sometimes the result of chemical spraying has been a tremendous upsurge of the very insect the spraying was intended to control, as when blackflies in Ontario became 17 times more abundant after spraying than they had been before. Or when in England an enormous outbreak of the cabbage aphid – an outbreak that had no parallel on record – followed

spraying with one of the organic phosphorus chemicals. At other times spraying, while reasonably effective against the target insect, has let loose a whole Pandora's box of destructive pests that had never previously been abundant enough to cause trouble... The question of chemical residues on the food we eat is a hotly debated issue. The existence of such residues is either played down by the industry as unimportant or is flatly denied... It has been medically established that, as common sense would tell us, persons who lived and died before the dawn of the DDT era (about 1942) contained no trace of DDT or any similar material in their tissues... [S]amples of body fat collected from the general population between 1954 and 1956 averaged from 5.3 to 7.4 parts per million of DDT. There is some evidence that the average level has risen since then to a consistently higher figure, and individuals with occupational or other special exposures to insecticides of course store even more. A... scientific team from the U[S] Public Health Service sampled restaurant and institutional meals. *Every meal sampled contained DDT...* The quantities in such meals may be enormous. In a separate P[HS] study, analysis of prison meals disclosed such items as stewed dried fruit containing 69.9 parts per million and bread containing 100.9 parts per million of DDT! ...Residues on [fresh] fruit and vegetables tend to be somewhat less[, but these] are little affected by washing – the only remedy is to remove and discard all outside leaves of such vegetables as lettuce or cabbage, to peel fruit and to use no skins or outer covering whatever. Cooking does not destroy residues. Milk is one of the few foods in which no pesticide residues are permitted by F[DA] regulations. In actual fact, however, residues turn up whenever a check is made. They are heaviest in butter and other manufactured dairy products. A check of 461 samples of such products in 1960 showed... a third contained residues, a situation which the F[DA] characterized as 'far from encouraging'. To find a diet free from DDT and related chemicals, it seems one must go to a remote and primitive land, still lacking the amenities of civilization. Such a land appears to exist, at least marginally, on the far Arctic shores of Alaska – although even there one may see the approaching shadow. When scientists investigated the native diet of the Eskimos in this region it was found to be free of insecticides... When some of the Eskimos themselves were checked by analysis of fat samples, small residues were found (0 to 1.9 parts per million). The reason for this was clear. The fat samples were taken from people who had left their native villages to enter the [US PHS] Hospital in Anchorage for surgery. There the ways of civilization prevailed, and the meals in this hospital were found to contain as much DDT as those in the most populous city. For their brief stay in civilization the Eskimos were rewarded with a taint of poison. [About the same time, 'in an attempt to eradicate malaria, the WHO embarked on a major campaign to rid the tropics of the mosquitoes that carry the disease. Borneo was to be one of the regions cleared, and a massive spraying campaign was initiated throughout the worst affected regions. The chosen pesticide was DDT – which is still widely used in the Last World. Initially the programme was successful and the mosquito population fell dramatically. But it was not only mosquitoes that died. Numerous other species were poisoned, among them a minute wasp that preyed upon caterpillars living in the thatch of local houses. With the wasp gone, the caterpillar numbers increased to plague proportions, devouring the roofs of houses and causing them to collapse. Nonetheless, the spraying programme continued. The dead mosquitoes were eaten by lizards which, as they became sick, proved easy prey for the local cats. As a result the cats accumulated large quantities of DDT, passed on from insect to lizard to cat. The cats began to die in their thousands – and the local population of rats exploded. The rats not only ate local crops but brought an even greater menace – bubonic plague. In desperation the Borneo government called for cats to be parachuted into the worst affected areas. The mosquitoes have returned to the sprayed areas and malaria is still rife. Many pesticides are now ineffective, the mosquitoes having developed resistance to them. But, as in other parts of the world, the spraying goes on unabated. And the subtle balance of nature continues to be disrupted.']The fact that every meal we eat carries its load of chlorinated hydrocarbons is the inevitable consequence of the almost universal spraying or dusting of agricultural crops with these poisons. If the farmer scrupulously follows the instructions on the labels, his use of agricultural chemicals will produce no residues larger than are permitted by the F[DA]. Leaving aside for the moment the question whether these legal residues are as 'safe' as they are represented to be, there remains the well-known fact that farmers very frequently exceed the prescribed dosages, use the chemical too close to the time of harvest, use several insecticides where one would do, and in other ways display the common human failure to read the fine print... The files of the F[DA] contain records of a disturbing number of... examples... [of] the disregard of directions: a lettuce farmer who applied not one but eight different insecticides to his crop within a short time of harvest, a shipper who... used the deadly parathion on celery in an amount five times the recommended maximum, growers using endrin – most toxic of all the chlorinated hydrocarbons – on lettuce although no residue was allowable, spinach sprayed with DDT a week before harvest... Even the chemical industry recognizes the frequent misuse of insecticides and the need for education of farmers... There are also cases of chance or accidental contamination. Large lots of green coffee in burlap bags have become contaminated while being transported by vessels also carrying a cargo of insecticides. Packaged foods in warehouses are subjected to repeated aerosol treatments with DDT, lindane, and other insecticides, which may penetrate the packaging materials... To the question 'But doesn't the government protect us from such things?' the answer is, 'Only to a limited extent.' ...The ultimate answer is to use less toxic chemicals so that the public hazard from their misuse is greatly reduced. Such chemicals already exist: the pyrethrins, rotenone, ryania, and others derived from plant substances. Synthetic substitutes for the pyrethrins have recently been developed so that an otherwise critical shortage can be averted. Public education as to the nature of the chemicals offered for sale is sadly needed. The average purchaser is completely bewildered by the array of available insecticides, fungicides, and weed killers, and has no way of knowing which are the deadly ones, which reasonably safe. In addition to making this change to less dangerous agricultural pesticides, we should diligently explore the possibilities of non-chemical methods. Agricultural use of insect diseases, caused by a bacterium highly specific for certain types of insects, is already being tried in California, and more extended tests of this method are under way... [U]nder the onset of a virus[, insect] hordes sicken and die... like the [human] plagues of old... Some of the most fascinating of the new methods are those that seek to turn the strength of a species against itself... The most spectacular of these approaches is the... sterilization... technique developed by the... [DOA]'s Entomology Research Branch... a quarter of a century ago... If it were possible to sterilize and release large numbers of insects... the sterilized[insects] would, under certain conditions, compete with the normal wild[insects] so successfully that, after repeated releases, only infertile eggs would be produced and the population would die out. The proposal was met with bureaucratic inertia and with scepticism from scientists... One major problem remained to be solved before it could be put to the test – a practical method of insect sterilization had to be found[(even though, a]cademically, the fact that insects could be sterilized by exposure to X-ray had been known since 1916[). Unfortunately, one]... of the problems of sterilization by radiation is that this requires not only artificial rearing but the release of sterile [insects] in larger number than are present in the wild population... A chemical sterilant, on the other hand, could be combined with a bait substance and introduced into the natural environment[–]...insects feeding on it would become sterile and in the course of time... would breed themselves out of existence... The sterilants currently being tested fall generally into two groups... The first are intimately related to the life processes, or metabolism, of the cell... [–] the organism 'mistakes' them for the true metabolite and tries to incorporate them in its normal building processes. But the fit is wrong in some detail and the process comes to a halt. Such chemicals are called anti-metabolites. The second group consists of chemicals that act on the chromosomes, probably affecting the gene chemicals and causing the chromosomes to break up. The chemosterilants of this group are alkylating agents, which are extremely reactive chemicals, capable of intense cell destruction... and production of mutations[– which means]... any conceivable use of such chemicals in insect control would be 'open to the most severe objections'. It is to be hoped, therefore, that the present experiments will lead not to actual use of these particular chemicals but to the discovery of others that will be safe and also highly specific in their action on the target insect... Some of the most interesting of the recent work is concerned with still other ways of forging weapons from the insect's own life processes. Insects produce a variety of venoms, attractants, repellants... Could we make use of them...? Scientists at Cornell University and elsewhere are trying to find answers to some of these questions, studying the defence mechanisms by which many insects protect themselves from attack by predators, working out the chemical structure of insect secretions... ['The larvae of the willow beetle squirts out little

droplets from turrets on its side. Each droplet contains very powerful repellents. Actually, ants don't even have to touch the larvae itself to be repelled by these compounds. Just being near one of these droplets is enough to make the ant turn around and flee. The larvae doesn't even waste these droplets because once the enemy moves off it sucks them right back into the glands. The tiny Oriental beetle has become a scourge of US golf courses, gardens and crops after being introduced from Japan accidentally and multiplying at an alarming rate. Filtered air was passed over virgin gal Oriental beetles in a glass chamber and their smell collected in absorbent crystals. The concentrated perfume was then tested on guy Oriental beetles to pinpoint which particular scent from within the blend originally collected caused the greatest response. The tests went so well that the key chemical was identified within days and an artificial scent manufactured. "As we set out the traps the beetles rose out of the grass like a swarm of bees. Originally we had hoped that we would be able to count the beetles in the traps but the very first day we collected well over a hundred thousand.""] **The gypsy moth lure was the first insect sex attractant to be synthesized... A number of... scientists are working on the so-called 'juvenile hormone',** ["a hormone secreted by a gland near an insect's brain. Normally this gland stops functioning as an insect develops into an adult. Using an insecticide made of this juvenile hormone will keep insects from maturing into harmful adults. The nymph of a milkweed bug will just become a giant nymph. A mealworm pupa will develop into a short-lived second pupa instead of an adult"]... **Sound is also being tested as an agent of direct destruction. Ultrasound will kill all mosquito larvae in a laboratory tank... A great many other possibilities exist for effective insect control by methods that will leave no residues on foods... Until a large-scale conversion to these methods has been made, we... are in little better position than the guests of the Borgias... It was reported in 1960 that only 2[%] of all the economic entomologists in the U[S]** were then working in the field of biological controls. A substantial number of the remaining 98[%] were engaged in research on chemical insecticides. Why should this be? The major chemical companies are pouring money into the universities to support research on insecticides. This creates attractive fellowships for graduate students and attractive staff positions. Biological-control studies, on the other hand, are never so endowed – for the simple reason that they do not promise anyone the fortunes that are to be made in the chemical industry. These are left to state and federal agencies, where the salaries paid are far less. This situation also explains the otherwise mystifying fact that certain outstanding entomologists are among the leading advocates of chemical control. Inquiry into the background of some of these [entomologists] reveals that their entire research programme is supported by the chemical industry. Their professional prestige, sometimes their very jobs, depend on the perpetuation of chemical methods. Can we expect them to bite the hand that literally feeds them? But knowing their bias, how much credence can we give to their protests that insecticides are harmless? - 1962

Before it was transformed by modern technology, a farm was simply a place where... ecological cycles tended to be in balance, and with care the natural fertility of the soil could be maintained indefinitely. In contrast, modern agribusiness is so intensive that it depletes the natural supply of organic nutrients; as a result, inorganic fertilizers are applied in increasing amounts, and their runoff from the fields pollutes water supplies... Furthermore... when the whole... production cycle is considered – from soil preparation, planting, cultivating, and harvesting, t[o] transportation, processing, packaging, distribution, and final preparation – far more fossil fuel energy than solar energy from photosynthesis goes into the food on our table. Thus the trend to further industrialization of agriculture may be less rational than has been assumed... As global food scarcities become more and more apparent, so also does the inequitable distribution of available food... The food substance of most concern is protein... Protein deficiency has come to be recognized as one of the most serious impediments to development of human potential... Even when death does not occur, nutritional deficiencies during the critical first few years can cause irreversible brain damage... When nations become richer their consumption preferences tend to shift from grains to meat. As a result of changing tastes and the industrialization of meat production, more and more of this is grain-fed meat. Today[(while wastes)]... from cattle confined to feedlots accumulate and result in more water pollution; in the U.S., cattle produce more organic waste than the total sewage from humans[])... an increasingly large portion of the world's grain protein is going to animals rather than humans – a dubious practice in view of the fact that it takes from four to 12 pounds of grain protein to produce a single pound of meat protein. But this trend reflects the laws of economics, since the rich can afford more and more beef while the poor can afford less and less cereal. - 1976

Generally speaking... animal protein is dietarily superior to vegetable protein unless the latter is derived from a balanced variety of different sources... The significant point is that to produce 1 Calorie of any animal product requires a number of Calories of primary production of whatever vegetable substance the animal has consumed. [Using a highly efficient and scientific method of animal husbandry, the 'feed input'/'food output' ratio in the western world are for beef, roughly 10:1 and lamb (mutton) 12:1, chicken 3:1. Where animal husbandry methods are less efficient, the ratio is higher, and where animals in general forage at will (ie India, Nigeria) the ratio is also higher.] The apparent inefficiency of consuming animal products is somewhat less than the ratios imply in the case of ruminants (eg sheep and cattle), since these animals, with their specialized stomachs, are capable of digesting and utilizing cellulosic material such as grass and cornstalks... that humans cannot utilize directly... To feed cellulosic wastes to ruminants entails no direct cost at all in terms of human food, but for optimum productivity, even ruminants require high-protein supplements consisting of grain... cotton seed meal, soy bean meal or fish meal. This could be used to feed humans directly without intermediate conversion by animals... ['In the 1970s roughly one-third of the world's grain harvest is fed to livestock and poultry']. At least two or three times as many people could be fed on pure vegetarian diets as in Western-type diets that are high in animal products... The most interesting (and saddest) case is that of India, where 200 Calories per day per capita are derived from animal sources – virtually none from fish... an insignificant amount comes from red meat: animal protein is mostly obtained from milk and milk products, such as yogurt and some poultry and eggs... [Meanwhile,] an estimated 100 million scrawny cows... [– not] counting an equal number of non-milk producing bullocks... – ...roam freely, consuming whatever forage they can find, denuding the landscape, and yielding less milk than 10 million fenced-in and well-bred European or American dairy animals. Admittedly, they consume very little or no grain, but the vegetation they do consume would – if better utilized – undoubtedly suffice for the needs of several times their number of humans... Given the realities of the situation... it seems idle for well-fed but guilt-ridden humanitarians in the West to recommend that Americans or... [European]s should stop eating corn-fed beef so that the extra grain could be exported to feed the malnourished people of India. Indians may starve, but if they do it will be because they refuse to adopt serious birth control measures and choose, on religious grounds, to allow cattle to consume vegetation that would otherwise permit them to feed themselves more adequately. Even if Western consumers were altruistic enough to deny themselves meat for the sake of religious... prejudices of Indians, U[S] or European] farmers can hardly be expected to sell grain at a fraction of its production cost. Since the poorest... countries... have no foreign exchange to purchase grain from the U[S] through normal commercial markets, the American taxpayer would have to make up the difference. In a period of straitened government budgets, slower economic growth, and increasingly acute inflationary pressures, this seems highly unlikely... As it happens, the major sources of high-quality plant protein in South Asia (and elsewhere) are not grains but pulses, such as peanuts, soybeans, field beans, chick peas, and lentils[(which 'contain more protein than any other vegetable; 100g provides 337 calories')]. So far, despite considerable effort, there has been no significant progress in the U[S] or anywhere else in the world in raising output per acre of this category of crops... In the advanced countries the prospect for [farming progress during] the next half century is, essentially, for a series of minor improvements in present techniques... These... in addition to earlier ones such as irrigation and crop rotation, have only been exploited widely in... recent decades... [More recently, a] number of breakthrough possibilities for agricultural technology have been suggested, especially in the realm of biological engineering: • Increasing photosynthetic efficiency in plants; for example, by utilizing special light sources, light filters, and so on in a controlled "greenhouse"

environment. • Improved control over plant growth using hormones. • Biological control over pests... or spreading artificially bred insect predators... • New hybrid crop species to develop useful new characteristics such as... nitrogen fixation ability... drought tolerance, and... salt tolerance... [‘Studies conducted by FAO show as much as half of the world’s irrigated land suffers from salinization, alkalization, or waterlogging. Once the damage is done, it presents an economically forbidding cost of repair. Consequently, about 10 million hectares go out of cultivation each year.’] Land can become unproductive through various mechanisms, but the usual sequence involves some combination of deforestation, over-grazing, overcultivation, erosion, salination, and desertification... The degradation of land through surface contamination – as, for example, by mining residues – is also increasingly important... For the U[S] as a whole, it was estimated twenty years ago by the D[OA] that the annual loss of topsoil through erosion might still be as high as 0.5% per year. It was undoubtedly far higher at earlier periods, such as during the “dustbowl” episode of the 1930s[– ‘when the prairie land was returned to grazing after having been cultivated since the First World War, and the hooves of livestock pulverized the unprotected soil’]. The growing need for synthetic fertilizers to replace lost natural soil is understandable in light of numbers like this.

...Already there is evidence that soil fertility cannot be maintained indefinitely with current methods of high fertiliser input as this practice tends to decrease the soil bacteria and reduce the humus content, leaving the land more liable to erosion. The East Anglian fens are a particular example of this... The main problem of chemical inputs is that the chemicals are usually of a kind not found in nature, and therefore there are no organisms capable of dealing with them... [B]acteria would probably evolve to break down most... [synthetic] chemicals, but the timescale... for such an evolution to take place... is too... [long, while the] given time... for... [averting the] consequences... of... present-day... [practices is too] short... Much has been said in recent years about the world’s inability to grow food for its increasing population... [H]owever... there are several options that may alleviate the worst... effects. Firstly, beef and dairy production [needs to] start to give way to arable production, as the tonnage per acre gained this way is far greater than by using animals as intermediates... After this, improved strains of plants could be used to increase food production from a given acreage... The soya bean, for example[– that ‘has the merit of being free from attack from insect pests, grows easily in dry country’, is ‘a soil-enricher (the seeds also produce oil which is used in paints and many other manufactured products, including plastics’), and ‘1000s of years ago was thought to be a sacred grain by the Chinese’ –] is virtually a wild plant and yields are low compared to other similar species. There are, of course, considerable dangers in going for culture of a single strain: the statistics are such that sooner or later we are likely to suffer from the effects of its becoming suddenly virtually extinct. Extreme pressure on food supply might lead to the situation where nobody grows a variety that is slightly less profitable... A more insidious danger is the replacement of wild strains by a single or small number of cultivated ones. A wild plant can be considered as a bunch of keys, each one able to unlock a particular environmental problem, whether it be drought, frost resistance, immunity from fungal attack or maybe a higher percentage of protein in the seed. A cultivated plant, while being very good at solving the problem it is bred for, does not have this variety of attributes. Thus, by destroying wild species, one is throwing away solutions to problems that have not yet arisen. Once these species have gone there is little hope of retrieving them, for the plant took... hundreds of millions of years to evolve and one cannot compress that kind of timescale into a five-year plan... One of the most likely developments resulting from a threatened or actual shortage of food is an increase in production by any means available. At present food production is limited to the use of only parts of plants: if more of the plant could be used as food, then production could be increased proportionately. There are several routes to this, the simplest being the chemical cracking of cellulose, which makes up the bulk of plant tissue, to derive sugar. Another route... [is] to use the inedible portions as feedstock for algae or other single-celled organisms. The use of algae direct might be a more satisfactory solution. Plants are inefficient as collectors of solar energy, and... have a slow growth rate. Algae can absorb many times the amount of energy out of a given amount of sunlight than higher plants can, and some have a doubling rate of the order of hours rather than weeks. Further, many of them yield higher concentrations of protein than the higher plants. Because they live in a liquid environment, handling problems are simpler – the liquid can be pumped, filtered and evaporated in a way that is not possible in normal farming. Indeed, the tank farm of the future will probably resemble an oil refinery more closely than anything else. [‘The nutritive value of algae is indubitable, and it is highly esteemed in the Far East and is used as a basis for a large number of widely marketed foodstuffs. It is not a question of replacing traditional cultivation with that of algae, but the latter may come in useful in the exploitation of solar energy in arid or semi-arid zones.’] There are other plants, yeasts and fungi, that do not get their energy from sunlight. Some yeasts can live on crude oil... The technique of growing yeasts in oil was first developed as a way of cleaning water from the heat exchangers of oil refineries, and later to clean the oil itself of impurities... It is not a far step from this to the adding of substances to the oil to improve the yeast crop and make this the main product. At the present time there is great interest in this possible route to food production, with particular reference to those organisms that can live on the paraffin series and convert some of the energy stored in oil to fats and proteins. This is probably one of the main areas of expansion for food technology... Refineries are sophisticated places where one [hu]man can produce an end-product measured in thousands of tonnes over the period of a year; they can be made virtually automatic, with very tight quality control. With the present shortage of food, rising prices and lack of other investment opportunities it is almost inevitable that ‘food factories’ of this nature will spread rapidly. At first the produce will probably be fed to animals, but before long it will be doctored... so as to be acceptable straight from factory to table... What could be done... ultimately, perhaps... is to... develop... techniques for the direct synthesis of food from inorganic material. If this were done then it would be a relatively simple process to phase oil out gradually and replace it with an ‘in cycle’ method. Even were this achieved, there is... one major danger to be faced. The... carrying capacity of the land will go up a hundredfold, and at the same time vast tracts of land will no longer be needed for agriculture. Thus the cities will be free to expand virtually until they meet each others’ boundaries. In short, the development of synthetic food is likely to lead to a population explosion that will make the present one look like a damp squid. This... will throw severe strains on the other resources of the planet. Metal and energy shortages will become more severe, pollution... much more widespread and interest in it will decline for a while as it no longer threatens the food base. We could even end up in the ridiculous situation where cities are domed and have their own air-conditioning plants, all waste being dumped outside with no further thought for the environment. We would then, to all intents and purposes, be living on an alien planet, because that is what we would have made it. This, of course, is speculation. However, at the present time refineries are being adapted to make food from oil and production is already in the thousand tonne per annum range. It is certain that this food will form an increasing part of the diet of humans. - 1979

The food pessimists with their tales of gloom have infiltrated the public consciousness to a far greater extent than the optimists – and this is hardly surprising since we often see in our newspapers, or watch on TV, reports of famine and crop failure, but hardly ever get any news of all the people who are now better fed than before and the crops that produce the required goods... Studies like... [Hum]ankind at the Turning Point... that... set... the basic human nutritional requirement... at 2200-3000 kilocalories and 70 mg of protein per day and... estimate that 95[%] of all available land in south-east Asia is already in use while most of Africa is ‘unusable’, have added to the gloom. Yet, during the decades since... [WW2] while there has been a widespread belief that world food supplies are already insufficient, or at best about to be overtaken by increasing population, *food production has actually been growing more rapidly than population!* Over those decades, food production worldwide has risen by an average of 2.8[%] a year, and population by only 2[%] a year, according to official... UN Food and Agriculture Organisation... figures. Obviously, there... is no problem of food *production*[, but]... there is a real problem involving food *distribution*... 1967 opinion gave a maximum possible area of land available for cropping of 6600 million hectares, of which about half had actually been cultivated sometime in history and only 1400 million hectares... is in use in any one year now. Almost two thirds of this estimated resource lay in Africa, Asia and South America, where, it was thought, only about one third of the available land was being harvested in any one year. Other studies in the middle and late 1960s gave similar figures in

the same range, providing a basis from which towers of gloom were built. Yet, even these figures show that world food production could be doubled immediately if all available land were put to effective use – and these figures underestimate the true position, as improved understanding of the Earth through monitoring from satellites] (‘from the heights of space, laser scanners can tell, with the precision of a few acres, where crops are too dry and where they are overwatered’).] use of the new UNESCO soil maps, and results of the 11-year International Biological Programme have now shown... The single most dramatic, and important, piece of work on the real potential of the world food production system was carried out in 1973... by a team at the Dutch Wageningen Agricultural University... With ‘best’ farming practice, but no new technology (not even desalination), they arrived at a figure of just under 50,000 million tonnes of grain equivalent a year, forty times the present world production... Of course, this maximum could never be reached in practice, since some land will be used for other purposes, and best yields are seldom achieved. But you can put in a... reduction by a fraction of two thirds to take account of this and still have left a capacity twenty times present production... Where does the scope for improved crops lie? In the real world, a shift from individual to commercial farming has *reduced* the productivity per hectare, in spite of increased use of fertilizers. Big business agriculture, with emphasis on machinery, produces less from the same amount of land than small farmers who cultivate every corner, plant rows of one crop between those of another (where the wheels of machines on a ‘commercial’ farm would crush them), and in general pay attention to detail. The ideal situation would be if the enthusiasm of farmers who own and manage their own land could be combined with modernisation of techniques, to increase both productivity per hectare and productivity per [hu]man. Is this really possible? In some countries, at least (notably China), the evidence suggests that it can be done. But what is *not* needed is the mindless application of ‘western’ agricultural methods in... countries... where, as well as the need to maximise yields, there is also a need to maximise employment in any case!

...To a considerable degree the revolution in the automation of agriculture, which has caused a massive shift of population from the farmlands over the last century, will be repeated by a massive shift of population out of factory cities during the next... I invite you to join me in a tour through... the world of 2081... in which our great-grandchildren will be just at their prime... In contrast to the streamlined shape of the jet airplane, the last vehicle [Eric]’d seen... Ellen’s car... was a chunky little box... Evidently the car’s on-board computer had been given a list of those people authorized to drive it, since the [controls] remained blank when... Eric... got in, but came to life immediately when Ellen took her seat... Ellen told the car... to leave at once for her home in Waterford, and... a large video screen confirmed the order by showing the street address, the routing, and the estimated time en route. The little car started to move immediately, and [Eric] heard the faint hum of electric motors... [The] way led between sloping, ivy-covered banks, then to a wide road... Cars were three abreast in each direction, and the spacing between [Ellen’s] and the cars in front and back was less than a car length. All were moving at a steady 50 mph... The car began to bump and pitch, and [Eric] could see patches of beaten snow on the ground... There were electric motors on all four wheels, usable as generators for braking, so the car was able to cope with most driving conditions unless the snow patches became too deep for its small wheels. If [it] began to skid, the road computer would direct [the] car to slow down. Ellen... wanted to speak with her mother, and after a few moments [Eric] heard the voice of an older [person. Ellen and her mother talked about the car’s] expected arrival time, and then [Ellen asked for Eric’s] drink order, saying that “Arthur” would have it ready for [him]. Arthur was... their household robot, and Ellen’s mother Jeannette was quite proud of him. As [they] drove... one by one the other cars turned onto sloping exits that curved off to [thei]r right. Far away at left or right there occasionally appeared large clusters of dim lights through the falling snow, and Ellen explained that those were open towns, exposed to the weather... [S]oon... a bell that was just audible, told... th[em] the Waterford exit ramp was 50 meters ahead. [They] left the main road and... Eric... was surprised to see no general glow of lights, but Ellen... [said Eric] should expect none because Waterford was totally enclosed... The car had slowed to perhaps 30 mph... to keep wind noise down within the town. Above... there was brilliant light, as bright as afternoon sun, and it seemed to come from a regular array of lights some twenty meters overhead. Although the color quality was that of sunlight, [Eric] found the arrangement rather artificial when contrasted with the natural sunlight [i]t... was used to in all of the [space] colonies. The feeling of enclosure was also strange to [hi]m... because... at home in Fox Cluster [there are] no roofs on... towns, and when [people] look up, far above [they] see the parks and villages on the other side of the sphere. The car slowed on a side street, a small sunken roadway bordered by hedges and flowering shrubs and the occasional stone gateway. [They] turned into one of them... Though the Tehaneys live in a separate, single-family dwelling, most of Waterford’s residential areas are... townhouses or apartments... 10,000 or so people... live within a space of a square mile... The house seemed much like those in one of [the] Polynesian-climate colonies, with plenty of open space, high ceilings, and thick roof beams in natural wood. The floors at the entry level were terra cotta tile, and large windows opened onto courtyards and gardens rich with tropical flowers. [They] climbed stairs with a carved wooden railing to a carpeted level where Jeannette showed [Eric to his] suite, with bedroom, balcony, bath, and exercise room. [Jeannette showed him] the controls for the stereo, the video, and the lights, and added that if [Eric] just spoke in a normal tone in any room the house computer would hear [hi]m... and carry out [his instructions. Eric] wasn’t at all... [keen on] the idea that every word... spoke[n] was being listened to, but it seemed to be the price of perfect service. After [Jeannette] left, there was a gentle knock at the door and [Eric] found Arthur outside it waiting with the last of... Eric’s... bags... [Arthur] was programmed not to enter a bedroom without permission... When [Eric]’d unpacked and showered [it] followed the sound of a cocktail mixer being shaken... Eric... was surprised to find... Ellen’s father... mixing the drink himself, but... Bill Tehaney... explained that with short working weeks and highly mechanized households most people treated cooking and drink mixing as creative hobbies... [Bill] and Jeannette didn’t allow Arthur to take over the kitchen unless they were ill or very tired. Jeannette suggested that [they all] take a drive in the Waterford park before dinner... The Tehaney’s town car was waiting for [them] at the front door. It was much longer than Ellen’s commuter car... Eric... leaned back for comfort, and turned [his] face up to the “sunlight,” now darkening gradually toward dusk... [Eric]’d estimated by squinting upward toward the lights that the height of Waterford’s roof... [– which] was supported at intervals by slim columns, mostly ivy covered... [–] was not much over twenty meters... though... over the... [park] there was a high oval dome. [They] watched as the “sunlight” faded. On the dome there appeared, dimly at first and then more clearly, cumulous clouds. An image of an orange sun slowly set, and as it passed behind layers of clouds the light turned from orange to red, with rays and streamers of light filtered, apparently, by the slow-moving clouds... Eric... heard, dimly and far away, a momentary burst of a hissing, pattering noise... and... Ellen... supplied the explanation: [the noise was]... sleet drumming on the outside of the dome... Waterford’s... citizens... choose the climate and the weather they prefer... [Because this was] a winter day of sleet and storm... the town[was] enclosed. A few months later... [the town might be] wide open to the sun and sky... The shape of its enclosure... [is] dictated by the practical realities of snow removal and of solar energy... Waterford’s flat roof, well suited to being swept by automatic machines, will never accumulate great depths of snow because the machines... just push the stuff to the nearest edge, and over... The dome... [is] fixed permanently in place... Over all the rest of the town the roof... consist[s] of three layers, forming three flat planes, and the upper two layers... [are] movable. The highest layer... [is] topped by a sheet of bright, reflecting aluminium to keep out rain and wind and to reflect the heat of the summer... Under the entire aluminium surface there... [is] insulation... to a depth of meters. This top layer... [was] built in modular sections, hundreds of meters in each direction, and the sections... roll aside to a storage area at the perimeter of Waterford. Under the opaque insulating layer... [is] a separate, independent layer of glass, also in modular sections. This... turn[s] Waterford into a greenhouse for solar energy on bright cold days... Only when the weather is very good, or when Waterford’s residents desire natural rainfall, [are] both the insulating and the glass layer... rolled aside. Then, only the third layer... remain[s], a stretched, flat sheet of screen to keep out mosquitoes and other insects... Towns with fixed roofs... require... no pesticides at all... Th[e third layer is]... supported on the same lightweight framework that... carry[s] Waterford’s artificial “sun” lights... Jeannette suggested... [they] stop at a market, and [Eric] asked her how far [the family] had to

go for groceries. [Jeannette said they normally] didn't go out for them at all... Most of the staple items... the[y] used regularly were on a list that the home computer kept. The computer reordered any time they ran low, so... the... pantry was always fully stocked. After a few minutes' drive the town car[, that is]... never used outside Waterford... let [them] off at a low arched entrance to a pedestrian avenue, which led... past small shops, fountains, and flowering plants. [They] turned into... a grocery market, and [Eric] was surprised to find that it had no checkout counters. Instead, the shoppers carried small baskets, and when they had accumulated a few things from the shelves they dropped them at one of the charge counters among the shelves[, where an automatic device sensitive to the ankle signals charged each item and routed it to the customer's car... [Eric]'d been surprised by the freshness of the fruit and vegetables in the shop, and Ellen explained that they were grown in greenhouses just outside Waterford's town walls, using as nutrients chemicals sterilized from sewage. The recycling system had been copied from those perfected years earlier for the space colonies, the only difference being that on Earth sunlight had to be provided artificially to permit a twelve-month growing season... Greenhouse agriculture, guided by computer, ha[s solved Waterford's] food problem by closing the water cycle and providing dependable crops free of weather. And by providing food at the village level, it had also bypassed the whole problem of an inadequate system of distribution... In my view, the development of closed-cycle (greenhouse) agriculture over the next century will be the only effective solution to the problems of agricultural pollution and deforestation and also of year-to-year variations of food production. In closed-cycle agriculture, runoff water is cleaned and recirculated instead of being allowed to escape, and fertilizers are recycled instead of being allowed to run off into watersheds... Crops are protected from climatic extremes outside... [while, inside,] bugs and... blights are excluded physically rather than attacked chemically... Basic research into greenhouse agriculture is being done by corporations and universities, and it will receive a boost from the development of self-sufficient space colonies. As soon as there are a few hundred people in residence outside Earth's biosphere there will be a stronger incentive than ever before to learn every detail of agricultural production in a closed system... The greenhouse agricultural revolution is closer than you might think. Already Soviet cosmonauts have grown wheat and cabbages in space, and Soviet technicians have lived in closed-cycle environments on Earth for several months at a time... At present, greenhouse agriculture is a commercial success in Holland, in Japan, and in several locations in the U[S (there are '30,000 greenhouses of fruit and vegetables in the San Augusta desert')]. On Kharg Island in the Arabian Gulf, it is the only source of fresh vegetables in a wide area. In the late 1970s, the General Electric Company spent corporate funds for the successful development of a pilot plant for enclosed agriculture at its main research facility in... New York. The plant used artificial lighting, a special atmosphere enriched in carbon dioxide to yield rapid growth of crops, and a closed system of recycled nutrients. Many of the detail's of G.E.[C.]'s work are unpublished precisely because the work was successful: the details became proprietary trade secrets. Greenhouse agriculture... requires only a small area... and produces crops of high quality... [Although it] demands considerable care and attention, [if]... the world... take[s] up greenhouse farming, enough can be grown to feed the world's people, and our land can recover its forests and the purity of its waters. - 1981

Tomorrow's farmer is as likely to wear a lab coat as a pair of overalls. Growing food will become a highly sophisticated, technological operation. From genetically-engineered seedlings to computer-controlled fields and space monitors for weather and water patterns, every step of the farming process will draw upon new scientific techniques. The techno-farmer will... be more concerned with monitoring the system than in watching the weather or sitting on a tractor... will run an operation with minimal waste and total efficiency[, will]... be able to grow more food on less land than today's agriculturalist, and the produce may be markedly different from today's wheat and corn... As the twenty-first century approaches... twenty-three square miles of arable land are engulfed by deserts every day[, largely]... through erosion... greed... and destructive farming methods... Desertification is a process as old as Western civilization. Some 8,000 years ago, the land around the Tigris and Euphrates rivers – the Fertile Crescent – was rich in grassland and forest. As shepherds built the first great cities, however, they cut down trees and built irrigation canals. With the remaining grass devoured by growing herds, the soil gradually eroded. Silt clogged the irrigation canals. Wars and upheavals wrecked the complex society needed to keep the land green. Today, the Fertile Crescent, covering much of Iraq, is barren. Similar changes have happened almost everywhere [humanity] has been careless with the soil. When Carthage, for example, was a great empire, North Africa was a breadbasket of the world. That land is now the Sahara Desert. Such deterioration continues into modern times. Even in the U[S], careless farming, soil erosion, and drought created the Dust Bowl of the 1930s... [US topsoil is currently] eroding at an average rate of nine to twelve tons per acre a year... Unless major changes are finally made in the way we treat our land, desert will eventually consume most of the arable land in twenty-four nations in Africa and Asia, many of them already poverty-stricken. Desert could claim significant land masses in at least twenty-three other countries, including Spain, South Africa, the Soviet Union, India, A[US], Chile and Bolivia... To feed the world of 6 billion people in 2000, world governments must affect certain improvements in food productivity. Some of the keys to improved production include the following. • International fisheries must be cooperatively managed to avoid disastrous overfishing. • Nontraditional marine species, such as the Antarctic krill, must be used as future sources of vital protein. [('A vivid idea of the abundance of Antarctic krill – which contain 7% fat and 16% protein – can be conveyed by a few statistics. During January to April the shoals contain about 35 lb of krill per cu yd and during this time whales are estimated to eat 150 million tons. The present annual world catch of marine animals is said to be 60 million tonnes and with better methods of fishing this could be expanded to 80-90 million tons. These figures have been presented by Russian biologists who point out that, on present showing, there will be a need to increase this last figure of 80-90 to 130-150 million tonnes by 2000 AD if people are to be adequately fed, and they see in krill one of the few large sources of food that could be exploited. The populations of whalebone whales have been reduced by 85-90%. Allowing that other species – the seals, sea birds and 32 species of fish which feed on krill – may have benefited from this it still means a vast harvest of krill to be tapped, if only an economic method can be found of locating the shoals.')] • Aquaculture must be further exploited... (Aquaculture produced 6 million metric tons in 1975.)... • Research and development in the area of closed-cycle (greenhouse) agriculture... must be expanded[, along with]... genetic engineering techniques... [to] craft new kinds of plants... Among the advances genetic manipulation of agricultural components will produce are: • Crops that fix their own nitrogen, making expensive, dangerous fossil fuel fertilizers obsolete. • Plants that can grow in... lands where too much irrigation has left the earth saline. • Corn that automatically blooms each year, like a perennial flower, without replanting or fertilizing. • Potatoes and tomatoes that grow on the same vine... • Crops that can be harvested three times a growing season... • Crops that contain all the basic nutrients in one food... Eventually, genetic engineers may attempt to construct a plant that will build an analogue for complete animal protein. This would be a true "soy-burger," a material grown by a plant that has all the best nutritional aspects of meat.

...Gandhi wrote: "...I do believe that all God's creatures have the right to live as much as we have. Instead of prescribing the killing of... fellow creatures... if... knowledge[able people] had devoted their gift to discovering ways of dealing with [our fellow creatures] otherwise than by killing them, we would be living in a world befitting our status as... animals endowed with reason and the power of choosing between good and evil, right from wrong, violence and nonviolence, truth and untruth." - 1982

I have no deep misgivings about the manipulation of plants and animals, because that has always been the human way. The earliest people, 2 million years ago, who took up a stick to knock fruit from a tree, or a stone to strike down an animal, were using... artificial methods. Clearing land to make a farm, whether with stone axes and wooden hoes or with modern tractors and chemical herbicides, was always a violent assault on nature. More subtly, around 10,000 years ago, people in West Asia, Indochina, China, Africa and Mexico independently took grasses and sowed them in new places... and thus evolved them into cultivated wheat, rice, millets and maize. These are unnatural varieties of grass, the products of

unwitting genetic engineering... The same story can be told about such unnatural creatures as poodles, milking cows, and racehorses. But we ought to leave ourselves alone... [I also have no deep misgiving about the fact that on] every continent the area in grass... – [for raising]1.2 billion cattle, 1 billion sheep, 400 million goats... 130 million water buffalo... camels... and [other animals] – ...exceeds that planted to crops... Of course it is conceivable that [in future] we shall produce our food in factories, without animals or plants... Eventually we should be able to manufacture satisfactory foodstuffs in great chemical plants, where masses of ribosomes would be supplied with synthetic amino acids and long-lived messenger RNAs, with energy-yielding phosphates produced by irradiating chloroplasts with laser-tuned light of the most effective wavelength... [In the meantime, a] factor influencing the productivity of cropland is a shrinkage of the world's fallowed area. As world wheat prices rose during the seventies, the US land in fallow declined from an average of sixty-five acres for every hundred acres planted in wheat during the sixties, to thirty-seven acres in 1970. As a result, US wheat yields have fallen, and severe dust storms reminiscent of those of the thirties are reappearing in some states. - 1983

Thirty-six out of the 40 poorest and hungriest countries in the world export food to North America (reported in 1981 by the U[N] Fund for Population Activities)! Meanwhile, large amounts of U.S. acreage are allowed to lie fallow because excessive domestic production has lowered crop values. The problem right now, therefore, is not that there isn't enough food to go around, but that the food that's available is going to those who can most easily afford it instead of those who need it. As Gandhi once said, "The earth can provide enough for every[body]'s need but not enough for every[body]'s greed." ...To emphasize the problem, [a US]Senator... notes that if just 20[%] of the world were to consume at the rate the U[S] consumes, the remaining 80[%] would be totally without food. - 1984

The goal of the transnational agribusiness corporations is to... create a single world agricultural system, a global supermarket in which they would be able to control all stages of food production and distribution... [However, the] disastrous consequences of global agribusiness becomes... apparent... where the exploitation of people and of their land has reached extreme proportions... In Central America at least half of the agricultural land – and precisely the most fertile land – is used to grow cash crops for export while up to 70[%] of the children are undernourished. In Senegal vegetables for export to Europe are grown on choice land while the country's rural majority goes hungry. Rich, fertile land in Mexico that previously produced a dozen local foods is now used to grow asparagus for European gourmets. Thus an enterprise that was originally nourishing and life-sustaining is now perpetuating world hunger.

...Peasants in Africa, Asia and South America are pushed off their tenancies because it is more profitable to produce coffee, tea or soya for... Western consumerism... than to use the land to feed them. Our demands force the poorest people on to hillsides and other types of marginal land, where desperate attempts at cultivation cause soil erosion or destroy areas of wood or natural grassland... But... there is plenty of land: about 21[%] of the world's surface is arable, yet only 8[%] is actually farmed... The food industry... condemns critics as 'food Leninists', makes generous donations to political parties and spends millions of pounds on advertising. The provision of cheap, wholesome, unadulterated food and the promotion of a less calorie-intensive diet that is not based on meat is clearly not in its interest. Its influence over home economics curricula in schools and catering colleges and even over advisory bodies concerned with health policy is all-pervasive. A European Community ban on growth hormones for cattle was another 'Luddite move in the face of scientific advance', according to one [British]government minister... Medical research confirms that allergies and hyperactivity in children are linked with the chemical content of food (though food manufacturers deny this). Yet food additives are consumed in large quantities: over 200,000 tonnes of additives are eaten every year in the UK at a rate of 4.5 kilograms per adult. Nine tenths of these are used purely for cosmetic effect – to make steaks look redder, batter more golden or otherwise grey instant-soup mixes more appealing. While some additives are valuable, enhancing the quality of food or preserving it, the majority are at best unnecessary and at worst dangerous. Britain has a poor record of endorsing additives banned by other countries... [and] lags behind nearly every other industrialized country in its outdated attitude to food safety. Potassium bromide was used for three decades in white sliced bread but banned in November 1989 after it was found to be carcinogenic. Food-processing workers are also at risk and are likely to come into contact with all manner of chemicals. Calcium propionate (a mould inhibitor added to bread) causes irritation to the eyes and nose. Sodium bisulfite, which prevents fruit and vegetables from becoming discoloured, causes painful blisters... Far from being a 'scientific breakthrough' or 'new advance in food technology', irradiation should be seen for what it is: a way of killing bacteria in food that has been stored for too long or shipped too far. Like additives, irradiation helps the industry but does little for the consumer, who deserves food that is good to eat without the dubious benefit of high-energy ray treatment. On the domestic front, November 1989 brought warnings of the danger of some microwave ovens, which were inadequately insulated, and we have all become aware of another danger, PVC clingfilm, from which di-2-ethylhexadinate migrates into food if the film is inadvertently heated.

...A crucial question is, 'what constitutes acceptable evidence of early [humanity]'s possession of fire?' We must be careful of negative evidence, especially in the tropics, for wood burned at a campfire might leave virtually nothing but fine ash, and the chances of its being preserved... are not high. Even in the Upper Palaeolithic when fire is well documented, much of the evidence comes from caves rather than open sites... [T]here is good evidence of cone-shaped masses of burnt clay, with a shallow concrete base... but... [such] features might have had natural causes... [rather than resulting] from the intentional ignition of tree stumps in order to preserve fire. Sites like this[, which were]... found at Chesowanja (Kenya)... and... the Middle Awash valley in Ethiopia... are... associated with *Homo erectus*... Fire is definitely associated with *Homo erectus* in their spread from the heartland into Europe and Asia... Where good evidence of fire is found it tends to be at settlement sites or in association with animal bones... [*Homo sapiens* are the only living creature to use cooked food. (Children, however, have an innate taste for raw vegetables and even for unripe fruit, which indicates that raw food should be an essential part of humanity's diet.) Cooking was born when primitive humans first discovered that if a hunk of meat was placed near the fire it tasted better, and was easier to eat. Some ingenious primitive found a way of heating water in a stone hollowed out into a basin. The clay vase succeeded this primitive pot. The spit and the pot, however rudimentary in the beginning, made many culinary operations possible.] An extension of the use of fire to technology is seen in its use as a hardener of bone and especially wooden implements of which a number, mostly spears, have turned up from this period in Europe and which seem indeed to have been the main weapon used to kill animals as large as elephants. A fire-hardened antler tip also appears at Zhoukoudian... in China... as well as charred bones from cooking, and at that site we get a tiny glimpse of the role of plants in the diet with the finds of the berries of *Celtis* and various tubers... Any reckoning of our past will show that humans have spent most of their history as hunters and gatherers... If [hu]mankind was once (perhaps at about 10 000 BC) 100[%] hunters and gatherers, then it is now more like 0.001[%], and the replacement of hunting by other modes of life has occurred at practically every period from the first agricultural communities... to the present... The key point is that these... 'hunter-gatherer'... people were and are food collectors... not food producers. As an energy source they rely on the sun in the form of recently grown organic material; to manipulate the energy and matter flows to themselves they use only fire and the muscular energy of their own bodies, together with that of a single tamed animal, the dog, which is found around 10 000 BC onwards in hunting societies. Yet because solar energy is so diffuse a source even when concentrated into the chemical energy of plants, the density of hunters has never been large, and an average for the world of 26 [sq]km... of land per head is often quoted, with the figure falling as low as 250 [sq]km... per head for the dry interior of A[US]... Archaeological evidence coupled with the reports of early European travellers has shown us some details of another kind of hunting economy, in the shape of the killing of large mammals by Indians and palaeo-Indians on the grasslands of

the High Plains of North America during the Holocene period... At the... Olsen-Chubbuck site in... Colorado, dated 8200[+/-]500 BC... hunters stampeded a herd of buffalo into a narrow canyon or *arroyo*, some 2-3 m wide and 2 m deep. The age of the calves suggests this happened in late June. The bone remains extended some 57 m along the arroyo and about 190 animals were killed... some... wedged so fast in the bottom of the canyon that they could not be extracted for butchering and thus must have rotted *in situ*... At one time during the years AD 1670-1740 another group of buffalo hunters used a spectacular site in... Wyoming, where a bluff 14 m high... was utilized. The vertical part of the bluff is restricted, and the animals had to be carefully controlled: a metre or two either side and they would probably escape down steep but not lethal slopes. In this case, the drive lane suggests the control of the herd's movements for 1.5-4.5 km before it was finally stampeded over the cliff. The bones suggest... this and similar bluffs might be used in rotation: as one author points out, about 100 buffalo stomachs left to rot might not be approachable again for a year or two, even to people less easily made queasy than ourselves... The fact that hunter-gatherer economies survived for such long periods is testimony to a [hu]man-nature relationship of a sustainable, though not necessarily static, kind. The question to be asked at this stage is: did their persistence derive from a care not to overexploit their biotic resources... or did it just happen, in the sense that although no particular 'tenderness' was involved, nevertheless the environment could withstand such pressure as was put on it? ...Because of the nature of the evidence, agriculture [only] tends to show up in the prehistoric record when it is well developed... [P]eople may have diverted streams to bring water to plants, and could have undertaken some elimination of competitive plants and perhaps even scared away herbivorous animals. But the people (who were in any case nomadic) went to the plants rather than brought the crops to the settlements... Two linked developments... behind the transfers of biota and agroecosystems... [are] the ocean-going vessels pioneered by the Portuguese which meant... Europeans could penetrate to most parts of the world's littorals, and the desire of Euro... states to extend trade and hegemony to the lands thus 'discovered'. Before Columbus, the Portuguese had taken crops to west Africa and the Atlantic islands: in the first half of the [15]th century... they introduced maize, sugar cane, bananas and the grape to those places, and by 1513... were trading plants in the spice islands of the Moluccas... Such trickles quickly became a braided flood... The 19th c... advent of iron as an architectural technology hastened the movement of plants around the world since bigger glasshouses could be built. - 1990

Through the miracle of biotechnology, scientists are beginning to produce crops beyond our wildest imagination... In the [First W]orld, people get their primary nutrition from no more than 10 plant species (including those processed through animal metabolism), and the standard recipes call on less than 100. These are the select few from an estimated 1000 species that have been in wide cultivation since the time of the agricultural revolution... In the tropical wilds, where the native people consume such a great variety of the indigenous flora, economic botanists are identifying attractive prospective additions to the cuisine of the outside world. Amaranth, "the cereal of the Aztecs," is already emerging as the first innovation in the "cereal" nutrition of the [outside] world in hundreds of years, the first ever from a plant not in the grass family... THE LOST TEMPLES of the Incas are renowned. But how about the lost vegetables? If it weren't for the scornful Spanish conquistadors who forced the local populace to grow the standard European fare instead of their native foods, people today might be feasting on candy-striped tubers and purple "tomatoes" that taste like melons. There is hope for a comeback, however. A report titled *The Lost Crops of the Incas* produced by a panel of the US National Research Council identified 31 of the most promising but overlooked native Andean crops that are still being grown in out-of-the-way gardens in South America... [But there is no longer a need to search the world for new crop species! In the US last winter], when consumers were still eating those pink vinyl rocks that pass for tomatoes, a scientist handed me a tomato as red as a fire engine and as juicy as any back-yard beauty in season... This delicacy, which you will find at your greengrocer's in a few years... is the first blockbuster product of "plant biotechnology," a new science that's expected to revolutionize agriculture... Ten year's ago, biotechnology hardly existed, though the groundwork was laid in the 1970s when scientists learned to cut genes and then move them from one organism to another. Soon, they were making bacteria churn out valuable proteins... Today, biotechnology is growing faster than ever... Supermarket tomatoes have to be tough and tasteless because nature is too quick. The acids, sugars and aromas that suffuse a tomato with tangy flavour are the last things it gets. From that moment, all the fruit wants to do is soften and burst so its seeds will scatter. To beat the softening, growers pick tomatoes green. But even with refrigeration, which kills any flavour the tomatoes might have gained, a third are spoiled by rot. The softening is caused, in part, by an enzyme known as PG, which dissolves the glue holding the tomato's cells together... So the challenge to put taste back into the billion dollar fresh-tomato market has been to block or slow the PG enzyme... The problem... was to switch off the single gene that sets the PG enzyme to work... Tomatoes, like humans, have about 100,000 genes... You can't snip out a gene that you want to turn off... but you can deactivate it by inserting a copy of the gene made in reverse... From a few cells growing on a dish under laboratory lights, the transformed plants were cultivated and then grown in a greenhouse. Ten months later, the first ripe tomatoes were picked... "By switching... [the] PG enzyme... off...,"... says... [a] microbiologist... of California's Calgene company... "...we bought the tomato an extra week on the vine. Now we no longer have to pick it green." It is only a matter of time before bioengineers bring tastier varieties of other soft fruits to market, including tamarillos... apricots, grapes... and... kiwi fruit... "Soon many fruits and vegetables will not only taste better," says... a molecular biologist with N[Z]'s Horticulture and Food Research Institute, "they'll look better, grow better and last longer." Nature's chemical language is the same in all organisms... so all genes are theoretically interchangeable. A tomato given the gene of a fungal-fighting microbe can fend off the grey mould called botrytis. A potato given the gene of the unappealing petunia makes the Colorado beetle reject it. Potatoes are the largest single vegetable crop in the world, but viral infections can devastate yields and quality... [The US DOA recently reported annual losses of 60 million bushels of potatoes due to crop diseases (plus 2 1/4 billion bushels of corn, oats, barley and wheat). What can be done about this enormous waste of valuable food?] The NZ Institute for Crop and Food Research at Lincoln is looking at ways to improve potato resistance by transferring a small piece of genetic material from a virus into the chromosome of the potato to "immunize" the potato against disease. Then there's the strawberry that might "marry" a flounder. Strawberries are often wiped out by frosts. Learning that the Arctic flounder makes an antifreeze to protect itself against winter chills, bioengineers at DNA Plant Technology Corporation in Oakland, California, plan to inject the antifreeze into a strawberry... Presto! Strawberries that survive frosts and don't go mushy when you take them out of the freezer... As more of these novelties are developed, plants will provide not only better flavours and nutritional qualities but special products. "We may see one bunch of farmers specializing in blue, shrinkproof cotton for denims, and another supplying flameproof cotton for aircraft seats," says Calgene... For scientists this truly is the golden age... N[Z] farmers spray chemicals up to three or four times a season, fighting the insects, viruses and weeds that attack their pastures and crops. But in the last few years, at a research station in Palmerston North[... a molecular]... geneticist... and his colleagues have augured a different future. Rows of tobacco plants in the glasshouse contain a potato gene. Deliberately exposed to their dreaded enemy, the green looper caterpillar, the tobacco shows little damage. "The caterpillars take a few chomps and die..." This "transgenic" tobacco has been programmed to manufacture a natural pesticide in its own cells. Similar traits are being engineered into soybeans, potatoes, cotton and corn, and [the Palmerston North] team is about to start testing a clover bred to resist grass grubs. When the seeds of these "smart" plants reach the market... crop yields should improve dramatically, and there will be less need for costly and potentially harmful pesticides... Another hope is that important crops can derive fertilizer from thin air... Scientists from the US and Europe are trying to get rice and corn to emulate peas and beans... [which], aided by bacteria, extract nitrogen from the atmosphere and store it in their roots... [P]erhaps the most exciting potential of biotech is the ability to add genes to existing proven cultivars without the need for extended breeding programmes. "Take apples..." explains... [the] director of the School of Biological Sciences at the University of Auckland. "It can take more than twenty years to develop new varieties and prove them in the marketplace. But now it may be possible to manipulate the colour and storage qualities of popular varieties within a few seasons." ...[the agriculture] genetics... industry is

dominated by 50 transnational corporations that have been buying up smaller companies, especially successful developers of seed for single species. In Europe and the U[S], these enterprises have come to enjoy patent protection on their house seed varieties. The concentration of the world economy is “even more significant at the crop level,” according to the UN Centre on Transnational Corporations, “with three firms holding 80[%] of the patents on beans and four firms holding... 60[%] on lettuce, 48[%] on soybeans and 36[%] on wheat.” However, although, as... of 1980, this industry had \$[US]12 billion in sales worldwide... the green-gene revolution will not get much further than the lab unless transgenic plants are accepted by consumers. Concern about tampering with the genetic makeup of food is a powerful force[, but the]... pioneering companies hope the benefits of genetically transformed products will be so tantalizing that any lingering resistance will melt away. The key point to remember is this: the green-gene technology that created a tastier tomato will also benefit the environment and help feed the ten billion mouths that will be here within half a lifetime.

...MORE than 780 million people don't get enough food to lead active, healthy lives although the world has more than enough to feed everyone... if distributed according to individual requirements... says... [a] new UN report... produced jointly by the... [FAO and WHO. By the way, experts say that your thoughts] influence feelings and behaviour and therefore the state of your body. Awareness of this can make an important difference in treating problems of being overweight... Food may be a solace, a response to boredom, and eating may be just something you do in your spare time. Only by understanding the emotions and situations that lead you to overeat can you begin to make changes. One of... the Mind/Body Medical Institute[']s... patients, a 55-year-old mechanical engineer, looked forward to relaxing at home after a challenging day at the office. However, after an ample dinner, [the engineer] always ate more, even if [it] didn't feel hungry. Upon questioning, the [engineer] explained that every night after his dinner, [it] settled into his favourite chair and watched television. After about an hour [the engineer] would feel bored, and his mind turned to food. [The engineer] would wander into the kitchen, fill a large bowl with ice cream and return to the television. Sometimes [the engineer] went back for a second helping. “Once I've had one bowl. I think, ‘I might as well have seconds.’ I feel terrible afterwards, of course... but by then it's too late.” ...[the institute] tried to help him break the chain of events. On some nights, instead of relaxing in front of the [television, the engineer was advised to] take a walk with his wife. Or as soon as television became boring, [the engineer] could turn it off and pick up something to read. Ultimately [the institute] decided that ridding the house of ice cream was essential, since [the engineer] found it so irresistible. You, too, can apply this kind of analysis. Think about when you are most likely to overeat... Write it down as a chain of events. Once you've laid out your overeating chain, decide at what point you can break it. The next time the situation arises, try your strategy. If it doesn't work, try another. Persistence will pay off... Once you have successfully adopted a new attitude and altered your eating habits, the challenge is to maintain that change. One key to doing that is not to be too inflexible. Remember, most people have lapses and need to allow themselves some room. The point is to see these lapses as isolated slip-ups, not as total catastrophes. The greatest single danger during a lapse is to take a “saint or sinner” attitude... Instead of viewing your diet lapses as defeats, try to learn from them... *Set realistic goals.* A healthy short-term goal is to lose 250 to 500 grams per week. Given that, look at a calendar and determine when you can expect to reach your weight goal... Now you have a weight goal within a reasonable time frame. Don't get angry at yourself if you don't lose weight on your schedule. And don't depend on a rigid diet designed exclusively for weight loss to do it. Anyone who is sufficiently motivated can follow... a strict, low-kilojoule regimen for two weeks, maybe even for a month, but eventually boredom sets in, and then come the familiar [desires to overeat]...

The... average... U.S. consumer... [has an] intake of 3600 kilocalories per day[, of which]... not much more than 10[%] comes]... directly from grain... Often remarked upon is the decline in U.S. agriculture employment – from more than 12[%] of the labor force in 1950 to less than 3[%] in 1985. Often celebrated is the increase in the number of people fed by one U.S. farmer – from 7 people in 1900, to 16 in 1950, and then to 75 in 1985. The astonishment and the numbers belie the true and more significant state of affairs. In fact, a much larger number of people are employed in feeding the nation. About 75 cents of each consumer dollar at the store goes to pay the farmer's many helpers. They make their contribution in a division of labor that starts before the farmer goes to work and carries on long after [the farmer] is done... All told, the feeding of the U.S. population employs one out of five persons in the labor force and remains the country's largest industry... [Incidentally, it] is possible, with the external inputs of fertilizer and pesticides, to grow the same crop year after year on the same field... [But the US DOA recently] ratified the advice of organic farmers that greater reliance be placed upon the regenerative power of the soil... [‘Early in the history of agriculture, it was discovered that crop yield decreased when, year after year, the same crop was planted in one field. During the Middle Ages, European farmers would leave one portion of their land unplanted each season, allowing the soil to “rest.” Later it was learned that certain crops remove from the soil minerals and helpful nitrogen-fixing bacteria, while others restore them to the soil. Thus, a system evolved for changing crops from year to year in certain fields. This is known as *crop rotation*.’] With crop rotation... the yields from... new technology can be raised by 10 to 15[%]. The plowing in of animal manure or the “green manure” of a crop of alfalfa or of crop residues[also] improves the soil's fertility, water-storage capacity, and tilth (or structure) and maintains its natural population of microbes, earthworms, ants, and other soil-turning insects. In the Corn Belt of the U[S], unfortunately, a tenth or more of the country's total livestock output of 1.7 billion tons of manure is produced in the feeding pens, at a considerable distance from the cornfields. Most of it goes to cause eutrophication of the Mississippi watershed. If pollution control and enhancement of the soil could somehow be harnessed to finance the collection and transportation cost, that manure... and... the composting of urban waste... could significantly reduce the use of fertilizer and enhance the soil of 100 million acres of crop land. No microeconomic interest, however, supports this obvious remedial action... [‘NZ farmers receive no subsidies from their urban counterparts but in most First World nations city-dwellers pay higher prices for food or taxes to support farm incomes. The OECD each year calculates the total transfers associated with agricultural policies in its 24 member countries. These transfers are the net costs to consumers and taxpayers. They are expected to average over \$US20,000 for each OECD full-time farmer next year (\$40,000 in Norway and \$35,000 in the US).’ Unfortunately for First World farmers, a]griculture... remains the last production sector subject to market forces. Prices for its output still respond to supply and demand. That is in contrast to the highly centralized industrial sectors, where not more than three producers dominate each industry; prices for their output move continuously upward, secured by strong ratchets against fallback. Farmers accordingly face perpetual inflation in the prices they pay for the inputs they purchase from industry, which add up to half of their total costs. The imparity of economic power between agriculture and industry brings, in every industrial country at one time or another, such imparity in income as to provoke the organization of farmers in protest. To this “farm crisis,” the political process invariably responds, in violation of free-enterprise shibboleths, with the provision of subsidies in one form or another... Sugar-beet growers in the U[S and other First World] countries (the beets return half the calories expended to grow them) could not otherwise compete with cane-cutters in [Last World] countries (the cane returns double and more the calories expended)... The purchase by the U.S. government of price-depressing surpluses from the country's farmers took tons of wheat, butter, and other commodities out of the domestic market during the late 1950s and through the 1960s. Under Public Law 480, the surpluses were shipped as food aid to [the Last World], answering desperate need there, especially in India... [Normally, however, food heads in the opposite direction]. As farmers to the [First World nations, the Last World] nations have neither the political nor economic power to claim parity. Food and agricultural raw materials made up more than half their exports to the [First World] countries at the beginning of this half century... To the... nations that import these goods, they represent less than 10[%] of total consumption; except for the protests of coffee and tea drinkers, their absence would scarcely be noticed. The imparity that governs this trade has widened since 1950[, while d]ecline in agricultural prices is a long-term trend in the world economy... The free-market law of comparative advantage brings in view a rational planetary division of labor. If the Corn Belt of the U[S] produces the cheapest grain and could, at full throttle, feed the world, it should do so. That would free the [Last World] countries to find the

contributions they might make most efficiently to the world economy... Japan employs four workers per hectare, twice as many as India or China, to achieve a yield per hectare four times that of India and twice as high as that of China. The land-maximizing technology of the green revolution yields generously to intensification of labor. Adoption of Japanese methods, it has been estimated, would reduce underemployment and unemployment in rural India by half. The attainment of Japanese productivity would make the country's present misery a part of the memory of the painful past... T[ag]ged... as a 'can't be saved' nation, India secured its first increases in food production by increasing the land under cultivation from 140 million hectares to 160... With its own Rice Research Institute in operation in Calcutta... the country's agronomists went early to work on the task of increasing the output per hectare. The 85[%] increase in total output achieved by 1973 (over the pitiful starting output of 55 million tons) could be attributed to the increase in cultivated hectares but, more promisingly, to a cumulative increase in output per hectare of more than 40[%]... On unirrigated land, the crop must be grown and harvested during the weeks through which the land holds moisture from the rains that it absorbed and that did not run off into the rivers... The average flow of the Ganges River is 2800 cubic meters per second, but it fluctuates between 1700 [cu. m/s] in the dry season and 56,000... in the monsoon... Supplied with water the year around, much of India's land could produce two and even three crops per year... Major national effort went to begin the impounding of the average 660 million cubic meters of rainfall delivered so erratically and torrentially by the annual monsoons... From less than 100 million [cu. m] in 1950, impoundment now exceeds 300 million [cu. m]... The land under irrigation has doubled, from 20 to 40 million hectares. The tripling of India's total output of grain to 166 million tons in 1985 is owed principally to the doubling of the output per hectare. This achievement has brought increase in the population's daily average intake of calories from a wasting 1700 kilocalories to a still inadequate 2500 kilocalories. To provide adequate nutrition to its prospective 1.2 billion population, India possesses the necessary resources and the technology... [Whether or not it eventually does so] is a question for sociology, economics, and politics... Responding to economic incentive... Chinese farmers increased... the land under cultivation from 90 million to 100 million hectares. With capital input from the center, they increased the land under irrigation from 30 million hectares in 1950 to 45 million in 1985... The input of energy per hectare, principally in the form of fertilizer, is estimated to have multiplied 100 times over the input of the biological energy of the farmer... Per hectare, the yield increased more than threefold, from 1200 kilograms of rice in 1950 to 3850 kilograms in 1985... Fossil water of Pleistocene vintage from aquifers under the Sahara and the Arabian Peninsula irrigates new farmlands there (at least for as long as those nonrecharging aquifers hold out)... [while t]he people of sub-Saharan Africa have secured an increase of the output of food since 1950 almost entirely by increasing the number of hectares under cultivation. In effect, each additional family in the fast-growing population has got its food by opening up new land. Following such primitive practices as slash-and-burn and bush-fallow, they plant and harvest less than half their cropland from year to year. Barred from the best 10 million hectares of river-valley land by insect vectors of parasitic diseases, they overwork the poorest land. In consequence, they lose millions of hectares each year to desert that advances at the rate of 5 kilometers per year into the Sahel region on the southern perimeter of the Sahara. The nomadic peoples, who have so successfully employed cattle to secure their nourishment from plant life inedible by [humans], are being compelled by the increasing density of their population to abandon their technology and way of life for "sedentarization" on the barren land... What the Africans want most are the professional cadres trained in the agriculture sciences that have led the Chinese and the Indians into the second agricultural revolution. The first generation of Africans taught by qualified African scientists is graduating from universities in Nigeria, Kenya, and Tanzania. These... [graduates] will begin the deflection of African history in the next century. Occupation and development of the 10 million hectares of river-valley land may be facilitated by the control of the insect disease-vectors issuing from the work of the International Centre of Insect Physiology and Ecology at Nairobi. - 1992

Plants and the soil have been the focus[of] our attention for many years. The book, The Secret Life of Plants, written by [a colleague] and myself, came an international bestseller in 1973 when it first came out, and still is in print today... We had promised a sequel... and it was a long time coming. At first, we wanted to entitle the new book The Secret Death of Plants, but, apt as the title was, various publishing "experts" thought it too macabre. So Secrets of the Soil, as it was named, came out in 1989. It proposed brand new solutions for turning around the disastrous state of agricultural practice. Among them was Biodynamic Farming[-] a method of healing sick or barren soils and of growing healthy plants first proposed back in 1924 by the Austrian scientist, and clairvoyant, Rudolph Steiner, founder of the Anthroposophical movement. Steiner's highly practical recommendations have been considered so "occult" or "alchemical" that they have been castigated by the scientific culture as a joke, not to say worse. And the arbiters of popular culture have been equally scoffing. Though the book is really a companion volume to The Secret Life of Plants, it was boycotted for review in all leading American newspapers with the exception of the Boston Herald in which it was compared to... [the] now classic Silent Spring[(r:p2025, ln3 to p2028, ln23)]. Steiner's healing methods for agriculture and horticulture were basically ones working from "the bottom up." If the soil was healthy, so would plants growing in it be healthy and, climbing up the pyramid, so would the animals who eat the plants, and the humans who eat them plus the animals. An equally healing and productive method set forth in the book worked from "the top down." This was "Sonic Bloom," invented and developed... in Minnesota. The method combines foliar feeding - feeding plants, from sprouts to trees, through their leaves, not their roots - with a simultaneous broadcast of sonic frequencies in the same diapason as those of early morning birdsong. The astounding results obtained with the "Sonic Bloom" method are detailed in the book. What can be added here is that [the Minnesota inventor] has recently found that his ministrations work wonders on the growth of trees. To take one example, the Black Walnut, prized not only for its nuts but for its wood used in cabinet making and by sculptors, is a notoriously slow-growing tree that takes 80-100 years to reach maturity. But starting with a "slip" or "whip," a branchlet cut from a tree and rooted in the ground, [the inventor] has found that foliar fed nutrients, plus "sonics", can create twelve years growth in a Black Walnut in two years. What does this imply for an earth being rapidly deforested with each passing minute? While most foresters would write off [hi]s claims as "pure fantasy," recently the owners of more than 100,000 hectares of teak wood forests have invited the inventor to their plantations in Papua-New Guinea and Indonesia to see if his method can grow teak trees as quickly as it did walnuts. So these methods are there, in place, waiting to be used, used to create a "new impulse" as Steiner used to say. So far, they have not been widely disseminated. Only in A[US] where, due to more than three decades of effort by a single... [entrepreneur], does Biodynamic Farming seem to be coming into its own. As for... "Sonic Bloom," which was inspired by [the inventor]'s dream of eradicating world hunger, it has yet to be accepted as the remarkable agricultural method that it is. Why aren't these new methods being used everywhere? - 1994

Despite advances in crop science, global population growth seems almost sure to outstrip growth in food production in the next forty years... World per capita grain yields have been falling by about 1[%] a year since 1984... [F]actors limiting harvests include... failures of genetically uniform crops to stand up to disease and to insects... pollution... and... the exhaustion of aquifers (the aquifer under the US grain belt, the one under the north China plain, the one supplying the vital Punjab wheatfields, those waters are sinking by a meter a year...)... Africa now needs 14 million tonnes more grain per year than it produces. With a population growing at 3[%] a year, and agricultural production at 2[%], that shortfall will reach 50 million tonnes by the year 2000. China's growing population... and... diminishing farmland... could boost Chinese grain imports from 12 million tonnes per year now to 100 million by the year 2000. If countries with surpluses must choose between giving grain to Africa[, which has decreasing prosperity,] and selling it to China, [which has greater political power and]... increasing prosperity... the choice may not be difficult... *Overfishing*... not pollution, has so far been the major cause of declining fish stocks. Trawlers use advanced technology to pinpoint shoals, and then sweep up everything in huge nets kept open by heavy trawl-doors which can utterly plough up seabed ecosystems, while driftnets extend for up to

fifty kilometers. Much of the catch is discarded as trash. Of the rest, much becomes fertilizer or animal feed. Sea fishing provides some of the clearest examples of the 'Tragedy of the Commons': ...when a resource is exploitable by many individuals, it is to the advantage of each to grab as much as possible, in spite of how this leads to resource exhaustion. Global catches kept growing until 1989... In 1990 they began to fall. But although the U[N] estimates that the world's fishing fleets now make an annual loss totalling about [US\$]50 billion... the fleets operate as enthusiastically as ever, thanks to governmental subsidies. Some doubt the gravity of all this. It has, for example, been denied, and by such experts as the two who produced the *World Atlas of Desertification* for the U[N] Environment Programme, that deserts have advanced on a broad front. Certainly, many alleged desertifications are only cases of temporarily reduced rainfall. [Regardless of who is right, less politically correct commentators suggest that future] food scarcities... could be resolved in the usual way through famine deaths instead of putting the very survival of the human race at risk... *The Population Explosion* (1990)... suggested that the maximum readily sustainable global population would be two billion... In connection with this theme that the carrying capacity of the Earth should be treated as sacred, [another writer] tells of an American visiting a refugee camp where almost half had starved: Noticing sacks of grain stocked in great mounds in an adjacent field, [the American] asked the patriarch of the refugee community why the people did not simply overpower the lone soldier guarding the grain. The patriarch explained that the sacks contained seed for planting the next season. 'We do not steal from the future'... [the patriarch said. There are also commentators who point out that there could be] countries whose militaries might believe that unleashing, say, biological warfare [in the First World] would be preferable to starvation[in the Last World], and an act of just revenge on the disgustingly overfed.

...World agricultural production is growing at a slower rate... In the 1960s, production growth averaged 3[%] a year; in the 1970s, 2.3[%]; and from 1980-1992, 2[%]. Since then, average yearly production was up 1.8[%]... "The slowdown... is... due to the fact that people who would consume more do not have sufficient incomes to demand more food and cause it to be produced," [an]... FAO... report said... But delegates to the first summit called to fight famine are divided about how to resuscitate the agricultural revolution that saved Asia from mass hunger in the 1960s.

...World food supply: first here is the good news If the importance of events can be measured by the number of chauffeured limousines and bodyguards, then the World Food Summit that closed in Rome on Sunday was almost as important as a... concert[by Wacko]. But the world's media mostly ignored... [the summit], and you can hardly blame them. The debate that should have been fought out in Rome really is important: will we still have enough food for everybody in 10 or 20 years' time? But all the optimists were on the inside, and all the pessimists were on the outside, and they never really connected. Which is a pity, because it would help to have a clearer idea of who is right. On the inside were people like... the [US] Secretary of Agriculture, boasting that... [his country] is "the leading supplier of food... Our farmers now plant for world demand." Or, as one trade expert put it: "The more mouths there are to feed, the more the food companies want to fill them." This generally upbeat assumption that the market will take care of everything set the tone for the entire conference, despite occasional dissenters such as [Cuba's President]. But then governments generally prefer to be optimistic in public about such questions because any other attitude would put them under severe pressure to do something now. By the same token, the aid agencies and environmentalists are professional pessimists: if there is no crisis, who needs them? ...[the] head of the Washington-based environmental group Worldwatch, [who was] one of the outsiders... argues that the... host of the summit... (FAO)... is "overstating food production and misleading political leaders... For the first time in history the oceanic fish catch and the grain harvest per person are both declining. In each of the past three years, we consumed more than we produced, drawing on depleted grain stocks that will not be rebuilt." ...[the FAO and the head of Worldwatch] are both working from roughly the same numbers, but they can't both be right. Or can they? The average human being, in a lifetime, consumes about 75 tonnes of water, 17 tonnes of carbohydrates, 2.5 tonnes of proteins, and more than a tonne of fats. There are now six billion people in the world, and even the most recent and hopeful figures for global population growth... suggest that there will be 9.4 billion of us – three more Chinas – by the time the global population stabilises around 2050. Even the FAO admits that the world will have to produce 75[%] more food over the next three decades to meet rising demand. That's a lot of extra food, and they're not making any more land. There is, however, still some mileage left in the "green revolution." The optimists point out that the U[S] went from producing 252 million tonnes of the 17 most important food, feed and fibre crops in 1949 to 610 million tonnes in 1980. Yet the amount of land in use increased by only 3[%], and the number of people working the land dropped drastically... The "green revolution" in the U[S] sparked similar agricultural revolutions in Europe and large parts of Asia, and kept world grain production growing comfortably faster than world population right down to 1990. But pessimists argue that this was a one-time jump in production that cannot be repeated... [However, we] just need two more continent-wide green revolutions to plug the gaps. And oddly enough, we happen to have two continents left... Africa, the second-largest continent, has scarcely benefited from the [green revolution] techniques at all yet. Then there is the cerrado – the endless, grassy plains of central South America, mostly in Brazil – where the acid soils were considered useless for farming until scientists began producing acid-resistant strains of rice, corn and soybeans in the past few years. Only 12 million hectares of the cerrado are farmed but the total, some 200 million hectares, is more than all the cultivated land that feeds India... So the FAO is right: the long-term prospects for feeding a world of 9.5 billion people are reasonably good – provided, of course, that its assumptions are not knocked sideways by major changes in global climate and rainfall patterns. But [the head of] Worldwatch... is... also right, because the short-term problems with food supply may be quite horrifying.

...World food supply: now here is some bad news... Last August, before the main autumn harvest in North America and Europe, we were down to a worldwide grain reserve of only 48 days. All we need is a few more years of declining reserves, then one really bad summer in the main grain-growing areas of the Northern Hemisphere, and we're looking at a worldwide shortfall of maybe 50 million tonnes of grain... The global market in food has come into being only in the past 20 or 30 years, and mostly it provides people with more food at better prices than if it did not exist. But it also creates the possibility of a global famine. Not a famine where everybody starves, of course... It is a safe bet that nobody reading this... will starve even if there is a global famine. Even in famines, only the poor starve. If you... live in a country rich enough to import grain at inflated prices and distribute it domestically, you will also not starve, even if you are poor. But if you live in a very poor country[... one that]... cannot pay the exorbitant price that grain will rise to if there is even a temporary worldwide shortfall in the amount of grain available... and you are not personally rich, then you are in great danger. For the next few decades, there are practically bound to be global famines. This prediction is entirely compatible with the other, more comforting, prediction that emerged from last week's World Food Summit in Rome. The... FAO... believes that we can eventually grow enough food to feed a world of 9.5 billion people. But in the short run, a lot of people may end up dead. The divergent predictions stem from the fact that the market's response to rising demand for food is quite slow. It takes time to bring new land into production... The new factor in the equation that makes such an unpredictable event [as global famine] possible is the "China syndrome": the fact that as China and other Asian countries climb rapidly up the ladder of industrialisation, the first thing that hundreds of millions of newly affluent consumers do is to add more meat to their diet. The average citizen of southern China already consumes more meat a head than the Japanese. Even India, where vegetarianism is widely viewed as a sign of virtue, is seeing meat consumption soar. And the problem is that the more meat and animal products rich people eat, the less grain there is for poor people to eat. A simple illustration: China has adopted the national goal of doubling the number of eggs[– which 'contain all known vitamins except C', but also 'contain cholesterol in the proportion of 20 parts per 1000 (a similar proportion to brains)' –] consumed by the average citizen from 100 to 200 annually by 2000. That will mean feeding an extra 1.3 billion hens... And what will the hens eat? Grain, of course – enough grain to use up the entire production of A[US] and more besides... Yet if affluent consumers are willing to pay a high enough premium for meat (and they are), then the required amount of grain will be diverted from human use to animal feed. That is the market at work... [■ At the summit, US] officials said many new techniques were being shared with [Last World] countries but private firms also had a right

to market their new inventions without seeing their ownership rights washed away... [Consequently,] many farmers were struggling to survive while research stations only a few miles away were growing food with yields three or even 10 times as high... The green revolution of the 1960s and 1970s depended on fertilisers, pesticides and irrigation... [However,] with fertiliser use reaching saturation levels in some countries, scientists are now toying with genetic engineering to create crop varieties that environmentalists describe as a risky experiment with nature. Greenpeace activists blockaded what they believed to be the first shipments to Europe of genetically altered soybeans developed by [US] chemical group Monsanto.

...The world that Greenpeace wants is pretty much the world I want. So why do I go slitty-eyed with suspicion over Greenpeace's doings? Could it be that Greenpeace has been invaded by flat-earthers and is going to be laughed off the face of the planet that it set out to save? Consider Greenpeace, genes and glyphosate. Glyphosate is a wonder weedkiller. It zaps what it touches and turns inert on hitting the ground. Some plants resist it: nettles, mallows, hearts-ease and sorrel. Otherwise it is so good I have been forced to put it aside and, instead, to hand-weed several kilometres of young grapevines... Monsanto, one of the companies that make glyphosate, had a brilliant idea: Why not slice the glyphosate-resistant gene out of nettles or whatever, splice it into the DNA of a crop plant and so produce a strain of plants which from generation to generation will withstand weedkiller while all around them weeds fall dead? It is not a new idea. Humans have been tinkering with genes for thousands of years. We have turned wolves and jackals into Pekingese and whippets, and wild cabbages into brussels sprouts and cauliflowers[(there are now 'a wide variety of cauliflower types available to choose from to find one appropriate to the climate and season'), then recently created a cross between the cauliflower and broccoli]. The new thing is that gene-splicing lets us bypass the limits on sexual reproduction and swap genes among plants and animals which, in nature, cannot interbreed... The alternative to glyphosate-resistant crops lies in every farm shed in the country – selective poisons which kill only target weeds and whose residues remain on food crops or accumulate in the soil and leach into groundwater. The priests and priestesses of Greenpeace, though, have been marching around a rape-seed crop in the South Island protesting that the crop has been bred to resist glyphosate. Rape is one of the cabbage family and Greenpeace asks: What if flying pollen crossed with a weed and bred a monstrous pest that glyphosate could not harm? Fair go! Crosses between unrelated species don't happen[outside of the lab]. Carrots and cabbages? Camels and elephants? The rape-seed farmers may just as well fret that their neighbours' dandelions will pollinate rape flowers and ruin the harvest... [Speaking of flowers, a] carpet made out of 800,000 begonias [is currently attracting] hundreds of spectators at the Grand Place in Brussels. The display, which measures 75m by 25m, is on show through the weekend. The flower exhibition has been mounted 10 times since 1971.

...MORE than 100,000 flowers and plants will take centre stage at this week's Ellerslie Flower Show, [which organisers]... say... is the biggest gardening and horticultural event in the South Pacific. This year 70,000 visitors are expected and will boost Auckland's economy by \$6 million in five days... Caterers expect to make more than 60,000 cups of tea, serve 5000 bottles of wine and 500kg of strawberries during the show. A meadow garden was planted at the site at the beginning of September and workers have been employed at the show for the past three weeks landscaping and preparing... more than 300... exhibits. ●... [Similar in concept to the annual show in Chelsea,] Ellerslie Flower Show runs from November 13... A full adult pass costs \$23; an afternoon pass \$18.

...LAVENDER – it's good for burns or as an antiseptic, helps the sleepless, soothes nerves. And now there's a blossoming business in N[Z], growing the sweet-smelling herb commercially... A lavender-oil industry is beginning to thrive and the dried flowers are sought after for the making of pot-pourri, scented sachets and other sweet-smelling gifts. Even so, the chair[perso]n of the Lavender Oil Producers' Association... [(which so) far... has fewer than 25 members although not all of them produce oil)]... cautions that the plant is not the answer to kiwifruit-growers' woes or an alternative to the depressed beef industry... [because] it is costly and time-consuming to set up even a small block of commercial lavender – close to \$7000 a hectare for young plants, with harvesting machinery and an oil still costing a further \$35,000 or more. Plants are grown at the rate of 6600 to the hectare... [T]he average size of commercial crops in this country is only 2ha. [The chairperson] is one of the largest growers and has just 6ha. "To grow it as a commercially viable crop you need to have about 20ha in plants,"... During the last season (late summer) [the chairperson]'s crop produced 20 litres of the fragrant essential oil... N[Z]'s annual consumption is 3.3 tonnes, from a world harvest of 1200 tonnes... France is by far the greatest oil exporter, with Bulgaria, Tasmania and, decreasingly, England, growing a number of species for... [the oil which] is used widely in the booming aromatherapy industry and in the manufacture of perfumes, scented soaps and candles... Hospitals are using it in increasing quantities for skin cleansing and the soothing of burns and scar tissue... WHILE there are scores of different varieties of lavender, the three most commonly used commercial species are *Angustifolia*, *Intermedia* and *Latifolia*... *Angustifolia* (sometimes referred to as "true lavender") is the main oil-producing plant because of its especially sweet aroma, but it produces only about 60 litres a hectare. *Intermedia*, on the other hand, will produce as much as 120 litres a hectare. The *Latifolia* species gives a more camphorous, less sweet oil... [T]he *Lavandin* species, a sterile hybrid of the *Angustifolia*... is also a good insect repellent... particularly against sandflies. [While on the topic of repelling insects, a new 'insecticide is being made from the root of the tropical derris plant', and the suppliers of *Genesis* claim their product heralds a 'new era in parasite control'.]

...The decision by the Pesticides Board to end the use of a volatile form of the herbicide 2,4-D is seen as a small victory for campaigners wanting to have all agricultural spray-drift branded as chemical trespass... Despite the agreement, the chemical can be manufactured in Dow Elanco's New Plymouth factory until next October, raising fears that long-time users will stockpile as much as they can. The 2,4-D compounds are part of the phenoxy acid family of chemicals that came into wide agricultural use after... [WW2], many of which have now been banned overseas... [as] they have been linked to a number of medical conditions and are probably carcinogenic... One of the family, 245-T, was voluntarily removed from use in N[Z] in 1989 after a four-year campaign against it... A biochemist and former member of the Toxic Substances Board... says the decision to stop using the isobutyl formulation was a regulatory charade. "Using any of the phenoxy acids, and in particular the wide use of 2,4-D, is an uncivilised procedure. Scientists still don't really understand how these chemicals provoke the disorderly growth of plant cells which they rely on for their effectiveness,"... [However, supporters] of the chemicals, including the manufacturers, say there is no "hard evidence" that 2,4-D causes cancer or other short-term problems, and that it is safe if used according to directions... A recent [regional] council report revealed... a number of users, particularly aerial sprayers, have been applying 2,4-D diluted with only 10 litres of water per hectare, rather than the recommended 60-100 litres... The isobutyl formulation is preferred by most farmers and spray contractors because it is more rapidly absorbed into plant tissue and is therefore less vulnerable to being washed off by rain in the hours immediately after spraying. It is the most widely used agricultural herbicide in N[Z]... It is also the chemical most commonly named in complaints to authorities about spray-drift. Research suggests that in some cases up to 40[%] of the herbicide can vaporise within a few hours of application, sometimes vaporising and drifting hours after it has landed on the target plants. If the wind shifts after application, the chemical can drift several kilometres... Over the years there have been a number of civil cases about spray-drift damage, particularly to susceptible crops such as grapes and tomatoes. Many more claims have been settled out of court... On the enforcement front, the board says it recognises the role of regional councils as the lead agencies in monitoring the use of agrichemicals. In Northland, where the greatest amounts of 2,4-D are used, the regional council has come under pressure to take a stand against spray-drift... A number of regional councils, including Northland, have indicated they will use air quality regulations to police the use of agricultural chemicals... A... stable amine (salt) based version of 2,4-D is already available and the Pesticides Board has now approved the manufacture of a 2-ethylhexyl ester version... 20 times less volatile than the isobutyl... But... Dow Elanco... has suggested the new formulation will cost up to 30[%] more. For farmers, some of whom spray hundreds of hectares in their annual battle against thistles, broadleaf weeds and noxious plants... the extra cost is a concern.

...environmental activists... yesterday voiced concern that... [a] shipment of genetically altered soybeans... bound for A[US], would find their way to [NZ], unleashing an unknown and potentially serious risk to the nation's health and environment... They have called for a moratorium on the importation and sale of genetically altered foods and for compulsory labelling... The soybeans[... which]... food regulators in A[US say are]... not for human consumption... have been altered to be resistant to the herbicide Roundup and under reciprocal arrangements through the new A[NZ] Food Authority... can freely enter N[Z]. The... "Roundup Ready Soybean" had been rejected by European consumers and retailers because of health risks... [But] the authority said [it] had a good guarantee the beans in question were safe. "That is that the soybeans are designed for cattle feed, not human feed." [The authority] also ruled out contamination by humans eating the cattle fed with the beans. But a physicist... who is the Auckland director of the National Food Commission, said that even if it was true the first shipment was not for human consumption other shipments would soon follow. [The physicist] also challenged the authority's ruling out contamination by humans eating cattle fed with the beans. "Research shows that antibiotic resistance... can pass from animals to other animals and on to humans through consuming foods and medicines in animals."

...SOYA-BASED infant formulas should be used only on medical advice in the wake of a UK Health Department report recommending urgent research into the safety of the products... The chief medical officer of the... [d]epartment wants the research done "as a high priority" to determine whether the formulas affect infant reproductive development because they contain phytoestrogens (plant oestrogens). The chemicals influence [human] menstrual cycles and have been shown to cause infertility in animals. [A]Wellington barrister... who has been campaigning to have soy infant formulas removed from the market until they are proven safe, said... "...our studies... have estimated that a child fed exclusively on soy infant formula would get the oestrogen equivalent of two to three oral contraceptive pills a day." ...[In related news, a] change in diet can be of major assistance to the 85[% of gals in AUS and NZ] who seek help during menopause. An expert says fruit and vegetables, cereals and legumes all provide hormonally active compounds which help balance the decreasing levels of fem[inin]e hormones at mid-life. But... [the] associate professor in reproductive endocrinology at Sydney's Royal Hospital for [Gals], head of the A[US]n Menopause Society and a world authority on the subject, also acknowledges that patch-delivered hormone replacement therapy is the only effective therapy for some [patients]. "Some... have a very efficient liver which simply removes all the oestrogen taken in tablet form... So oral HRT does not work for them..." Pharmacist this week announced it was halving the subsidy on transdermal HRT, which will increase the cost to between \$12 and \$16 a month. The drug-funding agency claims... patches offer no clinical advantage over the tablets and the convenience... is not worth the extra cost. [The expert], who has just completed a research programme addressing nutrition and the menopause, presented his findings at a conference in Rotorua this week, and spoke to a group of health professionals at the Auckland School of Medicine yesterday. His advice for [gals] approaching the years of menopause is to "eat as much plant material as possible and to be as vegetarian as you can stand." His ideal diet includes five daily portions of fruit and vegetables, with whole-grain cereal, legumes and a minimum of animal fats. [The expert] also suggests that [they] add tofu to their diet or substitute cow's milk with soy milk. All plants contain hormonally active compounds but soy beans are "in a class of their own" with 10 times more than other foods... Limiting alcohol intake is also recommended, as [gals] who drink more than three measures of alcohol a day increase their risk of breast cancer by 70[%], the expert says. But while [gals] commonly worry about breast cancer, far more die from cardiovascular disease. The fem[inin]e hormones provide a natural protection against CVD but this is lost after menopause. [The expert] has recently completed a pilot study using a clover-based product in tablet form which indicates... plant hormones may play a major role in preventing heart disease. Clover has even more phyto[estrogens] than soya beans.

...Shoppers go for healthy products... Researchers... studied N[Z] supermarket sales from July 1995 to July 1996 and found that Nature's Fresh bread is our top brand with \$54 million in sales. Coca-Cola beverages, Tegal frozen chickens, Treasures disposable nappies and Anchor milk... rounded out the top five... The research... did not include "house" brands such as supermarket labels... Despite severe advertising restrictions and anti-smoking warnings, three cigarette brands made the top 20... This compares well with A[US] however, where similar research placed nine cigarette brands in the top 20... [- including four] in their first five supermarket items of choice. Coca-Cola was the only product to outsell cigarettes across the Tasman... The results of the local annual study will be published in the November issue of *Marketing Magazine*. It suggests an increasing consumer sophistication with the growth in sales of ethnic foods, premium catfoods, hair care products, olive oil and a switch from cask to bottled wines. Rising new brands... were led by Sure As Eggs... with \$4.6 million sales. Bluebird megamix cereal snacks and Cadbury Timeout chocolate bars were second and third.

...Call for food consumers to be more knowledgeable What we don't know can't hurt us... or can it? ...As food consumers we... understand little of what happens between the farm gate and plate... [an] Otago University anthropologist told a conference of food writers in Dunedin. N[Z] has cheerfully participated in a global food system, for instance, that requires us to apply a solid marinade of pesticides to apples. Yet we trenchantly insist that N[Z] products are clean and green... and we believe these myths about our own produce more than overseas consumers do... Food advertising suggests (increasingly erroneously) that foodstuffs come directly from nature to our plates. But the truth is the processes of global food production are increasingly complex – and largely opaque to the consumer... [The anthropologist] describes a world food system that is lurching from crisis to crisis. Failures are apparent when regions experience famine and even successes have negative effects – such as increasing Western obesity... Most of us would be hard put to name even one of the five largest grain multinationals, though we could name several giant oil or computer companies. "Large food companies lurk in the shadows and are only occasionally dragged into the light of day,"... That happened in the 1970s when consumers boycotted Nestle products because the company was promoting infant formula in the [Last] World... Consumers glimpsed questionable business tactics and responded vigorously... [Nestle] was converting the time-honoured and simple system where [mothers] breast-feed infants into a far more complex one of purchasing First World milk and processing it into formula for [Last] World mothers. This "thickening" of the food system (or increasing complexity in the middle stages) continues to happen... In response to a butter surplus, butter fat is added to calves' feed – surely a complex way of getting milk from the cow's udder to the calf, says [the anthropologist – who] traces our present world food system back to the British industrial revolution of last century... Factory workers crowding into cities needed to be fed. But farmers could not produce enough food and transport systems were inadequate, resulting in bread riots. British workers were being slowly starved to death, and that put serious brakes on industrial progress. The solution lay in building on existing trade in luxury items like sugar, spices, tobacco, coffee and tea, and extending it to staple foods. Advances in steam transport allowed food to be imported from colonies, and by the end of the 19th century the British urban poor had a dramatically changed relationship with food. They shopped for food, rather than providing it themselves. The standard diet was wheat based, and spiced up with stimulants... and meat when available. Put another way, the classic working class meal was a chunk of white bread, a smear of jam or treacle, a sweet cup of tea and a smoke... • [The fruit of the BREADFRUIT TREE is an important item of food for natives of the South Seas. When fully ripe it has a sweetish taste, is laxative and indigestible, and goes bad quickly. It is gathered before it is fully ripe, when the flesh is firm and white, mealy and rich in starch, and has almost all the nutritive qualities of wheaten bread. It is cut in slices and toasted on hot coals, or baked in the oven until the outside skin becomes dark. Prepared in this way it is a valuable food, very nutritious, its taste recalling that of freshly baked bread'...

'Ever bought a loaf of "fresh" packaged bread, only to discover it was already stale? When an Aucklander found the crusts on her North's Kibble-wheat sandwich were so dry it couldn't eat them, the Aucklander promptly rang the factory. After all, the bread had been bought at the supermarket only that day, a Friday. Her call was put through to a dispatcher "who was probably more honest with me than a bakery employee should've been." The dispatcher told her the bread had probably been baked on the previous Wednesday morning. The loaf could have been sitting on the supermarket shelf until just before fresh deliveries at lunchtime on Friday. At packaged bread plants, loaves are bagged and closed with a plastic tag – colour-coded according to the day of

baking. That coding was introduced for the convenience of the contractors who deliver the bread, not the customer – who is instead offered a “best by” date stamped on the tag, and set at five days after the day of baking. This customer’s loaf carried a white tag (Wednesday) with no date stamped on it. The dispatcher told her it should have had a date. How can customers know they are buying bread actually baked two and a half days earlier, the Auckland asked. “We try not to let it happen to often,” was the reply. The dispatcher offered to post the Auckland vouchers for two replacement loaves. But the Auckland is still an unhappy customer. “I remember fresh, warm, crusty loaves being delivered daily to the letter box. What has happened to our so-called daily bread? Shouldn’t we know when our bread was baked?” Well, yes, we probably should – and canny shoppers already do. Furthermore, consumers who know how to crack the bread code might be in the bakeries’ best interest. Most NZ packaged bread is made by only two companies. Allied Foods has just over 19% of the \$225m bread market. Allied’s main rival is Goodman Fielder Milling and Baking, which claims 54% of the market. Allied’s managing director says the company delivers bread daily – and some days twice daily. The contractors who do the deliveries for Allied remove old bread from the supermarket or dairy shelves, and stack the new loaves. “When you buy the bread it is no more than 36 hours old,” says the managing director. “It almost makes me cry when I see the returned bread.” That is because it seems so wasteful – bread which still has two or three days before its best-by expiry date is either dumped or fed to pigs. “On average, 15% of the bread you bake is returned.” But sad as it might be to see almost 20 million loaves a year wasted, shoppers do want to buy the freshest bread available in the store – not the pig fodder. Perhaps the last word on bread freshness should go to Goodman’s research and development manager. “We demand too much from our bread in AUS and NZ. Customers want bread that is fresh, white and soft – and that can be kept like a packet of biscuits.” Some in the baking industry say we have gone too far to accommodate these conflicting desires, the manager says. Basic home-made bread with no improvers or emulsifiers does not last long, but the manager says no nasties or preservatives go into our commercially baked bread to make it last. Techniques and ingredients that do help include putting more water into the dough, using hydrogenated vegetable fat and a soft soy-based fat, and adding alpha-amylase enzyme (which is naturally present in flour as well). Adding sugar also helps since it attracts moisture. To prevent mould or bacteria growth (a problem with sliced bread) an acidity regulator (citric acid or vinegar are well known ones, but bakers tend to use calcium acetate) is added to reduce the pH of the bread.’ ‘All cereals – farinaceous foodstuffs are the basis of human diet – can be made into bread, but wheat and rye are particularly suitable.’]

...it’s hard to find a food that has all the wonders of bread. For those who bake their own there’s the hands-on satisfaction of mixing, kneading and shaping, and the ambrosial aroma from the oven while it’s cooking... In Christian scriptural language “to break bread” refers to the Eucharist and means to partake of food. Jewish communities the world over regard the breaking of challah, the special sabbath loaf, as a signal for the commencement of the Kabbalat Shabbat, the cherished Friday evening meal. The challah, enriched with eggs and sometimes made with raisins, sultanas, nuts, saffron and other spices, thus has special significance in the Jewish household. Some Jewish people still bake their own, but for others the pressures of modern living have meant buying this traditional yeast bread from commercial bakers... The variety of bread now available in N[Z] is limited only by the baker’s imagination... The shape of bread is also changing... The Designer Bread Company in Auckland... has made [its] mark with decorative bread, creating spirals, swirls, flowerpots, daisies, shamrocks, buttons, bows, twists and crosses. [The company] only takes orders, and... will make anything, however big, small or unusual. [The company also] turns out lavender and marigold biscuits, rose muffins and chervil rolls as easily as... pain au chocolat, panettone (a festive bread from Milan) and the German stollen. Bread has been a major food source since neolithic times, over 12,000 years ago, when coarsely crushed grain was mixed with water and the resulting dough was baked by covering it with hot ashes and placing it on heated stones. The earliest form of bread was flat, and in many parts of the world today flatbread (some leavened, others not) continues to be a staple food: chappatis... parathas... and naan... are popular in India, corn or flour tortillas in Mexico, and pita bread in Greece and the Middle East... Over 2000 years ago the Egyptians discovered that if wheat dough was allowed to ferment it formed a gas which produced a light, expanded loaf. Later civilisations used beer froth and other fermenting substances to get their bread to rise. In 1850 Louis Pasteur identified a single-celled microscopic fungus as the cause of this leavening process and determined that yeast converts sugar into alcohol and carbon dioxide. The gluten in the flour forms a skin that traps these carbon dioxide bubbles and aerates the dough. Today’s baker’s yeast is available in several forms: compressed, fresh and granulated. For sourdough, however, the ancient Egyptian principle of leaving the dough to attract wild airborne yeasts is still employed. Sometimes yoghurt or cheese is used to accelerate the process. Because wild yeasts differ between geographical areas, each sourdough develops its own characteristics and flavour. The Devonport Stone Oven in Auckland makes particularly good sourdough bread... Five bakers on rota enable The Stone Oven to operate around the clock. They supply nearly 80 restaurants, cafes and healthfood stores in N[Z] with organic sourdough bread, and two delicatessens in Tahiti with a weekly stock of sunflower seed sourdough... [B]lack Russian and barley ryes – no-wheat loaves – regularly wing their way to A[US] in the suitcases of visitors-in-the-know, and the East West bread and rice kaiu, containing cooked, organic, shortgrained brown rice, are hot favourites. French and Italian breads are also popular in N[Z]... Pandoro, an Italian bread shop in Parnell, Auckland, has 300 wholesale customers throughout the country. All-night baking ensures the product is ready for distribution by 5am, and the increasing demand resulted in the opening of a branch in Wellington last month... The most common grain used for flour is wheat. Wholemeal flour is ground from the entire kernel, comprising the bran, the germ or embryo, and endosperm. The embryo is rich in protein, vitamins and oil. The endosperm supplies the starch. Because both bran and germ are removed for refined white flour, the emphasis on healthy eating and awareness of the importance of dietary fibre has led to a decrease in the consumption of white bread in N[Z]... In 1985 63[%] of all bread consumed was white; by 1990 the figure had dropped to 44[%]. NZers]... eat about 4.5 million loaves of bread a week, which works out to about 1.3 loaves per person... To counteract the conception that white bread is unhealthy some bakers worked on improving its image. Even large establishments such as Quality Bakers N[Z] Ltd, with 22 bakeries around the country, got into the act and introduced a high-fibre white bread. “As a base food, bread is a good source of complex carbohydrates... It’s low in fat and is a good source of fibre and protein. But there’s no question that wholemeal bread and grain bread have more fibre content than white bread. They are, however, dense breads. Our high-fibre white, made from special maize, has 60[%] more fibre than ordinary white bread, but is as soft.”

...Low-fat, high-fibre diets may stunt children’s growth and could lead to anaemia, learning difficulties, and heart disease. British researchers have warned such diets could also lack zinc... [‘Fruits, vegetables and cereals contain high levels of dietary fibre which can bind zinc, making it unavailable to the body. At least one study has shown that a high fibre meal can reduce zinc absorption by more than 97%!’ On a positive note, don’t] fret if your toddler won’t eat anything but Weetbix, milk and strawberries, says [a] Sydney paediatrician... That kind of eating is perfectly normal – and temporary. But what if they demand corn chips, Coke and ice blocks – and nothing else will do? If those foods are in the house then the parent has the problem, says [the paediatrician]. “From about two, children are sussing out who in the family is in charge of what. If they learn that Mum is in charge of what food is available, and they are in charge of whether they want to eat it, then you have a very healthy system set up.” ...No more mealtime hassles. No threatening “no pudding unless you eat your veg.” No insisting on eating everything on the plate. You present the food and the child takes it or leaves it. It is that simple, says [the paediatrician], who is in N[Z] on a lecture tour. Her topic is *The Child Who Won’t Eat* and though her tour is sponsored by Watties, [the paediatrician] isn’t here to recommend little jars of her sponsor’s fine products. “Canned baby foods are nutritionally fine, but uninteresting. Starting on solids is about learning about colour and texture and taste, and canned foods tend to be all the same.” Better to serve tiny helpings of individual veges... but don’t waste time preparing special meals for infants with minuscule appetites. “You have too much vested interest in their eating them.” Just mash up your own leftover vegetables... and put them aside for toddler tomorrow. [The paediatrician] wastes no sympathy on parents who say “[my child]’ll only eat chocolate.” “I say: ‘Who gives him the chocolate?’ The parents’ role is to say: [‘]This is what is in our house, this is what is available. If you want to snack we have crackers and cheese and apples and you’re welcome to

it.” For years my... children refused anything green that was cooked, so I run that past [the paediatrician] “That doesn’t matter... If they’re eating fruit and raw vegetables they are getting all they need.” Parents should model good eating habits: sitting in front of the telly eating chocolate and chips and Coke is out... Not that [the paediatrician] would ban confectionery altogether – a regular ice cream treat is fine, but don’t make sweets either a no-no or a reward. What [the paediatrician] does advocate is respecting the child’s right to decline food... [O]ne study clocked parents prompting about food once a minute, says [the paediatrician]. This compared with only 2.2 prompts an hour for other activities. Some of this urging is because we don’t understand about children’s growth patterns... “Nature is very mean. Children in utero grow at a phenomenal rate. In their first year they grow more than twice as fast as adolescents.” Lulled into complacency by their burgeoning babes, parents can fret when growth slows markedly in the child’s second year. That is also when toddlers start to assert their independence... Not only does nagging (“negative prompting”) result in the child eating less (and less varied) food, but some studies suggest that warring at meal times may result in obesity or anorexia in latter life. A child’s attitude to food goes in phases... Tastes are forming even in the womb. “Amniotic fluid has taste. If mum has had a garlicky meal, the fluid swallowed will taste of garlic.” Breast milk is similarly affected. “Breast-fed babies will more quickly adapt to new tastes than formula fed babies because they get a wide experience of tastes.” In the first year of life babies will taste anything, but by one year “neophobia” develops. “That means if you haven’t seen it before, you don’t trust it.” It probably evolved as a protection mechanism – protecting the cave-crawling baby from eating new and poisonous berries. So during this phase mother has to present new foods several times over before the baby learns to accept them. By two that mistrust is diminishing, and by four to six it is over... The child is by then more influenced by family and by peer group, who may of course be crunching crisps and downing fizzy drinks – or fruit juice. Juice as a regular thirst quencher gets the thumbs down from [the paediatrician]. “At one, infants need about 600ml of full fat milk (or equivalent) a day. Above that, water is the best drink... Parents often say ‘[]but they won’t drink water.’” Presumably these are the same wussy mums and dads whose kids will only eat chocolate. What is confusing them is that junior who used to get through a bottle of juice in a session, now acts like a well-irrigated camel. The good news is that [such a child] is as likely to die of thirst as the camel. “Infants will only drink as much water as they need – and in winter that will be very little.” By offering them water you are familiarising them with the stuff that will quench their thirst in summer[(‘our bodies contain approximately 70% water, eliminating daily an average of three litres; when the water content is lowered to a considerable degree, the sensation of thirst results’)]... **The trouble with juice is that even the purest is high in sugar[, which makes drinks]... such as... orange juice... notorious... mood-changers... Toddlers will swig [juice] because it is sweet and because [drinking it] is less time-consuming than eating. Like chips and chocolate, it satisfies their energy requirements, leaving them no appetite for foods they need. Two cups of juice is the sugar equivalent of eating eight apples, says [the paediatrician], so if you must serve juice either dilute it or limit it to one cup a day.**

...An apple a day might keep the doctor away – but it could keep your dentist in business. That’s the message from [a]visiting Hong Kong dental health expert... who says chewing a stick of gum for half an hour after lunch is better than trying to clean your pearly whites with an apple. The sugar-containing fruit sticks around the teeth to help trigger cavities. Gum stimulates saliva which helps protect against fillings. It’s better to finish off your meal with a vegetable such as a carrot or celery stick, or even a wedge of calcium-containing cheese. “There is a lot of rethinking going on about so-called ‘safe’ foods,” says... [the] professor of children’s dentistry and orthodontics at the University of Hong Kong. The emergence of sugar-free chewing gum as a weapon in the dental war means school kids who were once chewed out for chewing gum may now be encouraged... [The] managing director of the Wrigley [chewing gum]company which, with the Dental Association, sponsored [the professor]’s visit, said gum is even being given out to school dental therapists to pass on to children as part of dental hygiene education packages. And the company is talking to health authorities on incorporating it in primary prevention strategies... ENZA (formerly the Apple and Pear Marketing Board)... said it had never promoted apples as dental cleaners – it was well aware of the sugar levels in the fruit – but as a healthy part of the diet.

...[FLETCHERISM is the ‘doctrine established by an American industrialist, who restored his gravely failing health by following an extremely austere diet (after having read Gornaro’s book on the subject). The industrialist claimed to have discovered the “golden key to health” in mastication pushed to its extreme limits: not swallowing a mouthful of food until it was reduced to the state of a liquid pap and had lost all its flavour...]

Psychologists define under the term natural appetite the tendencies which instinctively cause us to satisfy the needs of the body. In physiology appetite is defined as something rather different from hunger. Hunger in reality is nothing more than the need to eat, whereas appetite is the lure of pleasure which one experiences whilst eating, brought about by a particular condition of the organism. The appetite is stimulated by the sight and smell of food; bitter substances frequently awaken lost appetite by releasing digestive secretions. In certain psychic and mental cases, appetite can degenerate into a craving for offensive and non-edible substances.’ Incidentally, Popeye] had the right idea about spinach. The fictional sailor gulped it straight from the can – and it kept him so strong that [Popeye] didn’t even need an opener to get the top off the can. Spinach won’t make you an instant iron[person] of course, nor is it an overnight miracle. But it yields long-term health effects matched by few other foods. A cup of cooked fresh spinach has twice as much vitamin A as the daily requirement needed to keep eyesight functioning properly. It also contains nearly a day’s worth of vitamin C for forming protein collagen and half a day’s supply of the antioxidant vitamin E to protect cell membranes. And as a side-salad, half a cup of chopped fresh spinach has twice the recommended daily amount of vitamin K, which enables blood to clot normally. But that’s not all the nutritional muscle spinach packs. For a pregnant [person], spinach is the perfect food. A cup of cooked fresh spinach contains more than a daily dose of folacin, which is essential for the formation of DNA, RNA, bone marrow and blood cells. Folacin is crucial during the first four weeks of pregnancy. And in a one-two punch, the same amount of spinach is a good source of calcium and iron, two things a pregnant [person] needs plenty of. Many adults still harbour childhood phobias about spinach. Too bad, because they’re missing some great treats: cooked spinach dressed with a dash of vinegar, or fresh spinach as a salad, tossed with warm crumbled bacon and chopped egg. Spinach is easy to buy and prepare and is readily available in many shops.

...[‘the nutritional value of the peanut plant is considerable. Its pods bury themselves in the earth to mature the seeds, which are eaten either raw or roasted. Peanut oil and peanut butter are made from this nut. The latter can be eaten in sandwiches or on pieces of toast accompanied with jam or jelly.’]

...At their most severe, food allergies can make sufferers prisoners in their own homes. But... airlines at least are trying to help to lessen the dangers... The danger of inhaling peanut dust and oil was highlighted this week by the case of [an]Auckland toddler... who nearly died on a flight back to N[Z]. The 16-month-old suffered an allergic reaction after passengers opened packets of peanuts en masse. Experts say such a severe reaction to inhaling peanut dust and oil is extremely rare. However, the artificial environment on a plane, where the cabin air recirculates, can be lethal for sufferers... Flying is also a risky business because medical attention can be some hours away. Two years ago, an American tourist returning from a holiday in N[Z] went into anaphylactic shock. Mr John Kirst died minutes before the Air N[Z] Boeing 747 touched down in Rarotonga, where it had been diverted when the [tourist] collapsed after his meal. [However, an Air NZ spokesperson] says it is not certain exactly what Mr Kirst reacted to because [the tourist] was sensitive to several foods, including cashew nuts, sesame seeds and fish. [Unfortunately, medication] for his allergies was stolen when his campervan was burgled in Auckland... Since [the 16-month-old]’s attack, a new policy has been introduced[by Air NZ]. If an individual sends a written request, the airline will: • Remove peanuts and peanut product from meals. • Not serve peanuts as snacks. • Check the aircraft thoroughly before each flight for dropped peanuts. • Ask passengers not to eat peanuts they might have brought with them... According to the Allergy Awareness Association, milk... eggs, fish, wheat[(‘gluten is a possible culprit’)]... peanuts and... other nuts can trigger severe reactions. The association’s medical adviser... says allergies to milk usually decrease as children grow older, but sensitivity to peanuts and eggs often remain for life. In [a British teenager]’s case, her sensitivity increased as [the allergy-sufferer] got older. As an 18-month-

old her face swelled up after [the toddler] had eaten peanuts. But at the age of 15 the allergic reaction became dramatically more acute. Now... [the teenager] can't go to the movies or a nightclub... can't go on a bus, go out for a meal or even shop for clothes. The British teenager suffers from the worst case of peanut allergy doctors have seen. A life-threatening attack can be triggered by contact with someone who has eaten peanuts in the past 24 hours... [The association's medical adviser] remembers a case in Sydney when a university student went to an Indonesian restaurant with friends. [The student] had been given an assurance that her meal would be peanut-free. But after her first mouthful... uttered just one word – "ambulance" – then collapsed and died... Overseas studies have found peanut allergy is increasing in younger children. Doctors believe this may be because of their mothers' diet. Research suggests that youngsters can become sensitised to peanut through traces found in breast milk, bottled milks and nipple creams, many of which contain peanut oil... Food labelling is a major problem, says the president of the [association]... who has a four-year-old allergic to peanuts, dairy products and eggs. Inadequate regulations allow manufacturers to leave off some ingredients which... can trigger reactions... [By the way, b]iotechnologists at an independent research centre at Cornell University in the U[S] are genetically engineering a banana to produce an antigen found in the outer coat of the hepatitis B virus... The research team hopes the experiments lead to the development of banana vaccines with the ability to protect... millions of young lives in developing countries... from a range of diseases including measles, yellow fever, diphtheria and polio... The researchers say banana vaccines could slash the cost of vaccines from up to \$NZ231 to a few cents a dose. The vaccine would be delivered in a puree, similar to babyfood... They showed last year that hepatitis B antigens produced by genetically engineered potatoes triggered an immune response in rats. But they switched to bananas because cooking potatoes destroyed the vaccine. - 1996

I am amazed... the public has been so blinded by overconfident hype from the biotech industry that people will now swallow almost anything, even Monsanto's version of glyphosate, Roundup... Herbicide enthusiasts... think ...a... "Roundup Ready soybean"... is a brilliant idea because it allows the farmer to get out there with his wonder weedkiller chemicals and scorch the earth of everything except the crop [the farmer] wants to grow, thereby gaining a marginal advantage over his economic competitors. Glyphosate-resistant corn, cotton, canola and sugar beet are just around the corner. Free of cost, N[Z] provides large Northern Hemisphere firms developing these products the chance to get in an extra growing season, allowing them more quickly to multiply their seed to commercial levels. For years environmentalists have... advocat[ed] that we should preserve the genetic diversity of our seed stocks and reduce dependence on agricultural chemicals. It is little wonder... Greenpeace is objecting to mono-cultures of herbicide-resistant crops and a new agricultural economy based on the expanded use of glyphosate. Any notion of a transition to more healthy methods of organic farming has been abandoned in favour of quick profits for those who play to the rules of the multinational giants. Unless we change course within a few short years those with greatest control over the world's economic capital will extend their influence to cover the processes whereby the integrity and stability of the whole of biology has been developed and maintained during the billions of years of evolution – the Earth's gene pool. It would be comforting to know that behind commercial interests in genetic engineering, and all of the hopeful propaganda about it in the media, there were sober scientists who have a deep appreciation of the ways of nature, people of the intellectual calibre of Newton and Einstein who were not blinded by their success in understanding something fundamental about our world. Sadly, such is not the case. Biotechnologists are mostly absorbed by the cleverness of their experimental trickery. Any sense of awe or respect for nature has been replaced by a concept of life as a quaint genetic jigsaw puzzle. From such a narrow perspective it is easy to believe that genetic engineering will be the means of finally transforming our global society so... the starving can be fed, the diseased cured, world population controlled, new super-species created and old ones rescued or resurrected from extinction. But... [w]e have not yet learned about the downside of biotechnology and we would be foolish to meddle with it. The scope for harm is enormous. The ultimate consequences of putting bacterial genes in plants cannot be judged from the results of classical selective breeding and hybridisation, whereby wolves have been turned into Pekinese and wild cabbages into cauliflowers. If we were wise we would follow nature's precedents in ecology. The results of classical practices are confined by the natural limits of sexual reproduction but swapping genes between species which cannot interbreed is achieving precisely what evolution has guarded against for aeons. It is only self-justifying biotechnologists who declare... those limits are of little ecological or ethical importance and... any effect of violating them can be assessed in terms of the local operation of simple principles. Yet it is the judgment of such "experts" which dominates the regulation of biotechnology here as elsewhere. I take little heart from the fact that our Ministry for the Environment's "interim assessment group" put unprecedented restriction on the field trials of Roundup Ready canola being grown near Oamaru. In previous trials the group was not prepared to require that appropriate precautions be taken until there was proof... the genes could be transported further than had been guessed and that the herbicide resistance could cross more readily than expected to related species. The group has adopted the attitude that anything is allowed for commercial gain unless there is scientific proof of any postulated danger. By allowing the trials to proceed we are accepting chemical and genetic pollution as collateral damage to corporate profits. With enough effort, chemical pollution, even radioactivity, can eventually be cleaned up in most cases but self-propagating genetic pollution cannot be. The introduction of herbicide resistance into plants may, through crossbreeding in the wild, give rise to "superweeds." The presence of foreign proteins in foodstuffs may trigger new allergies in susceptible individuals. And even if glyphosate itself has relatively low toxicity for humans, we can expect soon to be eating more Roundup in our food. Monsanto has applied to the A[NZ] Food Authority to raise the allowed level of glyphosate in our food. All of this helps to minimise any inconvenience to Monsanto which has become skilled at keeping itself ahead of public awareness... 60[%] of processed food contains soy-derived material. It is likely to contain a significant fraction of Roundup Ready soybean in the future. Roundup is Monsanto's most profitable product, but the company now sees more money in biotechnology than chemicals. As the biotech industry outstrips the chemical industry we will find its big money exercising tremendous influence over all aspects of our lives.

...N[Z]ers may already be] eating genetically altered food – even though laws on the controversial new techniques are months away. A government-appointed group has given interested parties until this Thursday to have a say on genetic engineering of food and plants. But the Health Minister has already cleared... [two] food ingredients for use here... Chymasine, a genetic form of rennet, has been cleared... as an additive for cheese, while fungal alpha amylase, an artificially generated enzyme, can be used in some bread products. But manufacturers... appeared to have voluntarily declined to use this genetic material... Documents obtained under the Official Information Act show the Government was advised last December that "transgenic" soya beans were safe for N[Z] consumers. The beans have been injected with genes from a soil bacteria and from the petunia plant as well as cauliflower mosaic virus to make it immune to weedkiller. [The d]irector of Public Health... told the then Associate Health Minister and Consumer Affairs Minister... that foods could only be banned or restricted if there were "grounds to do so based on the need to protect public health and safety... To date no such data has been provided to the ministry and we are not aware of such material..." Despite the reassurance, the ministry was advised last November of at least six studies that raised concerns of safety risks with genetic engineering of food. One of these studies – from... [the] Professor Emeritus of Genetics at the University of Ontario – specifically warned about the use of... cauliflower mosaic virus. "Certainly the widely used cauliflower mosaic virus is a potentially dangerous gene... Modified viruses could cause famine by destroying crops or cause human and animal diseases of tremendous power." [The]Natural Food Commission director... said the... soya beans were being shipped to A[US, where NZ] sourced its beans. About 2% of the A[US]n soya bean stockpile is made of the physically indistinguishable genetic beans. "Soya is used in... 60% of processed foods... from margarine to baby foods to pasta and bread... In Switzerland, they recently tested a number of foods and found the genetically altered soya beans were in their beloved Toblerone chocolate, prompting an immediate product recall. Nothing like these checks are being done in N[Z]. We are living in a regulatory vacuum." The A[NZ] Food Authority... also recently identified a number of safety concerns... includ[ing] consumers suffering reactions to foods after genes from allergy-causing foods were placed in what might appear to be

harmless products. Another concern was that a build-up of genes, such as herbicide-resistant strains, might interfere with the therapeutic action of antibiotics... Any such product should be labelled to let the consumer decide. "The research says when the consumers are given a choice, the market diminishes,"... [the] Alliance health spokesperson... said. "That's what happened in... [Britain] when supermarkets insisted on labelling." ...[in NZ, current] labelling requirements did not distinguish between food additives derived from different sources, such as gene technology... ANZFA [i]s looking at five criteria for introducing labelling... ● When any gene was introduced that could cause an allergic reaction. ● When a protein was introduced from an animal in a vegetable product which might be of concern to groups such as vegetarians. ● When a product was changed in appearance by genetic modification. ● When a living organism such as a fruit, vegetable, grain or cut of meat was the product of genetic modification. ● When the product appeared unchanged but contained 5% or more ingredients that had been genetically modified.

...APRIL 3 is the deadline for N[Z]ers to have a say about an alarming new development... American food manufacturers and chemical companies are already selling... genetically engineered (GE)... soy and corn, despite widespread opposition in the US and Europe. Now the A[NZFA] is consulting the public on both sides of the Tasman about what to do, although few people here know about it. ANZFA is based in Canberra, and has one solitary N[Z] member. No N[Z] consumer groups are represented on it. The call for submissions consisted of a tiny advertisement in a few daily newspapers. Yet the topic is vital to the future of the planet's food chain. If some critics' predictions prove true, we may face environmental chaos as mutant plants invade new habitats and crowd out existing species. No one knows what the health effects of these strange new foods might be on humans. Rampant allergies and runaway viruses are some of the frightening possibilities... In the US, unrestricted use of a number of [GE] foods has been allowed including tomatoes... and oilseed rape. The best known example is the Monsanto Round-up Ready soy bean... created with genes from... substances humans don't eat. Ciba-Geigy has a maize which has a toxin gene to deter insects and a marker gene that creates resistance to the antibiotic ampicillin. So far only soy and maize are available internationally... You don't have to be a rocket scientist to foresee the dangers in interfering in such a fundamental way in the integrity of foods. If we need a reminder, the "mad cow" disease debacle... [- which] cost the British government £855.1 million between April 1 and December 31 last year[-] ...is it... As individuals and parents we could end up having no idea what goes into the food we put in the supermarket trolley. Processed foods often have unlikely ingredients. When the "mad cow" story broke, a shocked public learned that even vegetarians could have ingested contaminated meat products contained in foods as remote as sweets and jellies. For instance, avoiding [GE] soy is not as simple as swearing off tofu, TVP ['Textured Vegetable Proteins - processed soya protein which has been spun into fibres, or extruded at high heat under great pressure, to be made into a food product of the same texture as meat then flavoured and shaped to look and taste like beef, ham, pork, bacon, etc; *monosodium glutamate* - identified as the cause of the "Chinese Restaurant Syndrome" where people who have had a Chinese dinner suffer from severe migraine-like headaches a few hours later - is used in most TVP'; TVP can also be made with 'protein derived from wheat, oats, cotton-seed and other vegetable matter')]and soy milk... It's found in 30,000 food products... ANZFA proposes that foods be cleared for sale on a case-by-case basis. Only some will be labelled as containing [GE] food... a food... will not require labelling if the [GE] component is less than 5%. The 5% rule is arbitrary - it is not based on any known safety ground, but it means that many processed foods such as pizzas, pies and cereals would not have to be labelled. Nor would food containing [GE] micro-organisms - such as wine, cheese, beer and bread. Various trade agreements to which N[Z] is a signatory require this country to keep the doors open to competitors' products. The price of doing so may prove unbearably high. N[Z]ers who want us to stay clean, green and genetically pure might join in a fax attack to ANZFA, 04 473-9855.

...concerns about [GE] foods led to protests at Parliament today. The demonstrators claimed some food is already on sale here without proper tests and without proper labelling... The march called for an immediate moratorium on such foods... In [international news, scientists from]the country proud to have brought you the potato... have rooted around and found wonder tubers they say can boost world nutrition and help starve off environmental ruin. Experts at the International Potato Centre outside Lima have built an El Dorado of genetic plant wealth... "We are custodians of the world's biggest collection of potatoes," boasts the centre's research director... It has more than 500 local and international staff, a budget topping \$34 million and the bustle of a university campus... [But there are n]o patents here, its technology is freely available to those who seek it... With more than 150 of the world's 220 potato species kept thriving in an "in vitro plantlet" lab worthy of a sci-fi spud thriller, the centre is about serious science - research, not marketing... "The aim of all our work is to try to improve the living conditions of the poor and hungry... and at the same time take steps that are going to be helpful to the environment,"... Thousands of test-tubes containing potato plantlets, including many... rescued... from Andean nooks and crannies... shine under fluorescent light in a stark white earthquake-proof room... Scientists here made a splash a few years back by introducing a "hairy potato" with long and short sticky hairs on the plant and leaves, not the tuber. Crossing a commercial species with a wild Bolivian one, they built a better potato that snares pests and costs less to produce because pesticide costs are cut to nearly nil... But it's not all gene maps and test-tubes: in a lab out back technicians are frying away making test chips... to see if cross-breeds can pass culinary muster. Europe and the former... U[SSR] remain the biggest producers, but by the early 1990s, 30[%] of global production was in the [Last W]orld, up from 11[%] in the early 1960s. India is becoming a potato power, with a booming 5[%] output increase yearly, followed by China at... 3[%]. Indonesia has also] become a big producer. If the trend continues, most of the world's potatoes will be grown in Asia, Africa and Latin America in less than a generation...

For more than 25 years, the International Rice Research Centre (IRRI) has been working on identifying more high-yielding varieties of rice - the staple food of more than half of humanity. It has been credited with increasing average rice yields by 71[%]. More than 60[%] of the world's rice paddies are planted with varieties developed at the IRRI and their progenies. Much of Asia, where 92[%] of the world's rice is grown, is now self-sufficient and many countries have exportable surpluses. But with the prospect of at least four billion rice eaters by the year 2025, the IRRI is working on a new "super-rice," which can increase average yields by a further 25[%]. Scientists say the new thick-stalked variety can yield up to 12 or 13 tonnes a hectare and up to three crops a year. The IRRI hopes to perfect the new strain by the year 2000 but fears that cuts in its budget may hold up research. "We may have a \$US6 million... budget shortfall next year, which... could... severely... jeopardise our research," says [the] IRRI director... The IRRI needs \$44 million to operate annually, a measly sum considering the benefits possible[, but has been hit with]... budget cuts by traditional donors. "I think the rest of the world is so preoccupied with domestic issues they don't realise the importance of agriculture to economic development. Many spend so much on the military. The cost of one fighter plane is more than many years of research in this institute." ...BESIDES building disease resistance into the... potential super-rice... plant, genetics engineers at IRRI say they are also improving the grain's flavour to match local tastes... In... [local news], some imposters are sprouting amidst a forest of bonsai-size Radiata pine seedlings... [in] a hothouse out the back of the Forestry Research Institute's campus in Rotorua... On the outside, they look like any other tree. But if you cut open these pretenders they are stained... with a badge of abnormality. On the inside, these trees are blue... Scientists have added a new characteristic to their cells to produce the pigment. So what use, you ask, is a forest full of blue trees? Will we have multi-coloured forests that when processed will return to N[Z]ers those lost weekends spent painting the house? Well, no. What scientists are doing will have much more commercial impact. For the forests of the future they are developing trees resistant to herbicide, so foresters can kill weeds but leave trees untouched. They are also creating trees resistant to bacteria and fungal infections, along with plants that can withstand frosts and other environmental hazards such as salty soil and droughts... [P]erhaps highest on the must-do list is development of sterile trees. This will ensure modified pines don't takeover N[Z]'s forests. "That is absolutely crucial, even though Radiata pine isn't like most other trees here,"... Scientists are also working on accelerating or delaying the onset of flowering. Acceleration speeds reproduction, while suspending flowering redirects growth from cone to wood production. And the scientists plan to turn softwood to hardwood by injecting a gene that increases the density of logs. This is not fanciful thinking. Scientists

at the... [i]nstitute are already completing legal paperwork to take seedlings out of the glasshouse and into trial forests. Much of their work is being done in association with a development company, GEENZ Ltd. The company has only one full-time employee, [its] chief executive... But that belies the weight of corporates behind it. GEENZ' major shareholders are C[HH] Forests... Challenge Forests and Rayonier N[Z]. Its "minor" shareholders are Earnshaw One, Caxton Forestry, Wenita Forest and PF Olsen and Co. Together these companies control the majority of N[Z]'s plantation forests. [The chief executive] said the strength of the companies behind GEENZ indicates the potential impact [GE] will have on the forestry industry... "The economic impact of what we are doing could be enormous," [the]... manager of the... [i]nstitute's biotechnology division, said... But... the impact [GE] will have on conventional forests is huge, especially in an industry where investment decisions made today won't be realised for another 25-30 years. If genetic manipulation reduces growth times to 15 or even 10 years, the value of current plantations would decline sharply. [The chief executive] said forestry companies are now researching how the market for timber in 30 years might be altered by new breeds and breeding techniques. But, given the time involved, it is extremely difficult to make predictions. "For some of the trees that will be developed we won't know if we have got it right until they are cut down in 25 years' time,"... For that reason, forest industry analysts suggest investors should be cautious about any initial investment in genetically altered forests. "The N[Z] plantation experience suggests investors that get in at the beginning of any modified product have higher costs than those that come in later," one industry expert, who requested anonymity, said. "To capture the major benefits of [GE], we will require a strategic thinking process to evaluate options for potential markets two rotations out," [the expert] added. That could require even more investment than the money currently being pumped into the genetic research, [the expert] warned.

...*Blue genes into blue jeans*... Scientists are working on the ultimate in designer jeans – made with cotton that needs no dyeing. The blue gene project, created by... Monsanto, reveals the power of crop geneticists. This year, 4 million ha of modified soy bean will be grown, 10[%] of the U[S]'s total, and 1 million ha of modified cotton, a sixth of the national total, will be planted. The byproducts range from T-shirts to cooking oil. "G[E] crops are here to stay. People don't realise that yet," says [a p]rofessor... of Nottingham University. "We have successfully inserted blue pigment genes into cotton plants and have got them to express colour," says... [the] technical manager at Monsanto. But the process is patchy, and may take two years to perfect. Cotton plants... have also been inserted with a gene that makes a chemical that kills insect pests, and so need little spraying with insecticides. "By contrast, normal cotton needs spraying a dozen times a year. The cotton industry uses a million tons of sprays, 40[%] of the U[S] agricultural industry's total. Our plants will reduce that load dramatically, while crops such as blue-gene cotton should eradicate dyeing, which produces heavy pollution." ...[In another development, British s]cientists are scouring the tropics for the genes that could create a super chocolate... [which can save] the world from chocolate famine... Cocoa supply is more than adequate for present consumption and sliding prices reflect this. But... [major] Western chocolate manufacturers have already set up shop in China, Russia and other emerging economies to tap the potential demand. "The main problem is China... If everybody there eats one chocolate bar a year that's going[to] be an awful lot of cocoa," said... [the] secretary of Cocoa Research UK Ltd, which is financing the pilot project at the University of Reading. "You've got to be thinking... way ahead." The biggest snag is that cocoa can be grown only within a narrow corridor of 10 degrees north and south of the Equator where soil and weather conditions are just right. Production efficiency is also limited because, in contrast to plantation crops such as bananas, cocoa is grown by small farmers whose expertise often derives from sense and feel. "Most of the trees are ageing. If you have a pick-up in consumption you could get a bull market [which] there will be no turning off," said... [a] soft commodities analyst... in Toronto. Experts have worked out that if yields were at their maximum the world's potential output would be approximately two tonnes of dry beans a hectare a year compared with about 180kg now... Deciphering the cocoa genes can be a painstaking task... Identifying the key DNA in plants is so often prone to error that different laboratories may yield different profiles for the same plant. The problem is even more acute in perennial crops such as cocoa which take five to seven years just to enter the full productive cycle. Experts say genetic engineering, or a simple cross-fertilisation of trees, may produce results in 40 years. What scientists at Reading are hoping for more urgently, however, is to find the genes for such factors as pest resistance or high yield. This may take two or three years. With a bit of luck it may even be possible to come across the gene for exquisite taste, they say. To hasten the process, the Reading molecular biologists have resorted to a new version of a genetic fingerprinting method called "anchored micro-satellite." This... requires a much lower parity in the DNA which in plants tend to be hidden among a rich source of compounds. It works by tracing the "non-coding" DNAs that feature satellite regions of repetitive genetic codes. "The main advantage of this technique is that it's... able to distinguish between very closely related plants," said... [the] research leader and lecturer in genetics... Those paying for the research appear little worried about a consumer reaction if the outcome of the research is genetic engineering... Cocoa Research UK, said the idea that [GE] crops were bad for health was a total misconception.

...FOOD crops designed to incorporate medical benefits are on the horizon... says [Monsanto's NZ] product development manager... "Our people are working on nutri-medicinal crops which will have implications for public health. In future, when a child is born, as well as having a blood test they will have a gene map done. This might show, for instance, that they have a predisposition to heart disease later in life. With that knowledge they could eat bread made from nutri-medicinal wheat, and reduce their susceptibility."

...WHAT'S THAT YOU'RE EATING? ...BREAD, margarine, noodles, sausages, pies, baby food and chocolate: just a short list of foods on supermarket shelves that... can contain [GE] food products. Food suppliers can import them as they like. No questions, no pack drill – and no labelling. Whether this should happen or not, the situation will continue until next year at least, while our food regulations are harmonised with A[US]'s. Once there is an agreed standard, food importers are likely to face regulation, but... safe food... campaigners question whether it will adequately protect either our health or our environment. Aware that the issue of what some dub "Frankenfood" has happened at a time of regulatory limbo, the Ministry of Health has acted, writing to the food industry to invite companies to list what [GE] foods are already in the country... [a]s it wants to keep a "watchdog brief" and "respond to public inquiries." The meekly couched request warns recipients that confidentiality of disclosed information cannot be guaranteed. Canny food suppliers may read this as "tell us what you're selling – but if we have to let Greenpeace know then watch out for picketers." Perhaps not surprisingly, in five weeks only 30 of the 700 suppliers... have bothered to respond. The other interim measure taken by the ministry is to ask the food industry to import and supply only those [GE] foods approved by "competent overseas bodies." ...[However,] a natural food campaigner... is[n't] reassured by GE... foods which have been approved overseas[, and believes NZ's] public is under the mistaken impression that overseas authorities have thoroughly tested [GE] food... Some scientists say it is not possible to test such products for food safety. Says... a... professor of food safety at Leeds University, best known for his prediction of the mad cow disease crisis: "It is virtually impossible to even conceive of a testing procedure to assess the health effects of [GE] foods when introduced into the food chain." Many N[Z]ers don't need convincing of this. In the process of working out a food accord with A[US], our new regulatory authority invited submissions from the public on a draft standard for [GE] foods. The ANZFA has so far received... 2000 written replies – most expressing concern... and seeking a total ban or full disclosure on labels... [It's] manager in... [NZ] is busy forwarding submissions to the authority's A[US]n office. By the end of this year staff will have analysed them and reported to the authority – which in turn reports its decision on the standard to a council of the health ministers of the 10 jurisdictions involved (N[Z] is one). At that stage N[Z] can either make the new standard mandatory or opt for an entirely different standard, says [the manager]... "Our objectives are ranked in priority order. Health and safety is the top one." That doesn't satisfy [the campaigner], who says the public is not being asked whether it wants [GE] food, "but how and when." [The campaigner] wants a moratorium on [GE] foods in this country until the food authority's new standard is reported – and then a referendum on whether the standard is acceptable. The... [campaigner] suggests that the mutant beta casein A1 milk protein, selectively bred into cows, and later identified as triggering

diabetes, should act as a warning... “This is something completely new and we have the right to decide about it in our own time. Just because giant chemical companies want to feed us this food, we don’t have to rush. I would say N[Z]ers are more interested in food that tastes good, than in scientific manipulation of it.” ...[□ At present the ANZFA] has a six-member board, with two to come. An A[US]n member with a background in consumer rights has yet to be appointed. Of the two possible permanent N[Z]er appointments, only one has been made. [That NZer is the chairperson] of the board of Nestle N[Z].

...A FEW weeks ago I wrote about the A[NZFA] standard on genetic engineering of food. The N[Z] office of ANZFA has had such a huge response that it has extended the deadline for submissions. By this week, 2500-3000 had been received... [In comparison,] ANZFA’s principal food technologist in Canberra, who is running the food standards project, reports that only 200 submissions have been received from A[US]. This, the technologist said, was a big response for the Aussies... At the time of my column, the *Sunday Star-Times* revealed that foods containing... GE... ingredients were already on the shelves of N[Z] stores. I decided to write to the manufacturers and distributors of foods I ate to find out whether I was already unwittingly consuming GE ingredients. Here’s what I found: Real Foods, makers of soy products, sent statements from the companies which supplied its beans... and sent a parcel of products... Vitasoy in Hong Kong said it used only organic soy beans. Morinaga Nutritional Foods of California was similarly adamant... However, Real Foods could not be so adamant about other ingredients, but was in the process of surveying its suppliers “to establish the true position”... Stormont Bakeries, makers of Tip Top, Burgen and North’s bread, said that “to the best of our knowledge” they did not use GE ingredients... Griffin’s (biscuits and ETA products) does not use any GE ingredients. Pepsico Restaurants International, which owns Pizza Hut and KFC (NZ), could not confirm whether any of its ingredients were genetically engineered. Its suppliers were not required to tell them. “I would have to suggest,” said the brand manager, “that if your purchase decision is based solely on genetically engineered foods, that you steer clear of any of our products you think may concern you, because I do not have enough information to make a statement.” Point taken. Safeway Traders, which markets Pam’s and Budget label products, said I should avoid using products containing soy bean oil until “the edible oil industry clarifies the situation with the N[Z] Health Department”. Sanitarium did not answer my question, but sent recipes and an order form so I could buy some products. Nestle pontificated to me that “[hu]mankind has long benefited from using biotechnology” and that genetic engineering “allows improvements to be made more rapidly, precisely and safely”. Because there is no requirement to segregate GE soy beans from conventional soy beans, Nestle said it would become increasingly difficult for suppliers to give a guarantee of the absence of GE soy beans. Nestle said it did not add GE raw material directly into products, but it could not guarantee that two ingredients in its products – soy sauce powder and red miso powder – were not made from GE soy bean[s]. Nestle specifically said it supported the ANZFA proposal to only declare GE in the case of foods that are “substantially different” from the natural product. If every product with GE ingredients had to be identified “then any distinction would be lost on consumers”. I have outlined Nestle’s position at some length because it offered such a staunch defence of GE foods[– it] was the only one of my correspondents to do so[– and it is directly linked to the sole NZ]er on the ANZFA board to be recommending whether all GE foods must be labelled... This raises the question of how well N[Z] interests will be represented on the... authority... Despite their huge interest and strong opposition, there was no plan for the analysis of the submissions to identify a specifically Kiwi view. The next step is for the ANZFA board to make a recommendation to the [NZ and AUS] Food Standards Council. Here again, N[Z] is under-represented... N[Z] is in danger of being swallowed up in this trans-Tasman process. In the interests of global trading, N[Z] consumers may be saddled with something they don’t want and no one can prove is safe. At its most basic, this issue comes down to one of informed choice. It is not good enough for food authorities or food manufacturers to decide for us what we need to know about what we are eating. Consumers should be able to make their own decision with all the information... Borrowing from reproductive rights campaigns, perhaps the slogan should be: “My stomach, my right to choose!”

...*Keeping your mouth shut is the best way to get on-side with the public...* Biotechnology companies are being advised to avoid public discussion of the safety of genetically altered food. It comes from a damage-limitation consultan[cy firm] in a document which has been leaked to the *Observer* newspaper. [The document’s author] was the firm which represented the companies involved in the Three Mile Island nuclear crisis in 1979 and the Bhopal chemical disaster which killed up to 15,000 in India in 1984. The same firm stepped in after the Exxon Valdez oil tanker ran aground off Alaska in 1989, and helped to manage public relations for the British authorities during the BSE crisis. The company has been hired to improve the image of the European biotechnology industry and to challenge the green lobby over [GE] food. Its advice... is to focus on consumer benefits and steer clear of safety questions. “Public issues of environmental and human health risk are communications killing fields... EuropaBio’s communications strategy must be to stay off these killing fields – no matter how provocative the invitation.” The document advises the industry to abandon the use of logical arguments and to adopt symbols in its battle to win greater acceptance for genetically altered products... [A spokesperson for the consultancy firm] said the industry has behaved “like an axe murderer with something to hide... Now the industry has learned that if a product benefits the consumer that fact has to be communicated to the consumer.” Environmental groups have dismissed the strategy as cynical. Greenpeace... said: “We do not understand why they don’t accept public opinion rather than trying to change it.” [The consultancy firm] was hired after a Greenpeace campaign against [GE] food... The European Commission has decided to oblige companies to label such products.

...[GE] crops are no more dangerous to the environment than traditional crops... says an international panel of scientists. In a report for the World Bank, [a]1990 Nobel Prize winner... and seven other scientists recommended that the bank pay for genetic engineering research products... The report[– which]... acknowledged that some risks exist, including the potential for a herbicide-tolerant plant to cross with wild plants and produce a weed that could not be killed[– also]... attempted to calm fears among some watchdog groups, who contend plants should not be altered until more is known about possible long-term health effects. Brazil, which had banned the import of [GE] soybeans, reversed that decision because of the country’s need for soybeans for industrial use.

...Safe and wholesome food is a basic human need. N[Z]’s reputation for production of high-quality food earns a large proportion of its income and supports our lifestyle. Anything that threatens the quality of our food is a threat to our health and wealth. Recently a campaign against [GE] food has been promoted... [E]xamples used to illustrate the “dangers” of this technology... frequently included a series of misleading statements and misrepresentation of scientific facts. These have been presented to generate an irrational fear of a new technology to suit a political agenda to ban... genetic engineering of food... The statements are the result of repeated quotations, each time being slightly reworded until the “truth” has been diluted to a series of exaggerated myths. The result is nothing more than “folklore” presented as scientific fact. Another common strategy is to cite “leading international authorities” such as a medical expert warning of the dangers posed by [GE] plants. The risks... as perceived by scientists from other disciplines are merely casual comments by individuals who do not understand the basic principles of traditional breeding. In particular they do not realise that the risks they suggest can be equally attributed to genetic engineering and traditional breeding. Plant and animal improvement by traditional breeding has been going on for centuries, with a long and impressive record for the safe introduction of new genetic combinations in foods... [Indeed, new] genetic material arises every day by natural means at a far greater rate than humans can “engineer.” ...Any new technology contains potential risks that may pose a hazard to public health. Risk, however, has to be assessed against known hazards and there are plenty of those in our food already... [As lecturers] at Lincoln University in plant genetics, molecular biology and food biochemistry respectively[, we]... consider the risk of genetic engineering of food to be very low in relation to existing hazards... which include bacterial and fungal contamination that regularly cause acute human illness and sometimes death. Reports are seen regularly of food poisoning caused by coliforms, salmonella and campylobacter. Less obvious are the hidden nutritional dangers, such as excessive saturated fat and high levels of salt in some processed foods. Even some... foods... accepted as being “naturally derived” can contain high levels of hidden toxins. The use of pesticides and

herbicides is also a major food quality issue and it is generally agreed that the levels of these should be reduced in convenience foods... Another threat to our food is the control of its supply by multinational corporations... [While this is also a problem with GE foods], to parade genetic engineering as the underlying evil is misguided and overlooks the immense benefit this technology offers for the production of much safer foods... Finally, [in preparation for the new technology, GE]... foods in A[US and NZ] are poised to be controlled by what may be the world's toughest regulations. Manufacturers must provide an enormous amount of detailed scientific evidence to prove the safety of their proposed new food. They must provide data on the sources of new genes and full sequences of the DNA... manipulated, the vectors used to ferry the gene into place and the marker sequences that indicate whether they have been successfully introduced. Stringent regulations will also apply if some of the plant or animal genes have been deleted... It is ironic that the rules will not be applied to foods developed by traditional breeding despite the similarity of the risks.

...Greenpeace, Friends of the Earth, Soil and Health and other green groups will target supermarkets and shoppers today as part of a global week of action against [GE]. A... poll... th[ey]... commissioned... found... 60[%] of people were worried about eating [GE] food... only 12[%] were not.

...The public needs to be educated to understand rather than fear... developments in cloning and food technology... the Minister of Agriculture... [said at] a science convention at Lincoln University yesterday... A lack of understanding about modified food products could "put new technologies at risk, because in the final analysis the consumer has the final say through his or her spending decisions," [the minister] said.

...Governments are out of touch with public concerns about food quality, says a visiting critic... Failure to respect consumer concerns about food will result in "extreme public anger," warns [the British food industry critic... That might happen in N[Z] if the state relinquishes its health and safety role. "That [British] 1970s model of deregulation and 'hands-off state' has run out of steam. I know it is the model you have in N[Z], but it is no longer the right one for Government,"... [The critic] spoke of Britain's loss of confidence in Government food policies, and of corners being cut over food safety... In Britain there had been public unease over food additives, food poisoning caused by production methods, food contamination, use of growth hormones in cattle, irradiation of food – and now over genetic engineering... [T]he way the European Union and British Government handled issues like [GE] food would show whether they were willing to listen to the consumer voice. Before... [becoming] professor of food policy at Thames Valley University in London, [the critic] spent a quarter of a century farming and working with voluntary groups concerned about food and public health. [The critic] was one of the initiators of the British Food Commission – originally a think-tank and public advisory service on food issues, now a campaign organisation. "As the state withdrew from the food area, and failed to intervene over issues like BSE... and food irradiation, the food commission ended up setting standards and providing a public voice." ...[the critic urged NZ] dietitians to take a political view of food policy, to think about what sort of food and farming systems we want, to push for reform of our regulatory bodies, and to encourage governments to protect consumers from the excesses of profit-driven corporate power... So-called cheap, mass-produced food came with a huge hidden cost... At the beginning of the century, the average British household used to spend half its income on food; now it spent about 11[%]. But the story was different for the British poor... They spent a third of their income, or more, on food. Even so, one tenth of the population could not afford a healthy diet... and food was now a source of alienation... A "new food poor" was emerging.

...Hoechst and Monsanto... may well control the future of world farming and horticulture through their ownership of materials essential for developing plants... The significance of the near-monopoly is explained by a Karapiro nursery[-owner]... who... was offered recently a genetic development to prevent apple flesh going brown after being cut. "I had to ask, are you offering me just the genes, and do I have to go and deal with Monsanto for the transfer material and pay a separate royalty?" ...The transfer materials and plasmas are essential for causing genes inserted into cells to bond with the cells. Control of these agents, rather than other genetic technology, is a simple way of gaining awesome power by the two... giant companies... which grew to be multinationals by manufacturing chemicals... [Although the nursery-owner] deals in the intellectual property of horticulture – the rights to "ownership" of biological material – [it] disagrees with the principle of such ownership. "Nevertheless, the black and white of the law is that such rights exist, and I have to operate in it,"... HIS private contention is that biological material is a natural resource and the property of [hu]mankind. "After all, [the companies] haven't created these materials... They were there all along, and [someone] simply discovered their existence by applying technology and science. If th[e] totara tree is found to contain [a] miracle cure for cancer, who does it belong to – Maori who were the original settlers, or me, who has assumed the role of custodian of the land for the present time, or to everyone?["] ...wheat rust... once threatened crops everywhere. Eventually a strain of resistance was found in a grain in Siberia, and bred into wheat to save the world's crops. "Who got rich out of that? ...You can bet it wasn't the Siberian peasants." The issue has been canvassed by a Waikato University law lecturer... in a paper for the Environmental and Planning Law Journal. [The paper outlines what the lecturer] describes as a "chasm" between the so-called poor south of the world, which claims it provides most of the genetic material on which the world's food is based, and the rich north, which claims private ownership of such genetic material... [T]hat... chasm, which caused the refusal of the... U[S] to sign the 1992 Convention on Biodiversity, stems from basic conflict over what is common, as opposed to private, property... [E]ight nations have reserved their positions on such contentions in international forums because these northern countries saw the undertakings as "a blatant attack on the principles of private property." ...that confrontation over biological diversity seems set to continue into the indefinite future[, even though statements made by the FAO]... and international conventions[can be] summed up as: "Plant genetic resources are a heritage of [hu]mankind and consequently should be available without restriction... [T]his included elite and breeding lines ([e.g.], genetically altered biological materials) [which are] within the rubric of common heritage." ...[Incidentally, i]mplementation of the Hazardous Substances and New Organisms Act has been deferred to allow the Government more time to set up the new regime. The provisions relating to [GE] organisms are scheduled to come into effect [in July 1998], while those relating to hazardous substances are aimed for October. Both were to have come into force in April. The Minister for the Environment... said there was little to be gained by insisting on a tight timeframe when with more time "we can deliver a more stable and complete system that is workable."

...N[Z] may miss out on new agricultural chemicals if the Environmental Risk Management Authority (Erma) opts for too much public disclosure of commercially sensitive information, warns a chemical company lobbyist. The... Agricultural Chemical and Animal Remedies Manufacturers' Association... says the... need to protect confidential information is crucial to the import of new animal health and crop protection products... But... Greenpeace claims the public's right to know about new chemicals and [GE] organisms requires fullest disclosure. The Department of Conservation also questions whether Erma intends to disclose enough to ensure the public interest is protected. N[Z] is one of the first countries to set standards for "ecotoxic" substances and [GE] organisms in fully public hearings, and to give the public the right to request reviews. That protection is enshrined in the Hazardous Substances and New Organisms Act enacted in June 1996 – but the agency entrusted with enforcing the law is slow to get up and running... Until new regulations are finalised, the work of Erma is being carried out by a thinly resourced, stopgap body called the Interim Assessment Group, established in 1988. The group is having to make the hard and controversial decisions about whether to permit trials of [GE] crops and other organisms (including animals), without benefit of statute or regulations. The group's chair[person, who is]... a molecular biologist at Massey University... hopes this will be the last year the group will have to function[, and describes NZ]'s new law on [GE] organisms as trail-blazing. "No other country has done anything like this,"... But trail-blazers don't always get it right first shot. In resolving the knotty issue of public disclosure, N[Z]'s decision-makers may find it difficult to satisfy both greenies and the chemical industry. Greenpeace has already complained about lack of full disclosure by companies applying to field-test [GE organisms in NZ]. For instance, when Zeneca applied to carry out a modified canola (oilseed rape) trial last year, the company advised that the field-test would take place in Canterbury or Southland. The company would not reveal the exact location to Greenpeace or to the media... It turned out to be in North Otago.

...Rabbit-shooting and Greenpeace worry me. Carrying a rifle, I get mean, cautious and slow. I waste no shots on rabbits that are running for cover under the gorse bushes. If rabbits want me to kill them they must stand perfectly still and be patient while I get everything adjusted. Long-term, the result must be that trusting rabbits do not live long enough to pass on their fatal genes. But alert and lively rabbits that run without stopping live long and fecund lives. If I keep on killing three rabbits a day, there will soon be nothing left but an unkillable strain, selectively bred to flash out of sight before I can get a bead on them. Greenpeace friends will then be able to tell me I have bred a Frankenstein rabbit. Greenpeace people are big on scary words. They talk in a hectoring way about Frankenstein soya beans and Frankenstein rapeseed plants. I don't want to niggle over side issues. But Greenpeace really is up the boohai in putting this Frankenstein tag on newly developed plants it doesn't like. After all, Frankenstein... was not the monster. Frankenstein was the scientist who made the monster. Scientists today are making new plants by splicing, say, cold-resistant genes from fish into tomato plants to stop frosts killing tomato crops. In theory, splicing genes... could open up dazzling possibilities: disease-resistant people, farm animals that never need drenching, mangoes ripening in Southland... I want someone to splice a hedgehog gene into my rabbits. The gene I want is the one that makes hedgehogs stand... still, pretending to be invisible... when they see someone coming... Greenpeace people, though, feel dread not hope. Their photocopies pump out Frankenstein-phobia. I get the feeling that Greenpeace has stolen the job the Church performed in the days of the Inquisition. Just as the Church started off by challenging the established system and then turned itself into the established system, so Greenpeace has changed. Once it challenged authoritarian scientists. Now it has grown authoritarian itself. It is turning into a religion. It claims to own the one Great Truth. And in a world that thrives through harnessing expanding knowledge, the Greenpeace religion stands guard against new knowledge with barricades of slogans.

...[“Everything you see around you is constructed of molecules so small that it's only been in the last decade we've been able to see them. It takes trillions of billions of atoms to make up something as simple as a pasture and it's occupants. If the molecules are rearranged, what we see changes. Nature learned to handle atoms one at a time a long time ago, but the process is a new and exciting field for us. There are scientists who feel that when they can manipulate atoms one by one they'll be able to do away with the steer and just turn the grass into steak”! By the way,] British parents have been given [a] new weapon in the age-old battle to get their children to eat their greens – chocolate-flavoured carrots, baked bean-flavoured peas, cheese-and-onion cauliflower and sweet corn with just a hint of pizza are part of a line of “wacky veg” unveiled yesterday by a chain of supermarkets.

...[a shortage] of food technicians threatens to halt the pace of N[Z]'s spectacular growth in value-added food production... The value of food and beverage exports has nearly doubled to \$9.7 billion during the past 10 years. The industry is predicted to contribute half of N[Z]'s foreign exchange earnings by the year 2002... [However, big] changes in international food trends have led to a shortage of people with technical skills not only in product development, production and quality control, but also in marketing and general management.

...The fruit industry should speed development of new varieties to take advantage of changing consumer trends, says the chief executive of HortResearch... The premier status of apple varieties like Braeburn and Royal Gala appeared to be at an end, [it] told the Hortcuture conference in Auckland... “We must become the undisputed global leaders in innovation in horticultural products... The world expects more and we can deliver more but we must do that with an unprecedented sense of urgency.” ...while the vegetable industry had introduced pre-washed salads and coleslaws, it was noticeable that the same development had not taken place with fruit... Meanwhile, [a]... drop in plantings and prices has reduced the process vegetable industry by 40[%]... in four years. From a farm gate value of \$46 million... the industry was expected to drop to \$27m in the coming season, said... the Vegetable and Potato Growers' Federation (Vegfed) process sector chair[person. It] blamed cuts to contracted areas.

...[latest sales statistics have confirmed once again that the banana is NZ's m]ost popular fruit... Most popular vegetable: Potatoes... [Speaking of spuds, if you grow your own or purchase them unwashed, consider this the next time you clean them: e]ating dirt can be good for you, according to scientists who have analysed soil consumed by people in China, Zimbabwe and the U[S]. The samples contained exactly the nutrients needed to provide the benefits reported by soil-eaters[. ■ ‘In different parts of Asia, Africa and America, there are whole tribes of geophagists (earth-eaters). Certain American Indians in times of scarcity used to eat a type of clay soil. But this soil has no food value, and serves only to create an illusion of satiety. In Java and Sumatra, clay that provides food for the inhabitants undergoes some preparation in advance. It is mixed into a paste with water after all foreign bodies (such as sand and stones and other hard matter) have been removed. It is then rolled out into thin cakes and baked in an iron pan over a charcoal fire.’
